

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

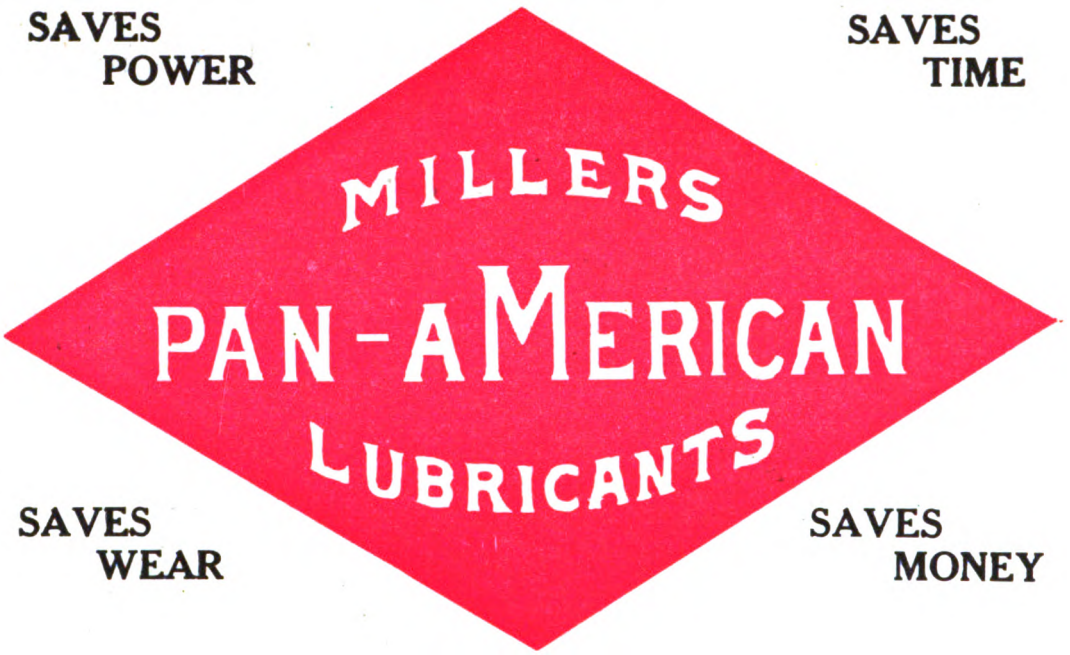
✱ the oil that lubricates most ✱

Mobiloil

A GRADE FOR EACH TYPE OF MOTOR

TO THE TRADE
ARE YOU HANDLING MOBILOILS?



Ten years ago Mobiloil was first manufactured and offered to the automobile owner with the guarantee that it was the result of long experience in the manufacture of lubricating oils. It has stood without an equal for many years, its quality is recognized the world over and today there is a greater demand for Mobiloil than for any other automobile oil on the market; it gives more mileage per gallon and if once used, is always used. In order to further increase the demand for Mobiloil, we shall follow an extensive advertising campaign, which will cover every section of the United States. We solicit your co-operation.

If oil saves power, it follows that
one oil saves more power
than another.

VACUUM OIL COMPANY

MILLER PAN-AMERICAN

Motor Cylinder Oils

are refined from the finest grade **Pennsylvania Crude** and are a pure, distilled, highly-filtered mineral oil.

GEAR CASE COMPOUND

Made in Three Densities---Light, Medium, Heavy

All have a low cold test and high melting points and retain their various consistencies at varying temperatures.

In order to convince you of the efficiency of these lubricants we are willing to make you a **special price** for an initial order, much lower than usually quoted on other high grade oils and greases.

Guaranteed the Equal of any high grade Oil on the Market at any price.

Silent WAVERLEY Electrics

Special Model on Exhibition at the Shows

Body Finished in black, with gold lines. Wheels and Window Frames Ivory White. Upholstered with rare brocade, fawn colored, rose, and white.

Ceiling painted to carry out design. Lamps, cut glass, with gold mountings, handles solid ivory. Note step lamp—another innovation.

Price, Complete, Standard Finish, $3,500

For All Town Car Purposes

Ample space for five grown people—no crowding and full view ahead for the driver—two average days' mileage in one charge—upkeep cost HALF that of the average gasoline car—no chauffeur needed—the

Silent Waverley Limousine-Five

Full View Ahead

Design and Construction Patents Applied For.

appeals to every man or woman who wants a big, serviceable town car.

Its richness, style and elegance capture every woman. Its proved mechanical perfection, assuring freedom from trouble—its size and impressive appearance, makes it preeminently a man's car.

The WAVERLEY LIMOUSINE-FIVE on exhibition at the shows combines the matchless taste and elegance of Louis Sixteenth's days with present day comfort and efficiency.

In addition to full view ahead and ample room for five, note the following exclusive features:

No-Arc Controller, so simple a child may run it. Solid or pneumatic tires at owner's option—High efficiency shaft drive with herring-bone gears—full elliptic springs.

Riding qualities are unequalled, body low hung, design, fittings and furnishing superb.

Ask for the Beautiful Waverley Art Book on Town and Suburban Cars. It shows ten models. Prices $3500 down to $1225. Also the Waverley Catalog of Commercial Vehicles. Exide, Waverley, National, Ironclad or Edison Battery.

No-Rim-Cut Tires

(10% Oversize)

At the Madison Garden Show

86 cars were shown equipped with Goodyear pneumatic tires. Goodyears led their nearest competitor, on pneumatic tires, by 138% and the two nearest competitors combined by 30%. At the Grand Central Palace Show Goodyears led their nearest competitors by more than 100%. More cars were equipped with Goodyears at this show than with any three other competing makes.

So it is everywhere.

127 leading motor car makers have contracted this year for Goodyear Tires.

Two years ago there were 44.

Last year we sold 409,000 automobile tires. That's more than the previous 12 years put together.

Goodyear No-Rim-Cut Tires now far outsell every other tire in existence.

Present capacity, 3,800 tires daily.

Because Tire Bills Are Cut in Two

Tens of thousands of users have proved for themselves that No-Rim-Cut tires cut their tire bills in two.

And they have told the facts to tens of thousands of others.

That's what men want—less tire expense. The figures show they found it in No-Rim-Cut tires.

23% Plus 25%

Figure it yourself.

Statistics show that 23 per cent of all ruined clincher tires are rim-cut.

No-Rim-Cut tires end that ruin entirely. Rim-cutting is simply impossible.

The 10 per cent oversize, under average conditions, adds 25 per cent to the tire mileage.

It means 10 per cent more air—10 per cent greater carrying capacity. It saves the blowouts due to overloading.

You get both these savings—23 per cent plus 25 per cent—in Goodyear No-Rim-Cut tires.

No Extra Cost

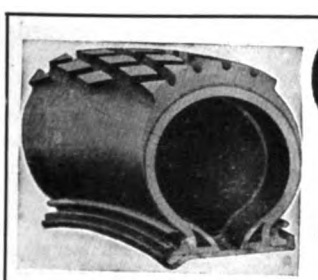
Men used to pay—and gladly—one-fifth extra for No-Rim-Cut tires.

Now they cost no more than other standard tires. The enormous demand has cut the cost of production.

Please remember that.

Tires that can't rim-cut cost the same as tires that do. Tires 10 per cent oversize cost the same as tires that aren't.

The Coming Tire



In two years the demand for No-Rim-Cut tires has increased by 500 per cent.

Our present output is three times that of a year ago.

This patented tire—the final result of 13 years spent in tire making—now stands in first place. And the demand is growing faster than ever.

Please mark those facts.

Clincher tires must go. The coming tire, with all men who test it, is the Goodyear No-Rim-Cut tire.

GOODYEAR

No-Rim-Cut Tires

With or Without

Double-Thick Non-Skid Treads

Our new Tire Book is ready. It is filled with facts, based on 13 years of tire making, which every tire user should know. Ask us to mail it to you.

What Motor Trucks Mean

If you are not using motor trucks, we take it for granted that you do not understand the benefits to be derived from them. Possibly you have the wrong view-point---perhaps you have been making too many comparisons with the horses and not really investigating what the truck meant to you as a machine to perform certain work. The individual or firm that has a better delivery system has an advantage---the kind of business doesn't matter---service is appreciated universally. If the White Company can place in your hands a more efficient means of making deliveries, they have given you an opportunity of extending your field---of broadening the horizon of your product---of making good---where you had been unable to go before.

White Trucks Known For Performance

Go into any large city in the United States---ask the men who have the largest delivery problems, to see what they know about these White trucks. Almost regardless of whether they own them or not, you will find that they know their record for splendid performance. To the man about to invest in trucks, a list of White owners will appeal as almost a directory of the big business men. They have invested their good money in White trucks and their endorsement is the fact that they are continually increasing their equipment. No one buys and buys again the thing that fails to stand the test. We could tell you why because it is all in the designing---in the building---in the care we take in the production of the truck. The important thing to you is that they do perform---that White trucks satisfy their owners---and, therefore, must be the kind that you want.

1500-lb. delivery wagons, 1 1-2 ton, 3-ton and 5-ton trucks---all with a universal type of power plant.

Let us submit a solution of your delivery problem. It will entail no obligation.

NEW MODELS REVEALED AT CHICAGO.

ELABORATE as has been the setting for the Coliseum show in Chicago for the past few years, the 12th annual display of the National Association of Automobile Manufacturers, which continued for two weeks, Jan. 27-Feb. 10, was staged amid grandeurs far in excess of previous attempts. Accompanying photographs may convey some idea of the rich, Oriental splendor of the Coliseum interior, but it is impossible to reproduce the wealth of color which greeted the visitor.

To the mind of the easterner, an automobile show is for the purpose of displaying the models of the coming season, that those who may be interested in studying the respective merits of various cars may have full opportunity to do so under conditions which will make comparisons an easy matter. As a result, there has been a tendency on the part of the managers of the so-called national exhibitions in New York to eliminate more and more the ornate decorations, making them so simple as not to detract in any manner from the cars on display.

Evidently the people of the Middle West prefer something entirely different. What has been said should not be regarded in the nature of criticism. The fact remains that it is impossible to attempt to describe the Chicago show without first devoting some space to the decorations. The visitor's attention was drawn to them first of all, and while the exhibition of cars was most complete and particularly attractive, the decorative scheme was such as to force their consideration into the background.

Interior of Coliseum at Chicago, During Pleasure Car Show, Indicating Beauty of Decorative Scheme.

A mosaic palace, is the description offered by the manager, S. A. Miles. The roof was a massive painted arch, the centre of which was a succession of circular panels, carrying red flowers. Each row of tiling, as the arch bent toward the side walls,

Digitized by Google

was of a different hue and design, until they joined a simulation of potted plants. And from this immense circular dome hung three rows of lanterns of square design and great size, which shed a rose hued light over the entire interior.

A wide main aisle divided the show spaces in half, these in turn being sub-divided, by superstructures suggesting immense clock towers and surmounted by small, squared spaces, with four projecting platforms on which potted plants were installed. Abutting these towers, and extending in either direction, was a lower structure terminating in small turrets, also carrying potted plants. Behind these plants were hidden green lights, which added their hue to the

One Corner of the Coliseum, Presenting Mosaic Ceiling and Clock Tower Effects.

red of the hanging lanterns and still further accentuated the mosaic effect.

The balcony, where the accessories were shown, was equipped with a white wood rail, below which, and extending the full length of both sides of the building, were panels depicting a forest scene, into which the semblance of mosaic design also was carried. Covering the walls at either end of the main hall was a huge drop curtain, on which the forest scene was even more strikingly portrayed.

And amid these fanciful clock towers, turrets and other superstructures the choicest designs of nearly 100 pleasure car manufacturers were arranged during the first week of the show. The same setting was utilized for the second week, or commercial vehicle section, at which 82 different makers were represented. One hundred and eighty-four accessory firms and 19 concerns showing motorcycles, also found space.

However, not all these exhibits could find room in the Coliseum proper. Some were located in the Annex, where the same general decorative effect was sought, but on a much smaller scale. Still others displayed in the First Regiment Armory, and here the decorations were even more simple.

The ceiling was hidden by a large painting representing a glass roof on which numerous autumn leaves had fallen, and through which glimpses of a painted azure sky could be seen. The railing of the gallery was draped with green and white bunting. The floor work was borrowed from the Coliseum decorations of 1911. The huge Louis XV vases and large, tinted seashells, holding palms and potted plants, set off the various exhibition spaces.

Fully realizing that this meagre description is utterly inadequate for the subject, the reader is referred to the accompanying illustrations for a more intimate consideration of this feature. After all, the cars are the principal attraction at an automobile show, and in this respect the display at Chicago set a new record.

Last year, there were 94 different makes of machines represented in this city. This year there were 98, having reference specifically to the pleasure vehicle section. The two New York displays presented 97, of which 60 were seen at Madison Square Garden and 37 at Grand Central Palace. The total number of machines and chassis shown at Chicago was 344, as compared with 248 at Madison Square Garden and 163 at Grand Central Palace. Of these, 37 were electrics, as compared with 23 for both displays in New York City.

Delving further into statistics, the number of touring cars at the three shows was as follows: Chicago, 169; Garden, 112; Palace, 73. Roadsters were represented by 52, 40 and 39, respectively, and enclosed types by 32, 37 and 16. There were 249 water-cooled engines and but four in which air was utilized for this purpose. In the matter of cylinders there were three of one-cylinder, one of two, 183 of four, five of four-cylinder, two cycle; five of four-cylinder sleeve valve, 55 of six, and one of six-cylinder sleeve valve.

For the most part, the Chicago exhibit may be classed as a repetition of the two New York shows combined in one. This is not wholly true, because, while there was but one more make on display, there were 12 producers of gasoline cars and four of electrics which were not represented in the East, and a few of those who made display in New York brought out a new model. Still, the main statement is unchanged. Nothing radically different was disclosed. The same refinement of details was to be observed as at the two shows which preceded it, and the exhibition still further accentuated the claim that the 1912 season is to see no wide variation from accepted standards.

The additional evidence produced by the 12 new makes shown here for the first time this year indicates even more clearly that in the matter of equipment the offerings for the present season are to be most com-

Digitized by Google

plete. As was true of the New York shows, demountable rims were more generally fitted than ever before, and the tendency seemed to favor slightly longer wheelbases and larger tires. Electric lighting, self-starting devices, central control levers, detachable and usable fore doors, and rich body designs were quite as prominent as at the eastern displays.

In fact, it may be stated that many of the exhibits were exactly the same as those made by the same concerns at New York. In some instances the cars were arranged a trifle differently, and as has been said a few added a new model. Among the latter was the booth of the American Motors Company, Indianapolis, Ind. Officially, this is termed the American Scout, and it is the same in all essential details as the remainder of this well known underslung line, except in size and horsepower, the latter of which is 22. The body is enclosed.

Inasmuch as The Automobile Journal went into detail concerning the changes in the various lines exhibited at New York it will not be necessary here to devote space to describing the displays of those concerns. The issues of Jan. 10 and 25 contain full information on this score. Those models which were

Pleasure Cars Disposed Along the Central Aisle, Giving Another Idea of the General Decorative Scheme.

Nordyke & Marmon Company, Indianapolis, Ind., maker of the Marmon line. The new design was termed a Speedway roadster, modelled somewhat after the lines of the Marmon Wasp, in which Ray Harroun won the 500-mile race on the Indianapolis speedway, last Memorial Day. To be sure, it lacks the elongated rear of the Wasp, and is otherwise changed to resemble a gentleman's roadster, with a dark green modified racing body and a large gasoline tank back of the seat. In common with other Marmon cars, it is equipped with a Prest-O-Starter and two point ignition.

Another addition, also a roadster, was seen at the shown at Chicago for the first time will be treated in a similar manner below.

The Austin Automobile Company, Grand Rapids, Mich., displayed two Austin six-cylinder touring cars and a six-cylinder chassis. One of these is entirely new, but first it must be remarked that the Austin line has contained nothing but sixes for the past five years. The new model is claimed to possess the greatest relation of stroke to bore of any car on the American market. The bore is 4.5 inches and the stroke seven. The motor is of the T head type, but has the valve pockets cast diagonally opposed to each other, instead of diametrically opposite as in general prac-

Digitized by Google

tise, a decidedly new idea in engine design.

Another feature is the left hand drive with central control levers, particularly as all the other Austin models are controlled from the right. The emergency brake lever has been eliminated and in its place is fitted a pedal with ratchet stop, and the service brake is interconnected with the clutch pedal. The equipment includes electric lighting and a compressed air self-starter, the latter of which is furnished with an attachment for inflating tires as well. Between the two front seats is a compartment for carrying tools, etc., as well as the gasoline tank, and the spare tires are carried in another compartment under the tonneau seats, entrance to which is from the rear by means of two wide doors.

The Bartholomew Company, Peoria, Ill., presented three four-cylinder Glide touring cars. This concern also has a new model, making two chassis instead of one as in former years. The new Glide is of 36 horsepower, while the old one was 45, and it may be added that the older is retained with practically no changes, except such refinement of detail as experience has found desirable. The 36 horsepower car has left hand drive with centre control levers, the motor, change speed mechanism and levers being arranged so as to be removed from the chassis as a whole, or each part separately without interfering with the other units. Electric side and tail lights and an acetylene self-starter are included in the regular equipment.

The Colby Motor Company, Mason City, Ia., showed two four-cylinder Colby touring cars and one four-cylinder chassis. The line is distinguished by a new model, in which the underslung body makes it entirely different from the other members. The motor is of the block type with bore of 4.0625 inches and stroke of 4.5. Lubrication is by means of a cam-driven plunger pump located in the crankcase. The change speed mechanism is mounted on the rear axle, and a torque tube combines the functions of a radius and torsion member. The tube itself extends forward and is attached to a cross frame member by means of a wide yoke around the forward universal joint. Torque and driving strains are sustained by heavy brackets securely riveted to the frame and forming the rear sub-frame hangers. In addition to the heavy torque tube, the axle is braced with two strut rods which extend to the pins on which the yoke turns.

The Crow Motor Car Company, Elkhart, Ind., displayed two four-cylinder Crow-Elkhart touring cars and a roadster. The entire line now comprises five

Presentation of the Individual Exhibits of Pleasure Vehicles Amid Oriental Splendor of Mosaic Design.

Digitized by Google

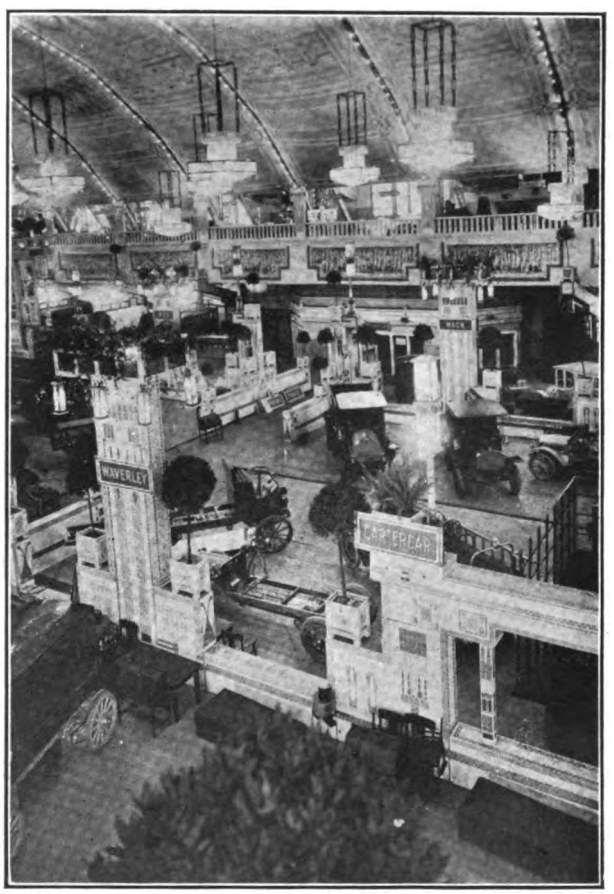
chassis instead of two, and 12 body designs. Few changes are noted, the new chassis maintaining the same general features which marked the product of this concern last year. One of these is the placing of the control levers in the centre of the floor boards, although the driver is still located at the right.

James Cunningham, Son & Co., Rochester, N. Y., presented a four-cylinder Cunningham touring car and limousine. This concern still adheres to the practise of producing but one chassis, in which it has not been found necessary to make a single radical change from past models. The distinctive features include a unit power plant of accessible design and rigid construction, long stroke motor, valves in the head, offset cylinders, etc. Equipment includes demountable rims and two extra rims, as well as the usual full list of accessories.

The Davis Carriage Company, Richmond, Ind., was represented by a four-cylinder Davis touring car and a roadster. This is another car in which the control levers are placed in the centre, although the driver is located on the right. The new motor is cast en bloc, instead of in pairs, and the stroke has been increased from 4.25 to 5.5 inches, the bore remaining at 4.25 inches. A full floating rear axle has taken the place of the semi-floating member used last year. The equipment includes a Prest-O-Starter.

Haberer & Co., Cincinnati, O., had on view a six-cylinder Cino touring car, six-cylinder chassis and four-cylinder racer. The six is a new model, although not particularly different from the older four, which is retained without material change. Perhaps the distinctive features of the new model may be termed the large cone clutch with spring inserts, three-speed selective gearset, full floating rear axle, and worm and double nut type of steering gear. The motor is of the T head type with bore of four inches and stroke of five. All Cino models are equipped with self-starters this year.

The Kissel Motor Car Company, Hartford, Wis., displayed a six-cylinder KisselKar touring car, a four-cylinder small tonneau, two four-cylinder touring cars and a four-cylinder chassis. One of the fours is a new model, rated at 40 horsepower, although it does not depart greatly from the standards set by the older members of the line. In the new car the cylinders are cast en bloc with a bore of 4.5 inches and stroke of 4.75. Particular attention is



Central Aisle of the Coliseum During Second Week of the Display When Commercial Cars Were Featured.

Digitized by Google

called to the light construction, although it is notable that none of the requisite strength has been sacrificed, and it is claimed that the machine is more than ordinarily economical to operate. Equipment includes demountable rims, and one extra rim, on all except the smallest model.

The Lexington Motor Car Company, Connersville, Ind., displayed one six-cylinder roadster and a four-cylinder touring car. Both are new products, and the line also includes another four-cylinder chassis, which is retained without material change. The six is a particularly racy appearing roadster, with an extra long scuttle dash. Both models employ the Rutenber motor, with cylinders cast separately, and

Impression Conveyed by Mosaic Palace Effect, Showing Disposition of Individual Truck Exhibits.

bore and stroke of 4.125 and 5.25 inches, respectively. All Lexington cars are equipped with the Prest-O-Starter.

The Republic Motor Car Company, Hamilton, O., showed a Republic touring car, roadster and chassis, all with four-cylinder motors. The roadster is new, and presents novel features, some of which have been incorporated in the older members of the line. For instance, the windshield is built into the body of the car, the scuttle dash being carried up to meet it, and a distinctive type of ventilator is incorporated in that portion conforming to the usual filler board. The entire body is enclosed, the levers being located in the centre. An auxiliary seat is placed over the running board, and when not in use this folds up and is made to insert into a special compartment under the regular seat, like a drawer. The gasoline tank is in the rear compartment, and an additional feature is the location of the Prest-O-Lite tank and tool box out of sight between the fuel tank and body proper. Still another detail is the hanging of the rear springs below the axle instead of above.

The Staver Carriage Company, Chicago, displayed one large Staver touring car, one smaller touring model and a chassis, all with four-cylinder motors. Practically the only change in the line is the discontinuance of the 30 horsepower model, and the substitution of new motors in the others. The two remaining chassis are identical with the exception of the size of the engines, these being 35 and 40 horsepower, respectively. The former has a bore of 4.375 inches and the latter 4.5, with the stroke five inches in both cases. The lubricating system is held to be distinctive, in that two separate shallow pans are suspended below the crankshaft. Into these each pair of connecting rod big end bearings dip. In the sides of the pans are a number of small holes through which the oil seeps. The initial splash of the connecting rods throws out practically all of the oil, which seeps back slowly, yet sufficiently fast to keep the bearings well lubricated. It is claimed that this method eliminates all danger of smoking.

The Streator Motor Car Company, Streator, Ill., showed two four-cylinder Halladay touring cars and a four-cylinder chassis. The 40 horsepower model is continued practically without change, but the 30 horsepower chassis has been redesigned throughout. Both motors are of the Rutenber make, the new one being of the true long stroke type, with bore of 3.25 inches and stroke of 5.25. The change gear mechanism is suspended from three points in the middle of the chassis, and by reason of this change the rear axle has been redesigned, although it is still of the semi-floating type. The rear springs also have been altered slightly. Equipment on all Halladay models includes a self-starting device.

In the electric pleasure car division, four makers who were not represented at New York made display at Chicago. One of these, the Borland-Grannis Company, Chicago, made its first appearance at any show, with two Borland electric broughams. Standard construction has been followed in every respect. One model is chain driven, and this is the older, while the other is shaft driven. Motors and controllers are of the General Electric manufacture. One of the features is the use of suitable connections, by means of which the power is shut off the moment the emergency brake is applied, and this cannot be turned on again until the brake has been released and the controller returned to neutral position.

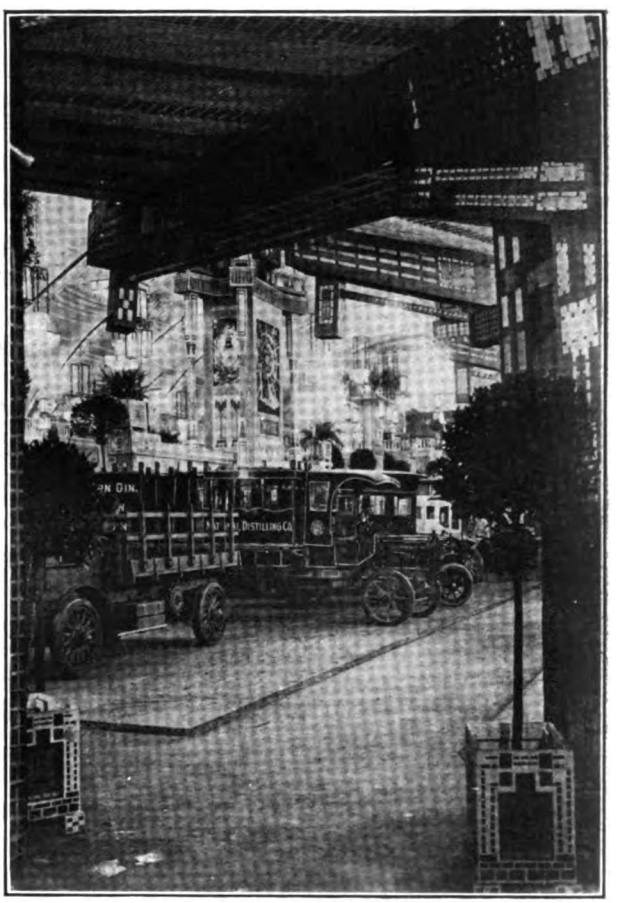
The Broc Electric Vehicle Company, Cleveland, O., showed three Broc coupes. A particular feature is the firm's own combined controller and brake lever adopted last year. No radical changes in design are noted.

The Rauch & Lang Carriage Company, Cleveland, O., displayed two Rauch & Lang coupes, a limousine and a chassis. Two chassis are produced, one with chain drive and the other with shaft. Practically no change has been made, with the exception of the addition of chain cases on the chain driven model.

Digitized by Google

The Woods Motor Vehicle Company, Chicago, presented two Woods coupes, a five-passenger limousine and a chassis. A number of minor changes are noted chief among which may be mentioned the practise of enclosing all wiring to eliminate the possibility of short circuiting. There are no radical departures from the original Woods design, however.

Concerning the accessory exhibits, it may be stated that the list was much smaller than at the Madison Sqare Garden show in New York. In the latter 329 separate concerns were represented, whereas but 184 were counted at Chicago. There were a number who did not make display in the East, as follows:



Avery Portable Lighting Company, Milwaukee, Wis., Electrobola lamps; Barco Brass & Joint Company, Chicago, exhaust horns, cut-out valves, accelerators and locking pedals; S. Breakstone, Chicago, Hopewell tire cases; Continental Motor Manufacturing Company, Muskegon, Mich., Continental motors; Cotta Transmission Company, Rockford, Ill., transmissions; E. Edelmann & Co., Chicago, tire and oil gauges, hydrometers and twin screw drivers; Falls Machine Company, Sheboygan, Mich., Falls motors; C. T. Ham Manufacturing Company, Rochester, N. Y., lamps; Hayes Wheel Company, Jackson, Mich., wood wheels; Kinsey Manufacturing Company, Toledo, O., frames, radiators, fans, tanks and windshields; W. H. Leland & Co., Worcester, Mass., machinery; Longdin-Brugger Company, Fond-du-Lac, Wis., automobile tops; Martel Blowout Protector Company, Chicago, emergency tire sleeves; Mayo Manufacturing Company, Chicago, automatic tire pumps and tire gauges; Model Gas Engine Works, Peru, Ind., motors, transmissions and clutches; Norton Grinding Company, Worcester, Mass., abrasive materials; United States Ball Bearing Company, Oak Park, Ill., ball bearings; Waukesha Motor Company, Waukesha, Wis., motors; Western Motor Company, Marion, Ind., Rutenber motors; Wisconsin Motor Manufacturing Company, Milwaukee, Wis., motors.

Of the so-called accessory exhibits, perhaps none occasioned more comment than the new rotary valve motor brought out by the Model Gas Engine Works, Peru, Ind. It was expected that possibly some new engines would make their appearance at Chicago, since it was remembered that the Knight sleeve valve type was first brought to the attention of the public at a show in that city.

The new rotary valve motor is decidedly different from any other, principally in the fact that the valves themselves are located inside the combustion chamber. They are of phosphor bronze, operating on cast iron seats, and are carried on spindles below the gear wheels which operate them. These wheels form a train which is actuated by a smaller gear meshing with one of the large gear wheels and mounted on a vertical shaft between the pairs of cylinders. The vertical shaft is worm driven from the crankshaft.

The Western Motor Company, Marion, Ind., also presented its two new Rutenber motors, one the four-cylinder en bloc design and the other a six. The latter does not differ materially from the older Rutenber designs, with the exception of the number of cylinders. The block motor is a decided departure, however, since the older models have their cylinders cast individually. It is of the long stroke type, the bore being 3.75 inches and the stroke 5.5. The method of driving the magneto and water pump is unique and simple. A single shaft, worm driven from one of the gears in the timing gear train and located transversely to the engine casting at front, operates both.

As was true of the commercial vehicle section of the 1911 show, the second week in Chicago this year was of decided importance to the industry. In this connection, it may be stated that the management has organized a most effectual method of calling the attention of business men, farmers and others to the advantages of the modern industrial transport. Long before the Coliseum exhibition of last year, a campaign of correspondence was begun, in which personal letters to thousands of those who should be

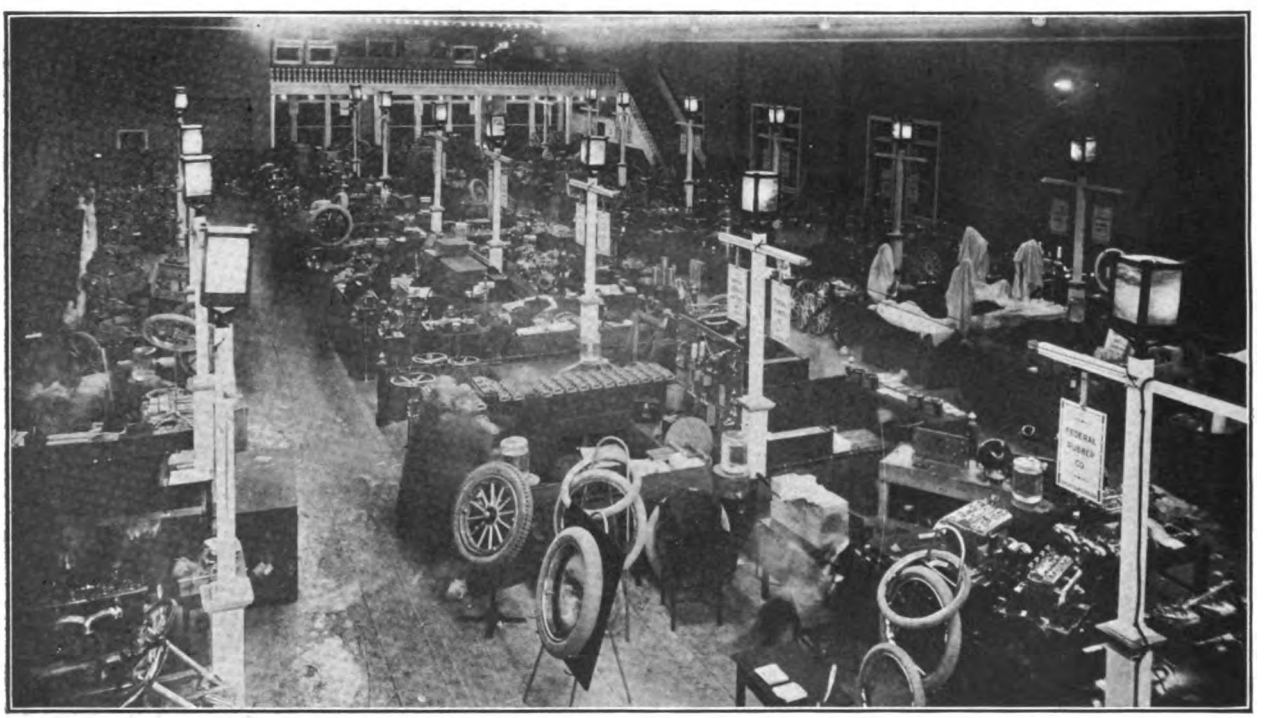
An Alcove Setting in Which the Oriental Design of the Decoration Scheme Is Still Further Accentuated.

interested in motor trucks and municipal wagons played a prominent part. This campaign was not allowed to end with the close of last year's display. In fact, its effectiveness was increased throughout the entire season, until at the opening of the second section, Feb. 5, the entire Middle West had received a personal invitation to be present and inspect the offerings for 1912.

It is small wonder that the number of exhibitors was far in excess of those who made display in New York City, counting both shows. The total was 82 makers, against 57 for 1911. There were 37 different concerns represented at this year's Grand Cen-

Digitized by Google

tral Palace show and 33 at Madison Square Garden, a total of 70 for the two. Thirty-one manufacturers exhibiting at Chicago did not make display in the East. Some of these are entirely new to the industry.



As was to be expected, in connection with so many new designs, several innovations were to be noted. The list of worm and worm wheel drives was increased from three to six. Last year the Pierce-Arrow was the only American truck thus equipped. This was shown this year at the Garden in New York, while the Newark, a new product, also displayed a machine thus driven, and the Roe, another new vehicle, offered it as an option. Both of these were seen at the Grand Central Palace. The new makes at Chicago were: A. O. Smith, Blair, and Dain. The Stegeman, an older concern, presents a spiral drive on its smallest model, which may be regarded as a tendency toward the worm.

Other new features will be brought out in a somewhat more detailed description of the exhibits which were not seen in New York. As was true of the pleasure vehicles, The Automobile Journal outlined briefly the changes in design presented by the trucks shown at Madison Square Garden and Grand Central Palace in the issue of Jan. 25, while an even more comprehensive review of these exhibits was presented in our contemporary, Motor Truck, for February. The Chicago show will be considered in full in the March number of Motor Truck, but the following details some of the more important features of the new trucks shown at Chicago:

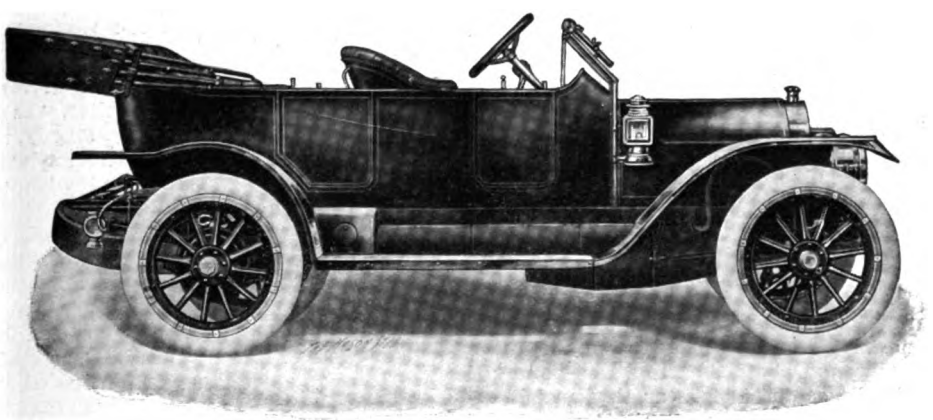
The Adams Bros. Company, Findlay, O., presented the Adams, which is a one-ton model, with left hand location of driver, the levers being in the centre. The motor is in front under a Renault type hood, with radiator behind, following foreign practise. Complete accessibility is afforded by lifting the hood from the front, exposing the entire power plant for adjustment or removal as desired.

The Avery Company, Peoria, Ill., displayed the Avery in two and three-ton vehicles, although other sizes are manufactured. The motor is in front under a hood, and the driver and levers at the right. These machines are fitted either with solid tires, or with cast steel rims and wood plug tires. Provision is made for utilizing the truck as a tractor, as well.

The Bessemer Motor Truck Company, Grove City, Penn., showed its one-ton Bessemer. This also has the motor in front, with left hand position for the drivers and central control levers. The motor is of the block construction, with bore of 3.75 inches and stroke of 5.25, rated at 25 horsepower. The radiator is hung on a spring suspension. Other features claimed for it are the use of nickel steel spindles and gears, and large brakes.

A Glimpse of the Accessory Department, Indicating Method of Displaying Parts and Supplies to Decided Advantage.

The Blair Manufacturing Company, Newark, O., showed the 1.5, 2.5 and 3.5-ton Blair, this being one of the makes which presents a worm drive this year. The motor is in the cab, beside the driver, who is located at the right with right hand levers. The worm has four threads and is of the Hindley type. A 28-degree angle is used and there are four separate and distinct bearings. Of these two on either side are thrust, while the others are annular. The worm is made demountable from the rear by the removal of two holding and two housing bolts.



The Chicago Pneumatic Tool Company, Chicago, presented the Little Giant in the 1500-pound size. The motor is a two-cylinder, horizontal opposed unit, lo-

Digitized by Google

How Long Will a Motor Car Last?

Two factors are responsible for the length of service one may receive from an automobile. One is the quality of the product and the other is the care it receives in service. And each is equally important.

But there is a limit to the life of a well-built car which has received thoughtful care. What that limit is we do not know because there are more Knox cars 10 years old in daily service than those of any other two manufacturers.

Knox Model "R" 40 H. P., 5-Passenger Torpedo Car.
One of the Most Popular Knox Models.

This speaks well for the attention these cars have received in the hands of their many owners, but it tells more than this in the quality of material and careful workmanship necessary to last and endure 10 years of the hardest work machinery has ever been forced to stand.

The high standards in practise in the early Knox models have been improved and made even higher in the perfected Knox cars of today.

It is the only business policy that can possibly stand the test of time.

The Knox Is Built to Last and Endure

SEND FOR CATALOGUE

KNOX AUTOMOBILE COMPANY, SPRINGFIELD, MASS.

NEW YORK——————Branches——————CHICAGO.

Digitized by Google

cated under the chassis, while the driver and levers are at the right. Practically no changes are noted, except such as make for refinement.

The Clark Delivery Car Company, Chicago, displayed the one-ton Clark model, with motor under the floor, and driver and levers at the right. Accessibility of the power plant is afforded by removal of the floor boards. It is of the block construction, with bore of 3.75 inches and stroke of five, rated at 25-30 horsepower. The radiator is carried on a three point spring suspension.

Joseph Dain, Ottumwa, Ia., presented the new Dain truck of two tons capacity, fitted with worm drive, as previously stated. An additional feature is the use of the friction transmission. This latter is utilized only for low speed and reverse, the direct drive being through a cone clutch, without using the transmission in any way for high speed. The worm is of the Hindley triple-threaded type, mounted on the full floating rear axle.

The Diamond T Motor Car Company, Chicago, displayed the three and five-ton Diamond T trucks, with motor in front under a hood, and driver and levers at the right. While this is a new design, it follows standard practise for the most part. The motor has a bore of five inches and stroke of 5.5. The clutch is a multiple disc, steel plates running in oil. Transmission is of the three speed selective type. Drive is by chains. The two models are identical, except for lighter springs and tires.

The Dorris Motor Car Company, St. Louis, Mo., showed its 1500-pound Dorris wagon for the first time. This is a well known pleasure car maker, which has entered the commercial vehicle field, and the motor is the same which has done good service in Dorris cars for the past seven years. It is located in front under a hood with driver and levers at the right.

The Harder Auto Truck Company, Chicago, had on view its combination chemical and hose fire apparatus and small meat wagon, both bearing the name of Harder. This is the same concern as that which exhibited at last year's Chicago show under the name of Harder's Fireproof Storage & Van Company. A distinctive feature is the mounting of the engine on a sub-frame, and hinging the radiator so that the entire power plant may be removed at the front.

The Harwood-Bailey Manufacturing Company, Marion, Ind., displayed a 3000-pound wagon under the name of Indiana. Although a new product, it does not depart greatly from accepted standard construction. The driver is located at the right with right hand levers.

The International Harvester Company of America, Chicago, presented its well known line, in which there has not been material change. The motor is a two-cylinder, opposed, air-cooled unit, located amidships, with driver and levers at the right.

The Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler pleasure cars, calls its truck the Jeffery, which was displayed in the 3000-pound size. The motor is located under the floor, with driver at the left and central control levers. Standard construction is maintained throughout.

The Kissel Motor Car Company, Hartford, Wis., presented its two and three-ton KisselKar models. In these the motor is in front under a hood, with driver and levers at the right. It is claimed for these machines that they have considerable excess ability, which is not gained at the sacrifice of economical fuel consumption, and that the special form of KisselKar differential lock prevents stalling when one traction wheel is in a hole or in mud. The construction is standard throughout, and the success which has attended the design in the past has not made it necessary to incorporate radical changes.

The L. A. W. Motor Truck Company, Findlay, O., displayed a new line of trucks, known as the L. A. W., this being very complete. The 1.5-ton model is furnished either with right or left hand drive, although the one and two-ton vehicles are with left hand position of the driver only.

The Henry Lee Power Company, Chicago, presented the Old Reliable, which has been on the market for a number of years, and has not been changed materially, except as experience has dictated that certain refinements are necessary.

The Mercury Manufacturing Company, Chicago, displayed its 1000-pound Mercury wagon, with motor under the floor, and driver and a single control lever at the right. In one of these vehicles the driver was completely enclosed, a feature which will appeal in certain lines of business. The construction is along standard lines.

The Mogul Motor Truck Company, Chicago, had on view its two, four and six-ton Mogul trucks. The motor is under the seat, with driver and levers at the right. As the name implies, the construction of these machines is decidedly sturdy, and it may be added that the six-ton vehicle is designed especially for lumber work, being fitted with rollers for easy loading and unloading.

The Monitor Automobile Works, Janesville, Wis., presented its 1500-pound and one-ton Monitor models. In these the motor is under the chassis with driver and levers at the right. No radical changes in design or construction have been found necessary, the success of this make in all sorts of service for the past few years having demonstrated its value.

The National Motor Truck Company, Bay City, Mich., has changed the name of its product from National to Natco. This was shown for the first time and in the one-ton size, although it is understood that vehicles of higher rating will be manufactured. The motor is located under the floor, with driver at the left and levers in the centre. A distinctive lubrication system is among the special features.

The Premier Motor Manufacturing Company, Indianapolis, Ind., one of the well known pleasure car makers, which has not hitherto brought out a commercial vehicle, showed its new Premier delivery wagon. It does not differ materially from the standard set by the Premier pleasure cars, the same motor being employed. A heavier frame; the use of strut rods, and semi-elliptic springs all around, are its distinguishing features.

The Philadelphia Truck Company, Philadelphia, Penn., displayed its 1500-pound Philadelphia utility wagon. Although a new model, it has the general appearance of the conventional design. Its chief feature is the electric self-starting system, the combined motor-generator taking the place of the usual flywheel.

The Sandusky Auto Parts & Motor Truck Co., Sandusky, O., presented its new 1.5-ton Sandusky, which is fitted either with solid rubber or pneumatic tires as desired. The motor is located under the floor, with

Digitized by Google

driver and levers at the left. A particular feature is the mounting of the unit power plant on a sub-frame, to which the radiator is attached. The whole assembly may be withdrawn from the front of the vehicle.

The Schmidt Bros. Company, Chicago, showed its one-ton Schmidt. This has an air-cooled motor located under the chassis, amidships, with driver at the right. A distinctive feature is the placing of the high speed lever on the steering column, while low and reverse are operated by pedal.

The Service Motor Car Company, Wabash, Ind., brought out a new 1500-pound Service truck. This employs a friction transmission, and another feature is the fitting of a pulley back of the frame in the centre, by means of which it is possible to supply power as a stationary engine.

The A. O. Smith Company, Milwaukee, Wis., had on display its five-ton A. O. Smith truck. As already stated, this is worm driven. The motor is located in front under a hood, and the driver and levers are at the right. The worm is of the Lanchester design and is so mounted that it may be removed by taking out the rear flange bolt, this permitting the displacement of the entire housing. A double thrust bearing and two annular bearings on the worm shaft are employed. The wheels are of cast steel. The motor and radiator are mounted on a sub-frame, making for complete accessibility.

The Staver Carriage Company, Chicago, exhibited a Staver ambulance, which does not differ materially from the pleasure vehicles, made by this concern, except in size and strength of parts.

The Stegeman Motor Car Company, Milwaukee, Wis., presented its line of Stegeman trucks, with capacities ranging from one to six tons. The motor is in front under a hood, and the driver is at the left with centre control levers. With the exception of the one-ton vehicle the models follow standard construction. The small machine is fitted with a spiral gear drive with full floating rear axle.

The Stephenson Motor Car Company, Milwaukee, Wis., which it is understood has now been acquired by the J. I. Case Threshing Machine Company, Racine, Wis., displayed the Stephenson truck, which is to be known in the future as the Utility. The line comprises vehicles of from one to three tons capacity. Its chief distinction lies in the fact that it is friction driven.

The Sternberg Manufacturing Company, Milwaukee, Wis., showed the four-ton Sternberg truck, although other vehicles in the line are rated at two, three and six tons capacity. These have been on the market for some time, and follow standard design for the most part. Only such changes are noted as make for refinement.

The Whitesides Commercial Car Company, New Castle, Ind., displayed the 1500-pound Whitesides wagon. The motor is located in front under a hood, with driver and levers at the right. Perhaps the chief characteristic is the construction of the frame, which is white oak, covered with .1875-inch armor plate.

The H. E. Wilcox Motor Car Company, Minneapolis, Minn., presented the three-ton Wilcox truck. The motor is under the floor and located 7.5 inches to the left of the centre of the chassis. Driver and levers are at the right. Accessibility is afforded by placing the power plant on a sub-frame close to the radiator.

Only one new electric commercial vehicle was shown, this being the M. & P. made by the M. & P. Electric Vehicle Company, Detroit.

ORGANIZE HIGHWAY SAFETY LEAGUE.

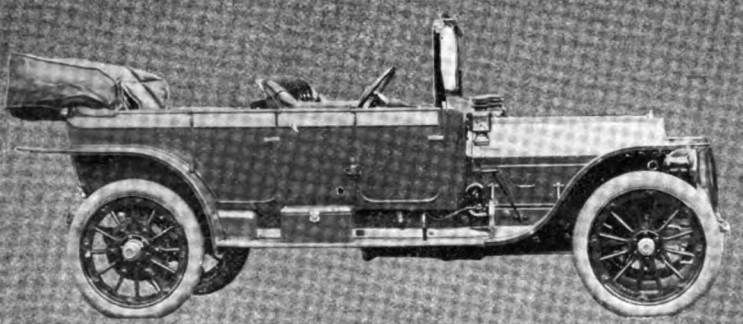
The Highway League, an organization, the announced purpose of which is to make travel on public streets and highways safer, has been formed in Boston, and both men and women are eligible to membership. It proposes to employ counsel to act for the public and to collect evidence which will insure prosecution in proper cases. In a statement issued by the league its aim is set forth as follows:

"It is patent to every one that the increasing use of motor cars on the public streets is attended with constant danger, not only to other travellers, but to the occupants of the automobiles, and that this danger is not controlled by the existing laws as they are now enforced. The needless emission of bad smelling smoke and ear piercing noise, at all hours of the night and day, with the splashing of mud and water over passengers on the sidewalks, are just grounds for complaint, and it is clear that these abuses should be stopped, or at least mitigated."

HOOSIER MOTOR CLUB ACTIVE.

At a meeting of the Hoosier Motor Club, Indianapolis, Ind., plans were made for the coming season and these included routing the roads of the state for touring, posting of sign boards, and reliability runs. The club is working in conjunction with the trade to pool interests in properly marking the ways. The plan includes the use of the names of local firms upon the sign boards of the club, each company to be allowed approximately three signs to a road.

COST OF COLLECTING LICENSE FEES.



According to the annual report of the secretary of state of New York it cost $224,961 to collect $918,197 in the automobile department. This is about 24 per cent., as compared with seven and 10 in Connecticut and New Jersey, respectively. The expense will be reduced materially next season.

DECLARE EXPORT FIGURES TOO LOW.

Detroit automobile manufacturers declare that the Department of Commerce and Labor at Washington errs in the statement regarding the export of American cars in 1911. The government placed the figures at $20,000,000 and it is claimed that Detroit alone exported more than that amount. Ten of the factories exported during the year 21,715 machines, which brought $20,400,000. This amount does not include other makers who shipped both pleasure and commercial vehicles, or companies doing an export trade handled by their New York City offices. It is stated that in 1911 the Studebaker Corporation sent abroad cars valued at $6,000,000 and that 15,000 Ford automobiles were exported valued at $9,000,000. Factories that a year ago were shipping only one or two cars are now actively engaged in the export business. It is the opinion of Detroit managers that a great foreign trade has only begun.

Electric Lighting of Motor Cars

Outlining Various Systems Employed and Methods of Operation.

By C. P. Shattuck

CONSIDERABLE progress has been made during the past year relative to electric lighting for the automobile, and the fact that an increasing number of makers include this as regular equipment is sufficient indication that it has passed the experimental stage. In view of the general acceptance of the magneto for ignition purposes, it is not unreasonable to assume that similar success will attend the efforts of electrical engineers in developing a practical, efficient and inexpensive method of lighting by electricity. That the day is not far distant when this method will be employed even more universally is conceded by those who have followed the evolution of the mechanically propelled road vehicle.

Electricity appeals to the progressive motorist, as the simple operation of turning a switch or pressing a button lights one or as many groups of lamps as may be desired and not only does it lend refinement and taste to the car on which it is employed, but it possesses advantages that are essential to luxury and comfort. The annoyance of dismounting in the rain and mud to light lamps is eliminated, as well as other disagreeable features.

The practical automobilist demands that the lighting of the machine shall be safe, sufficient, convenient and dependable, and that the head lamps furnish a good driving light, one that will illuminate the surface and sides of the road directly in front of the car as well as at distant points. Holes in the road, curves and cross roads make the former point obvious.

The efficient light is free from bright patches in the illumination close to the machine, which dazzle the driver's eyes; shadows, and any side rays which might blind the other users of the highways. Electric lighting, when standard, reliable apparatus and lamps are employed, meets these requirements simply and economically.

Importance of Reflector.

Much of the superiority of the electric headlight, when properly designed, is due to the deep parabolic reflector which gives a powerful, almost parallel beam expanding at an angle of four degrees, and a soft diffused beam expanding quickly at an angle of 90 degrees or more, this quickly diverging beam being quite unreflected and eliminating side dazzle.

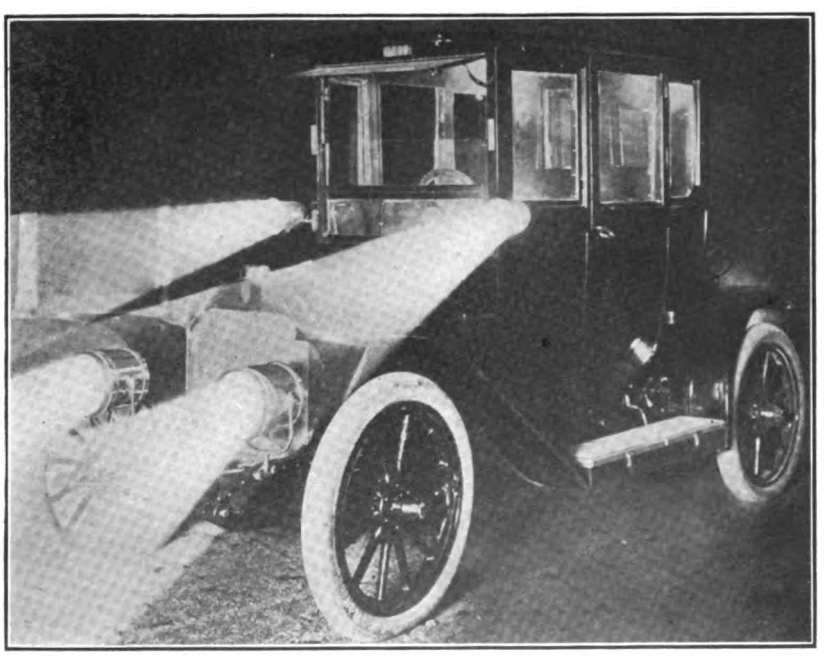

Fig. 1—Motor Car Lighted by the Apico System Which Includes a Dynamo for Charging the Batteries.

Regarding efficiency, it is stated that a properly burnished bare silver plate has a reflecting power of about 97 per cent. If the surface be not allowed to tarnish it is more effective than a lens mirror, through the heavy glass of which the rays of light must pass twice before being projected in a useful beam, and in addition, the lens mirror owing to its lim-

Digitized by Google

ited angle can receive upon its surface only a much smaller proportion of the rays than the deep metal reflector.

The simple parabolic reflector was perfected many years ago, but early application with lighting by a gas flame developed the fact that the lens mirror was the better; in fact, it proved to be the only practical member on account of the highly corrosive effects upon the metal by the products of combustion. And it is interesting to note that after practically being discarded by makers of automobile lamps, the parabolic is again in favor. In addition to lighting advantages it is dust and moisture proof, being enclosed tightly.

Lamp Efficiency.

Early experiments with electricity for lighting the motor car were conducted with the carbon filament lamp, and while some of these are still used, the amount of current consumed for the light given does not appear to warrant their employment. With the advent of the tungsten bulb which operates at an efficiency of 1.23 watts a candlepower against 1.97 and more than three for tantalum and carbon, respectively, interest in electric lighting for automobiles was stimulated. Besides materially excelling in candlepower for energy consumed, the tungsten produces a light which in quality is superior to either of the other lamps, and it also is nearly as rugged as the carbon filament.

Despite the improvements in lamps, lighting batteries and current generators, many motorists while admitting the advantages of electrical lighting over other forms, are unfamiliar with electricity, its generation, application and operation. Others who experimented with unsuitable apparatus, many systems of which were installed incorrectly, became prejudiced through these. The use of electric lighting is no longer an experiment and the reliability of the various systems upon the market is such that with proper care satisfactory service is assured. The object sought by each manufacturer is to make his device as nearly fool proof as possible.

It may be said that there are three distinct systems in use; namely, the straight storage battery, the generator and battery, and the alternating current magneto. It is the intention of the writer to take up each of these in logical sequence, and to explain their construction, application and operation in practise, avoiding the use of technical terms, so that in making a selection of a system the purchaser will be familiar with its details.

Straight Storage Battery System.

Considering first the straight storage battery system: To apply and utilize this method successfully does not require any great knowledge of electricity, but the motorist contemplating its installation should acquaint himself with its details if efficient service and economy of operation be desired. A practical understanding of the battery and its care is essential for successful lighting, as well as the method of wiring the automobile to economize in current, for cost of operation is an important factor in the maintenance of the motor car.

Many owners who are conversant with the high-tension ignition system hesitate to attempt the installation of electric lighting, but as far as the straight battery system is concerned, it is a simple matter if standard equipment be employed. The question of expense will be a factor, but the tungsten lamp is not expensive nor the devices for transforming the oil and gas lamps into electrical units. Respecting the battery, there are many excellent makes upon the market at reasonable prices, and in making the investment it must be borne in mind that the lighting storage battery is adaptable for ignition purposes as well.

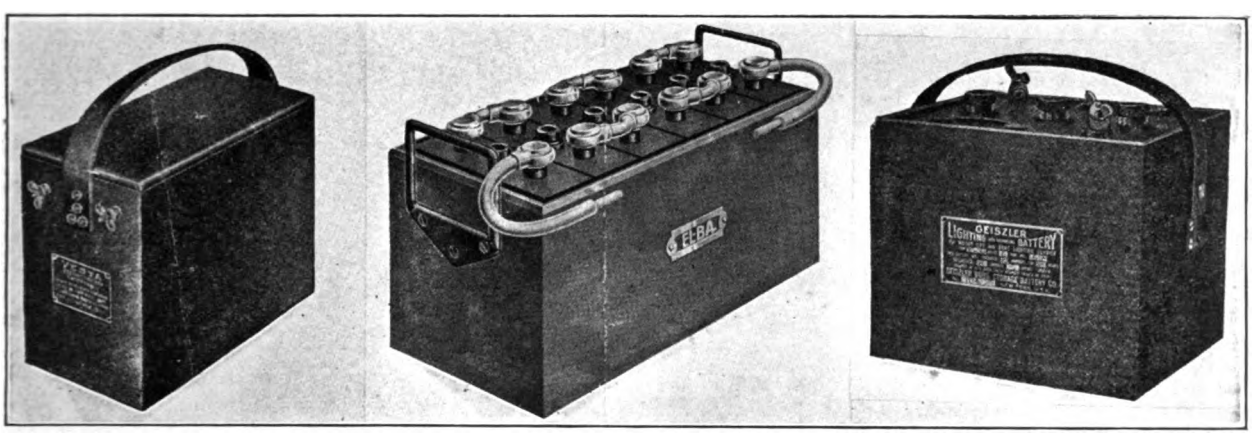

Fig. 2—Conventional Types of Lighting Batteries: A, Vesta; B, Elba; C, Geissler—The Ampere-Hour Capacities Range from 60 to 160.

To the average automobilist the electrical terms employed are mystifying. Volts and amperes convey some meaning, but watts, watt-hours, candlepower, ohms, etc., are bewildering, especially if one be trying to determine how many hours of service his battery will give him with a certain number of lamps. It is even more discouraging to be told by an expert that with the size of lamps decided upon but a few hours lighting will be available and that the battery will have to be charged frequently,

Planning the Lamp Equipment.

Before selecting the battery it is advisable to consider the number of lamps to be burned, their capacity and the conditions under which they are to be operated. Those who do considerable night driving involving the use of the headlights should figure

Digitized by Google

Fig. 3—Edison 80 Ampere-Hour Battery, in Which the Acid Is Replaced with a Solution of Caustic Potash.

accordingly, making provision for a reserve battery if necessary, an arrangement which will permit of constant and efficient service.

On the other hand, city driving with the head lamps extinguished lengthens considerably the time of discharge, because these members take a large proportion of the energy supplied to the system as will be explained later. The time of discharge will depend largely upon the service. It is obvious that the operator who employs electricity for short runs, utilizing the gas lamps for long trips, will obtain more hours of lighting. The dual system will appeal to the suburban motorist who desires the use of head lamps lighted by electricity when reaching the unlighted sections in the run homeward from the city.

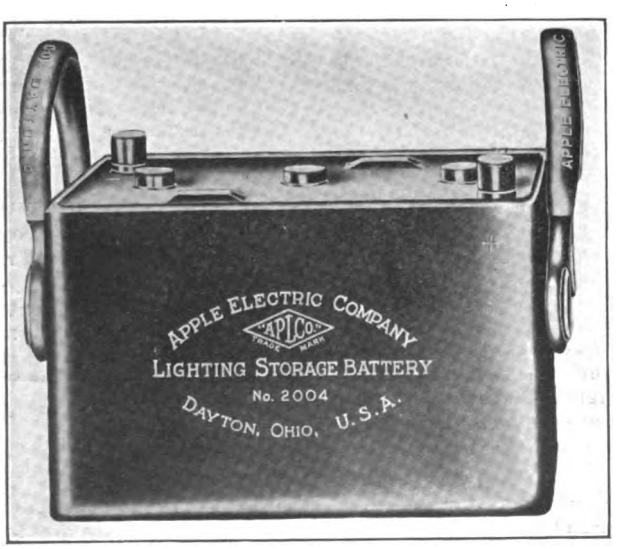

Fig. 4—Apico Battery, Suitable for Straight Storage System or with Dynamo.

As lamps are commonly rated in terms of their mean horizontal candlepower, and their energy consumption in terms of watts a mean horizontal candlepower, it is essential that these factors be taken into consideration in planning the lighting equipment. The new lamp ratings (May, 1910,) of the National Electric Lamp Association designate all lamps by wattage, instead of candlepower as formerly.

Tungsten Lamps Economical.

Ordinary carbon lamps take from three to four watts a candlepower. Thus a 16 candlepower lamp using 3.5 watts a candlepower or 56 watts at 110 volts takes a current of $56 \div 110 = .51$ ampere. For a given efficiency or watts a candlepower the current and power increase directly as the candlepower. As the tantalum operates at an efficiency of less watts a candlepower, and the tungsten even more so, it is obvious that the latter is more economical in current consumption.

Electricity or electrical energy may be generated in several ways but by whatever means it is produced there are many properties which are common to all. The current supplied by a storage battery will flow continuously until it is practically exhausted, while that from dry cells can only be used intermittently; that is, it must have slight periods of rest, no matter how short they may be, to obtain good results.

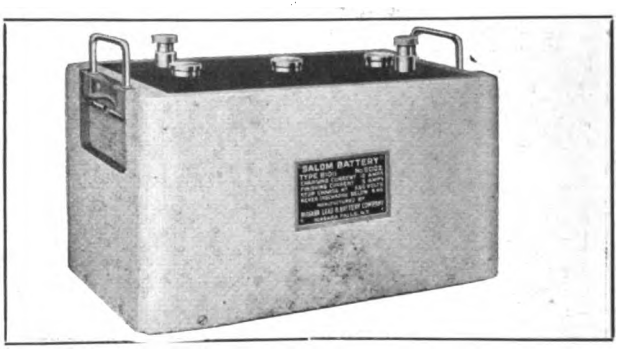

Fig. 5—The Salom Battery, Especially Constructed for Lighting of Motor Cars.

Electrical force is any cause of change of motion of matter and is expressed usually by volts, pounds or other units. Resistance is a counter force or whatever opposes the action of another force. Work is force exercised in traversing or crossing a space against resistance of counter force. Force multiplied by space or distance represents the work in foot-pounds. Energy is the capacity for doing work, and is measured by the work done. The cause of a manifestation of energy is force. If this be electromotive energy or electric energy in current form it is called electromotive force, the practical unit of which is the volt. When electromotive force does work in a closed circuit a current is produced, the practical unit of which is called the ampere.

A current of electricity, when flowing in a closed circuit, passes through some substances more easily than others, and the relative ease of the passage is known as conductivity. In practical calculations its reciprocal, which is called resistance, is generally used. This practical unit is known as the ohm. A current of one ampere is maintained by one volt through a resistance of one ohm.

Digitized by Google

The term ampere-hour is employed to denote the capacity for current of a storage battery in a closed circuit. A storage battery that will keep a two-ampere lamp burning for eight hours is said to have a 16 ampere-hour capacity. In a similar manner an 80 ampere-hour battery would operate the same lamp 40 hours. The voltage does not enter into the calculation of its ampere capacity.

Regarding the term watt-hour, it may be stated that a current of one ampere flowing in a closed circuit, with an electromotive force of one volt, is equal to one volt-ampere or one watt. The voltage of the circuit, multiplied by the rate of current flowing in amperes, gives the rate of work, or the energy expended in watt-hours. An electromotive force of one volt, with a current strength of one ampere, is capable of developing an amount of work or energy called a watt. Therefore one volt multiplied by one ampere is equal to one watt.

It will not be necessary to utilize all of these units in computing battery and lamp capacity and to simplify matters the ampere and watt may be employed. The voltage practically may be eliminated insofar as the straight storage battery system is concerned, as the majority of the lighting members are rated at six volts. Regarding the ohm or resistance, this will be dealt with later.

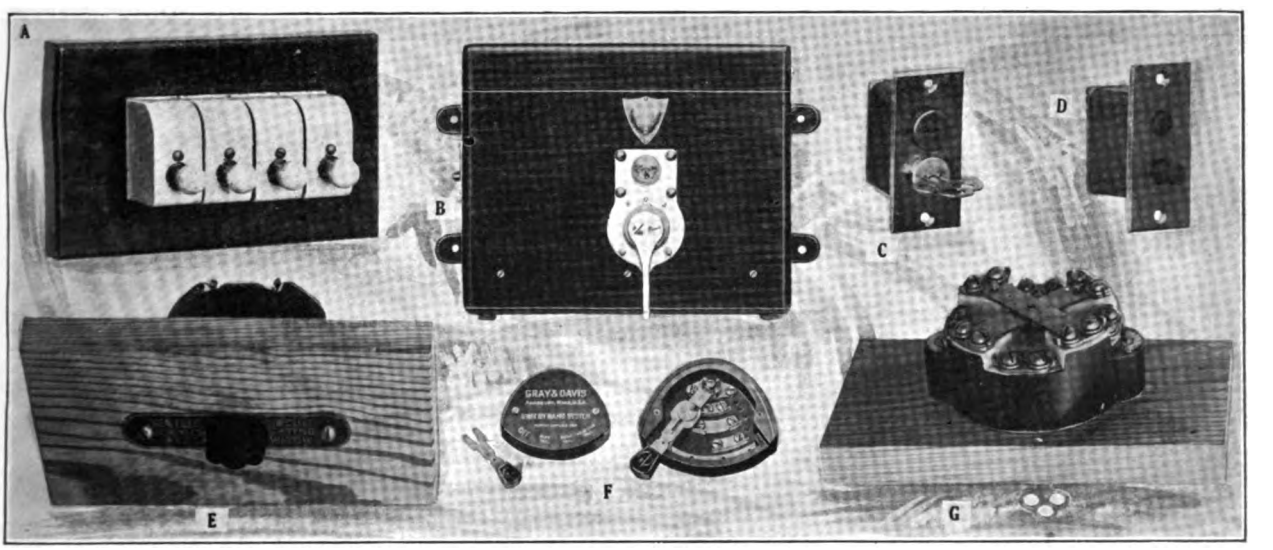

Fig. 6—Lighting Switches Which Permit of Controlling Differing Groups of Lamps: A, C, D, E, G, General Electric; B, Remy Ignition and Lighting; F, Gray & Davis.

Lamp Ratings.

Although lamps are rated by wattage instead of candlepower, the latter term is still employed, many lamp makers incorporating it in their catalogues. This arrangement makes it an easy matter to determine the amount of service a certain battery will give with different sized lamps. In an accompanying table is presented a number of lamps suitable for automobile lighting, and the candlepower, amperage and wattage, as well as the size of the lamps, are given.

It will be noted, however, that the lamp catalogues will give the mean horizontal candlepower in fractions, and the total watts will vary from the given figures slightly. For instance, a "Mazda" six-volt lamp is listed as having a mean horizontal candlepower of 6.1, and the total watts are given as 7.5. These differences, however, are small. The "Mazda" lamp, it may be stated, is a form of tungsten.

Assuming that the lamp equipment for the car consists of two 10 candlepower headlights, two four candlepower side lights, and one two candlepower tail lamp, the entire equipment aggregating approximately 31 watts, a 120-ampere six-volt battery would give 23 hours continuous illumination. A different group of lamps may be more satisfactory and might consist of two 16 candlepower head members, two four candlepower side and one two candlepower tail lamp, a total of 32 candlepower. Taking it for granted that the head lamps operate at an efficiency of 20 watts, the side at five and the tail at two, the total watts will be 52.

To simplify matters, let it be assumed that one ampere is equivalent to six watts, inasmuch as it has been explained that an electromotive force of one volt with a current strength of one ampere is capable of developing an amount of energy called a watt. Having ascertained that the approximate number of watts is 52, this sum divided by six would denote that slightly over eight amperes would be utilized. Consequently, if the battery be of 120 ampere-hour capacity, it will furnish lighting for 15 consecutive hours.

Various groups may be figured on the same basis. For instance: It is desired to utilize two 16 candlepower lamps in the headlights, employing oil for side and tail members, this method to be used in the dual lighting system, and the lamps fitted with either a parabolic reflector or an attachment for equipping the gas burner with an electric socket. Two 16 candlepower tungstens would denote 30 watts or five amperes. With a 60 ampere-hour capacity battery 12 hours lighting would be obtained and 24 for a 120 ampere-hour battery. With a group of five or seven lamps, including the head, side, tail and speedometer lights and current for operating an electric

Digitized by Google

signal or trouble lamp, it is evident that the larger battery is advisable, especially if lamps of large candlepower be incorporated in the system.

Concerning Filaments, Etc.

The question of selecting lamps is a matter of choice insofar as their candlepower is concerned. That there is a wide variety in the shape of the filaments will be noted at Fig. 7, which depicts conventional types of standard automobile tungsten lamps and as the drawing shows the bulbs half the actual size with the candlepower of each indicated, the arrangement will assist the motorist in choosing his equipment, as well as estimating the amount of current required to operate each to obtain the rated efficiency.

Attention is called to the lamp shown at J, which is fitted with the new helical coil filament, the distinct merit of which is that it gives a closer focus and more uniform illumination than previous designs. The filaments depicted at I, K and H are of the cluster loop type, for which is claimed great strength and large surface area for light radiation.

In connection with the lamps the sockets or containing devices should be considered and in planning a lighting equipment it should be borne in mind that sockets should be purchased which will fit the type of lamp selected.

Lighting Batteries.

To obtain best results from the lighting battery, careful consideration should be given this important factor of the system. There are several makes upon the market and of these it may be said that they are reliable and efficient if given proper care. The manufacturers have made considerable progress in perfecting the lighting battery, but they do not recommend the use of an ignition member for lighting purposes owing to the low rate of discharge. On the other hand, the lighting battery may be employed for ignition if desired.

The lighting battery is made in divers sizes and shapes and at Figs. 2, 3, 4 and 5 are depicted conventional types. Their capacity varies, as 60, 80, 100 and 120 ampere-hour, respectively. The sizes of the batteries range approximately from 9.5 inches

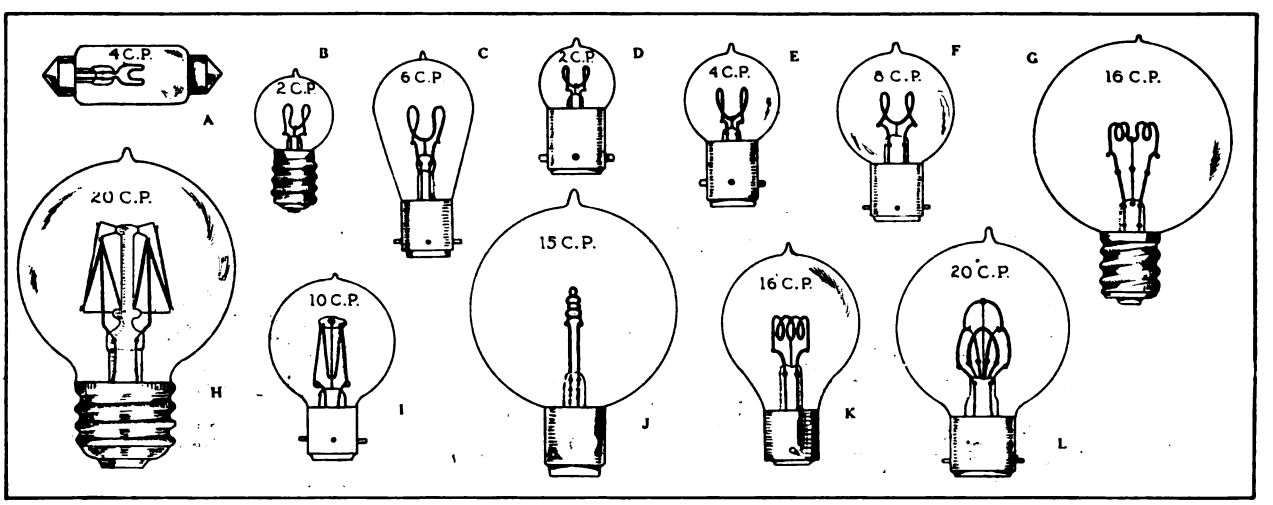

Fig. 7—Outlining Different Types of Tungsten Lamps Suitable for Motor Car Lighting, These Being Half Actual Size; G, H, J, K, L, Headlights; C, E, F, I, Side Lamps; B, D, Tail Bulbs; A, Limousine Tubular; D, E, J, General Electric Lamps.

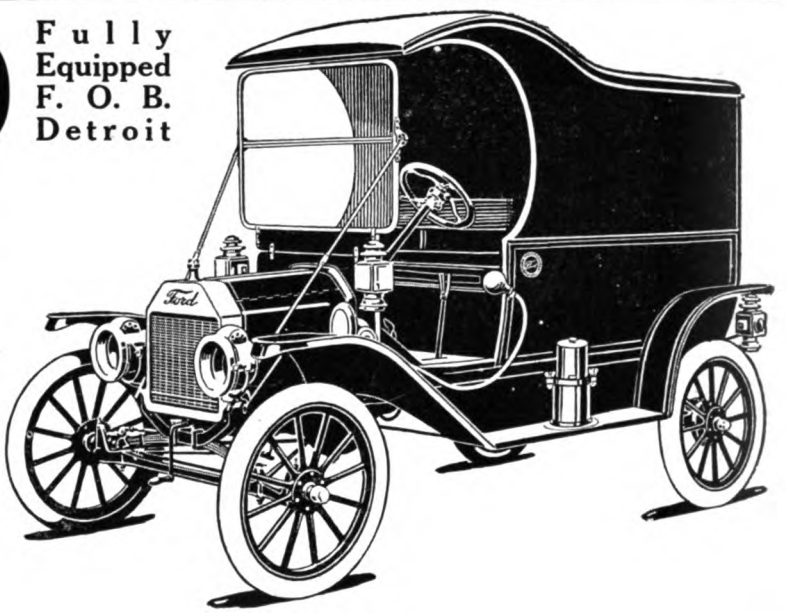
It will be seen that three distinct types of bases are shown in connection with the lamps. These are known as the Edison candelabra, Ediswan candelabra

	Amperes	Diameter	Watts
2 Candlepower	0.3	0.7500	2.46
4 Candlepower	0.6	1.0000	4.92
6 Candlepower	1.0	1.0000	7.38
10 Candlepower	1.6	1.5000	12.30
12 Candlepower	2.0	2.0625	14.76
16 Candlepower	2.4	2.0625	19.68
20 Candlepower	3.0	2.0625	24.60
25 Candlepower	4.0	2.0625	30.75

and standard Edison. The latter is depicted at H, while J and B are Ediswan and Edison candelabra, respectively. While the last named is used very generally in connection with motor cars, the Ediswan is more often recommended. This type, due to the nature of its construction, holds the lamp firmly at all times, preventing it from working loose and thereby eliminating a broken bulb or a damaged reflector.

long, 7.25 wide and 8.5 high for the 60 ampere-hour members to 15 inches long and 9.5 high for the 120.

They may be fitted to the running board if desired, but the general tendency is to keep the latter free from accessories. To meet these conditions boxes are manufactured which can be underslung beneath the rear footboard or supported on auxiliary cross members made of strap iron and attached to the side members of the chassis. These containers are equipped with a wood lining which has been treated chemically to make it acid proof and the construction of the box provides an air space between the battery and sides of the holder for ventilation as well as keeping the former dry. Accumulation of water or spilled electrolyte in the bottom of the box is prevented by grooves in the bottom board, extending downward from the corners to an outlet at the centre of the board. Rubber bushings are utilized in the apertures through which the wires pass to the terminals.



The subject of batteries may be dismissed with a few suggestions as to their care and maintenance:

Ford

Model T Delivery Car

$700 Fully Equipped F. O. B. Detroit

This price includes full equipment—Automatic Brass Wind Shield, Speedometer, Ford Magneto built into the motor, two six-inch Gas Lamps and Generator, three Oil Lamps, Horn and Tools. No Ford Cars sold unequipped.

Capacity of this Universal Delivery Car is 750 pounds of merchandise.

This Delivery Car was most thoroughly "tried out" in actual delivery service for two years before we offered it to the business world. (By the Wanamaker Stores in New York and Philadelphia, by the Bell Telephone Company all over the country, and by others.)

We made sure of the dependability of this car in delivery service. We made sure of the economy of this car in actual use. We recommend it in all respects.

The capacity—750 pounds of merchandise—meets the demands of all retail lines—department stores—wholesalers and jobbers—Telephone and Electric Light Companies, etc.

Simple in operation—low in purchase price—cheap in maintenance—Vanadium steel construction (the same strong chassis that has made Ford Model T Touring car so deservedly popular)—it will give years of service.

FIXED PRICES ON QUANTITY ORDERS FOR FORD MOTOR CARS FOR COMMERCIAL PURPOSES

To concerns who purchase Ford Cars in quantity lots for Commercial Purposes we will give the benefit of a rate reduction or discount, we have fixed a sliding scale of prices which will be submitted on request. Catalog and detailed descriptive literature will be mailed gratis. Branch Houses and Large Distributors in all Principal Cities—Dealers Everywhere.

Good dealers in unoccupied territory are requested to write us.

Ford Motor Company

Detroit, Michigan.

Digitized by Google

They should be kept clean and dry, especially the terminals. The electrolyte should always cover the plates and as the operation of the battery evaporates the water, the loss should be replenished with rain or distilled water, not acid. Test frequently with voltmeter to ascertain condition and when fully discharged, which is approximately at about 5.4 volts, recharge at once.

Types of Switches.

Decided improvement has been made in the matter of switches, it being possible to control a number of lamps or groups with one switch by simply throwing a lever, turning or pressing a button. This arrangement simplifies operation, does not detract from the appearance of the dash, and as each group of lamps is wired and connected to a separate control, in the event of trouble the faulty member is located quickly.

At Fig. 6 are illustrated several forms applicable for motor car lighting. That at E is a three-circuit snap switch of the flush type having a sturdy porcelain base on the back of which is mounted the terminal plates and battery bus bar with binding screw for each conductor as depicted at G, which is a rear view. This switch may be wired to give the following combinations: Side and tail light, head and tail, all lamps on, and all off. Extra terminal connections are provided so that if desired the electric horn and speedometer light may be wired to it. The switch handle is removable by turning it backward, thus preventing persons interfering or tampering with the lights when the car is left unattended. The bus bar feature eliminates all joints, splices, etc., and makes it a very simple matter to install.

At F is presented a lever switch, having a detachable lever which when removed prevents tampering with the system. This device affords the same number of combinations as the one previously described; is compact and durable, and installed easily. A flush tumbler four-gang switch is outlined at A, and both on and off positions are controlled by one and the same lever, thus reducing the number of levers and simplifying the control of the lights. This is utilized for five-light equipments, one switch being used for the tail light, another for the two side members, and one each for the head lamps. The bus bar feature is provided on two, three and four-gang switches.

The push button switch shown at D is designed for use where the space is very limited. The button is of metal, insuring durability, and the plate on which the terminals and contacts are mounted is fastened to the frame with two long screws, preventing it from jarring loose. The bus bar feature also is incorporated. A similar member with a lock and key is depicted at C. That at B is utilized for a combination ignition and lighting system and is equipped with a lever in front for control of the ignition and lighting mechanism while the lamp control, which is not shown, is located on the left side and is of the push button type.

Reference has been made to the ohm, the unit of resistance, and this is applicable to the wiring methods. It is not the intention of the writer to indulge in a technical discussion of wiring, but simply to emphasize the advantages of employing the proper size wire, as upon the well designed wiring depends the success or failure of the system. The light circuits should be separate from that of the ignition as annealed copper has considerable less resistance than iron.

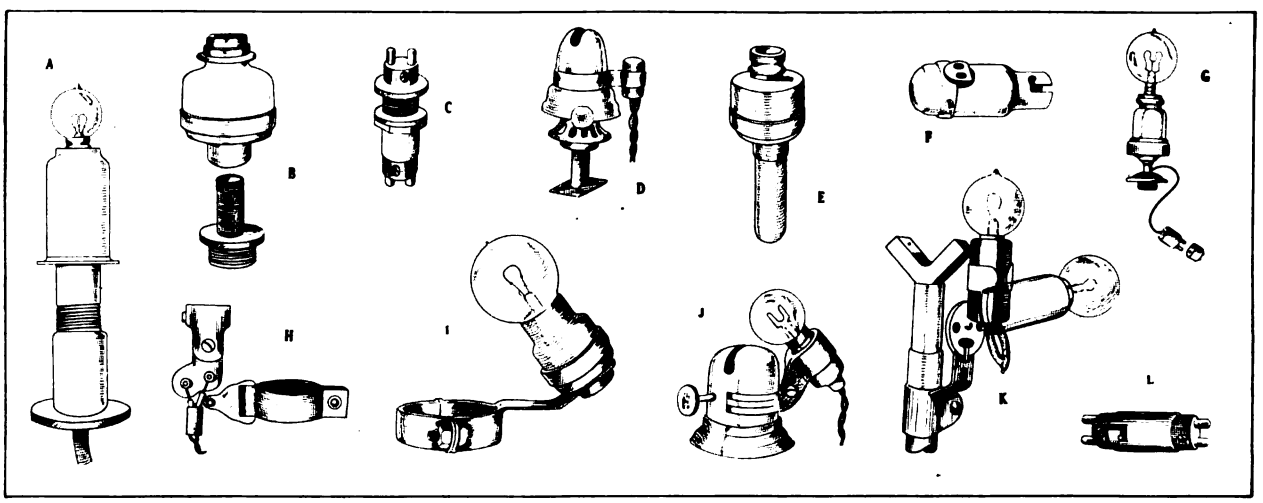

Fig. 8—Devices for Converting Oil Lamps into Electrical Units: A, Apleo Adapter; B and D, Morse Converters; C and L, Standard Connectors; E, Vesta Fitting; F, Ediswan Socket; G, Elba Burner Device; H, Adapter Socket; I, General Electric Socket; J, Manhattan Oil Adapter; K, Gil-Bo Adapter.

Nos. 10, 12 and 14 are recommended for various parts of the circuit and it is important that the wires be protected from abrasion due to wear. Otherwise, if they should be grounded to the frame of the car they might interfere with the ignition circuit which usually is grounded to the frame. The use of wire armored cable is becoming more general, although circular loom and metal tubing are employed still.

Lamp Converting Devices.

Regarding the lamp equipment it may be stated that there are a number of practical devices manufactured for converting oil and gas members into electrical units and these are not expensive. There is a wide variety in design, including complete outfits for installation to single members for attach-

Digitized by Google

ment, and the prices range from 35 cents to several dollars, meeting every desire of the motorist.

Considering first the oil members: These may be fitted with permanent or removable appliances, the type depending largely upon the design of the lamp. Where the side lamp is of the square type it is an easy matter to install a fixed electric light in such manner that it will not interfere with the operation of the oil burner. This arrangement is preferable, as a dual system is obtained. The same results are to be had with attachments which may be moved in or out of position at the will of the operator. A third method consists of attachments fitted in place of the burners. Where the permanent members are employed they usually are located in the corner, an arrangement making for good reflection as well as safeguarding the bulb from the heat and smoke of the kerosene light. The stationary type is fitted by cutting a hole, inserting the socket and screwing up the adjusting member.

Detachable connectors are employed to connect the wire leading from the switch to the lamp member and are manufactured in different types, but the principles upon which they operate are similar. They are preferable to the plain wiring method as they permit of removing the lamps easily for cleaning, etc.

At Fig. 7 is presented a number of devices for converting oil and gas lamps into electrical units, also sockets, connectors, etc., and both the stationary and removable types are outlined. The former are shown at A and E, and the latter at D, I and J. The third form is outlined at B and G, these members being fitted to the oil container. At H and K are illustrated burner attachments which permit of swinging the electric light in or out of position as desired. Where trouble lamps are incorporated in the lighting system a connector such as shown at C is utilized. At B is depicted a flangeless connector which may be employed to advantage.

Reference has been made to the Ediswan candelabra socket and at F is shown one of these members. When employed in connection with a detachable side light this is inserted through the bottom of the lamp and held in position by a locking nut. The electrical connection is then made by inserting a plug in the receptacle.

Headlight Reflectors.

Although some may limit the lighting equipment to headlights, fitting these with burner attachments, it must be borne in mind that electric lamps utilized in connection with the lens mirror will not give as efficient light as the parabolic metal reflector. It may be stated, however, that with the latter method about 75 per cent. of the total light reaches the reflector and is converted into usefulness, while that with the lens mirror is considerably less. This subject will be considered later.

There are several forms of metal reflectors which may be utilized in conjunction with the gas head lamps and at Fig. 9 are presented different devices, that at A being a bayonet base socket bracket having a six-inch reflector. It is attached easily to the gas pipe in place of the burner, and is held in position by means of brass nuts. The lamps may be focussed by screwing the reflector backward or forward on the socket. The reflector is readily accessible by opening the door of the lamp proper, is nickel plated, highly burnished, and in the form of a true parabola.

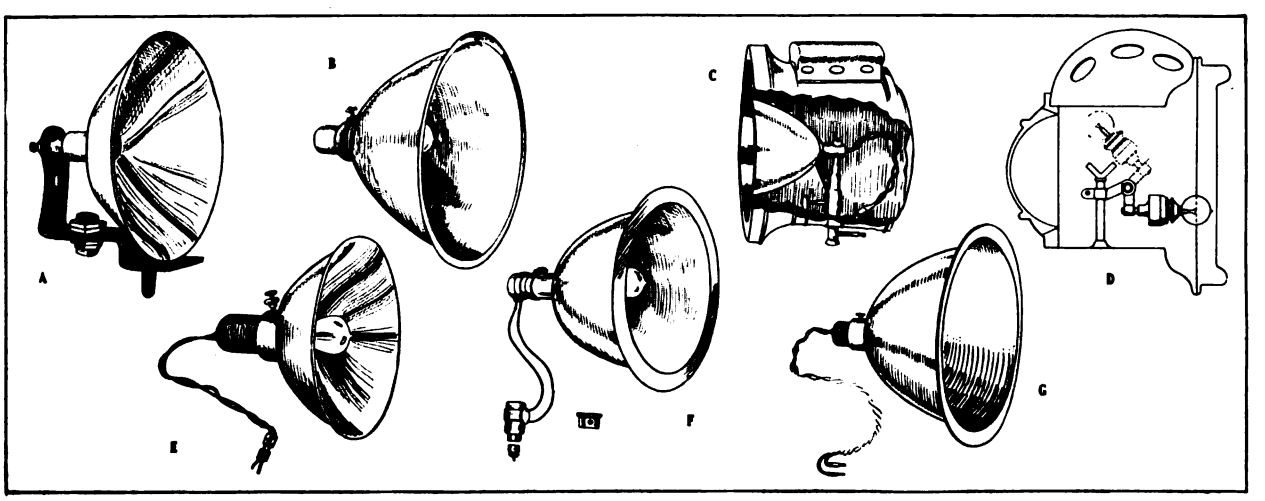

Fig. 9—Parabolic Reflectors Utilized for Gas Burner Lamps: A, General Electric Bayonet Base Adjustable Socket; B, Apleo; C, Narragansett Demountable; D, Gray & Davis Burner Device; E, Vesta Adjustable Reflector; F, Elba; G, Silvey.

Another type is depicted at E, and this is inserted inside the regular lamp, means being provided for adjustment. Another device for remodelling the headlight is illustrated at F, this being designed for similar application and fitted for an attaching plug. A convertible type is depicted at D, this being employed with the lens mirror lamp, and it will be noted that the bulb may be swung out of position when the use of acetylene is desired. A demountable device which is attached to the gas burner by a form of set screw is shown at C. Here the parabolic reflector is slightly smaller than the usual type, but it is said to be efficient.

(To Be Continued.)

Ed. Note—The next installment will deal with the various methods of wiring the car, outlining the proper installation of different straight storage battery systems and explaining the adjustment of the lamps to obtain the best results from the lights.

BIG BOSTON SHOW

... NUMBERS OF ...

The Automobile Journal

February 25 March 10

This will be the biggest and most important exhibit of Motor Cars, Accessories, Supplies, Parts and Fittings of the year—and will mark the opening of the active motoring season in the East.

8,000,000 People to draw from—all within easy riding distance of the display—5,000 interests, representing all branches of the industry—in the heart of the Greatest Motor Vehicle and Accessory Market in the World.

The Show Numbers of the AUTOMOBILE JOURNAL will be the most comprehensive of any yet published by a motoring magazine—either from the viewpoint of present value alone or as a book of reference to be retained for future use.

Whether you will exhibit or not, these issues will afford an opportunity for publicity seldom accorded—Reach the owners and prospective purchasers through the Journal—No duplication of circulation—One expenditure.

MOTORING NEWS OF NATIONAL IMPORT.

Sixth Annual Canadian Display in Montreal, Quebec---Important Exhibitions in St. Louis, Pittsburg, Rochester, Bangor, Brockton and Other Cities--- Boston Show Space Exhausted---Plans for Remainder of the Month.

Although the sixth annual display of the Automobile Company of Montreal was formally opened in the Drill Shed, Montreal, Quebec, at 8 in the evening of Feb. 3, and the doors had been opened since 1 in the afternoon, many exhibits were not yet in place. Some of these were shipped by American makers direct from shows in the States, and were not in place until Monday morning. However, it was demonstrated from the first that the building was wholly inadequate to accommodate all the cars the local dealers desired to present to the people of eastern Canada.

The decorative scheme was quite in keeping with the standard set by previous displays under the direction of E. M. Wilcox, and consisted largely of a liberal use of bunting of various colors. In the centre of the main hall a huge King Edward crown was suspended from the ceiling, and this was a literal mass of electric lights. A total of 3000 incandescent bulbs were employed in strings from the several corners of the building, and 20 arc lights and 100 tungsten lamps aided in illuminating the interior.

It was largely an American exhibit, only four French cars being shown. Many of the makes were represented in Montreal for the first time. It was quite noticeable that the tone of the Canadian papers had changed much in the past year. In 1911 their columns were filled with data concerning French cars and much credit was given to French manufacturers for the development of the gasoline propelled vehicle. This year the publishers apparently had declared that this position was an error and that henceforth American machines are to be featured.

The addition of electric lighting systems and self-starting devices proved to be a decided revelation to the Canadians. Some of the French cars were thus equipped, but the Canadian manufacturers appeared to have overlooked these features, although inquirers were informed that they would be added in the near future.

Manager Wilcox was compelled to disallow six applications for space in the commercial vehicle section, and there is every evidence that 1912 is to see a decidedly increased business in motor trucks in the Dominion. Several sales were recorded during the show and many excellent prospects secured.

Among those who displayed pleasure cars were: Robert & Robert, Jackson; Ford Motor Company of Canada, Ford; Russell Motor Car Company, Russell; McLaughlin Motor Car Company, McLaughlin, Fiat, Rauch & Lang electrics; Harold Cook, Detroit electric; Comet Motor Car Company, Chalmers, Packard; Brockville-Atlas Auto Company, Brockville-Atlas; Automobile Francaise, Berliet; Motor Import Company, Hupmobile, Hudson, Franklin, Pierce-Arrow; Pope-Hartford Company, Pope-Hartford; Baker Electric Company, Baker electric; Hamilton Machinery Company, Inter-State; J. A. Michaud, Vinot; Rousseau Bros., Cadillac; Levesque's Agency, Abbott-Detroit; Reo Motor Company of Canada, Reo; Montreal Locomotive Works, Alco; E-M-F Company, E-M-F, Flanders; Legare Gadbois, Marmon, Cole, Warren, Mitchell, Imperial; Gareau Motor Company, Amplex, Everitt, KisselKar; Ramsay Motor Company, Schacht; W. E. Baker, King; J. I. Case Company, Case; J. M. Landry, Speedwell; Regal Corporation, Regal; Clarke-Carter Automobile Company, Cutting; Royal Automobile Company, Renault, K-R-I-T, Stevens-Duryea.

The following displayed commercial vehicles: Brantford Carriage Company, Brantford; Motor Import Company, Pierce-Arrow; A. Jennings & Co., Gramm; Pope-Hartford Company, Pope-Hartford; Baker Electric Company, Baker electric; Reo Motor Company, Reo; Montreal Locomotive Works, Alco; Legare Gadbois, Kelly; Gareau Motor Company, KisselKar.

Accessories were shown as follows: Auto Tire Company, Goodrich tires; Bosch Magneto Company, Bosch magnetos; S. F. Bowser & Co., Bowser gasoline tanks; Canadian Consolidated Rubber Company, Canadian tires; Mussens, Ltd., Clayton air compressors; Dunlop Tire & Rubber Goods Company, Dunlop tires; Goodyear Tire & Rubber Goods Company, Goodyear tires; Imperial Oil Company, Polarine oils and greases; Independent Tire Company of Canada, Independent tires; Gaulois Tire Agency of Canada, Gaulois tires; R. J. Levy, welding process; John Milen & Son, accessories; Russell Motor Car Company, accessories; Diamond Rubber Company, Diamond tires, Wayne Oil Tank & Pump Company, Wayne storage systems; McColl Bros., oils and greases.

ST. LOUIS SEES 1912 MODELS A SECOND TIME.

For the second time this season the dealers in St. Louis held an automobile show in that city beginning Feb. 5. The first exhibition was given in the open air in Forest Park last fall, and was a much larger representation of the local agencies than the second, which was held in the Coliseum. The building was handsomely decorated, carrying out the open air effect so far as possible. The various spaces were marked off by trellis work and numerous electric lights were employed to illuminate the display.

Among those represented at this second show were: White Motor Car Company, White pleasure and commercial vehicles; Weber Drayage & Warehouse Company, E-M-F, Flanders, Studebaker electric trucks; M. W. Bond Automobile Company, Warren; Lewis Sales Company, Midland; Wiemeyer Motor Company, Apperson; Anderson Electric Car Company, Detroit electric; Heinrich Automobile Com-

Digitized by Google

pany, Michigan; C. P. Kimball & Co., Kimball electric; Charles F. Swartz, Velie pleasure and commercial cars; Cochrane Motor Sales Company, Cochrane trucks; Chase Motor Truck Company, Chase trucks; Columbus Buggy Company, Columbus electrics; Franklin Motor Car Company, Franklin; Mack Motor Truck Company, Mack trucks; Kingman-St. Louis Implement Company, Rambler; KisselKar Agency, KisselKar pleasure and commercial lines; Haynes Automobile Company, Haynes; American Welding & Auto Repair Company, welding systems; Coats & McDonald, Aero unicycle; Hurck Motor & Cycle Company, motorcycles; Auto Parts Sales Company, accessories.

LYNN DEALERS HOLD THEIR FIRST EXHIBITION.

The small towns of Massachusetts are entering the automobile show circuit with considerable vigor this year, the agents evidently preferring to demonstrate to their clientele the merits of the various models before they have had opportunity to study the larger display at Boston. Fifty cars were shown by the dealers in Lynn at the Oxford Garage, Feb. 6-10. The interior of the building was handsomely decorated and the various models were so arranged as to bring about the best effect. The event was under the management of the following committee: L. D. Robbins, Frank E. Vallier, L. H. Barrett, S. P. Tierney and W. W. Whitney.

Among those who made display were the following: W. W. Whitney & Co., Overland; F. E. Vallier, Velie; L. D. Robbins Company, Cadillac, Winton; E. T. Reynolds, Pope-Hartford; M. Plumstead & Son, Maxwell; Warren H. Beede, Ford; S. P. Tierney, Metz, Buick; C. E. Whitney, Chalmers, Packard, Federal trucks. E. L. Brown and Fred C. Mitchell also exhibited pleasure car models. The event was a decided success from every viewpoint.

Interior of the Drill Shed at Montreal, Quebec, During the Sixth Annual Display of the Automobile Club of Montreal, Giving an Idea of the Decoration Scheme and the Illuminated King Edward Crown.

SECOND ANNUAL AUTOMOBILE SHOW IN BANGOR.

The second annual automobile show under the management of F. M. Prescott was held in the big new garage of the Bangor Motor Company, Bangor, Me., Feb. 5-10. The railroad companies leading into the city assisted materially in reducing rates, and the people throughout the entire eastern section of Maine made it a point to visit Bangor and inspect the 1912 models. The decorations were unusually attractive, and the various exhibits were set off to the best advantage. Another feature was the special illumination of the street leading to the garage, making the event of local importance in every way.

Digitized by Google

Among those who made display were the following: C. P. Treat, Jackson; Harmon Automobile Company, Thomas, Hudson; J. H. Rice, Lozier, Stearns; Clarence B. Swan, E-M-F, Flanders; Bangor Motor Company, Pierce-Arrow, Cadillac, Sampson truck; Arthur A. Robinson, Buick; Asa M. Robinson, Metz; Eastern Sales Company, Haynes; T. D. Talbot, Oakland; A. W. Mutty, Stoddard-Dayton; C. M. Conant Company, Maxwell; George F. Reynolds, Knox, Cole; L. P. Sweet, Oldsmobile, Winton, Nyburg, Elmore, Reo; S. L. Crosby Company, International Harvester truck; Standard Oil Company, Polarine oils and greases; James Bailey Company, accessories; Pyrene Sales Company, fire extinguishers.

BROCKTON DEALERS TRANSFORM PALACE RINK.

The first time in the history of Brockton, Mass., an automobile show was opened in the Palace Rink, at 1 in the afternoon of Feb. 8, continuing until Feb. 10. The event was under the auspices of the Brockton Automobile Association and the direct management of William H. and James F. Powers. Thirteen different makes of cars were shown.

The decorations were borrowed from the recent show in Providence, R. I., the general effect being that of an open air palm garden. The entrance was hung with red, white and blue bunting, but once the visitor entered the main hall he found a massive painted sky overhead, and the exhibition spaces divided with white trellis work, over which smilax was entwined. Potted plants and palms also were used freely in carrying out the garden scheme.

Among those who made display were the following: Harry Windle, Oakland; Brockton Automobile Exchange, E-M-F, Flanders; Arthur L. Turner, Chalmers; Charles Lawton, R. C. H.; Stephen H. Kelley, Maxwell, Hudson; Frank E. & Herbert Cushing, Cadillac; Gay Automobile Company, Buick; Young & White, Overland; Edgar D. Hartwell, Jackson; Jared W. Pratt, Metz; F. W. Swift, Bergdoll; Brockton Sporting Goods Company, Indian and Excelsior motorcycles; American Motor Company, M-M motorcycles; Nathan E. Packard, supplies; Brockton Vulcanizing Company, tires; Eagle Oil Company, Eagleine oils; Charles Lawton, carburetors and tire pumps; Flagg & Willis, vacuum cleaners.

DEXTER, ME., HAS ITS FIRST MOTOR CAR DISPLAY.

The first automobile show to be held in Maine, outside of the cities, was conducted by E. D. Blaisdell in the new Blaisdell garage in Dexter, Jan. 30-Feb. 1. The interior of the building was entirely transformed by the liberal use of bunting, and a special effect was obtained with an entirely new system of electric lighting. Coming as it did shortly before the opening of the show at Bangor, many of the cars shipped into the state for display in that city were first presented in Dexter.

Among the cars shown were: Reo, Maxwell, Cadillac, Ford, Buick, Pierce-Arrow and Metz. Included in the concerns represented were: Bangor Motor Company, Arthur A. Robinson, Darling Automobile Company, Little, Coffin Company, Maxwell-Briscoe Motor Company, Buick Motor Company, F. M. Howard, Central Maine Power Company, C. H. Wyman, and Ajax-Grieb Rubber Company.

ATLANTA SHOW FIRST IN SOUTHERN CIRCUIT.

The residents of the South are to have abundant opportunity to study the 1912 models, several shows having been planned in that section. The first of these opens in the Auditorium Armory, Atlanta, Ga., the afternoon of Feb. 10, and will continue for one week. The event is under the auspices of the Atlanta Automobile & Accessory Association, a new organization formed a short time since for the purpose of holding this show.

It will be remembered that the first show held in the South was under the management of the National Association of Automobile Manufacturers in November, 1909. It was expected that it would prove of sufficient importance to warrant the holding of an annual event of this character in that section. The experiment was not considered a success, however, and until this year southern motorists have been content to secure their information of the current models from the shows in other parts of the country. When the matter of holding another exhibition was broached early in the present season, it met with a ready response on the part of the local dealers.

The committee in charge of arrangements adopted a plan much in the nature of that used by the national association in advertising the propositfion, with the result that it is anticipated that all sections of the South will be represented among the visitors during the week.

Among those who will display cars are the following: Buick Motor Company, Buick; Velie Motor Vehicle Company, Velie; Overland Southern Motor Company, Overland; E-M-F Atlanta Company, E-M-F, Flanders; United Motor Atlanta Company, Columbia, Maxwell; White Company, White; Georgia Motor Car Company, National, Everitt, Brush; Locomobile Company of America, Locomobile; Ford Motor Company, Ford; Mitchell Motor Company, Mitchell; Fulton Auto Supply Company, Peerless, Marmon, American, Hudson; States Atlanta Company, Stoddard-Dayton, Courier; J. I. Case Company, Case; Steinhauer & Wight, Cadillac, Detroit electric; Northcutt Company, Chalmers; John M. Smith, Pierce-Arrow, Apperson; Johnson-Curtis Company, Stevens-Duryea, Baker electric; International Harvester Company, International truck; R. C. H. Corporation, R. C. H., Hupp-Yeats electric; Firestone-Columbus Southern Company, Firestone-Columbus, Columbus electric; Autocar Sales Company, Autocar truck; Herman J. Haas; L. S. Crane, Pope-Hartford; Cole Motor Car Company of Georgia, Cole, K-R-I-T; F. B. Stearns Company, Stearns.

The following accessory dealers also will be represented: Chas. E. Miller, Wayne Oil Tank & Pump Company, Elyea-Austell Company, J. K. Gewinner, Alexander Seawald Company, Atlanta Top & Trimming Company, Standard Oil Company, Gulf Refining Company, Reed Oil Company, Hardy Accessory Company.

The Car That Marks My Limit

By R. E. Olds, Designer.

I have no quarrel with men who ask more for their cars—none with men who ask less. I have only to say that, after 25 years—after creating 24 models and building tens of thousands of cars—*here's the best I know.* I call it My Farewell Car.

Reo the Fifth is no great innovation.

Its only sensation is the price at which we sell it.

It simply shows the best that men have discovered in every detail of motor car engineering.

And it shows the best I have learned after 25 years of continuous striving.

There are no petty economies. Every detail shows the final touch.

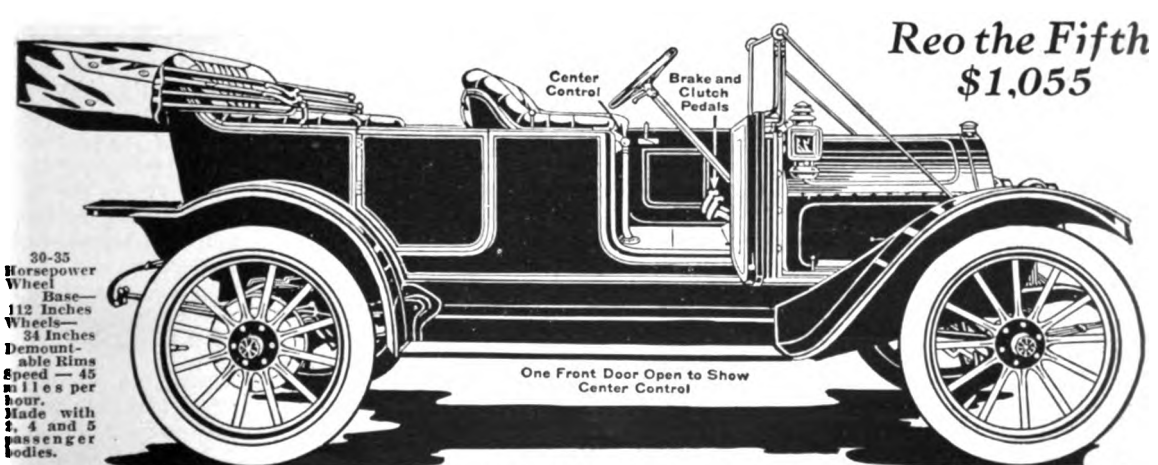
The center control is a new and exclusive feature. The foot pedal brakes—the absence of side levers—the left side drive, all show the coming vogue.

I regard the car as close to finality.

Price, $1,055

The initial price on Reo the Fifth has been fixed at $1,055.

The price may be advanced, and must be advanced if anything adds to present cost of construction.



But the price of today offers far more for the money than has ever before been attempted.

This car—my finest creation—will prove, I believe, the most interesting car of the year. Ask for our book about it.

R. M. OWEN & CO. General Sales Agents for

REO MOTOR CAR CO., Lansing, Mich.

Canadian Factory, St. Catharines, Ontario.

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip-cover, windshield, gas tank and speedometer—all for $100 extra. Self-starter, if wanted, $25.00 extra

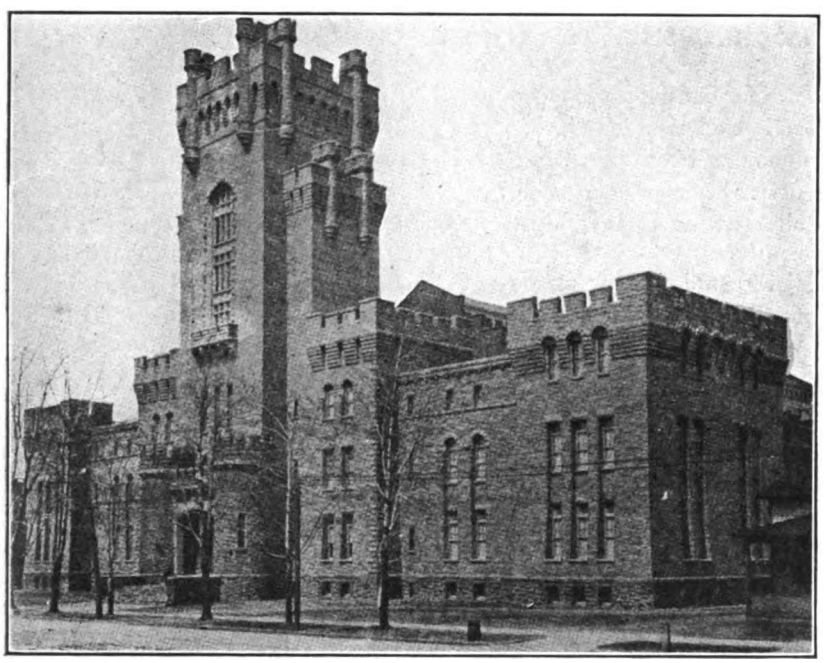
ARIZONA'S FIRST MOTOR CAR SHOW AT PHOENIX.



The people of Phoenix, Ariz., as well as the residents of the entire state, had their first opportunity to inspect an automobile show last month, the event being held under the joint auspices of George F. Gardiner, Leon S. Jacobs and Mark Dunbar. As a result, the press of Arizona is unanimous in the opinion that Phoenix not only is a coming city but has arrived.

The show was staged with every attention to detail that would mark the presentation of 1912 models in the business centres of the East. Nothing was lacking, not even the electric lights, the floral decorations or the music. So much of a success was the week's display that it is announced that the automobile exhibition will be an annual event in Phoenix in the future.

Among those who made display were the following: J. M. Smith, American, Regal; Transcontinental Motor Company, Hupmobile, Cutting; Ferguson & Raub Company, Buick, Apperson; W. D. Tremaine, Hudson, Cadillac, Mitchell; George Hageman, Franklin; Arizona Motor Car Company, E-M-F, Flanders, Brush.

ROCHESTER DEALERS FILL NEW STATE ARMORY.

The big new 74th Regiment armory in Rochester, N. Y., was filled to overflowing at the fourth annual display of the Rochester Automobile Dealers' Association during the week of Jan. 22-27. This was the first show held in that city in two years and every dealer in the vicinity took advantage of the opportunity to call attention to the offerings for the 1912 season. The event was under the direct management of Col. C. A. Simmons, but every officer and member of the association took an active interest in the successful outcome.

New 74th Regiment Armory at Rochester, N. Y., Scene of the Recent Rochester Automobile Show.

Electric lights played a prominent part in the decorative scheme, and the chief features were an electric fountain at the main entrance and a splendid sunburst in the rear of the hall. Lattice work, surmounted by decorative flower pots entwined with smilax, separated the exhibition spaces, and made a decidedly attractive setting for the various cars and accessories on display. Among those represented were the following:

Robert-Thomson, Pierce-Arrow; C. L. Whiting, Buick; F. R. Luescher, Rambler; Shafer Motor Car Company, Cole; Overland Rochester Company, Overland; Cutting Auto Sales Company, Cutting; Peck & Arnold, E-M-F, Flanders; A. M. Zimbrich, Haynes; Babcock Electric Carriage Company, Babcock electric; Mabbett-Bettys Motor Car Company, Cadillac; Davidson & Sucker, Moon; A. V. Hart, Everitt, K-R-I-T; Franklin Automobile Company, Franklin; E. W. Fisher, Stearns; McKenney & Gilpin, Paige-Detroit, De Tamble, Clark, Westcott; Knipper-Kipp Company, Stutz; Kline Motor Car Company, Kline-Kar; Selden Motor Vehicle Company, Selden; Turk & Brown, Premier; Gillis-Rand Motor Car Company, Stevens-Duryea; James Cunningham, Son & Co., Cunningham; Kate & Pawlk, Alco; Strong-Crittenden Company, Lozier; Arthur McNall, Peerless; Mandrey Motor Car Company, Packard; Gabel-Hill Company, Ohio electric; Genesee Motor Vehicle Company, Maxwell; Ball-Washburne Motor Company, Bergdoll; Elliott-Porschet Auto Company, R. C. H.; Marathon Sales Company, Marathon; C. E. Hartson, Warren; Hollis-Rand Company, Pullman, Imperial.

THIRD ANNUAL DISPLAY FOR HARRISBURG DEALERS.

Had the Harrisburg Automobile Dealers' Association, Harrisburg, Penn., been able to secure a building twice the size of the Arena it still would have been impossible to stage all the makes of cars which the local dealers desired to present to the attention of the public. The third annual show was held Feb. 3-10, under the management of J. Clyde Myton, well known in the industry as the secretary of the Motor Club of Harrisburg. Thousands of electric lights were used to good effect in the decorative scheme and some 50 1912 models were presented by the following agencies:

Harrisburg Auto Company, Abbott-Detroit, Reo, National; East End Automobile Company, Overland,

Hupmobile, Velie, Oldsmobile; I. W. Dill, Hudson, Inter-State; Andrew Redmond, Maxwell, Columbia; Keystone Motor Car Company, Pullman, Chalmers, E-M-F, Flanders; Crispen Motor Car Company, Cadillac; W. J. Huntert, International Harvester; J. I. Case Threshing Machine Company, Case; E. M. Hottenstein, Buick; Kline Motor Car Corporation, Kline-Kar; West End Motorcycle Company, Indian; Hengy Bros., Harley-Davidson.

Accessories were displayed by the following: Haines Measuring Pump Sales Company, Keystone Lubricating Company, Wayne Oil Tank & Pump Company, Sterling Auto Tire Company, Atlantic Refining Company, West End Electric Company.

SCRANTON HOLDS ITS FIRST AUTOMOBILE SHOW.

The interior of the 13th Regiment armory at Scranton, Penn., was transformed into a Japanese tea garden for the first annual display of the Scranton Automobile Association, under the management of Hugh B. Andrews during the week of Jan. 29-Feb. 3. Inasmuch as this was the first opportunity the people of Scranton and vicinity had ever had to inspect the various models in an organized exhibition, the event was a decided success from every point of view. Numerous sales were recorded during the week, and there is every reason to believe that the motor car show will be an annual feature in that city under the same management in the future.

Among those who made display were the following: Conrad Bros. Company, Ford; Morris R. Zehnder, Stanley steam; Bishop Bros., K-R-I-T; Simpson & Hubbard Automobile Company, Mercer; Stoddard-Dayton Automobile Company, Stoddard-Dayton; P. J. Needham, Maxwell; Eureka Motor Car Company, E-M-F, Flanders, Hudson, Mitchell, Speedwell, Franklin, McFarlan, Regal; Lackawanna Auto Company, Packard, Chalmers; A. M. Baker, Jr., Hupmobile; Scranton, Penn., Automobile Company, National, Cole, R. C. H.; Anthracite Motor Car Company, Oldsmobile, Overland, Chase truck; City Hall Garage, American, Matheson; Economy Automobile Company, Locomobile; Schnell's Garage, Abbott-Detroit, Kline-Kar; Rambler Motor Car Company, Rambler; Republic Motor Car Comompany, Winton; Peter Beyrent, Haynes; Charles P. Scott Company, Stevens-Duryea; Wyoming Auto Company, Ohio gasoline; Deitrich Motor Car Agency, Stearns; Motorcycle Sales Company, Harley-Davidson and Thor motorcycles; John Rawley, Indian motorcycles.

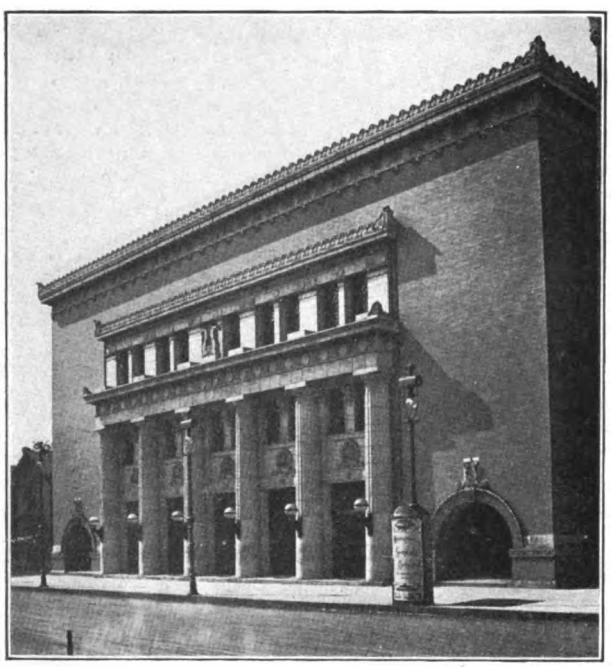
SIXTH DUQUESNE GARDEN DISPLAY IN PITTSBURG.

The Pittsburg Automobile Dealers' Association held its sixth annual display in the Duquesne Garden, in that city, Jan. 27-Feb.10, the first week being devoted to pleasure vehicles and the second to commercial cars. Accessories were shown both weeks. The committee in charge was composed of the following: R. P. McCurdy, chairman; Frank D. Saupp, A. X. Phelan, G. P. Moore and Thomas Dunn.

The interior of the building was entirely transformed into a bower of flowers. The prevailing color scheme was red, white and green. Fifteen thousand red poinsettias were utilized in covering the white lattice work which surrounded the main hall and separated the various exhibits. Electric lights were combined in a variety of designs to give the whole a most pleasing effect.

As is well known, Pittsburg will have two shows this year, the other exhibition being under the auspices of the Pittsburg Automobile Association, and this will be staged in the Exposition building, Feb. 17-24. At this first display there were 35 different makes of pleasure cars, shown by 28 dealers or manufacturers. During the week several representatives of makers visited the city and aided materially in bringing the merits of the respective models to the attention of the local people. So satisfactory was the first week's business, that it was decided to continue the showing of some of the pleasure cars during the second week, particularly as there was an abundance of room after the trucks had been placed in position.

Among those who made display during the first week were: Abbott-Detroit Motor Car Company, Abbott-Detroit; Eddie Bald Motor Car Company, Everitt; Baker Electric Sales Agency, Baker electric; W. W. Bennett Motor Car Company, Pope-Hartford; Buick Motor Company, Buick; East End Auto Company, Waverley electric; Ford Motor Company, Ford; Franklin Automobile Company, Franklin; J. E. Graham Company, Reo, KisselKar; Hiland Automobile Company, Peerless; Keystone Automobile Company, Stoddard-Dayton; McAllister Bros. Motor Car Company, Cadillac; McCord-May Company, Pierce-Arrow; N. C. Morrison Company, Pilot; A. X. Phelan, Lozier; J. M. Quimby Company, Simplex; Pioneer Motor Car Company, American, Hudson; Pittsburg Chalmers Company, Chalmers; Pittsburg Mercer Company, Mercer; Poffinberg Motor Car Company, Marmon, Amplex; Robinson Painter Company, Garford, Overland; F. B. Stearns Company, Stearns; Standard Automobile Company, Packard; United Motor Pittsburg Company, Sampson, Maxwell, Columbia; Vesta Motor Car Company, Stevens-Duryea; White Company, White; Winton Motor Car Company, Winton; R. & L. Electric Sales Company, Rauch & Lang electric; Schacht Motor Car Company, Schacht.



Atlantic Refining Company, oils and greases; Auto Tire Company, tires; Bell Telephone Company, telephone service; Banker Windshield Company, windshields; W. G. Bratton, speedometers; Chamberlain Manufacturing Company, polishes; Eyler & Henry, insurance; E. J. Flentje, shock absorbers; Hipwell Manufacturing Company, horns; Hoover & Hurst, insurance; Iron City Spring Company, springs; Jackson Motor Supply Company, accessories; A. E. Kent Company, insurance; Mutual Windshield Company, windshields; McGraw Tire and Rubber Company, tires; Penn Automobile Supply Company, accessories; Pittsburg Lamp & Repair Company, radiators, lamps, etc.; Pittsburg Auto Equipment Company, accessories; Standard Automobile Company, accessories; Universal Appliance Company, mirrors; Pyrene Sales Company, fire extinguishers; Wayne Oil Tank & Pump Company, gasoline storage systems; Winterton Manufacturing Company, windshields; Joseph Woodwell Company, accessories; Union Auto Specialty Company, windshields.

SPACE AT TWO BOSTON SHOWS IS ALL GONE.

From the very beginning of automobile show history the annual display in Boston has been the largest of the year, both from the standpoint of number of exhibitors and total attendance. Manufacturers, while denying its representation as a national event, always have regarded the New England exhibition as the best business show of the country. There is every reason, therefore, that makers represented by agents in Boston and vicinity should strive to secure space.

This increasing demand for opportunity to display wares in what has come to be recognized as the greatest market for motor vehicles in the world, had reached a point last year where it was impossible to house all of the displays in one building. Early in the season representatives of commercial vehicles

State Armory, Scene of Minneapolis' Forthcoming Display.

urged that a separate show be devoted to their product, and a decision was reached to follow that plan this year. It was expected that the division would result in better opportunity to accommodate those who waited until the last minute before applying for exhibition space.

Feb. 1, a full month before the opening of the pleasure vehicle section in Mechanics' building, March 2-9, Manager Chester I. Campbell announced that all space had been taken. This applied as well to the commercial car division of March 15-20. Even the adoption of the new plan will not enable Mr. Campbell to provide for those whose applications were received after that date. In fact, it is stated that a long waiting list had been formed at that time.

There seems little doubt that the two shows in Boston this year will be the largest the industry has ever known. There is little lessening of interest on the part of pleasure vehicle owners and buyers in the New England states. The section offers the same splendid market for cars and accessories, as it always has done.

In addition there has been a growing demand for more and more knowledge concerning the business vehicles during the past two years. Boston is the centre of an immense district that can utilize industrial transports to the best advantage, and the results that have been obtained by the pioneers in this line have been such as to encourage others to follow their example. Those who have secured space in the commercial vehicle section are bound to realize this situation next month.

As evidence that not all of the new things have been uncovered at the New York and Chicago shows it is announced that a new Knight motor is to be displayed for the first time at Boston. This is the product of Miss Margaret E. Knight of South Framingham, Mass., and it is said that it possesses many distinctive features of merit.

The Boston exhibits always have been regarded as of sufficient importance to warrant the presentation of new products, despite the fact that it has come much later in the season than the two so-called national displays. The practical knowledge of mechanics possessed by the skilled workmen in the New England factories is such as to grasp readily the details of new inventions or designs, and it is a simple matter to interest others after the article has received the approval of the visitors at the Boston show. It would appear that the 1912 display is to maintain the former reputation of this section in this respect.

PLANS FOR COMING EVENTS IN OTHER CITIES.

The next two weeks will see a number of so-called minor shows in various sections of the country. New England will contribute no less than four. Of these, the first is to be held at Fall River, Mass., Feb. 12-17. Hartford, Conn., will have the largest exhibition in southern New England, Feb. 19-24. The annual event at Portland, Me., will be held in the Auditorium during the same week. The Consolidated Motorcyclists of Keene, N. H., will present its annual show Feb. 21-23.

The Middle West will be represented by the following: Kansas City, Mo., 12-17; Dayton, O., 12-17; Grand Rapids, Mich., 14-17; Minneapolis, Minn., 17-24; Cleveland, O., 17-24; Omaha, Neb., 19-24; Cincinnati, O., 19-24; Davenport, Ia., Feb. 26-March 2.

New York state will have four displays as follows: Binghamton, 20-24; Troy, 21-24; Brooklyn, Feb. 24-March 3, and Elmira, Feb. 26-March 2. Newark, N. J., will have its annual show, Feb. 17-24, and Paterson, N. J., Feb. 26-March 2.

The South will have four, as follows: Atlanta, Ga., 10-17; Memphis, Tenn., 12-17; New Orleans, La., 20-25; Louisville, Ky., 21-24. Baltimore, Md., will be represented, Feb. 20-28, and Pittsburg, Penn., with a second show, Feb. 17-27.

Canada has two more shows scheduled for this month, one at Ottawa, 12-17, and the other at Toronto, 21-28.

LAMBERT—$1200

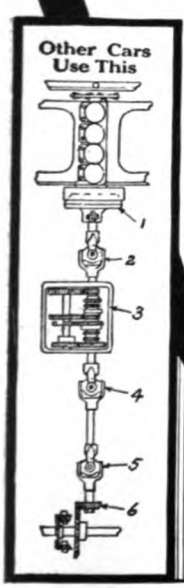
The Car With a Thousand Speeds

STUDY the two drawings shown in this ad. On the left is the common form of Power Transmission. On the right is the Lambert Patent Friction Drive. Do you realize that all automobiles are friction driven? Our combination clutch and transmission is as positive as any friction clutch, cone or multiple disc.

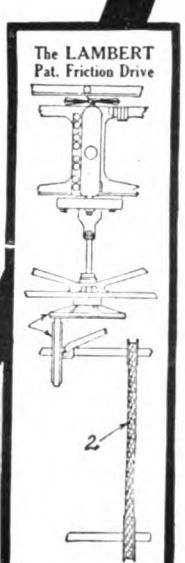
The First $1200 5-passenger Touring Car Equipped with Self-Starter, Top, Windshield, 112in. Wheelbase, 35 H. P., Ball Bearing Motor, Gas Tank, Horn, Lamps, Tools, etc.

We have spent twelve years perfecting Lambert cars. Our output has been sold every year to agents and buyers who appreciated the merit of our famous Patent Friction Drive. Our business has increased as fast as we have been able to take care of it. We have proven its efficiency in every form of service, from pleasure cars to five-ton trucks. Replacement of worn parts will not amount to the cost of oil in a sliding Gear Transmission. Perhaps you have been caught in the last few years by some of the many mushroom factories which spring up over night in so many parts of the country with the intention of doing business on agents' deposits. During this time we have been turning out cars on a proposition which has proven a money maker to hundreds of agents. Owing to our increased facilities for 1912, we are in a position to serve a number of new dealers. The Lambert Friction Drive is the ideal transmission for trucks. We have a complete line, and all of them winners in their class. The truck will be a big end of your business next year. Get in line now and secure the agency on a complete line built in our factory and built around the one correct form of Power Transmission—the *Famous Lambert Friction Drive.*

What a Friction Drive Means to You, Mr. Dealer



With the advent of the Self-Starter thousands of women will take up the driving of motor cars. You know what it means to teach a woman to shift gears. The Lambert Friction Drive is as easy to handle as an Electric. Seventy-five per cent. of cars are bought with women's consent. You can secure her consent easier by selling a car she can drive. It means increased sales for you.



OUR PROPOSITION TO DEALERS

The Lambert contract for 1912 is the most liberal agency agreement ever written. We have made our prices so you can make money. The small dealer gets the same show as the big one. Write today for complete literature and discounts.

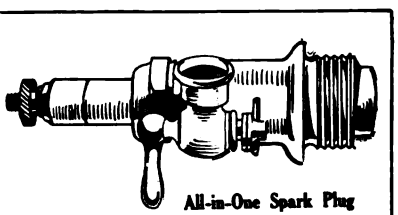
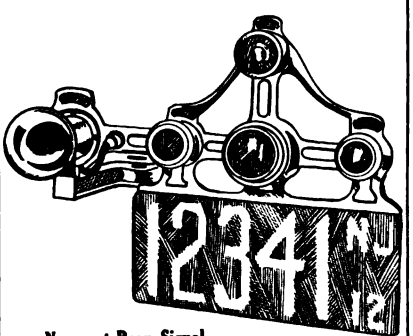
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.



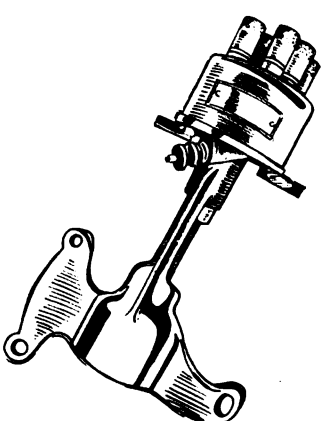
All-In-One Spark Plugs, marketed by the Frontier Specialty Company, Buffalo, N. Y., are manfactured in six different types to meet the requirements of varying motor designs. The construction eliminates the removal of a spark plug for priming purposes as a priming cup is incorporated, a feature which will interest motorists whose engines are not thus fitted.

★

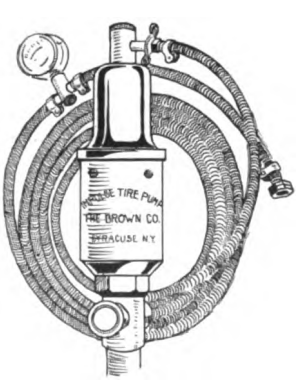


The Neverout Rear Signal Bracket is a combined rear lamp, license bracket and signalling device produced and marketed by the Rose Manufacturing Company, Philadelphia, it being patented in this country and abroad. It is operated by electricity and a push button switch is placed in an accessible position. This is equipped with three buttons for lighting the desired signalling lamps. The latter are four in number. A red disc is [illegible] to the middle of the bracket, this light burning constantly during the night and serving as the usual tail light. This is provided with a slot which allows a white light to be thrown upon the number plate attached immediately below. On either side of the red lamp is a white disc, these being employed for signalling to a vehicle in the rear that the operator of the machine in front is about to turn to the right or left as the case may be. Above the tail light disc is a similar member which shows a green light, this being utilized to warn those in the rear that the automobile is about to be stopped. Attached to the device is an electric horn which is sounded each time the white or green lights are operated, or flashed. The buttons on the switch are so arranged that a mistake cannot be made in signalling as the right hand member operates one white light at the rear, the left button the other, and the centre, the green.

★



The Atwater Kent Unisparker is a device brought out by the Atwater Kent Manufacturing Works of Philadelphia for model T Ford cars and consists of a bracket and gears operating its well known system of ignition. For it is claimed large mileage with small current consumption, that synchronism is obtained and that once adjusted it does not require any attention. It may be installed easily without the use of special tools or machine work, by anyone who knows how to time a motor. The device is gear driven from the timer shaft, a pinion being attached to the latter after removing the usual commutator. By drilling two small holes in the gear-case cover the bracket is readily attached and this arrangement permits of quick removal of the member for inspection. Although the device is designed particularly for Ford cars special sets of gears and brackets are manufactured for several other makes.



All-in-One Spark Plug

Neverout Rear Signal

Atwater-Kent Unisparker

Brown Impulse Tire Pump

★

The Brown Impulse Tire Pump is a device which will appeal to motorists as by it a large tire may be inflated quickly and without exertion upon the part of the operator. It is compact and may be stored in the automobile easily and is said to be free from complications and noise. The instrument is fitted with a special breather valve providing means for drawing in and conveying cool, fresh air to the tire, and in addition, it is equipped with a pressure gauge which automatically indicates the amount of air in the shoe. This arrangement dispenses with the usual device and its operation. To attach the pump, any convenient spark plug is removed and the former screwed in by hand until fairly tight. The motor is then started and run very slowly as the pump will deliver its full efficiency under this condition. The air hose is attached to the tire and the pressure gauge watched until the required amount is indicated. The length of the tubing is sufficient to reach every wheel. When more than one shoe is to be inflated it is not necessary to stop the motor. The pump is manufactured by the Brown Company, Syracuse, N. Y.

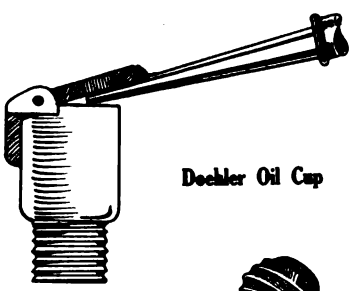
★

The Doehler Oil Cup is a lubricating device manufactured and marketed by the Doehler Die Casting Company, Court and Ninth streets, Brooklyn, N. Y., and a feature is that it may be attached easily by means of a screw driver.

Digitized by Google

The oiler is fitted with a spring retained lid which closes on the outside of the container, this arrangement, it is said, facilitating the flow of the lubricant to the bearing. The cup may be filled easily, the operation involving the use of but one hand, as the nozzle of the oil can is inserted readily.

★

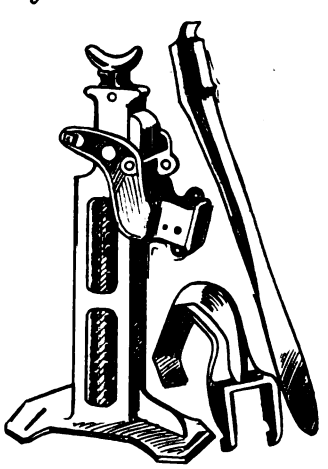


A Hydrometer Syringe that will appeal to motorists who charge their storage batteries as well as those who test the acid of the members, is marketed by E. Edelmann & Co., 49 West Kinzie street, Chicago. The device is a combination acid syringe and hydrometer, the latter being contained in the instrument and its action is said to be very accurate. This arrangement is an improvement over the usual apparatus which consists of a jar and a hydrometer. The syringe is neat and compact and may be carried easily in the motor car.

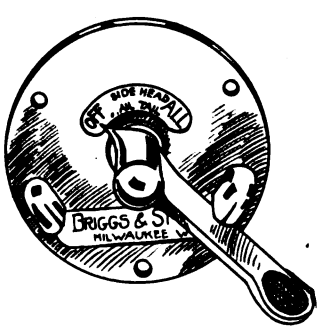
★

The Peerless Jack of the 1912 design, presents interesting features, inasmuch as the device may be used to remove stubborn tires as well as raise a wheel of the automobile. Believing that there is a demand for a light jack of compact size but strong enough to stand the strain of heavy work, the Oliver Manufacturing Company of 326 South Desplaines street, Chicago, brought out the new model, which is fitted with a large arched base to prevent tipping and provided with means for increasing its leverage and simplifying its lowering arrangement. It is said that it will work well in any position and that it is lowered easily by turning the handle. One of its features is a bracket which when attached to the jack and placed between the spokes of a wheel, will push or pull upon a tire, as desired. The handle is so constructed that it forms a handy tire tool. It weighs four pounds and is about eight inches in height.

★



The Briggs & Stratton Lighting Switch has been brought out by the Briggs & Stratton Company, Milwaukee, Wis., to meet the demand for a high grade switch for automobiles fitted with electric lighting. It is a four point switch of the kick type and the moving of the lever provides for lighting



Doehler Oil Cup

Hydrometer Syringe

Peerless Jack

Briggs & Stratton Switch

the side and tail lamps, the headlights, all five, and an off position. Any one of the groups may be utilized singly or in conjunction with others. The device is finished in either brass or nickel, polished or frosted, is compact and very attractive in appearance.

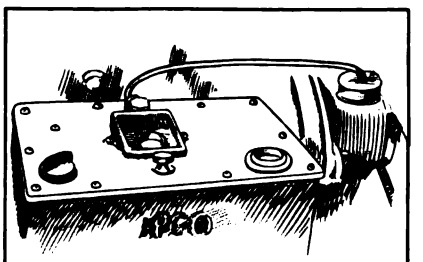
★

The Apco Force Feed Oiler is marketed by the Auto Parts Company, Providence, R. I., and is made especially for this concern by the Detroit Lubricator Company, Detroit, and is designed for model T Ford cars. It is fitted easily to the right hand side of the motor and it is claimed that it may be installed in less than an hour. The oil is fed into the breather pipe by means of a small tube, the latter passing through a small opening in the screen of the breather member. The mechanism of the oiler consists of a double plunger pump which pumps the oil from the reservoir through the sight feed nozzle, from which it drops, and the other plunger takes the lubricant from the sight feed chamber and forces it to the breather. Drive is by a steel belt from a pulley attached to the camshaft, the former replacing the retaining nut of the timer brush. The amount of oil fed is regulated by turning a button in front of the sight feed, this permitting of a fine adjustment.

★

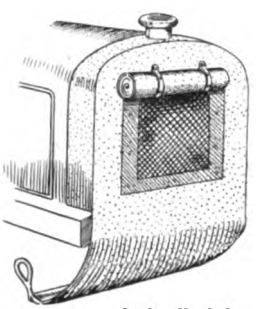
The Gordon Radiator Robe, manufactured and marketed by the Vehicle Apron & Hood Company of Columbus, O., is designed for covering the front of a radiator and protecting the contents from freezing. It is constructed of heavy, artificial leather and lined with wool, and attached to the cooler by means of straps. In addition, it is provided with a curtain which may be rolled up when the car is being operated, and lowered and fastened when the machine is standing idle. It is made in three sizes, large, small and medium.

★

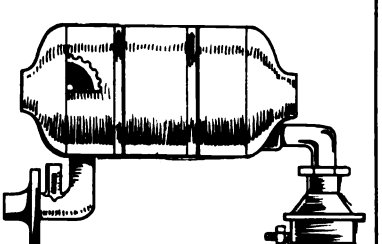


The Kerosene Gas Producer is an attachment invented by William K. Bassford, a mechanical engineer and authority on internal combustion engines, and designed for use in connection with any type of automobile, marine or stationary engine, whereby the less

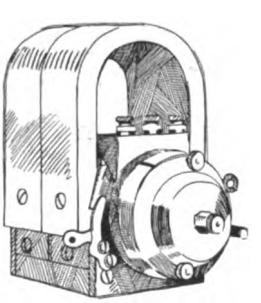
Digitized by Google



highly refined non-explosive fuels, such as kerosene or denatured alcohol, may be utilized instead of gasoline. The device is cylindrical in shape, about six inches in diameter, its length varying according to the horsepower of the motor, and is attached in the same manner as a muffler. It is produced in the form of an exhaust manifold when it becomes an integral part of the engine, thus permitting the use of gasoline or kerosene. In this type the control is automatic, and it is claimed that it does not require any attention upon the part of the operator. The motor is started in the usual manner, and after running for about three minutes, the kerosene is turned on and gasoline shut off, this being performed automatically by means of a thermostat, which also regulates the temperature of the gas entering the cylinders. But a small quantity of gasoline is required, this being contained in a priming tank holding about one gallon. It is pointed out by the maker that the device utilizes all of the heat units and that the low price of kerosene reduces the operating cost to about one-half of that when gasoline is employed. The gas producer is not only adapted to motor cars, but to large plants. It is manufactured by the Universal Oil Converter Company, Long Island City, N. Y., for which the Kerosene Gas Producer Company of New York City is agent.



★



The No-Lag Magneto, manufactured and marketed by the American Circular Loom Company, Aldene, Union County, N. J., is of the low-tension type and two alternating waves of current are generated in the armature at each revolution. One of these waves is interrupted by one pair of contact points of the circuit breaker, and the other by another similar pair of points located directly opposite on the other side. The low-tension current is built up by two transformers, compactly arranged, by which it is claimed that the efficiency is increased greatly, and that the spark occurs in the cylinder at the same instant that the break takes place at the contact points of the circuit breaker. It is also claimed that wear is reduced and that by placing the condensers directly over and very near the circuit breaker, burning and pitting of the platinum points is eliminated. Instead of distributing a high-tension current to each plug and returning through a ground, two spark plugs are placed in a series circuit, producing a spark in two cylinders, timed to take place, in one, at the end of the compression stroke, and in the other, at the end of the exhaust. The spark in the latter cleans the points of the plug and intensifies the spark in the cylinder on compression.

Four-Wheel Auto-Jack

★

The Four-Wheel Auto-Jack and tire saver is a device for raising the entire car from the floor of the garage or ground and the operation is so simple that it is said a child can lift the heaviest automobile in less than a minute. The jack consists of two rectangular steel frames which lean against the axles of the machine at an angle. The frame bases are connected by a chain which also is attached to a powerful differential jack screw. When the latter is operated the tilted frames are drawn together which movement pushes the car backward and at the same time raises it. The device is operated easily, being laid upon the floor and the machine driven over it and stopping within a foot or so of the correct position. The rear jack is then placed under the rear axle and the front member attached. The differential lever is then turned and the machine is not only blocked securely but raised two or more inches. The chain is adjustable and the device will fit any motor car. To demount, the jack is compressed, this requiring but a few seconds. The advantages of a tool of this type are numerous, among which may be mentioned that it removes the weight of the car from the tires, increasing their service, prevents contact with oil drippings and dampness; permits of drying the shoes after being exposed to the rain and washing; allows a daily examination for cuts; facilitates the application of tire chains, adjusting brakes and mechanism, and washing. The Four-Wheel auto-jack, for which John E. Nattress, 3132 Columbia avenue, Philadelphia, is agent, is guaranteed to lift safely a load of 6000 pounds.

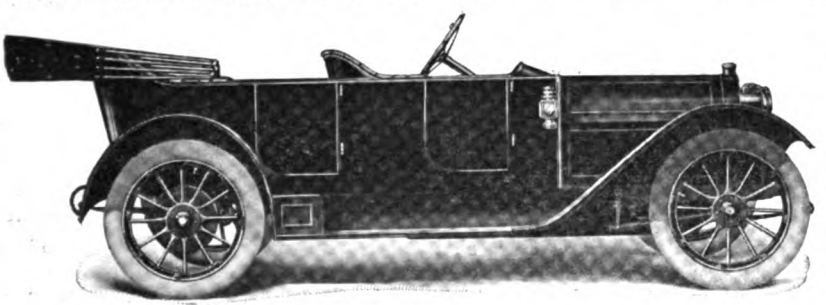
Dealers, Why Are You in the Automobile Business?

Are you in it for fun? Or do you want to establish a permanent business future. And make money—*now*.



Here is a car, Mr. Dealer, with every powerful selling argument known to Motordom. Into it goes the prestige of the world's greatest vehicle builders. Back of it is a wonderful selling plan—an economy that saves the buyer from $600 to $1,000 a machine.

No Cut in Agent's Profit

But the best feature of all is that we have provided liberally for the agent—the man who sells the car.

We realize that no matter how good our machine, or how attractive our selling proposition, what counts most in making the sale is the personality of the salesman. And that is one reason why we have thought it only just not to deduct anything from the agent's profit on account of the special selling features included in the car.

This policy of ours makes the MICHIGAN agency a valuable asset—an opportunity. And it is a big thing for us, too. Because MICHIGAN agents will always hustle. They make money—big money—for *themselves!*

SPECIAL FEATURES

- 40 Horsepower
- 116-in. Wheel Base
- 34x4-inch Tires
- Demountable Rims
- "Michigan" Self-Starter
- Nickel Trimmings
- Three-Bearing Crankshaft
- Enclosed Valves
- Absolutely Silent Motor

MICHIGAN "40"—$1,500

Contains Every Big Selling Feature

MOTOR

Compare our motor with those of $2,500 cars. Full forty horsepower. A strong three-bearing crank shaft with extra large bearings. Large valves. Cylinders 4 1-4x5 1-4 inch. Except fan, every moving part enclosed. Result: Ample power—long service—freedom from vibration—and silence, absolute silence.

SELF-STARTER

We have tried out nearly every self-starter made. The one self-starter that our engineers found to be entirely practical we have approved for use on MICHIGAN cars. It is simple and easy to operate, nothing complicated. Very light and thoroughly dependable. We gave it thousands of tests under all sorts of conditions, and it proved itself absolutely efficient. Nobody likes to crank a car. What folks will insist upon in six months you get *now* on the "Michigan Forty."

IGNITION

Tests of all kinds were made before we finally decided on the Briggs magneto. Not only did we find the Briggs the most efficient, but we felt that its strong guarantee gave MICHIGAN agents another big selling recommendation possessed by no other cars of equal price.

CLUTCH

The "Michigan Forty" is equipped with a clutch of the multiple disc type, dry plate, thermoid against steel. Can't grab—nor slip. A clutch that transmits a greater percentage of power to the rear axle than any other clutch on the market, bar none.

AXLES

Our three-quarter floating rear axle combines all the advantages of both the full-floating and semi-floating types, with none of the disadvantages of either. Hyatt High Duty roller bearings are used throughout.

WHEELS AND TIRES

We use genuine Shortsville wheels, known everywhere for their strength. 1 1-2 inch spokes—12 to a wheel. 34x4 inch tires and demountable rims—just to make sure that MICHIGAN owners will not be bothered with that bugbear of Motordom, tire trouble.

BRAKES

One square inch of braking surface for every eight pounds. Brake drums 14 inches in diameter, 2 inches wide. They are lined with raybestos, making it impossible to burn them out.

MOUNTINGS

Look at the 1912 models of the most expensive cars. You'll find very few mounted in brass. Takes too much time to keep all the lamps and other metal parts polished and cleaned.

On the other hand, look at the cheap cars. How are they mounted? Brass—always brass.

And that's the answer.

The "Michigan Forty" goes to the dealer with expensive white nickel mountings throughout. Another big selling point.

BODY

Here's where we have made big capital of our vast carriage building experience. Big and massive, yet graceful, and wonderfully suggestive of character and power.

COMFORT

Easy riding qualities secured by 116-inch wheel base, soft springs and luxuriously comfortable cushions. Appointments are perfect—such as you would expect to find only in cars costing $4,000.

GUARANTEE

The broadest and most liberal that it is possible to put on a motor car. A life guarantee backed up by an old line concern. One that has been here for thirty years and that will be here thirty years from today.

MAKE UP YOUR MIND

You've looked into every car proposition on the market. You've studied this contracting matter from every conceivable angle. But if you want to get machines before the selling season is all over, now is the time to *decide*—and you know it.

If our proposition looks best write us. Not because we talk the loudest, but simply because of our proposition. We ask you to investigate. Get the facts. Then ACT.

FRAME BRACING DEVICE.

Broken or sprung frames are not uncommon and many times these members being out of alignment are responsible for other mechanical troubles, among which may be named that of a leaking radiator, when the fracture is near the latter. There are several ways of repairing a frame, the methods varying according to the location of the break.

An instance of an effectual repair was noted by the writer recently. The frame was cracked near the goose necks and the workman fitted plates, riveting these members securely. As a severe strain was

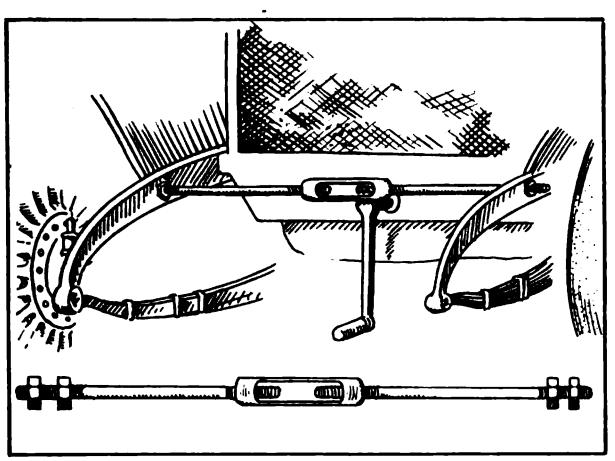

Fig. 1—Method of Bracing Securely Cracked Frame of Motor Car.

imposed upon the part, owing to the service performed by the car, a brace was employed as outlined at Fig. 1.

A .625-inch hole was drilled in each side member, these being directly opposite and on a line with each other. Two pieces of cold rolled steel, .625 inch in diameter, were threaded at each end, and a turnbuckle made as illustrated in the drawing. Each rod was fitted with two nuts, these being for the purpose of locking.

One of the rods was threaded into the turnbuckle and a nut screwed up after which it was inserted in the opening of the frame. The other rod was fitted with a nut and screwed into the turnbuckle. The nuts on either side of the frame were then locked and by means of the turnbuckle the tension adjusted.

CUTTING GEARS.

When cutting gears care must be taken to have the cutter central with the index centres, and to have the cut exactly the depth required. A good method of testing the setting is to cut a groove in a piece on the centres, then shift the piece end for end and try the groove upon the cutter. A good method of holding the gear blanks is on an arbor with a taper shank which fits in the index spindle, the outer end of the arbor being supported by the foot stock centre. Frequently in cutting gears a shank arbor is used with an expanding bushing and a nut at each end of this, one nut forcing the bushing up on the arbor and holding the gear blank, while the other pushes the bushing off the taper and releases the gear when finished.

If the ordinary arbor and dog be used, care must be taken that the dog does not spring the arbor. The depth of the cut can be gauged from the outside of the blank, or if so desired, marked on the side by a gear depth gauge. In cutting gears, when the blank has been placed in position it is raised by the elevating screw until it just touches the cutter. The graduated column on the vertical feed shaft is placed at the zero line and the blank moved horizontally away from the cutter. Then the work is raised the number of thousandths of an inch required for the depth of the tooth.

GALVANIZING CAST IRON.

To galvanize cast iron the casting should be cleansed thoroughly by immersing it for a few hours in a bath of one part muriatic acid and two parts water. After removing the work it should be scrubbed thoroughly with a brush and fine sand, after which it is washed with hot water. When the metal is clean it is dipped in a solution comprising one-half pound of sal ammoniac to a gallon of water. It should be dried quickly and dipped in a zinc bath. If the surface of the metal be oily, the grease may be removed by boiling in caustic soda or lye.

THE LEHMANN PISTON RING.

The efficiency of the internal combustion engine depends largely upon the piston rings and if these be not gas tight a considerable loss of power results. One of the causes of the escape of gas past the members is that the pressure of the rings against the cylunder walls is unevenly distributed. In addition they are broken easily when being removed or fitted.

A French firm is manufacturing a new form of ring known as the Lehmann double spiral, and it is claimed that the defects of the usual design are eliminated. It is formed of a double spiral having one opening only to each complete circle as will be noted at Fig. 2 A. It is stated that but two of these are necessary to a piston and that the usual retaining pin is not required to prevent the rings from turning and the openings coming opposite each other.

In fitting the ordinary ring it is customary to have its two extremities join when inside the cylinder, and when the bevel type is utilized, to make an allowance for a large range of adjustment. A common fault is the ring's insufficient elasticity and the unequal pressure at various points of its circumference.

It is claimed that the eccentric rings partly overcome this disadvantage, but even with these it is impossible to obtain perfectly round members when the bevel ends meet. A feature of the Lehmann is that owing to its double spiral formation, the elasticity of the two spirals increases or decreases in contrary direction round the ring. Thus all the differences of elasticity experienced opposite each other are equalized, so that the pressure of the ring against the wall of the cylinder is equal on the entire surface.

The principle of the Lehmann permits of its being made absolutely circular in shape, and it remains perfectly round when in position on the piston. Another advantage claimed is that it permits of the reduction in the depth of the ring slot in the piston, and not being eccentric, it does not require so deep a recess. In placing it on the piston the bevel extremities are inserted in the slot, and the ring, if turned around by hand, falls into position readily.

HOOK MAKING KINK.

In fitting cut-outs, signal devices, etc., to the motor car considerable time is consumed by the repairman in making the S hooks or couplings. At Fig. 2 C is shown a method of making one or many at the same time. It consists of gripping in the vise a round bar of metal of the size of the required hook. One end of the wire is caught as depicted, and the balance coiled snugly about the rod. Two complete turns will be necessary for each hook. When enough wire has been wound it is removed and with a pair of pliers, one coil turned back and cut at the end of the second. The result will be a perfectly shaped S hook.

DISC HOLDING DEVICE.

When working on discs it is difficult to hold the members securely in the vise, as owing to their shape the jaws of the latter cannot grip them firmly. Frequently they slip, making it impossible to do accurate work, such as drilling, etc. A simple method of fitting the vise with holders is depicted at Fig. 2 B. It consists of drilling and tapping four holes as indicated in the drawing, to take a like number of bolts, the heads of which are slotted to permit the use of a screw driver in fastening and removing. But two bolts are necessary as these may be shifted to fit large or small discs. When fitted to a small hand vise the arrangement will permit of carrying the work about the shop for the purpose of marking and fitting.

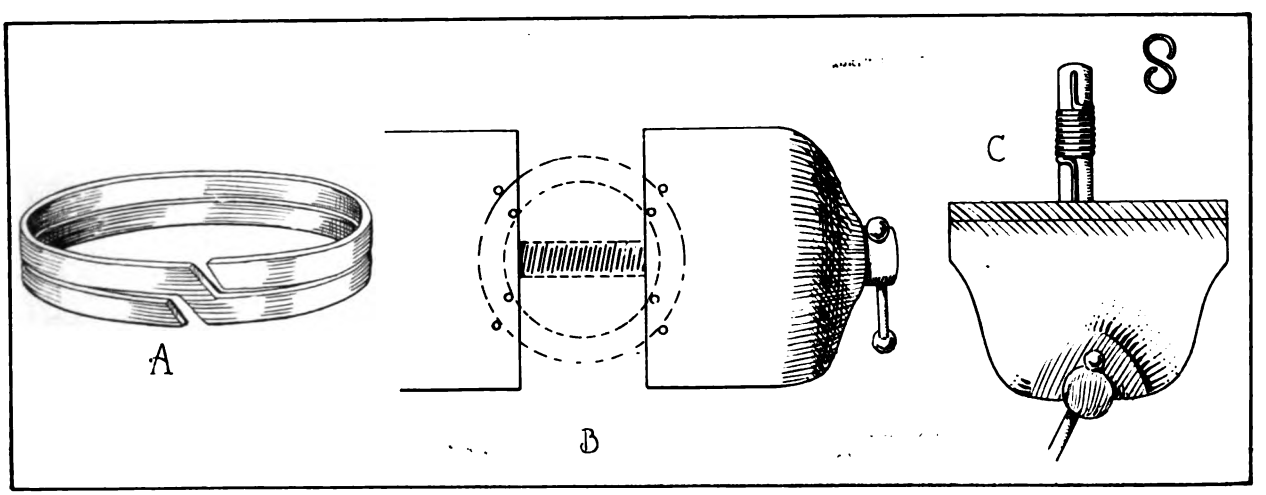

Fig. 2—Some Repair Shop Kinks: A, New Type of Piston Ring; B, Device for Holding Circular Parts in the Vise; C, Simple Method of Making S Hooks.

SURFACE HARDENING CAST IRON.

The surface of cast iron may be hardened by taking equal parts by weight of saltpetre, sal-ammoniac and prussiate of potash. These should be pulverized and mixed thoroughly. Next make a solution by adding four ounces of prussiate of potash and two ounces of sal-ammoniac to a gallon of cold water. Heat the metal to be hardened to a red, roll it in the powder, covering all parts, then dip them in the liquid.

Digitized by Google

PARTIAL SOFTENING OF HARDENED PARTS.

Frequently in fitting parts it is necessary to draw the temper of a certain portion to machine or bore as the case may be. For example: In attaching a new bevel gear which has been hardened and ground, if the bore be of incorrect size, it is necessary to place it in the lathe and rebore. Usually this would mean softening and rehardening, but the temper may be withdrawn from the section to be bored by filling the opening with red hot lead which will render the metal soft enough to work.

Sometimes it is necessary to soften the ends of a wristpin that they may be drilled and tapped. By dipping the ends in a vessel containing lead heated to a red, the immersed parts will turn blue while the other portion will not be affected. Where the centre of a pin requires softening, the ends may be wrapped with asbestos cord and the member placed in the heated lead. In using the lead it should be borne in mind that the work must not be allowed to remain immersed too long, and it should be cooled quickly in water before the heat has time by direct conduction to affect the part that has not been in actual contact with the molten metal.

Ends of small, hardened pins may be softened by grinding on an emery wheel, pressing the work tightly against it. The pins, however, should be made a trifle longer to allow for the metal ground off. Where hardened parts are to be riveted, this kink will be found useful.

BLACK FINISH FOR BRASS.

A handsome black finish may be put on brass by the following process: Dissolve in 1000 parts of ammonia water, 45 parts natural malachite. Carefully and thoroughly clean the metal, and if oil lamps are to be finished, remove the oil and wicks. Place the darkening solution in a large vessel and immerse the articles. After allowing the mixture to stand for a short time gradually warm the same, examining the articles from time to time to ascertain if the color be deep enough. Rinse and let dry.

An alternate method is to immerse in the following solution and then heat over a Bunsen burner or a spirit lamp: Add a saturated solution of ammonium carbonate to a saturated copper-sulphate solution, until the precipitate resulting in the beginning has almost entirely dissolved. The immersion and heating are repeated until the brass turns dark; then it is brushed and dipped in negative or dull varnish.

ENLARGING WITHOUT A REAMER.

Sometimes it is necessary to enlarge a hole slightly and a reamer is not available, especially when odd sized members are to be fitted. The work may be accomplished by using a flat or twist drill with its point ground slightly out of centre. If a hole be required for a taper pin, a flat drill should be made with the diameter the same as that of the taper pin at its smallest end. The drill should then be ground out of centre. After about .125-inch depth is drilled, the tool ought to be ground a trifle more towards the centre. In this manner a fairly good taper hole may be made.

SOLDERING FLUXES.

The repairman is called upon to attempt the joining of different metals, and a knowledge of the proper fluxes to be used will prove of value. Resin may be used either with the soldering iron or blowpipe for joining lead, tin, copper, brass, and tinned metals. Tallow with the blowpipe or by the wiping process for lead, tin or tinned metals. Sal ammoniac for copper, iron or brass, and muriatic acid with the iron for dirty zinc. Chloride of zinc may be employed with the iron or blowpipe for clean zinc, copper, brass, tin and tinned metals. Resin and sweet oil is a good flux for lead and tin pipes, while borax is recommended with the blowpipe for iron, steel, copper and brass.

BELT CEMENT.

A good belt cement may be made by mixing five ounces of bisulphide of carbon, and one-half ounce of spirits of turpentine with enough gutta percha to make a paste. In preparing the belt, care should be taken to remove all grease and this may be accomplished by absorption, using blotting paper and a warm flat iron.

REMOVING MICA PLUGS.

Mica is utilized as an insulator in some types of plugs and as this material is very brittle it is destroyed easily. When overhauling these members the use of a box wrench is preferred, for with the ordinary wrench an undue strain is brought upon the insulation, which is liable to be injured.

WEIGHT OF CASTINGS.

When a pattern is made of soft pine, put together without nails, an iron casting made from it will weigh 16 pounds to every pound of the pattern. If the casting be of brass, it will weigh 18 pounds to every one of the pattern.

FILING BRAZED JOINTS.

In filing joints or brazed work to reduce the surplus metal a new file is soon spoiled. If salt be placed upon the work as soon as it is brazed it will soften the metal and borax, and as a consequence the file will last longer.

REO ECHO ANNOUNCEMENT NUMBER.

The 1912 announcement number of Reo Echo, published by R. M. Owen & Co., New York City, distributor for Reo cars, is handsomely illustrated with views of timely interest in which cars of this make figure prominently. A. Lincoln Crayon, the veteran motorist and automobile writer, tells in his clear, realistic and intensely human way a story of his trip from New York to Jacksonville, Fla., in the 1911 Glidden tour. Many other popular authors are represented in the 48-page brochure, which will be mailed free to those who make request of the publisher.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

THE VALUES OF THE KISSELKAR

30 H. P.	$1500
40 H. P.	$1850
50 H. P.	$2350
60 H. P. "Six"	$3000

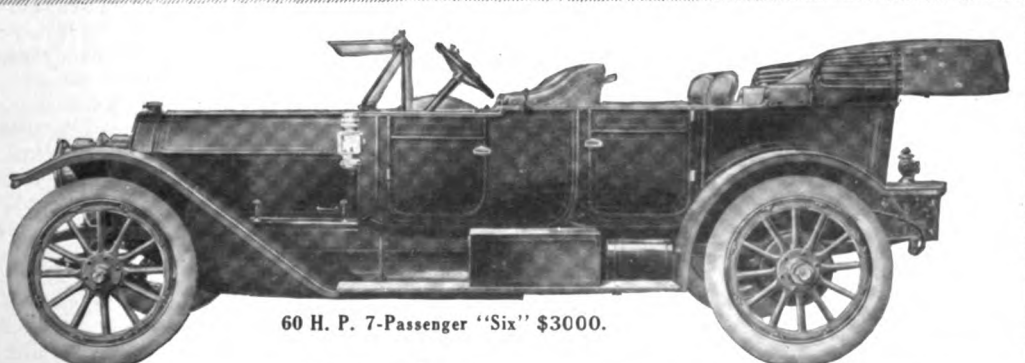
Fully Equipped.

1½ to 2 Ton, 3, 4, 5 Ton Trucks, Delivery Wagons, etc.

WE are not in the race to produce the cheapest car. Every KisselKar is a dependable value. No model has a pinched wheel base or a cramped tonneau—there is no slighting of material or workmanship in any part. The KisselKar is built to meet a standard not a price.

Every KisselKar model has the generous wheel base, the roomy tonneaus, big tires and wheels essential to comfort, low maintenance and attractiveness.

Among the conspicuous values in the whole history of the industry is the 60 H. P. KisselKar "Six",$3000. Several seasons of marked success have established the ability and dependability of this model—you will find it with other KisselKars in every State in the Union, with tremendous mileage behind it and a striking record for low operating cost.



WRITE FOR THE KISSELKAR PORTFOLIO—

One of the Most Informing Automobile Books Ever Published. Write for the KisselKar Portfolio—it will give you an entirely new standard by which to judge Automobile values. Free on request.

TRUCKS AND DELIVERY WAGONS—KisselKar Commercial Vehicles have been demonstrated to be 15% to 20% lower in operating cost than competitors—special features make them dependable on roads that would stall ordinary trucks or wagons.

KISSEL MOTOR CAR COMPANY, 174 KISSEL AVENUE, HARTFORD, WIS.

Branches and agencies everywhere.

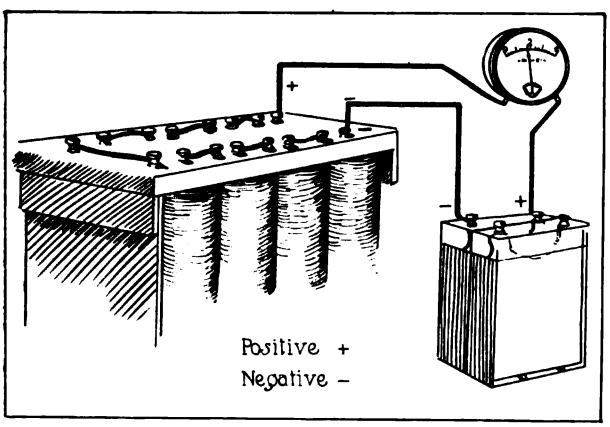
CORRESPONDENCE WITH THE READER



Fuel Consumption.

(1331)—Will you kindly publish in the columns of your valuable Journal the amount of gasoline used for a one horsepower motor an hour, also how you would figure to obtain the result? I have had the question asked me many times, and according to my figuring on different sized cylinders, my figures do not agree

L. N. WALTER.

Montello, Mass., Feb. 5.

The amount of fuel consumed by an internal combustion motor will depend upon a number of conditions, such as bore and stroke, number of cylinders, carburetor, work performed, etc. It is obvious that a cylinder having a five-inch bore and stroke will consume more fuel than one with a bore and stroke of three inches, all other conditions being equal. Different fuel results may be obtained with two similar engines fitted with different carburetors. There are so many conditions entering into the question that the figures obtained would only be satisfactory when two motors were tested in the same service.

Charging Ignition Storage Battery with Primary Cells.

The amount of fuel consumed, however, may be obtained by measurement, a practise common with motorists and others. The fuel container should be emptied, a gallon of gasoline poured in, a stick inserted, and the height of the liquid noted and marked upon the rule. The balance of the fuel may be poured a gallon at a time or in less quantities, the amount depending upon how fine the measure is to be calibrated. After running the motor for a stated period, the tank may be measured, the amount of fuel consumed noted easily and computations made accordingly.

Charging Ignition Batteries.

(1332)—Please publish in your columns when convenient, a description of some efficient arrangement if there be any, to charge storage batteries for ignition purposes by windmill power. I have heard that there are some successful plants of this sort in operation.

W. H. B. JACOBS.

Omaha, Neb., Feb. 1.

While the energy of a windmill might be utilized to operate a dynamo for generating a current to charge storage batteries, the writer has never seen one in practise. The variable speed of the mill would have to be regulated by fitting a governor to the current generator. In charging batteries it is essential that the flow of current be of a stated amperage, this depending upon its construction. This rate should be maintained evenly to obtain satisfactory results. Perhaps some reader has experimented with the system mentioned and will present the results obtained.

Cracked Cylinders.

(1333)—Being one of your subscribers I would like to inquire if you can inform me if the ——— car is being manufactured, and if so where? I have a 1907 model, touring car, the motor of which I think is a ———. One cylinder is cracked. I wish to repair it as I am going to sell the machine.

G. W. JEPSON.

Melrose, Mass., Feb. 3.

The automobile referred to has not been marketed for some time although it is stated that steps are under way for a reorganization of the company. The address of the concern was Charlotte, Wis.

Regarding the motor, you could have it identified by some repair man or person familiar with the make, or write to the company you mention whose address is Muskegon, Mich., explaining the circumstances and giving the model of the car. The damaged cylinder may be repaired by autogenous welding process, this depending upon the nature of the fracture.

Adjustment of Tappets.

(1334)—I have a model ——— car and the adjustment of the intermediate tappets works loose. I have set the lock nut up as tight as possible, but it works loose just the same. The power of the motor is considerably affected as there is too much play between the tappet and valve stem. Is there any way I can remedy the trouble as I do not wish to go to the expense of new members? The car was not new when I purchased it.

WILLIAM FORDHAM.

Bridgeport, Conn., Feb. 4.

The best repair would be to purchase and install new members. The old parts have worn through careless locking by the former owner and it would involve considerable machine work to make them satisfactory. A simple method of obtaining results with the old tappets is to unloosen the check nut and remove the tappet proper. As the locking member is recessed, the tappet should be screwed down snugly as far as it will go and the nut locked securely. Then take a piece of round steel, the same diameter as that of opening in pushrod, and cut off a number of different sized discs. Insert one or more as may be necessary to offset the space lost by screwing down the tappet. An accurate adjustment may be obtained by filing the disc if too thick and it is advisable to make the latter a trifle longer than necessary to permit of fitting. The discs may also be hardened to prevent wear.

Another method is to utilize fibre. Cut a number

Digitized by Google

of discs, slightly smaller than the opening, and hammer them as hard as possible, this being done to improve their wearing qualities. The fibre has an additional advantage as it will be quieter than the metal members. The writer effected a repair to a motor of the same make by making solid tappets, and after fitting them hardening the ends. In adjusting the parts it is advisable to time the opening and closing of the valves by the marks on the flywheel, rather than by measuring by a visiting card, etc.

Charging Battery with Cells.

(1335)—I read an article in your magazine describing how to charge storage batteries with electricity of the house or garage. Not having electric lights, can you inform me of a method of charging a battery without using a dynamo or house current? F. A. CARLTON.

Jacksonville, Fla., Feb. 2.

A storage battery, such as is employed for ignition purposes, may be charged with primary batteries as illustrated in the accompanying sketch. When using this system an ammeter should be incorporated in the circuit, and the zincs of the batteries let down into the solution just so far that the required number of amperes is indicated by the instrument. Instead of raising or lowering the zincs a small resistance may be introduced in the circuit, such as lamps, but as these would consume current, the other method is preferable. The number of cells employed will depend upon their type, but this may be determined by experimentation.

Adjusting Brakes.

(1336)—Can you inform me why it is that the brakes on my ——— car do not hold equally? I have taken up the rods evenly on both sides, but the right hand brake does not hold as well as the other. Is there any way to adjust the members so that they will grip the same? The linings appear to be good as I have had the wheels off and examined the former.

W. S. GOODCHILD.

Cleveland, O., Feb, 5.

The reason the brakes do not grip evenly is because of the adjustment of the rods. It is a difficult matter to set the latter so that both members act the same owing to the design which is not being employed in modern motor car construction. If an equalizer, that is, a device for distributing the pressure applied, were utilized, the trouble would be overcome.

An excellent method of adjusting brakes is to jack up both rear wheels clear of the ground. Then release brake pedal and disconnect turnbuckles. Next shorten each rod a little, and move it forward and note if the brake begins to grip when the end of the rod is in a position for attaching to its holding member. Then set the brake pedal a trifle and try each wheel, noting if one grips more than the other. By shortening or lengthening the rod of the member which allows the wheel to move easier or harder than the other, the brakes may be equalized. Next apply more pressure and try both wheels, making further adjustment for pressure if necessary, but in the operation take the same number of turns with each turnbuckle.

Starting Two-Cycle Motor.

(1337)—Being a reader of your magazine I take the liberty of inquiring about a two-cycle engine which is not utilized in connection with automobiles but for sawing wood. I have used the engine for some little time with good success, but lately it is difficult to start and I have to change the mixture, giving it a richer one in starting than formerly. It is not because of cold weather as I have tested this out. It is a two-port motor and was used some time before I got it. I have tried all the things I can think of, but the trouble continues. Can you give me any suggestion as to the cause?

W. Z. CARTER.

Westerly, R. I., Feb. 7.

The description would indicate that the difficulty experienced in starting was due to a leak in the crankcase, either around the bearings or in the crankcase proper. The writer knows of an instance where a tiny blowhole in the casting, which was covered with paint, caused starting troubles after the paint wore away. This was detected by turning the flywheel until the piston was compressing the charge when a slight hissing noise was heard and traced to the hole in question. This was sealed and the motor gave excellent service thereafter. A leak of such a nature will affect the operation of a two-cycle motor, especially in starting.

Coil Gives Trouble.

(1338)—I have a ——— car and have experienced considerable trouble with my coil. I have been advised to install a K-W master vibrator as the repair man claimed it would eliminate my troubles. Will you please give me your opinion as to the merits of the same?

C. T. EVANS.

Hartford, Conn., Feb. 3.

A master vibrator would improve the running of your motor and as the repair man states, prevent a repetition of your troubles. The K-W device is employed on many cars and has proven very satisfactory in practise.

R. C. H. COMPLETES LONG TRIP.

Averaging 205 miles a day for 15 days an R. C. H. car recently completed a trip from San Francisco, Cal., to the site of the Panama-Pacific Exposition. The automobile made by R. C. Hupp, manufacturer, was piloted by R. H. Luther, and a feature of the run was that the speedometer was sealed. Throughout the tour the schedule was adhered to in spite of heavy rains, bad roads and steep grades. The valleys of the Sacramento, San Joaquin, Santa Clara and Sonora in California were traversed and throughout the journey the motor car ran perfectly, the operator experiencing no trouble whatsoever despite the strenuous work performed by the automobile. R. C. Hupp is naturally elated over the showing made by his product.

WARD HEADS INDIANA ASSOCIATION.

Frank E. Smith of Newcastle, general manager of the Maxwell-Briscoe Motor Company's plant, and president of the Indiana Automobile Manufacturers' Association, has appointed J. M. Ward of the Waverley Company to succeed P. P. Willis of the National Motor Vehicle Company as secretary of the association. Mr. Willis resigned previous to the New York shows and President Smith did not name his successor until the term had expired. The new secretary is well known to the automobile industry and is particularly prominent in the electric field.

Digitized by Google

KNIGHT MOTOR ATTRACTS MECHANICS.

During the Detroit automobile show at which the Stoddard-Dayton and Columbia automobiles were exhibited, the Knight motor with which these cars are fitted, attracted an unusually large number of mechanics from the different motor car factories of the city. Those in charge of the exhibits were kept exceedingly busy answering the questions of the factory men who displayed a decided interest in the sleeve valve engine, even going so far as to inquire as to the materials used and methods of casting, etc.

CORRECTION OF ERROR.

As the result of improper attention to details in making up the issue of The Automobile Journal for Jan. 25, the article concerning the promotion of Harry W. Griffith of Indianapolis, Ind., to become general manager of the Remy Electric Company, Anderson, Ind., was illustrated with a likeness of P. P. Willis, who recently was appointed advertising manager of the Mais Motor Truck Company of Indianapolis, Unfortunately, Mr. Willis' picture bore Mr. Griffiths' name, and undoubtedly the friends of the two gentlemen had some trouble trying to identify the illustration. Both men are exceedingly well known in the industry, particularly in the Middle West. Mr. Griffith has been secretary-treasurer of the Remy Electric Company for the past year, while Mr. Willis has taken an active part in the organization of the Indiana Automobile Manufacturers' Association, of which he was the first secretary, and assisted materially in the success of the Indiana Four-States tour of last summer. Mr. Griffith's photograph is presented herewith.

Harry W. Griffith, General Manager Remy Electric Company.

WOLGAST BUYS A MERCER.

Adolph Wolgast, lightweight champion pugilist of the world, has purchased a Mercer roadster, made by the Mercer Automobile Company, Trenton, N. J., and with his wife is planning a transcontinental trip from Los Angeles. The car will be equipped with the necessary articles and the Sante Fe trail will be followed, this being over the proposed route of the national boulevard. The start will be made about April 1.

WILL PROTEST BOARD'S DECISION.

It is stated that the Abbott Motor Company, Detroit, intends to file a protest against the severity of the decision of the contest board of the American Automobile Association, which at its last meeting disqualified Abbott-Detroit cars from entering races until next July. This is because one of the rules concerning advertising results in non-stock events is held to have been infringed by the Abbott company in the Savannah events.

In discussing the question, Vice President W. M. Botto said: "We feel that we are disqualified because of the purest technicality. The fact remains that we did enter an entirely stock car in the Vanderbilt race. The report of the A. A. A. does not even pretend to question this. And, in view of the fact that this stock car entered a field with the finest American, French and Italian specially built racing machines of several times its price and horsepower, and made a record of speed, reliability, endurance and consistent performance, we think our enthusiasm in advertising the fact was understandable and perhaps even pardonable. We are particularly concerned in the six months' disbarment because it prevents our entering the Indianapolis races next May, where we hoped to make another good showing. In consideration of the circumstances we feel that a reprimand would have been sufficient punishment for what, after all, was merely an infrngement of a technical point, and that disbarment is an unnecessary hardship."

BRISCOE ADVISES A. A. A. ON RACING.

Believing that high speed motor car racing no longer serves a useful purpose, besides bringing discredit upon motoring and the automobile trade, Benjamin Briscoe, president of the United States Motor Company, New York City, has prepared a letter to the American Automobile Association, advising that it abandon the control of speed contests and devote its time to the promotion and encouragement of touring and reliability events and particularly furthering its work for good roads. Mr. Briscoe suggests that the government of speed contests be turned over to any organization that will care for it, leaving the A. A. A. to continue its work in connection with roads, legislation, foreign and American touring maps, guide books, touring contests, etc.

FIRESTONE TIRES WERE EMPLOYED.

One of the straws which tell which way the wind blows in the matter of motor truck equipment is that of tires fitted to commercial cars at the shows. A careful count of these at the recent New York and Philadelphia exhibitions, showed that Firestone tires, made by the Firestone Tire & Rubber Company, Akron, O., led at both displays, with 47 sets at the former and 25 at the latter. Many of these were equipped in addition with Firestone quick-removable rims, enabling the driver to make changes on the road without difficulty.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

PERSONAL ENGINE CARE.

With the exception of the one item of lubrication, most of the things learned by the man who cares for his own engine and car are those which he works out by physical experiments, rather than by scientific research. He adjusts the carburetor one way or another and notes the effect, but in the matter of oil he has neither the time, the laboratories nor the exact scientific knowledge which is necessary to reach a definite and satisfactory solution of the rather complex problem of proper automobile lubrication.

He may know that his engine misses fire, and that this is due to a deposit of carbon, but he will not know how to overcome the difficulty. He may guess, and rightly, that the carbon deposit can be traced to the lubricating oil, but he will not know wherein this oil is unsuited to his engine. He may find that his engine heats up, that his bearings bind and cause mysterious and very annoying squeaks and weird noises, and again he may rightly guess that the oil is to blame. Guess work is not only unsatisfactory in results, but is expensive, and if the man who takes care of his own engine can find a lubricating oil that is especially adapted to his motor's specific needs, probably 90 per cent. of his troubles are at an end.

Although the average car owner has neither the time nor the equipment for the proper scientific study of lubricants, there are many manufacturers of oils who are quite willing to offer him brands that are claimed to be exactly what he wants. Then, again, there are producers who have devoted many years to the scientific study of the problem and who place in the market an oil which is especially adapted to the purpose for which it is advertised.

The Havoline Oil Company, New York City, is one of the concerns which has prepared its product scientifically. Controlling, absolutely, its own oil fields, it is thus enabled to secure a uniform quality of crude as a basis of its finished products. In its four refineries, it maintains laboratories in charge of expert chemists who are constantly at work keeping up the standard of Havoline oils. After the laboratory investigation and tests, all oils made by this concern are first thoroughly tested in actual severe service, both in engines on the block and on the road, before being placed in the market and backed by the name of Havoline.

By a scientific system of filtration, which is too expensive to admit of its being followed by some concerns, this company eliminates the carbon to a minimized point, so that the resulting product is as near a non-carbon perfection as it is possible for an oil to be carried in preparation without a loss of its lubricating qualities. It follows that these oils burn up cleanly and thus eliminate carbon deposits and with them the bulk of the owner's troubles.

In an effort to familiarize car owners with the real needs of lubrication, the company has prepared a booklet entitled "The Common Sense of Automobile Lubrication," which it will send to anyone addressing the Havoline Oil Company at its main office, 17 Battery place, New York City.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

BECOMES BRANCH MANAGER.

William Q. Cramp, formerly an officer of the Seneca Rubber Company, Buffalo, N. Y., has been appointed manager of the new branch opened by the Kelly-Springfield Tire Company in that city. Mr. Cramp is well known in the industry through his connection with the Seneca Company and moves into his new position as a result of the absorption of that concern by the Kelly-Springfield Tire Company.

HALLADAY AFFAIRS ADJUSTED.

The Streator Motor Car Company, Streator, Ill., maker of Halladay cars, starts the 1912 season in a better position than ever before to handle its increasing business. It is announced by the concern that the company originally started business with insufficient capital, and because of the large demand for its product, soon found it was impossible to secure ready money.

John C. Barlow and Paul R. Chubbuck, two of the principal stockholders, offered to convey to a trustee a large amount of real estate and other property which was to be used as security for bonds, the proceeds from which were to reimburse the creditors. An attempt was made to bring this about without the assistance of any court, but a few of the creditors objected, and the matter was taken into the bankruptcy court, not for the purpose of declaring the company insolvent, but to take advantage of the bankruptcy law, which provides that the court may compel a minority of creditors to accept a proposition to which a majority has agreed. The objections filed were subsequently withdrawn, and the proposition was confirmed by the court, leaving the company with all of its assets and free from debt.

NEW TYR IS A PRESERVATIVE.

A waterproof liquid composition, which it is claimed not only improves the appearance of the car but will preserve the tires, has been placed in the market by the New Tyr Manufacturing Company, 771 Lexington avenue, New York City. This product is termed New Tyr, and is said to be a German invention, which has been used for years throughout Europe. It penetrates into the fabric of the shoe, fills up any air holes, prevents sand blisters and keeps the rubber from cracking. The preparation is applied with a two-inch flat brush after the rubber has been thoroughly cleaned, and is said to dry in from 15 to 20 minutes.

FAIRMOUNT PARK RACE.

While the park commissioners of Philadelphia are known to be divided in their opinion regarding the annual Fairmount Park road race in that city, it is said there is every probability that permission will be granted as in former years. It is pointed out that the event has done much to advertise the city and that the plan under which the Quaker City Motor Club has conducted the race has resulted in large sums for charity. It is added that during the four years the contest has been held cars have travelled fully 25,000 miles in practise and competition without serious accident to contestants and no injury to spectators.

ADVERTISING DEPARTMENT:
NEW YORK—W. R. Blodgett, 25 42nd Street.
DETROIT—C. A. Eldredge, 304 Sun Building.
CHICAGO—P. G. Lurlau, 1405 Clifton Avenue.
BOSTON—John W. Queen, 6 Beacon Street.

Subscriptions:

The United States and Mexico, the year, $1 in advance; Canada and Foreign Countries in Postal Union, the year, $2 in advance. Ten cents the copy.

Advertising Rates:

Information given at request. All advertising copy to insure publication must reach this office 10 days preceding the date of issue.

Remittances should be made by Check, Draft, Postoffice, Express Money Order, or Registered Letter. Money enclosures must be at sender's risk.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

THE BURDEN OF RESPONSIBILITY.

Massachusetts, which has set many an example to other commonwealths in the matter of automobile legislation, has a proposition before it to limit the size of motor trucks operating over the highways. It seems hardly probable that the highway commission could have studied the full effect of this bill before giving it indorsement. Motorists, as well as automobile manufacturers, should familiarize themselves with its provisions without delay, in order that the fullest possible publicity may be accorded what seems to be decidedly injurious legislation.

Briefly, the bill provides that no traction engine, trailer, motor or other vehicle in excess of a weight of six tons shall be operated on a highway or bridge, without obtaining a permit from the authorities in charge of such highway or bridge. Also that the owner, driver or operator of such vehicle unless relieved from liability in such permit, shall be responsible for all damages which the highway or bridge may sustain as a result of his action. It further provides that no traction engine or motor truck carrying a weight of more than four tons, including the vehicle, shall be operated at a speed greater than eight miles an hour. A fine of not less than $10 nor more than $500 is provided for violation of this law.

It is understood that the bill is a direct result of the failure of certain bridges in various sections of the commonwealth. At best, it appears to be an attempt on the part of town officials to transfer the responsibility for damages from the town treasury to the individual. Its effect upon modern methods of transportation readily may be conceived.

Massachusetts is too well informed to deny the approach of a new era, and it would seem that the proper solution of the difficulty was to recognize this fact by increasing the strength of roads and bridges which must be used by the modern vehicles. There should be no attempt to evade responsibility or to delay the inevitable.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

THE HIGHWAY SAFETY LEAGUE.

A new organization has made its appearance in Massachusetts, having as its object the elimination of the motor car operator with little regard for the interests of others. This is the Highway Safety League, which aims to become national in character. Time and funds will be devoted to the enforcement of existing laws and the punishment of violators. If the present laws are not sufficient for the purpose, it is proposed to secure others, more stringent.

It may be pointed out that the present statutes seem to be adequate for the purpose sought, but there has been a decided failure on the part of those whose duty it is to enforce them. It takes little effort to hale into court the driver who is travelling just over the maximum speed allowed, but few means appear to have been found for apprehending the real offenders. It is to be hoped that the new organization will devote its time and attention to the more serious side of the situation, and in so doing it will have generous support from the majority of motorists, who have quite as much at stake as other users of the highways.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

THE 1912 AUTOMOBILE.

While it is but natural that the growing importance of the commercial vehicle end of the industry should cause the improvements made therein to stand out more prominently than the changes in the pleasure car field, it will not be denied that the present show season reveals much progress here as well. The radical departures from accepted design are few, as was to be expected. Even the adoption of the so-called valveless engine has not been sufficiently widespread as yet to indicate any pronounced departure from what may be regarded as standard practise.

The most interesting developments of the past twelvemonth have been along the line of equipment. Whether the 1912 automobile be used for business or

Digitized by Google

pleasure, the owner will find it fitted with all that makes for comfort and convenience. This applies quite as well to the machine of low price as to those heretofore recognized as of the first rank.

Electric lighting was beginning to come into vogue a year ago. Today it is regarded almost in the light of a necessity. The self-starting model is the rule rather than the exception. Practically all makes are equipped with fore doors, and in many instances this means four real doors, which may be removed at will. Demountable rims, tire carriers and luggage racks are now almost as commonly fitted as the magneto, speedometer and windshield.

There has been no appreciable reduction in price, for the most part, but so many things in the nature of accessories are being fitted as regular equipment this year that the resulting outlay is decidedly less than formerly. That it is only necessary to purchase a supply of fuel and secure a license tag before leaving on the summer tour is more nearly true than ever before. The 1912 model is a splendid investment and presages an excellent year's business.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

LOOKING BOTH WAYS.

Recently the Boston Elevated Railway Company offered prizes for the best poems written by school children, relating to the modern dangers of the public streets. First award went to a young woman who selected as her title, "Look Both Ways." Her advice to young people was to look in both directions before venturing on the highways.

Of course, the competition was arranged with the trolley car in mind, but it might be applied as well with reference to the automobile. There is little doubt that if children would adopt the title of this poem as their motto there would be far less accidents. And it may be added that the advice will be quite as beneficial for adults as well.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

LEGISLATIVE PLANS CHANGING.

The agitation for uniform motoring laws appears to be having its effect during the present legislative season. A number of states are looking over their statutes with a view to carrying out the desires of motorists in this respect. Word comes from New York, for instance, that a new law, patterned after the liberal provisions of the Connecticut statute, is in the process of formation. Rhode Island and a number of other states are turning their attention to the matter of universal lighting, following the example set by Massachusetts.

While it is still too early to predict what the final outcome shall be, there appears to be a disposition on the part of legislators to look upon motoring in a different light than has prevailed in the past. Much of this is due to the work of organized motorists, but it should not be forgotten that this is the season when automobile clubs and associations should be most active.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

CHAUFFEURS' NATIONAL ORGANIZATION.

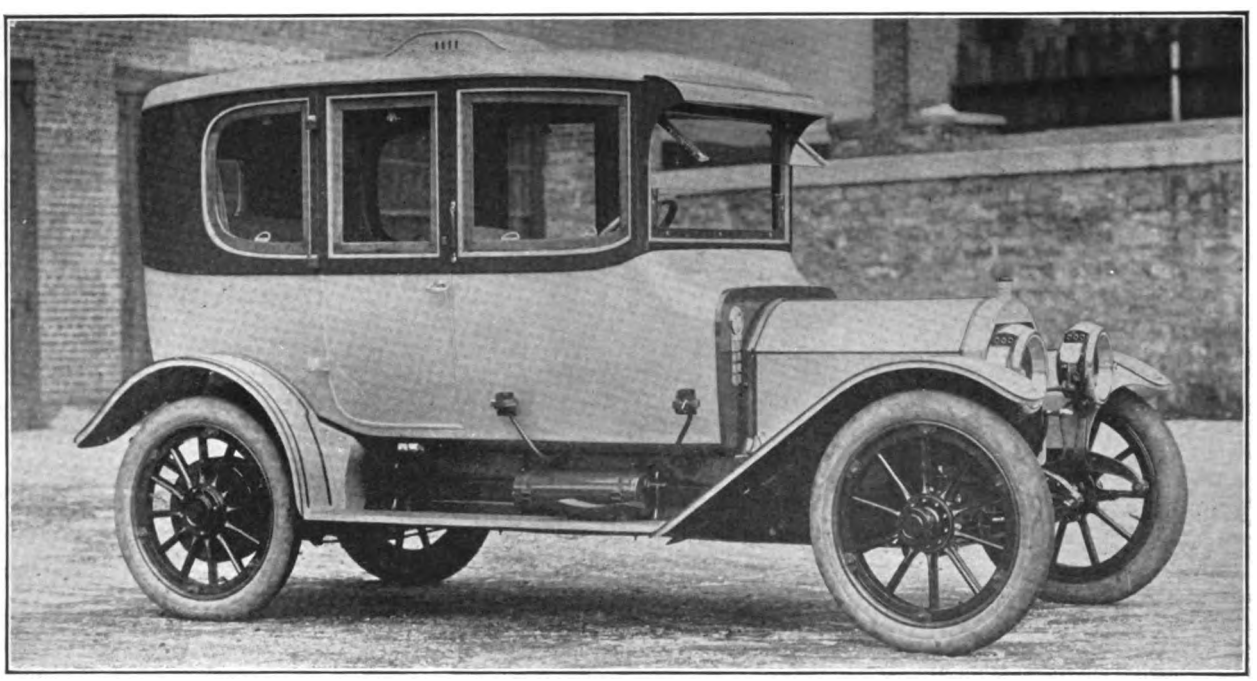
The prospectus of the Chauffeurs' Federation of America claims two definite objects—obedience to the laws governing the use of the highways, and making the federation button a testimonial of the fitness of the holder to take a position of responsibility. Applicants for membership must pass an examination before a board composed of men who understand the mechanism of the automobile and its practical use on the public ways.

The aims of this organization appear to be decidedly worthy, but it may be added that the blame for misuse of the highways does not fall upon the heads of the chauffeurs in most instances. A careful investigation of the situation will indicate that usually the owner is at the wheel. The majority of chauffeurs, like the majority of motorists, have due regard for the rights of others. The party at fault is the man who cannot control himself and who should be refused a license to drive under any circumstances. There ought to be some way for the licensing board to determine in advance whether or not an applicant is a fit person to entrust with such responsibility.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

WHY THE CHANGE OF NAME?

Announcement is made that the national automobile tour is not to be known any longer as the Glidden tour, and that a new trophy is to be secured, in order that the event shall not bear the name of any one man. There must be some very good reason for this action, since it will not be denied that the generosity of Charles J. Glidden in presenting the trophy bearing his name was responsible for one of the most important contest features in the industry.



In 1911 there was very little disposition on the part of manufacturers to enter the tour, but when the governing body revived the original plan of making it a contest for individuals there was less difficulty in securing entrants. Still, the national tour of last year was not the same success as previous events. It hardly seems probable that the name had a great deal to do with it, since the Glidden tour had come to be recognized as one of the motoring classics of America. It will be interesting to note whether the change of title effects the result expected.

Digitized by Google

MARMON 32-40 HORSEPOWER STOCK CARS.

THE standard Marmon chassis is rated at 32 horsepower, which is marketed with six different types of body. With all of these bodies the equipment differs somewhat, but the mechanical qualities are identical. From these six body models one may select the five-passenger touring car, the four-passenger touring car designated as the "suburban," the two-passenger roadster, the three-passenger roadster, the five-passenger inside driven limousine and the five-passenger landaulet.

The Marmon car has become widely known through recent racing achievements, these including numerous track and road events. Among these was the International Sweepstakes at the Indianapolis speedway, Memorial Day, 1911, in which the two Marmon entries finished first and fifth out of 40 cars to start. The

The Marmon Five-Passenger Inside-Driven Ventilated Top Limousine.

winning machine was driven 500 miles at an average speed of 74.61 miles an hour, and the other Marmon was in third place with two laps to go when its radiator was punctured by a tire lug thrown by another car and fell back with its cooling system practically useless.

While Marmon cars have won races consistently and their successes have been on all of the noted courses and speedways and against the most skillful drivers, one fact pre-eminent is that many events were won without stops. That is, the cars not only endured the hardest work but went through without the stops for tire changes that delayed many other entries. This quality has been pointed out by the maker, the Nordyke & Marmon Company, Indianapolis, Ind., who has claimed that the Marmon car has no equal for easy riding. It has also been offered as abundant evidence of the economy of fuel and lubricant consumption, to say nothing of the proof of substantial and enduring construction.

The Nordyke & Marmon Company has been engaged in manufacturing for more than 60 years and the methods which firmly established this concern have been applied to the production of the Marmon cars. It is maintained that these cars are the result of the highest degree of motor car development and engineering skill. The design is simple in every sense. Every endeavor has been directed toward minimizing weight and insuring against complications. Extreme accessibility is another quality to be pointed out, as well as the protection of every moving part from wear.

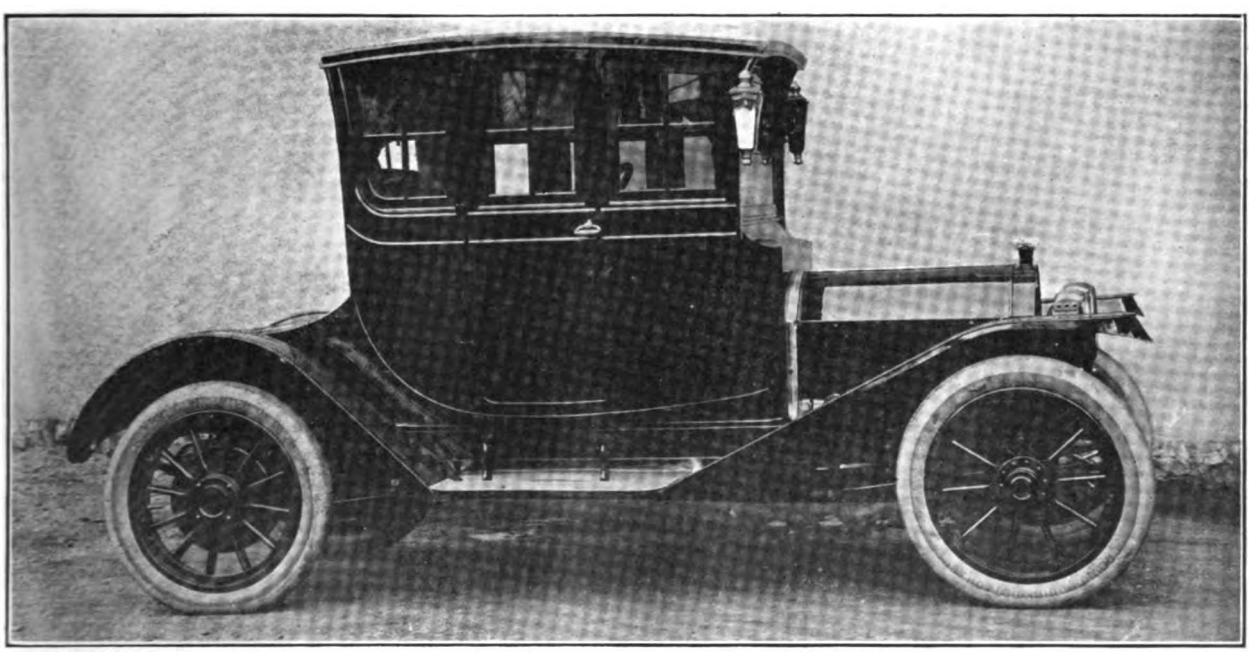
The Marmon 32 Horsepower Motor.

The Marmon motor is of four cylinders, cast in pairs. The motor is the T head type with the valves on opposite sides. The bore is 4.5 inches and the stroke five inches. It is rated at 32-40 horsepower. The cylinders are cast from a special quality of gray iron with the water jackets integral, the water jackets being with liberal spaces for effective radiation and circulation of the water. Exhaust is at the left side and the fuel intake at the right side of the motor. The pistons are of the same material as the cylinders and are unusually long. The cylinders are carefully bored and ground to size and the pistons are accurately fitted by grinding. The cylinders are ground under a strong air blast to remove all metallic or stone particles. The pistons are fitted with three rings, two above and one below the wristpins, these being specially designed three-piece rings that permit free movement of the pistons without loss of compression.

The crankcase is a barrel type aluminum casting

Digitized by Google

with a lubricant reservoir or base. It is so designed that the crankshaft may be withdrawn through the forward end of the case. It is of the three-bearing form and the main bearings are anchored with heavy through bolts instead of studs. There are three main bearings in which the drop forged one-piece crankshaft, carefully ground and fitted, is mounted. The bearings are generous and are white die-cast brass, making for long life without need of adjustment.



The wristpins and crankpins are large and the drop forged steel connecting rods are unusually long, the length insuring against vibration at high speed and minimizing the side thrust upon the walls of the cylinders. The connecting rod bushings are of die-cast white brass.

Marmon Lubricating System.

One of the special features is the system of motor lubrication, which has been employed in Marmon motors for nine years and has proven under all conditions of service and contest to be amply efficient and dependable. The method is force feed from a reservoir to all the moving parts of the motor. The reservoir has a capacity of six quarts and is bolted beneath the engine case, there being a large opening for the free flow of the lubricant from the engine base to the reservoir. There is a circular filter of fine screen in the centre of the reservoir and in this filter at a point above any possible accumulation of sediment is located the intake of the gear driven oil pump.

From this pump are two leads, one of which is carried to a pressure gauge installed on the dash within constant view of the driver of the car. The other has three branches whch extend to the three main bearings. The crankshaft is drilled through the shaft, webs and crankpins longitudinally, the channels through the webs being smaller. The larger channels are capped at either end and from these the centrifugal force of the crankshaft revolutions tends to carry the oil through the smaller. The shaft is drilled radially with holes that register with the oil grooves in the main bearings. The crankpins are similarly drilled with holes that register with holes in the big end bearings of the connecting rods, and these are fitted with tubes that extend to the bearings for piston wristpins.

As the engine is started the oil is pumped from the reservoir and is forced to the main bearings, through the hollow crankshaft to the crankpins and thence to the wristpins, there being a constant pressure that insures a liberal lubrication of all these parts. There is considerable excess of oil and this is thrown off from the revolving crankshaft, amply lubricating the cylinder and piston walls, the camshaft bearings, the cams, the valve lift rollers and the valve lifts and guides. From the forward main bearing the oil flows into a pocket formed by the timing gearcase and these gears revolve constantly in a bath of lubricant.

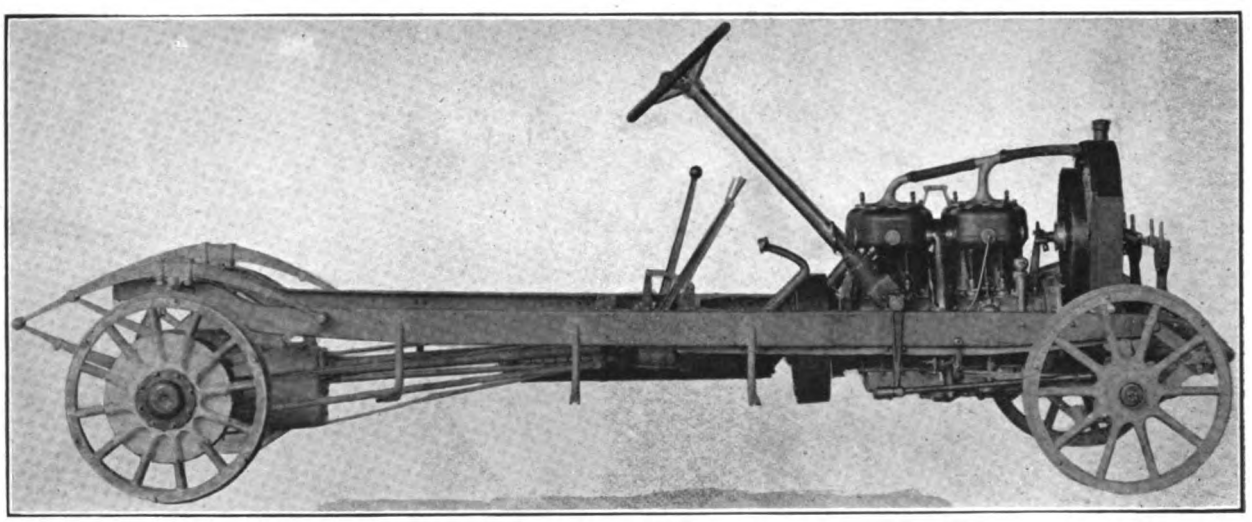
The Marmon Three-Passenger Colonial Coupe.

The oil pump is driven from the intake camshaft by spiral gears and while it is in operation every bearing or moving part is flooded, the oil being circulated very rapidly. The excess is drained into the reservoir, filtered and is used over and over again. The amount of oil in the reservoir may be determined at a glance by the pressure gauge. An automatic relief valve insures a uniform pressure of the system and there can be no failure save by the exhaustion of the supply within the reservoir, of which there will be long indication.

The pump is in a housing outside the engine case and may be readily removed should there be need, and the reservoir may be taken off for cleaning as desired. There is a removable plug for draining the reservoir should this be necessary. The pump is absolutely automatic in its action, starting and stopping

Digitized by Google

with the motor and insuring that sufficient oil is delivered to all the bearings. The circulation of the oil is such that it is always under control and besides being exceptionally economical of lubricant it requires little attention. It is further claimed that it entirely eliminates the smoke nuisance.



Highly Efficient Valve Action.

The valve action of the motor is such as insures the greatest efficiency. The exhaust valves are at the left and the intake valves at the right side, these being actuated by camshafts with liberal bearings, the shafts and cams being ground accurately to size. The valves and ports are large to facilitate complete charges of fresh fuel and thorough exhaust of the consumed gas. These valves operate in guides of white brass and the lifting pressure on the valve stems is a vertically straight line with the guides, this eliminating all side strain and pressure on the valve stems, insuring accurate and noiseless seating of the valves as well as long life of the mechanism. The valve springs are fitted with a special installation which makes for durability and facilitates quick removal and replacement of valves and springs. The tappet rods are installed in guides of white brass and the rods are fitted with hardened steel rolls with bronze bushings mounted on hardened steel pins to contact with the faces of the cams. The tappets have dust proof caps to protect the bearings between the rods and the guides and screws and lock nuts afford means for accurate adjustment of the valve clearance and to compensate for wear.

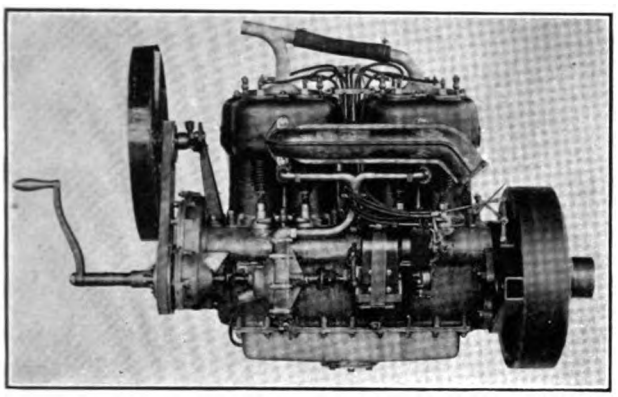
Cooling and Carburetion.

The cooling of the motor is by a circulation through the liberal water jackets and a cellular radiator. The circulating medium is a gear driven centrifugal pump of large capacity that is driven by an outside shaft from the exhaust camshaft. The inlet to the pump is large and a free flow of water is insured. The water is delivered to the cylinder units midway between the exhaust valves, at the base of the water jackets. The outlet manifolds are attached to large caps that are retained to the cylinder heads by cap screws. These manifolds are connected by flexible rubber hose. The curves of the manifolds are easy and there are no obstructions to the free flow of water. The radiator is mounted on a trunnion to eliminate any strain upon it. The radiation is further facilitated by a large fanwheel carried on a ball bearing and mounted on a bracket carried on the engine case. This fan is driven by a belt that is carried from a pulley on the extension of the same shaft that drives the water pump and magneto. The efficiency of the radiation is best evidenced by the results of the racing contests in which these machines have taken part. The exhaust header is of large proportions and affords free passage of the burned gases to the muffler, which is an especially effective silencer. The header is ribbed to increase the radiation.

The carburetion of the fuel is by means of an automatic float feed instrument with air valve adjustment, which may be adjusted from the seat. The carburetor is a type that has been carefully tested and developed and is highly efficient. The intake is a straight pipe from the carburetor to the connection with the intake manifold, which is cast integral with the cylinders and, being water jacketed, is surrounded by the circulating, cooling water, which simplifies the construction as well as insures against condensation of the fuel at low temperatures or slow speed.

The Marmon Standard Four-Cylinder 32 Horsepower Stock Chassis.

Three Point Motor Support.



As mounted, the motor has three supports, that forward being on a heavy cross member of the frame, while at the rear it is supported by a pressed steel member that is carried on brackets attached to the chassis frame side members. The engine is slightly inclined toward the rear, which makes for a nearly straight line of the driving members, this minimizing the stresses upon the universal joints and making for the greatest economy of power created. The manner of installation also affords the complete accessibility of the motor and all its parts.

Dual Type of Ignition.

The ignition is of the true dual type in that it consists of a high-tension magneto and energy is supplied to two sets of spark plugs located over both inlet and exhaust valves, two sparks being generated

Digitized by Google

in each cylinder simultaneously. This increases the rapidity of firing and the consequent expansion and power of the motor. This certainty of firing is an-

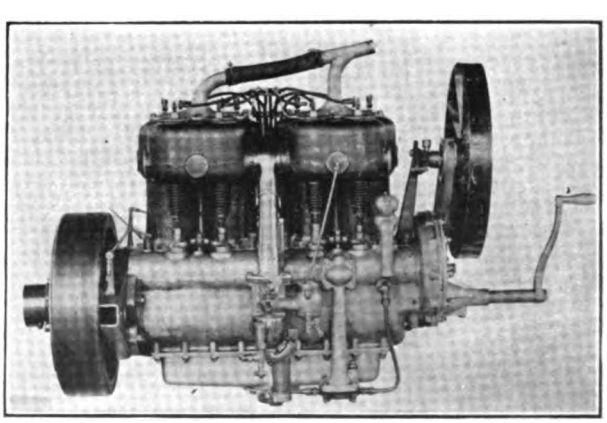
Exhaust Side of Marmon Motor, Showing Water Pump, Magneto and Ignition Leads.

other factor in the admirable results obtained in racing and other forms of contests. In addition the system may be used with the storage battery that is utilized for starting and as a spare, the current being intensified by a coil located on the dash.

The clutch is of the familiar cone type, the female member being the recessed flywheel and the male member being a cone faced with an asbestos fabric facing. This form is not only very effective but is free from troubles. Engaging springs are placed beneath the cone facing to prevent harsh engagement, this insuring smoothness in operation. In the driving system, back of the clutch and where the gearset is usually located is the support for the forward end of the heavy steel housing for the driving shaft, and paralleling this is the tube that carries the rods controlling the gearset. There is a universal joint within the clutch construction to prevent torsion stresses upon the motor, and another within the shaft housing. The shaft housing is suspended forward by a ball and socket joint.

Combination Gearset and Differential.

The transmission itself is constructed in combination with the bevel gear and pinion drive at the rear end of the driving shaft and is of the selective type with three forward speeds and reverse. It is claimed for this construction that it affords better distribution of weight, lower centre of gravity of the car, ease in riding, tire economy, accessibility, avoids all exposed universal couplings, and that the propeller shaft is always run at engine speed, it being held that the power a shaft will transmit is always proportioned to its speed. The gearset is thus combined with the rear axle design, being, with the differential, carried in a large central housing.



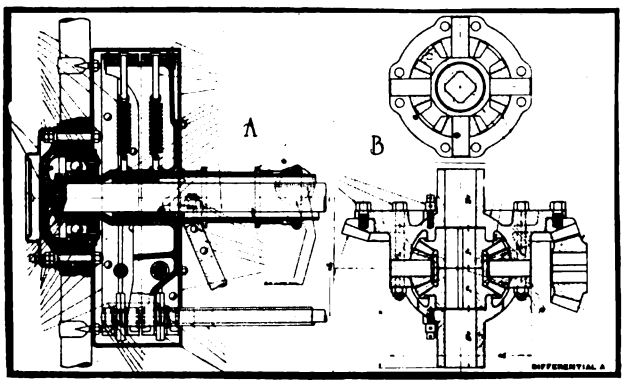
The housing is heavily webbed to insure strength, for the axle is of the full floating type, in which the wheels revolve on bearings at the outer ends of the axle tubing, the wheels being firmly fixed to the driving axle shafts. The axle house is of pressed steel and that encasing the differential is cast aluminum. The rear of the housing is closed with an aluminum plate which, when removed, permits the removal of the gearset or differential after the driving shafts have been partly withdrawn. When mounted the differential is carried on large roller bearings and into the differential assembly are extended the ends of the driving shafts. The outer ends of the shafts are bolted solidly to the hubs of the rear wheels, this making practically a single construction. The wheels run on heavy ball bearings that are centred in the hubs. The stresses of road shocks are borne by the wheels and the springs and not by the gears and shafting by which the car is driven.

The bearing supports for the differential are integral with a heavy steel cage or case, which also carries the bearing for the bevel pinion and the rear gearset bearing. The transmission shafts are mounted in imported ball bearings. The bevel driving pinion has an easily accessible adjustment which may be made use of from the outside without opening the housing so that it is not necessary to open the transmission to compensate for any wear. The large torsion tube strengthens the construction and heavy distance rods maintain the rear axle in its correct relation with the chassis.

Brakes and Control Details.

The brakes are of the internal expanding type and are with shoes of steel, faced with asbestos fabric, operating within pressed steel drums 16 inches in diameter bolted to the rear wheels. The shoes have two-inch face and have a total braking area of 403 square inches. They have improved screw and segment adjustment accessibly located. The brakes are dust proof and operate effectively under all conditions, and are equalized as to pressure. All brakes are in duplicate and the parts interchangeable. The front axle is a forged steel I section and of such design that the load is carried by ball thrust bearings protected by aluminum housings. The wheels are mounted on roller bearings. The yokes and the steering arms are steel forgings, carefully annealed. The draglink and the tiebar are located behind the front axle for protection against road obstructions. The clearance of the axles is 10 inches.

The wheelbase is 120 inches and the tread is 56.5 inches. The chassis frame is of pressed steel channel section, cambered at the rear to permit the use of



Inlet Side of the Marmon Four-Cylinder Motor, Showing Carburetor and Oil Pump.

full elliptic springs. The rear springs are 40 inches in length and two inches in width and the semi-elliptic forward springs are 35 inches long and two inches

Digitized by Google

wide. The spring shackles are provided with grease cups for lubrication. The wheels are of the wood artillery type which are regularly equipped with 35 by

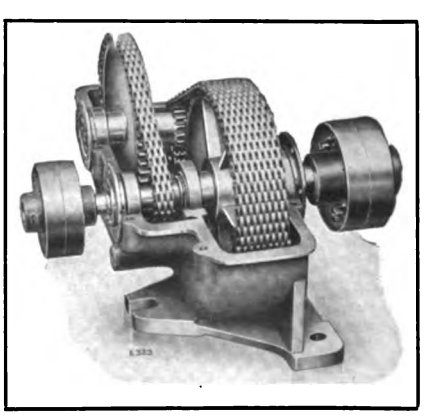
Marmon Rear Axle Construction: A, the Floating Driving Shaft and Brake Installation; B, the Differential Assembly.

4.5-inch tires carried on quick detachable rims.

The control is by gearset and emergency levers at the right side, the former being mounted in the conventional H slot. The clutch and service brake are operated by left and right pedals respectively and the motor also may be accelerated by pedal. The ignition and throttle are controlled by hand levers on a quadrant on the 18-inch steering wheel. This wheel has a solid spider and grip. The steering column is of large size and the gear is of the irreversible type of the screw and nut construction, in which one adjusting nut will compensate all wear. The fuel supply is carried under the driver's seat on the touring types and behind the seat of the roadster. It has a capacity of 18 gallons and the feed to the carburetor is by gravity. There is a float sight gauge to indicate the quantity and the tanks have large hand holes to permit of cleaning.

The fenders are of steel with mud aprons between them and the chassis frame and there is a skirt between the aluminum pyramid-faced running boards and the frame. The motor is protected by an easily removable dust pan. The hood is of sheet metal with a centre panel bolted to the radiator and the dash. The bodies are of the Marmon perfected cast aluminum construction with sheet metal seat backs. All upholstering is of selected black leather, with coiled spring backs and spring edge cushions stuffed with the best of curled hair and with leather welts and binding. All models are finished with blue-black bodies with white striping, the running gear being olive with blue-black striping. The exposed metal work is polished brass. The weight of the cars is approximately 2750 pounds.

BAUER REMAINS WITH OAKLAND.



Harold A. Bauer of Buffalo, N. Y., who is well known because of his performances in hill climbing contests, endurance and reliability runs as pilot of Oakland cars, has been re-engaged to handle the contest work of the Oakland Motor Car Company, Pontiac, Mich., during the present year this announcement being made by General Manager George F. Daniels of the company. Bauer began his career when 16 years of age, piloting an Oakland through the Glidden tour, and finishing with a perfect score. Since that time he has engaged in many hill climbing contests with success. The Oakland company will adhere to its established rule of participating in hill climbs, endurance and reliability runs during the coming season.

ENTER LEXINGTON IN BIG RACE.

Announcement is made that the Lexington Motor Car Company of Connersville, Ind., has entered a six-cylinder Lexington car in the 500-mile international sweepstakes race to be held at Indianapolis, May 30. This is said to be the first entry made by the company in a contest of this nature. The car will be piloted by Harry Knight, who made such an excellent showing in the event last year, but who met with an accident when he voluntarily drove his car into the pits to avoid striking a mechanician who had fallen from a car. The machine entered by the Lexington company is equipped with a six-cylinder motor having a 4.125-inch bore and 5.25-inch stroke, giving a piston displacement of 421 cubic inches. It is the third six-cylinder to be entered and the 10th entry received thus far. The new machine is nearly completed and will be sent to the speedway shortly for a try out.

COVENTRY SILENT CHAINS FOR MOTORS.

One of the mechanical features of the foreign motor car shows was the growing tendency of makers to utilize the silent chain for driving camshafts, magnetos and pumps. At the Scottish motor exhibition, recently held in Glasgow, Scotland, many of the best known manufacturers of British machines exhibited models which employed the Coventry noiseless chain drive in the motor. The product of the Coventry Chain Company, Ltd., Coventry, England, for which S. Hoffnung & Co., Ltd., New York City, is United States representative, was shown also in many change speed gearboxes an application that was noticeable at the Olympia show. Another exhibit of proved utility was the speed reduction gearbox, which is shown in an accompanying illustration. This method is said to solve effectually the question of reducing speeds of electric motors to the desired number of revolutions with a minimum loss of power, by either double, triple or quadruple reductions.

Speed Reduction Gearbox for Electric Motors.

March 6-9 —Show, Tiffin, O.
March 11-16—Show, Cedar Rapids, Ia.
March 12-16—Show, Syracuse, N. Y.
March 13-20—Commercial car show, Boston, Mass.

SPECIAL BOSCH SERVICE.

Arrangements for special installation service have been made in all branches of the Bosch Magneto Company, New York City, so that motorists in the vicinity of any branch desiring to install the Bosch system may leave their machines and have the change made not only with promptness but at a reasonable figure, with the usual Bosch quality and guarantee.

INSURANCE BUSINESS SUSPENDED.

Supt. Blake of the state insurance department in Missouri has prohibited casualty companies from writing business for automobile owners in that commonwealth, claiming the possession of liability insurance causes carelessness on the part of motor car operators. In this connection, it is interesting to note that the organized motorists of St. Louis had been agitating a revision of classification for liability risks in that city, as it was held there was no good reason why the residents of St. Louis should be compelled to pay a larger premium than those of any other city in the country with the exception of New York and Chicago.

HUPP COMPANY LITIGATION.

Announcement is made from Detroit that Judge Murphy of the Wayne County Court has handed down a decision in the case of the Hupp Motor Car Company against the Hupp Corporation and R. C. and L. G. Hupp, granting the prayer of the plaintiff for a permanent injunction restraining the use of the name "Hupp." Under the terms of the decree, the Hupp Corporation is required, within 15 days, to change its name, eliminating the word "Hupp," and is forbidden to use the name "Hupp" as a part of its corporate name, or in any manner as applied to the manufacture and sale of gasoline automobiles. The Hupp brothers are permanently enjoined from using the name jointly or singly as applied to gasoline cars, and R. C. Hupp is prohibited from making any written or printed statement in advertising or otherwise by which he claims to be the designer of any car or cars produced by the Hupp Motor Car Company.

NO MORE GLIDDEN TOURS.

At a meeting of the executive committee of the American Automobile Association held in Chicago during the progress of the Coliseum show in that city, it was decided to raise money for a new trophy, to be known as the A. A. A. cup, which will be awarded in future national tours. It is understood that this step was taken in order to eliminate the name of any one man, since the success of the annual tour depends upon the efforts of so many.

The Glidden trophy, which has been the chief award in all but one national tour, was presented by Charles J. Glidden of Boston, and the annual Glidden tour has come to be known as one of the American motoring classics. It is held at present by the United States Motor Company, it having been won in 1911 with a team of Maxwell cars.

It also was determined at the meeting that New Orleans shall be the destination of the 1912 tour. One of the following five cities will be the starting point: Detroit, Cleveland, Buffalo, Cincinnati or Indianapolis. Other plans, including the date, will be announced later.

PRATT HEADS OHIO GASOLINE CONCERN.

At the annual meeting of the directors of the Ohio Motor Car Company, Cincinnati, O., Charles F. Pratt was elected president and general manager. A. F. Schaefer was chosen vice president and factory manager; Robert Kennedy secretary, and O. M. Baker treasurer. The former succeeds C. M. Anderson as the latter resigned to engage in business at Middletown, O. R. E. Northway, chief engineer; H. T. Boulden, sales manager, and C. E. Evans, assistant factory manager, continue in their respective positions.

THREE PREMIERS
OF THE
MOTORING WORLD

Specialized Publications For Owner, Industry and Trade

The AUTOMOBILE JOURNAL—Devoted to the Interests of the Owner and User of the Motor Vehicle for Pleasure. The Most Comprehensive Popular-Priced Magazine Published. The year, 24 issues, $1; the Copy, 10 Cents.

The MOTOR TRUCK—The National Magazine of the Power Wagon Industry, Promotive of the Interests of the Manufacturer, Distributor and Owner of Industrial Transports. The Leader of Its Class. The Year, Monthly, $1; the Copy, 15 Cents.

The ACCESSORY and GARAGE JOURNAL—The Only Publication in America Given Over to the Motor Car Industry and Allied Interests. Exclusively a Medium of Trade Information for the Trade. The Year, Monthly, $1; the Copy, 15 Cents.

TEN STANDARD MECHANICAL AUTOMOBILE HANDBOOKS

The A B C OF INTERNAL COMBUSTION ENGINE MAINTENANCE AND REPAIR—The Most Complete Work Ever Written of Gas Motors. Not Principles, But Practise. Illustrated by More than 50 Cuts and Drawings and Eight Full-Page Charts. Price 35 Cents.

The A B C of MAGNETO IGNITION SYSTEMS—Every Detail of Construction, Maintenance and Care, Covering Standard Makes of Instruments and Their Service, Illustrated by More Than 100 Cuts, Drawings and Wiring Diagrams. Price 35 Cents.

The A B C OF CARBURETOR CONSTRUCTION, MAINTENANCE AND REPAIR—Theory and Practise of Carburetion by All Recognized Methods and Devices Exhaustively Reviewed and Described, with More Than 125 Special Illustrations and Charts. Price 35 Cents.

The A B C OF BATTERY IGNITION SYSTEMS—All Standard Constructions and Their Adaptations in Practise, Together with Special Applications and a Series of Wiring Diagrams for All Installations, Shown by 50 Illustrations and Charts. Price 30 Cents.

The A B C OF MOTOR CAR OPERATION—A Complete Text Book of Theory and Practical Experience with All Types of Standard Automobile Vehicles, Systematically Written and Illustrated by More Than 200 Cuts and Full-Page Charts. Price 50 Cents..

OVERHAULING, REBUILDING AND REPAIRING THE MOTOR CAR—A Treatise of All Conventional Types of Cars with Advice for Meeting All Service Conditions, Based on Practical Experience. Containing More Than 200 Illustrations and Diagrams. Price 50 Cents.

The A B C OF MOTOR CAR CHASSIS MAINTENANCE AND REPAIR—Systematic Presentation of Conditions Resultant from Use, and Means for Remedy and Restoration Applied from Practical Knowledge. Contains More Than 50 Cuts and Charts. Price 25 Cents.

MAINTENANCE AND REPAIR OF MOTOR CAR TIRES—An Exposition Treating of Tire Service from the Viewpoint of Economy, Founded on Manufacturing, Repairing and Operating Experience. Illustrated by More Than 100 Cuts and Charts. Price 25 Cents.

LIGHTING THE MOTOR CAR BY ELECTRICITY—A Comprehensive Work on All Current Producers, Lamps, Lights, Installations and Practical Wiring Diagrams for Every Type of Vehicle, Singly or in Combination. More Than 75 Cuts and Diagrams. Price 25 Cents.

The A B C OF AERIAL NAVIGATION—A Veritable Encyclopedia of Aerial Science, Dealing with the Latest Designs and Types of Airships, Construction, Materials, Equipment, Control, Etc. Containing More Than 200 Illustrations and Charts. Price 50 Cents.

FULL SET, 10 VOLUMES, $3.60.

Digitized by Google

The new Heinrich 1912 type mono-biplane, made by Heinrich Bros., Baldwin, N. Y., is presented herewith for the first time. A distinctive feature is the provision for adding a second pair of wings at pleasure, convertng the machine into a biplane, although the illustration shows it as a monoplane purely and simply.

Particular attention has been paid to the design in an effort to reduce head resistance so far as possible. The fuselage is of the box girder type, 22 feet long, running from a blunt point at the front to a sharp point at the rear. Its four ash members are joined at the centre by a sliding fit into square steel tubes one foot long so that the assembly may be taken in half for shipment. The four main members are 1.25 inches square at the front, tapering down to .75 inch at the rear, where they join a sternpost of ash two feet by two inches by .75 inch, to which the rudder is fastened.

The fuselage is 26 inches deep and 28 inches wide at the front, tapering down to one foot deep and one inch wide at the sternpost. It is strengthened by stanchions every 2.5 feet, except at the motor, where these are located two feet apart. All the stanchions aft of the pilot's seat are one inch square, while those around the motor are one by two inches. The whole is further strengthened by No. 33 galvanized steel wire, which is fastened to U bolts of .1875-inch cold rolled steel.

The seat is slightly forward of the trailing edge of the wings, and forward of this point the fuselage is entirely covered with aluminum, with the exception of three windows of celluloid, one in the bottom, two feet wide and extending entirely across the machine, and one on either side one foot by 16 inches. This gives the aviator a good view of the ground at all times, and also allows him to inspect the landing chassis while in flight.

A steel tube, two inches in diameter, runs across the fuselage in front into which the main spars of the wings fit. A box of laminated spruce and ash extends across in front of the seat, into which the warping spar is fitted. This also serves as a dashboard carrying the tachometer, watch and engine controls. The fuselage also is covered with fabric.

The wings are built up of four spars, the two main members of ash being 2.5 by 1.25 inches, channeled out for light weight. The other two are located, one at the leading edge and the other about one foot from the trailing edge. The former is of spruce, one by 1.5 inches, and the latter of ash, one inch square. Ribs are spaced 10 inches apart, and are of I beam section, the middle members being of ash and the others of white wood. The wings are held up by two steel wires in front, two to each wing, capable of withstanding 1500 pounds each. Two flexible steel wires in the rear, capable of withstanding 2000 pounds each, run

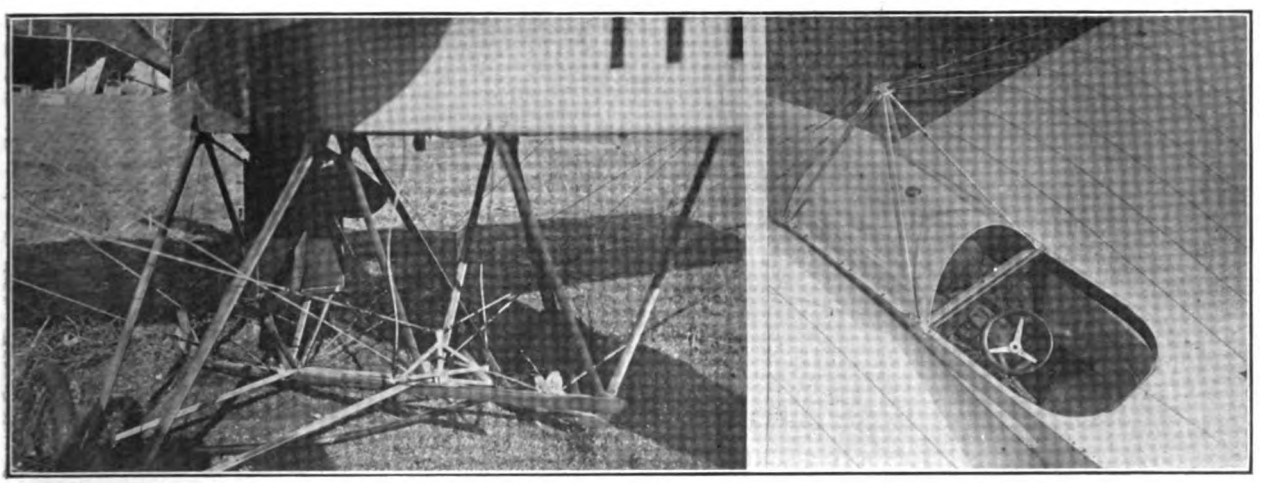
Heinrich 1912 Type Mono-Biplane, for Which It Is Claimed That It Is Converted Easily Into a Biplane by Adding a Second Pair of Wings.

Digitized by Google

through two tubes on the truss to allow warping. The under fastenings are five in number, two to the front main spar designed to sustain 2300 pounds each, two for warping and a fifth fastened to the small spar one foot from the trailing edge and running over a separate pulley.

The tail is of the flat non-lifting type. It is swallow tail in shape, and the rudder, two by 2.5 feet, swings between the two ends, which are hinged to the main portion and form the elevators. The whole assembly is so constructed that it is a matter of only a few minutes' work to remove for shipment. When on the ground it is supported by a light laminated skid.

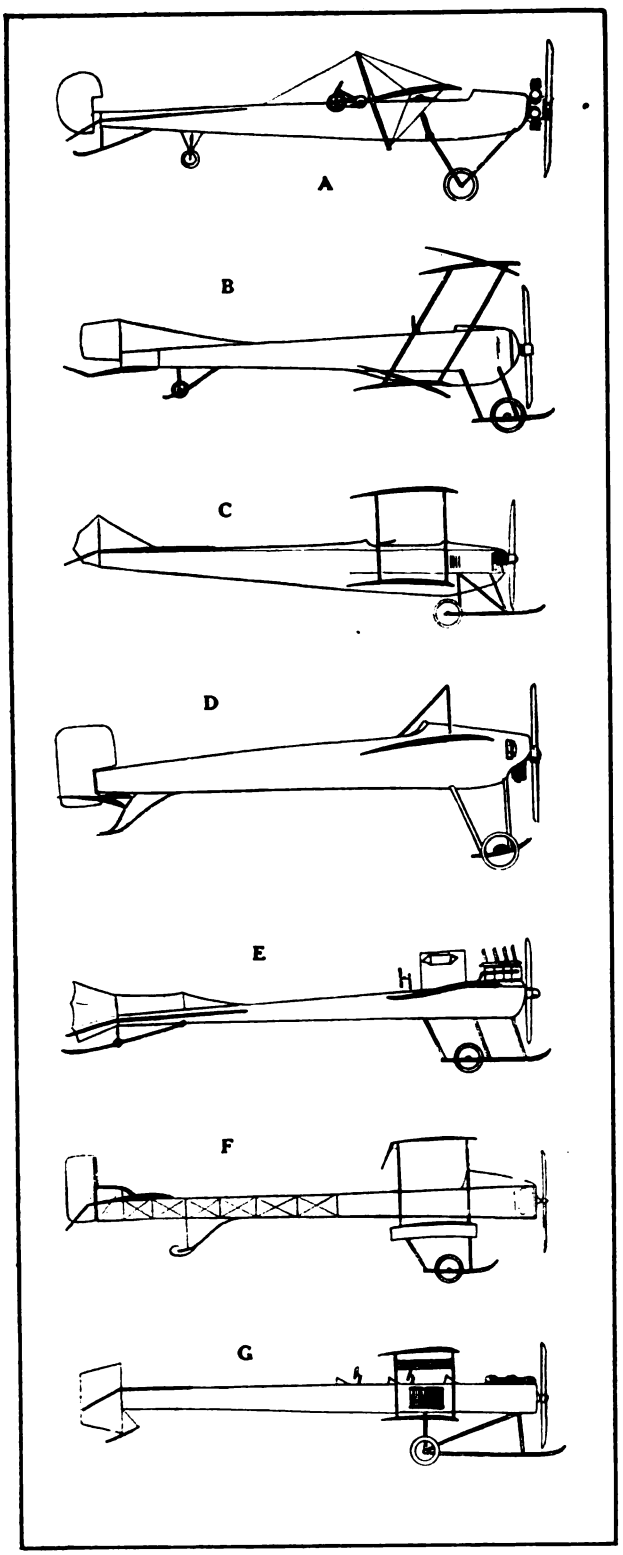
The chassis is of the wheel and skid type. One long central skid of laminated spruce and ash, turned up well at the end, is designed to serve three purposes; to protect the propeller in case of a poor landing and the rest of the chassis is damaged, to keep the machine from tipping headforemost in landing, and to form a substantial anchor for the wing wires and warping arm. Two small skids, one on either side of the large member, are braced out with oval tubing. To these are fastened the rubber shock absorbing springs through which the axle runs, with a wheel at either end. The small wheels and skids take all the shock of landing.



The motor and gasoline tank are so located as to eliminate any possibility of danger from fire. The tank is separated from the motor by an aluminum partition, and the space occupied by it is provided with drains, so that any leakage will immediately drain out. The control consists of the Heinrich one wheel type, by which longitudinal movement works the elevator; lateral, the warping wires, and turning, the steering mechanism.

The monoplane wings have a surface of 180 square feet for the high speed type and 210 for the passenger. The biplane wings have 300 square feet of surface on the high speed machine and 420 on the passenger. Other general dimensions are: High speed—length, 24 feet six inches; spread, 29 feet four inches; chord, six feet six inches; camber of wings, two inches; angle of incidence, six degrees; dihedral angle, 3.5 degrees. Passenger type—length, 25 feet; spread, 33 feet; chord, seven feet; camber, 3.5 inches; angle of incidence, 7.5 degrees; dihedral angle, 3.5 degrees.

Continuing the discussion of 1912 models shown at the recent Paris Salon, it will prove of interest to illustrate and describe briefly some of the more essential features of the machines on display. As already has been noted, the constructional details were worked out much more carefully than ever before, and as a whole the exhibition was one of decided progress in the new science. No attempt has been made herein to present all of the distinctive designs, space permitting of little more than a resume of the show with a few suggestions as to the chief characteristics of the various makes.



A machine that presents a number of original ideas is the De Marcay-Moonen monoplane, in which the wings are pivoted at their inner ends not only to permit of folding back along the fuselage, but to allow the angle of incidence and the setting of the wings to be altered to suit particular flying conditions. The pivoted pillars are relieved of a greater portion of the lifting strain, this being taken by triangular guys in the usual manner. The leading edges of the wings are connected by a stout cable, which passes over a pulley block in the forward end of the fuselage, while the trailing edges are similarly connected, but in this case the cable is extended to pass over a drum, by which the movement of the wings is controlled. The folding is accomplished by a hand wheel at the side of the fuselage, and the same action also is used for control instead of warping. This wheel is connected to the middle bevel pinion of a small differential gear, which causes one wing to be pushed forward and the other to be pulled back. The landing chassis also is somewhat original, in that two running wheels are carried on a single triangulated angle, which is supported at either end by a pair of struts. The upper ends of these are attached to a slide bar inside the fuselage in such a manner that they are free to work up and down against the action of a set of rubber shock absorbers. At the extreme front is a skid to protect the propeller.

The Goupy biplane is recognized as one of the first to employ the staggered main planes, as well as the monoplane type of fuselage. Each of the main planes is fitted at either end with interconnected

Constructional Details on Heinrich Machine: At Left, Landing Chassis and Special Skid; at Right, Pilot's Cockpit and Warping Wires.

Digitized by Google

New Machines at Paris Salon: A, De Marcay-Moonen Monoplane; B, Goupy Biplane; C, Clement-Bayard Military Biplane; D, Borel Monoplane; E, Aviatic Monoplane; F Sloan Bi-Curve; G, Astra Biplane.

ailerons, which formerly were worked in conjunction with similar ailerons at the tail, although the latter have been abandoned in the latest design. The landing chassis is of the so-called Farman type, comprising a pair of wheels connected by a long axle, while the rear skid arrangement is somewhat novel. Here a small pneumatic tired wheel is mounted on a cranked axle, which is supported in bearings by wooden skid struts. At each end of the axle is a small cam arrangement, which when the wheel meets the ground causes the skid struts to be forced apart, thus giving the wheel a certain spring action. If the latter receive a hard blow it is forced upward above the skid, and is then held by niches cut in the cams, under which circumstances it is completely out of action and the running is done on the skid alone.

The Clement-Bayard military biplane practically is the monoplane of the same make, with the addition of another pair of main planes. The construction is of metal, the fuselage being of aluminum. The landing chassis is of steel, although the skids are of wood. The non-lifting tail plane is set neutrally, and is cambered as to both its upper and under surfaces. The elevator flats are of the bat wing type. In design and construction, the Clement-Bayard may be said to have developed a new idea in biplane manufacture.

The Borel, formerly the Morane-Borel, retains all its original characteristics, chief among which is the setting of the wings with practically no dihedral angle. A particular feature is the tail construction, which is of the Bleriot lifting type, and is controlled by a rear flap formed to operate with the pivoted wing tips. Another feature is the unusual size of the rudder.

A German monoplane, which secured a number of prizes during 1911, is the Aviatic, which resembles the Antoinette in many respects. The landing chassis is quite different, however, being more like the old Hanroit in general arrangement. The fuselage practically is triangular in section. The tail is non-lifting, and is protected by a skid furnished with a small trailing wheel. The main supporting surfaces follow the Etrich design, having a pronounced upward turn at the trailing edge.

The Sloan bi-curve follows present day biplane practise, and gains its name from the fact that the upper deck is curved so as to have both a negative and positive dihedral angle, while the lower arc is undulated so as to resemble the end view of a bird's wing. Trailing ailerons are fitted to the extension of the upper plane. The tail is of the slightly lifting type, with an elevator flap at each side of the large rudder. Underneath is the double skid furnished with a suspension composed of a bent strip of steel.

The long covered fuselage of the Astra biplane is triangular in shape, and the entire machine resembles the Avro, of English design. Seats are provided for the pilot and two passengers. The fixed tail plane is triangular is section and non-lifting, with two elevator flaps on either side of the rudder, the latter being somewhat large.

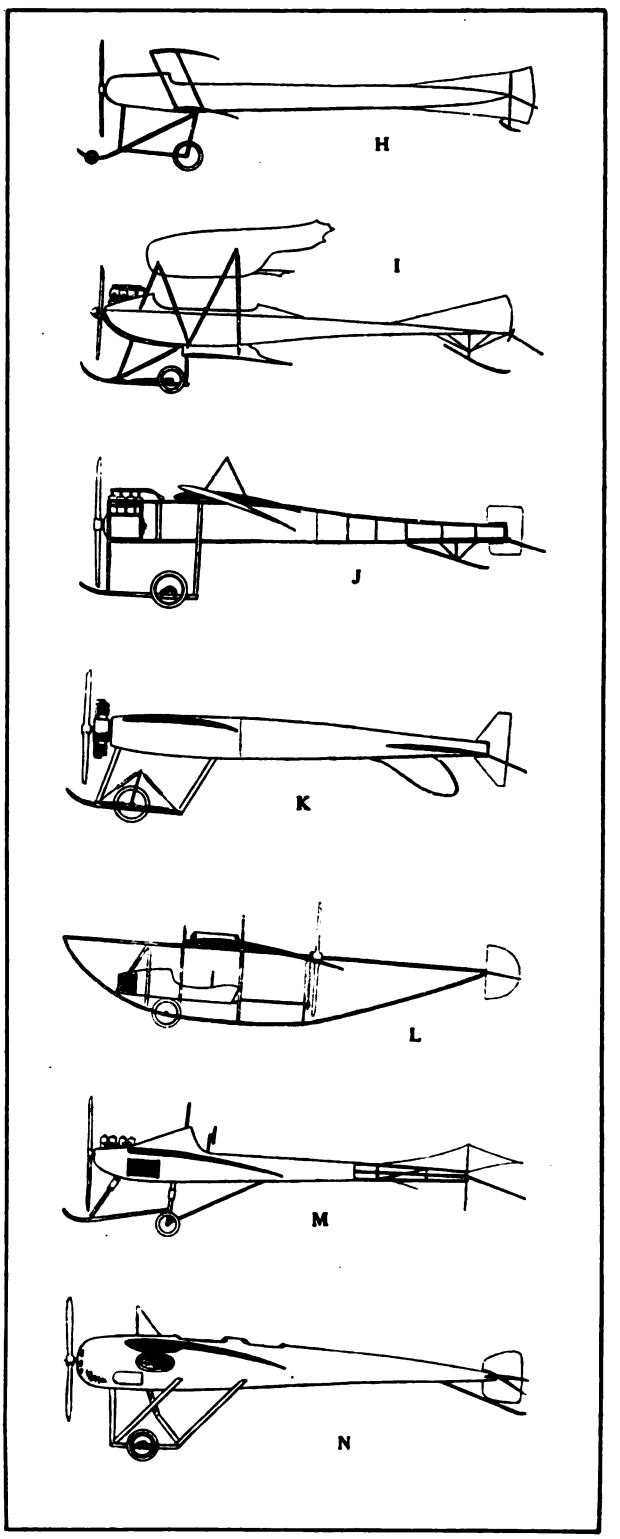
A distinctly new design is presented in the Albatross biplane of German manufacture, as may be gathered from the accompanying illustration. Lateral control is by warping the turned back tips of the main planes. The fuselage is entirely covered, and carries a non-lifting fixed tail plane back of which is an un-

Digitized by Google

balanced elevator flap and above this is a large triangular balanced rudder.

Another biplane in which the main planes are staggered is the Zodiac. Lateral control is by a pair of flaps in the rear edge of the lower deck. The tail is of the non-lifting type, and both the centre of gravity and line of thrust are placed fairly high. The landing chassis is more or less of the Antoinette pattern, the running wheels being supported by a central steel pillar, attached to fuselage by a universal joint.

The monoplane produced as the Sotinel-Guerin-Corneloup has the wings arranged in an unusual position and with a dihedral angle, but they are pivoted centrally, so as to swing more or less freely against the action of shock absorbers in relation to the fuselage. In doing so they operate movable wing tips, the function of which is to restore lateral stability. In flight, of course, it is the fuselage which swings relatively to the wings, and the tips are so arranged that if the fuselage be swung toward the right, the right wing tip has its angle of incidence increased, while that of the left is decreased. This is a new machine and its trials have not been very exhaustive as yet.



In the Kauffman, which is manufactured by what is claimed to be the youngest successful constructor in the world, the wings imitate in shape those of a bird, although they are not sloped backward to a noticeable degree. Special claims are made for their strength, the principal point being the direct staying of every rib. The landing chassis is quite original, comprising a pair of disc wheels fitted to a common axle, which is not rigidly fixed to anything, but is braced in all directions to the framework of the skids with with rubber shock absorbers.

Another decidedly novel creation is the Tubavion, which is described as a monoplane, although it does not greatly resemble the usual construction at first glance. The machine is of metal throughout. The propeller is directly behind the main plane, being carried directly on the long steel tubing which forms the backbone of the fuselage. Two tensional members perform the office of skids. The centre of gravity is very low indeed. The wings are of aluminum sheeting with ribs of the same material threaded upon a pair of steel bars.

The Berthaud W monoplane is a decidedly graceful machine, the construction being principally of steel tubing. The fuselage is diamond shaped in section. The empennage is a modified Antoinette type, as is also the chassis.

The Morane-Saulnier military monoplane is of metal construction, the fuselage being of steel. The revolving Gnome engine is entirely enclosed within the forward end of the fuselage, a series of holes being provided for cooling and exhaust purposes. Mica windows appear on either side, presumably to permit of taking observations. The landing chassis appears to possess great strength, and is composed largely of elliptical section steel tubing.

New speed records were made so often during January that it is difficult to determine just who holds the honor at the present writing. The year 1911 closed with all marks up to 100 kilometers held by the late Edouard Nieuport, the 150-kilometer record by Charles T. Weyman, and that for 200 kilometers by M. E. Helen, all with Nieuport monoplanes. The

Additional Designs Revealed at Salon: H, Zodiac Biplane; I, Albatross Biplane; J, Sotinel-Guerin-Corneloup Monoplane; K, Kauffman Monoplane; L, Tubavion Monoplane; M, Berthaud W Monoplane; N, Morane-Saulnier Monoplane.

Digitized by Google

time for 100 kilometers was 40:27.4, for 150, 1:11:36.2, and for 200, 2:13:35.4.

At Pau, France, Jan. 19, Jules Vendrines in a Deperdussin monoplane covered 100 kilometers in 41:56.8, and 150 in 1:02:43.8. Jan. 24, Maurice Tabuteau covered 200 kilometers in 1:54:21, 250 in 2:22:57 and 300 in 2:51:00. At Douzy, France, Jan. 26, Leon Bathiat flew 100 kilometers in 41:29..

Passenger carrying records also have undergone a decided revision since Jan. 1. Dr. G. L. Ulich flew a Harlan monoplane with three passengers at Berlin, Germany, Jan. 31, in 1:35:00, exceeding the former record of 45:46, made by Adolph Warchalowski at Weiner Neustadt, Austria, Oct. 1, 1911.

Henri Molla of France drove a biplane with five passengers, Jan. 26, at Douzy, France, remaining aloft for 46:27.4. Guillaume Busson of France carried four passengers for 17:28.2 last March.

George W. Beatty, carrying three passengers, a total load of 537, flew a Wright biplane at Nassau Boulevard, Long Island, Feb. 3, covering 16 miles. This is a new American record. The world's record for a three-passenger flight with aviator is held by Guillaume Busson of France at 31 miles.

Prevost of France carried two passengers to an altitude of 7150 feet at Rheims, France, Jan. 23. The previous record was made by Lieut. Henrich Bier at Weiner Neustadt, Austria, Sept. 29, at 3916 feet.

Jan. 23, Dr. G. L. Ulich of Germany carried two passengers in his Harlan monoplane for 2:02:45, exceeding the former record held by Lieut. Henrich Bier in an Etrich monoplane at 1:05:18.3.

Brig.-Gen. James Allen, chief of the signal corps, United States army, has $65,000 left from the appropriation of $125,000 made last year for the purchase of aeroplanes, and has decided to secure eight and possibly nine new machines before June 30. The army now possesses seven biplanes, located as follows: One Wright at Manila; one Wright at San Antonio, Tex.; one Wright, one Burgess-Wright and two Curtiss at Augusta, Ga., and one Curtiss ready for delivery at Hammondsport, N. Y.

At the annual dinner of the Aero Club of America, two new trophies were announced, one donated by Clarence H. Mackay for competition by aviators of the United States army, and one by Henry Payne Whitney for the navy. The details of the competitions have not been arranged as yet. The club awarded the Collier prize for the year's greatest achievement in American aviation to Glenn H. Curtiss for the development of the hydro-aeroplane. A medal was awarded to Calbraith P. Rodgers for his successful transcontinental flight.

A complete copy of the regulations adopted by the Federation Aeronautique Internationale for the government of the 1912 race for the international cup has been received by the Aero Club of America, and it is learned that the course must conform for the the following:

1—The track must have a width not less than 100 meters on its entire extent and a perimeter of not less than 1500 meters.

2—The interior surface bound by the course as expressed in square meters must equal at least the product obtained by multiplying by 25 the perimeter of the track as expressed in meters.

3—There must be between the outer edge of the track and the space reserved for spectators a strip of neutral territory 30 meters in width. On this strip aeroplanes are not allowed to be moved unless when pushed by hand.

4—The surface of the track must be everywhere of such a nature that an automobile can be run over it.

Harold F. McCormick, president of the Aero Club of Illinois, which is trying to secure the meet for Chicago, has asked for an extension of time in which to secure a plot of ground conforming to these regulations. If he is successful, it is probable that the event will be held in that city during the last week in September.

It is announced that the cash awards accompanying the cup have all been made, and that it will be necessary for the winning city to offer a cash prize this year. Entries are expected now from Great Britain, France, Germany, Italy, Russia, Austria and Spain.

E. Percy Noel, secretary of the Aero Club of St. Louis, announces that a movement is under way looking toward an aerial tour of 600 miles, over the States of Illinois, Missouri and Indiana some time in June. The route will lie from St. Louis to Indianapolis, thence to Chicago and back to St. Louis. The tentative course calls for six daily stages with night stops at Champaign, Ill.; Indianapolis, Ind.; Logansport, Ind.; Chicago, Ill.; Bloomington, Ill., and St. Louis, Mo. Suitable prizes will be awarded.

British military authorities have been giving tests to a new "silent" aeroplane at Laffan's Plain, England. The machine is equipped with an eight-cylinder Wolseley engine, and it is said that when it was running it could not be heard at a distance of 50 yards. Another feature is its ability to start without the aid of assistants, the aviator, de Havilland, jumping into the seat and switching on the ignition. The machine arose from the ground within 10 seconds under this demonstration.

The third annual aviation meet at Los Angeles, Cal., during the latter part of January appears to have been no more of a success than previous events of this character. One fatality was recorded, that of Rutherford Page, who had secured his pilot's license only the day before the accident. He is said to have lost control of his biplane while attempting a turn at a height of 80 feet and jumped from the machine.

The programme was decidedly varied, including duration, altitude and speed events, with such added attractions as aerial man hunts, shooting at toy balloons, races between aeroplanes, motorcycles, automobiles, horse and man, etc. One feature was scheduled as an aerial wedding, in which the contracting parties were seated in a biplane while the minister performed the ceremony, to be followed by a short trip aloft, as individual passengers with an experienced aviator. It cannot be said that the meet added much to the sum total of aerial scientific knowledge.

SELF-STARTERS FOR GASOLINE ENGINES.*

(By J. W. Fitzgerald.)

WITH the invention of the gas engine arose a very serious difficulty, that of starting it, and almost simultaneously with the advent of the first engines we find records of inventors and engineers at work on this problem. There was so much room, however, for improvements on the motors in earlier days, that most of the efforts were directed toward this end, and although many starting devices were made, they proved of little practical value. During the past 10 years the great improvement in gas engines and ignition devices has taken care of the question of easy starting to a great extent. Easily started motors, however, will not answer the requirements of the present day. The demand is for engines equipped with a device that will make them self-starting, and it is safe to say those not equipped with a device of this nature will be in slight demand.

The earlier starting devices are of little interest, as they were designed for engines long out of date. So we will take up the description of only such starting devices as are suitable for present day motors. An engine is started by putting a power fuel in the cylinders and igniting it. This can be done in two ways: By rotating the engine and causing it to supply and ignite a charge in the cylinders, or by igniting a charge in the cylinders independently of an engine movement. This at once puts starting devices in two classes; viz., mechanical and gas. A better term than gas starters is ignition starters, as all devices of this class depend on the ignition of the gas for their successful performance.

Mechanical Starters.

Under the heading of mechanical starters are included all devices that rotate the engine and cause it to perform its regular function of charging and igniting an explosive mixture in its cylinders. Motion is imparted to the engine in two ways: By the use of independent motors or by making a motor out of the gas engine. The chief requirement of this class of starters is capacity; that is, ability to rotate the motor a sufficient number of turns and at such speed as will force it to pick up its own gas and run, regardless of weather conditions and without the necessity of priming the engine. Independent motor devices consist of spring, air and electric motors.

Spring Motors.

Spring motors are being used on automobile and motor boat engines. Energy is supplied by the engine while in motion and stored in the springs. The motor is geared to the engine shaft and automatically thrown out of gear when the springs are fully wound. Means are provided for throwing them into gear and unlocking the springs when they are to be used. On account of weight and space requirements of modern engines, these motors are limited as to power and capacity, and therefore do not meet the main requirements of this class of starters. The application of this device is, as a rule, somewhat difficult and adds considerable weight to the engine, and in most instances makes cranking more difficult in case of a failure. They do possess, however, the good feature of being able to rotate an engine that has stopped on centre.

Air Motors.

Air motors are of two classes, those that impart a continuous motion to the engine and those that impart an intermittent motion. The first class is the better, as the continuous motion has the same advantage over the intermittent as spinning the engine has over a single pull. A continuous-motion air motor must have no dead centre point in itself, and must be able to be thrown in and out of gear. It is ordinarily used for storing its own power, compressed air. The intermittent motion air motor has not the necessary qualifications to entitle it to serious consideration, as it is well understood that it is absolutely necessary at times to spin an engine in order to start it.

A very serious problem, and one difficult of practical solution, concerns all classes of independent air motors, and also all air starters that make use of the engine as an air motor, and that is, the producing and storing of compressed air. Air pressure is obtained either by means of a pump or by the storage of burned gases resulting from the explosion in the engine. All methods of furnishing air by means of air pumps have a distinct advantage, in that the air furnished is clean and can be used for other purposes than starting, chiefly filling the tires. When air compressors are used, they may either be geared permanently to the engine or arranged to be thrown in and out of gear at the will of the operator. In case they are geared permanently to the engine they must be provided with an automatic valve for releasing air when a predetermined pressure is reached.

On account of the continuous load under which the pump works when it is geared to the engine, arrangements must be made for properly cooling it, and it also must be so well built as not to become noisy. Many pumps have been designed to fill these requirements, but as yet there is none that will stand up under the work for any considerable length of time. In fact, they have given so much trouble in practise that the idea of the permanently geared pump has been given up. There are cases on record where permanently geared pumps have been made to do the work satisfactorily, but they have required the greatest skill and the best of material in their construction, and have proven very expensive to build. Air compressors that can be thrown out of gear by the operator when an indicated pressure is reached, are being used with fair success only. There is a great objection on the part of the operator to watching a gauge until the maximum pressure is reached and then throwing it in when the pressure is low.

There is a type of air compressor peculiarly adapted to the gas engine, comprising only a cylinder with a differential piston, the pressure in the engine working on the larger diameter while the smaller end of the piston compresses free air. It is much simpler than the ordinary air compressor, having no crank or connecting rods, and if properly made can be operated without noise. It has, however, the very serious ob-

*Extract from a paper read before the January meeting of the Society of Automobile Engineers.

Digitized by Google

jection of being directly dependent upon the engine pressure for the pressure that can be stored in the tank, and unfortunately maximum pressures can be obtained only when the gas engine is being worked under a full load.

A third device for obtaining pressure is a modified form of the ordinary check valve connected to the explosion chamber of one or more of the cylinders, which permits of a small portion of the exploded gases passing into the tank at each explosion. This device is open to the same objection as the differential pump as regards maximum pressures. Being directly dependent on the explosion pressures, it requires high explosion pressures for maximum tank pressures, and these are only obtainable, as in the case of the differential pump, when the engine is working under full power.

Conclusion as to Air Starters.

In conclusion, it would seem that most all classes of air starters require a great deal more mechanism than a good designer would care to attach to his engine, especially in view of the none-too-positive results. Some very good men are constantly at work on the problem of using air, and it is quite likely that a device very much simpler in every detail than any that has been built up to date will be brought out. There does not seem, however, any way to overcome the most serious trouble, viz., that of chilling the cylinder walls by the admission of the compressed air.

There is still left but one independent motor starter and that is the electric motor. Starters employing electricity as a power have been the last ones to enter the field, and unquestionably do go a long way toward answering all of the requirements of an ideal starting device. When properly made and kept in good condition they are capable of rotating the engine for a considerable period, in some cases as long as 20 or 30 minutes. Of course, no engine requires to be spun more than five or 10 seconds at the outside, if it is in running condition; but the enormous capacity of this device permits of innumerable starts without recharging the batteries. These devices further have a distinct advantage of being able to rotate an engine that has stopped on centre. To gain all of these advantages requires a great deal of complicated, heavy and expensive mechanism.

First, there must be a source of electrical supply; second, means for storing the supply, and, third, means for using the power to rotate the engine. The source of supply consists of a motor generator geared to the engine permanently. When the engine is running this motor generator is acting as a generator only, supplying electricity to the source of storage—the storage battery. On account of the varying speeds of the generator, due to the change in speed of the gas engine itself, it is necessary to have an electrical controlling mechanism for connecting and disconnecting the generator to the storage battery as the varying conditions may demand.

For instance, with the engine running at a low speed, the generator will not produce sufficient current to properly charge the battery and must be kept disconnected therefrom until it has attained a speed sufficient to generate a voltage that will overcome that of the battery. Many ingenious devices for controlling the charging and discharging of the batteries have been made, and, although they are necessarily instruments requiring very accurate adjustment and must be exceedingly sensitive, they seem to stand up under the exacting work to which they are subjected. If they are properly made and designed there is no reason why they should not perform their work without any serious trouble. The generator itself requires only good workmanship to last indefinitely.

Conclusion as to Electric Starters.

The combination of electric motor, controller, storage battery and the necessary gearing arrangement adds a great deal of weight to the engine equipment and all of the individual parts are expensive and complicated. But as long as everything is kept in running condition the device gives absolutely perfect satisfaction. An objection to this device would seem to be the difficulty of having repairs made in case of trouble. It is so complicated and so little known as yet that even a first class automobile man cannot make repairs on it. This could be eliminated to a great extent if it were possible to get the device generally adopted and establish a first class service arrangement.

Ignition Starters.

We are now down to the second class of starting devices, those that furnish an explosive mixture to the engine and put it in motion by exploding the mixture in the proper cylinders, performing the same function as the engine itself when running under its own gas. I call these devices "Ignition Starters," as they are all dependent on some part of the ignition system. Devices of this nature were among the very earliest used, some employing the same fuel for power as was used to run the engine, although the general tendency seemed to be to use a fuel that was more easily ignited. Today the successful devices are using but two fuels, gasoline and acetylene.

In starting an engine with an ignition starter all conditions are similar to those when starting the engine on the spark. "Starting on the spark" has become a popular term and means that the engine can be started by throwing on the switch, producing a spark and igniting the charge still left in the cylinder, thus starting the engine. In order to do this, it is necessary that the engine shall have stopped or be balanced in a normal position, which it will do if it is in good running condition, and that a good spark be produced when the switch is thrown on, and finally that there be an explosive mixture in the cylinders to be ignited. All engines will fulfill the first two conditions; it then becomes necessary for the starter to furnish the cylinders with an explosive mixture to be ignited.

Gasoline as Starting Medium.

The general procedure in devices using gasoline is to first form a gasoline vapor and then force it into the cylinders. All styles of carbureting devices have been used. The ones in general favor are in the form of a force feed carburetor. These devices consist of a pump for taking into their cylinders a definite amount of gasoline and air at each stroke, forming a fixed gasoline mixture which is then forced into the engine. A distributing or selecting device of some kind must be used in conjunction with the force feed carburetor. Distributors timed and operated by the engine similarly to those used with air starters give good service. They are usually constructed so as always to put two cylinders in communication with the gas supply when the engine is stopped in a normal position. The two cylinders thus put in communication with the source

Digitized by Google

of explosive mixture are the firing and the compressing cylinders; these two having both their inlet and exhaust valves closed. This condition is common to both four and six-cylinder engines. Very simple distributing and selecting devices have been invented, particularly those that do not necessitate mechanical connection with the engine. It is obvious that it is not essential that any timing arrangement be followed, provided an explosive mixture is put in the firing and compression cylinders. It does not matter which one is charged first, or whether we charge only these two or all of the cylinders, as far as obtaining the start is concerned. Starters that inject and ignite a mixture in all of the cylinders have a very decided advantage over a device that only produces an explosion in the firing and compression cylinders.

Conclusion as to Gasoline Ignition Starters.

The failure of gasoline ignition starters can be charged to the operator in most cases, because good judgment is required on his part as to how much mixture to force into the engine. Gasoline has a very small range of explosibility, approximately from nine to 14; that is, a mixture of air and gasoline with less than nine per cent. of gasoline cannot be exploded, nor a mixture richer in gasoline than 14 per cent. This ratio can be maintained easily by the carbureting device, but it is affected greatly by the condition of the engine itself. When the engine is cold it can be charged with a mixture from the force feed carburetor and fired with little difficulty, but when it is fairly warmed up care must be used with the amount of mixture put into it. If too much of the mixture is put into the cylinder when it is warm it floods it. In other words, it makes the mixture too rich in gasoline, so much so that it will not ignite. This is due to the fact that an engine that is warm has, of necessity, been running and still retains a certain amount of gasoline in some state in its cylinders. Just how much is in the engine has to be guessed at by the operator, and it is a question of his judgment how much more he shall add in order to get a firing mixture. The ordinary driver will not, as a rule, have the patience, or take the time to experiment on this point, and consequently is not able to get the best of results from starting devices using gasoline as a fluid. The efficiency of these starters has been increased by the use of ether mixed with the gasoline, and also other chemicals tending to make the mixture more highly explosive and increase its range of explosibility. But this was found objectionable on account of the necessity of providing the additional fluid. Contrary to the general idea, gasoline of high specific gravity does not give as good results as the lower grades, due to its tendency to flood a hot engine much more easily.

Two Classes of Acetylene Starters.

There are two classes of acetylene starters: The one that charges the cylinders with acetylene through the intake manifold and the regular valve mechanism of the engine at the time that the engine is stopped; and the other, which charges the cylinders of the engine in some manner at the time a start is desired to be made. In the first class the gas tank is connected with the intake manifold by means of a small tube, in which is interposed a valve mechanism for connecting the gas supply to the manifold. In one of the earliest devices of this kind the operation of the valve mechanism simultaneously short circuited the magneto, thus causing the gas to flow into the manifold at the time that the engine started to stop. It was found that this device wasted a great deal of gas, because the motor continued to run for 15 or 20 revolutions after the ignition system was disconnected, meanwhile taking in and exhausting the acetylene gas through the muffler. This device was later very much improved by a valve mechanism which opened and admitted gas to the cylinders during the last two or three revolutions only. This was accomplished by means of a valve which was operated by the suction through the intake, only when the speed of the engine was so low as to produce the proper lift of the valve.

First Class Not Satisfactory.

It must be said of this class of starters that they are certainly extremely simple, but they do not prove satisfactory in practice. Acetylene gas has a very wide range of explosibility, but it is necessary to get an approximately proper mixture of acetylene and air into the engine in order to furnish sufficient power to rotate it. The class of starters just described, known as suction starters, delivers a variable amount of gas, dependent upon the tank pressure. This amount can be varied to suit the fall of pressure in the tank by means of a regulating valve, but this requires considerable judgment and experimenting on the part of the operator.

Second Class of Ignition Starters.

The second class of ignition starters consists of those which charge all of the cylinders of the engine at the time a start is desired. This is accomplished by various kinds of valve mechanisms, which make a connection between the tank and each cylinder, generally through one of the priming cup openings or an opening tapped in the valve cap. They are subdivided into two classes, known as high-pressure and low-pressure systems.

Low-Pressure Systems.

With the low pressure systems some sort of a reducing valve is used to reduce the tank pressure of 260 pounds maximum down to a few ounces. In connection with the regulating valve it is then necessary to use some device in the form of a pump for forcing the gas into the cylinders. The pressure of three or four ounces is not sufficient to cause the gas to flow into the engine, as it will not overcome the resistance of the small tubing and the check valves used; and at times it must pass in against the engine compression. The basis of these starters is a reducing valve which is attached directly to the outlet of the tank and consists of a flexible diaphragm which is acted upon by the tank pressure and movement of which works the needle point valve which in turn controls the gas supply. This gas supply is then conducted by means of a small tube to the device for charging the cylinders.

High-Pressure Starters.

The other division of this class is known as high-pressure starters, because they depend upon the pressure of the gas in the tank being sufficient to carry it into the cylinders. No reducing valve is used with these starters, but the amount of gas admitted is controlled by a regulating valve. The variation in tank pressure will vary the amount of gas admitted to the cylinders, but this is taken care of by the operator, as he is able to control the amount of gas admitted by the speed with which he operates the charging mechanism, or by the number of times that he operates it.

All pressure starters have advantages over suction

Overland

ALL of the standard popular priced cars are represented in this issue. This gives you a splendid opportunity to make a few comparisons of motor car values and to verify our claims, that in an Overland car you get more real car for less money than in any other machine on the market.

¶ For example—take our Model 61. This car has a big 45 horsepower motor. Is a five-passenger touring car. The wheel base is one hundred and fifteen inches. The axles are fitted with the finest Timken bearings. The transmission is fitted with F & S annular bearings. The pressed steel frame has a double drop. The handsome body is finished in rich Brewster green trimmed with heavy nickel plate. The lamps are dead black and nickel plated. The magneto is a Bosch. This car is priced at $1500. Have you ever seen its equal for less than $2000?

¶ Our interesting factory book explains why the greatest organization in the business can make these fine cars to sell at such remarkably low prices. Write for a copy. Please ask for copy K42.

The Willys-Overland Company, Toledo, Ohio.

Model 61—$1500

Wheel base, 115 inches; body, 5-passenger fore-door touring; motor 4 3-8 x 4 1-2; horsepower, 45· Bosch magneto; tires, 34x4 inch, Q. D.

Digitized by Google

starters. First, they are able to put the gas in the cylinders at the moment it is desired to use the starter and to put it in all of the cylinders and obtain results from all of them; and, second, they are able to repeat the operation as many times as may be desired; that is, if the engine should not start with the first operation which causes four explosions in the cylinders, the same operation can be repeated indefinitely.

Advantages of Ignition Starters.

The advantages of ignition starters are in general, extreme simplicity, lightness and ease of application and operation. Their main and distinguishing advantage is their ability to warm the walls of the cylinders when the explosion takes place, so that the incoming mixture from the carburetor is warmed and kept in a gaseous state by the heat imparted to the cylinder walls from the explosion of the acetylene mixture. With a very cold engine it is possible to spin it rapidly for 50 to 60 turns without getting any results, because the engine is too cold to hold the gasoline vapor in a gaseous state after it comes from the carburetor. The same motor started by means of an acetylene starter, will often fire its charge on the first few turns due to the warming effect of the starter.

Ed. Note—It has seemed to the Automobile Journal that the subject discussed by Mr. Fitzgerald is particularly timely, although it will be admitted there is opportunity for a difference of opinion. Other articles along similar lines are invited from those who may have reached other conclusions.

KNIGHT ON LECTURING TOUR.

Charles Y. Knight, the inventor of the sleeve valve motor bearing his name, is touring the country lecturing upon his invention. Upon the close of the New York shows he visited Cleveland, Detroit, Philadelphia, Chicago, Minneapolis, Denver and St. Louis, and returned to Chicago in time to witness the show in that city. Additional lectures will be given later.

FLANDERS BECOMES MOTOR SLEIGH.

Many automobilists have taken advantage of the continued cold weather to indulge in spins upon frozen rivers and lakes while others have converted their motor cars into motor sleighs and enjoyed long rides over the roads. Many ingenious methods are noted but the most novel is the design constructed by Frank B. Willis of Indianapolis, Ind., which is presented in an accompanying illustration.

He began his experiments with his 20 horsepower Flanders, made by the Studebaker Corporation, Detroit, by equipping the front axle with runners, and with this arrangement found that he had so much reserve speed and power that he concluded to enlarge the carrying capacity of the car. He obtained an extra Flanders body of the suburban type with front axle attached and joined it to the back of the first automobile. The auxiliary vehicle was fitted with runners at the rear and these were controlled by means of a steering device operated by the usual wheel. The arrangement increased the carrying capacity by five persons although the motor sled has carried as many as 20.

Novel Form of Motor Sleigh Designed by Frank B. Willis and Fitted to Flanders "20" Car—The Rear Vehicle Is Equipped with Runners and Controlled by a Steering Device Permitting of High Speed on Curves.

Considerable speed is developed, it being stated that 40 miles an hour is obtained easily. So successful was the device that Mr. Willis took a party of friends to the Chicago show, where the design attracted considerable attention. He calls the sled "The Skeeter," and owing to the fact that the rear vehicle can be steered makes high speed around the corners of city streets.

BOSCH LED AT AEROPLANE SHOW.

At the recent Paris aerial salon 48 of the 51 machines displayed were fitted with Bosch magnetos, made by the Bosch Magneto Company. One Nilmelior and two Nieuports were the equipment of the other designs. Naturally the company is very much gratified with the showing made by its product.

While the annual automobile show in Brussels, Belgium, fails to attract the attention that has surrounded the displays at the Paris Salon and the Olympia show in London, the exhibition held last month was of more than usual interest. Very few new pleasure cars were seen, having in mind the recent show at Olympia, and most of these were of Continental make, although America was represented by the Ford. Rich body designs, for which the Continent, and particularly Belgium, is so famed, were very much in evidence, and some of the coachwork on display appeared to be the result of a strenuous attempt to bring out something distinctly new. Americans would call these extremely freakish. However, it must not be understood that the general impression was anything other than that of a determined effort to produce artistic effects.

The display was a combination of pleasure and commercial automobiles, and aeroplanes, the latter being well represented. Perhaps the most interest attaches to the display of industrial transports, especially as Belgium has been turning its attention toward this branch of the industry with increasing vigor during the past two years. A number of new Belgian firms have been organized for the purpose of manufacturing motor trucks, and some of these made display for the first time. Among these may be mentioned Albert Bory of Brussels, Robinson & Co. of Antwerp, the Auto-Mixte Company of Liege, and the Preudhomme-Prion Works of Huy.

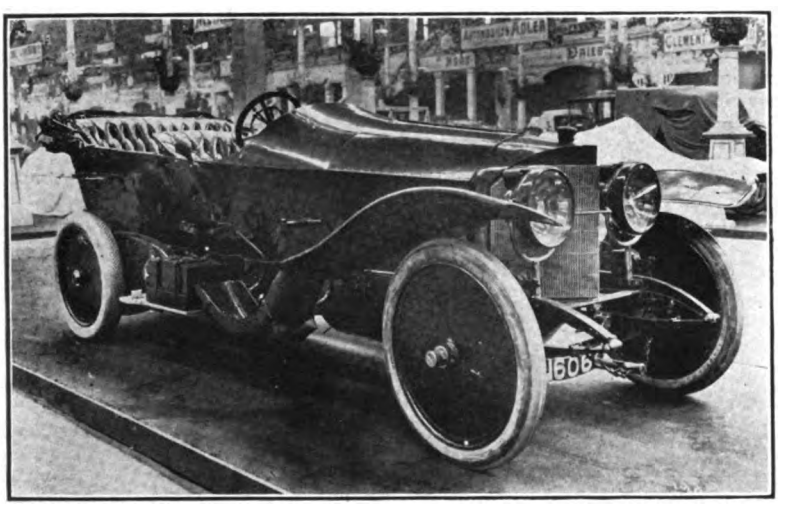
It may be pointed out in this connection that Belgium seems to offer a splendid market for all types of commercial motor vehicles. Since the international road congress of 1909, the government has been engaged in a systematic campaign for the improvement of highways, and in many localities business houses have adopted motor transports to the exclusion of horse drawn equipment. Still others are said to be on the verge of following their example. The question appears to be one simply of supplying the vehicles which will meet the requirements best.

★

Thirty-nine cars were entered for the annual winter trials of the Royal Automobile Club of Sweden, Feb. 2-4. While the route was the same as that of others years, it covered twice the distance, being from

General View of the Main Floor During the Progress of the Recent Automobile and Aeroplane Exhibit at Brussels, Belgium.

Digitized by Google



Stockholm to Gothenburg and return, about 600 miles. There were two classes, one without limitation as to price or power and the other limited to cars selling for 6000 krona ($1608) or less.

In the first class, the award is the Winter cup, won last year by the German car, Minerva. Second place went to the American, Cadillac. This year there were 27 entries, of which the American representatives were a 32 horsepower Cadillac and a 36 horsepower Maxwell. The others were divided as to countries as follows: Germany, 13; England, three; France, three; Belgium, three, Sweden, two, and Italy, one.

In the second class, the prize is the Gothenburg cup, won last year by the German car, Piccolo. An American, Ford, finished in second place. This year there were 12 entries, six representing America, and all of 20 horsepower. These were: Four Fords, a Buick and an Overland. The other countries represented were: Germany, two; England, two; France and Belgium, one each.

★

The holding of the 1912 Grand Prix race in France is now an assured fact. Forty-eight cars have been entered for this event, and 26 for the L'Auto cup race, which will be held at the same time, over the same course, but for cars of smaller horsepower, and for a shorter distance.

Latest Type of Mercedes Car with Pointed Radiator and Disc Wheels.

Those makes which have entered for the longer event are as follows: Four Lorraine-Dietrich, two Peugeot, two Lion-Peugeot, four Darracq, four Gregoire, four Sunbeam, two Singer, one Mathis, three Vauxhall, three Alcyon, one Ford, three Vinot et Deguingand, three Sizaire et Naulin, three Arrol-Johnston, three Calthorpe, two Th. Schneider, one Excelsior, one Koechlin and two Cote.

For the smaller car event the following makes are entered: Two Lion-Peugeot, one Darracq, four Sunbeam, two Singer, three Alcyon, three Vinot et Deguingand, three Sizaire et Naudin, three Calthorpe, two Th. Schneider, one Koechlin and two Cote.

★

The fact that American automobile manufacturers are able to sell their products on the Continent at a price much below that at which local makers feel called upon to ask, has occasioned some little discussion among the heads of the industry in France. M. Clement has been commissioned by these manufacturers to visit this country in an effort to determine the reason for this condition.

★

The postal authorities of Coventry, England, have decided to replace the horse drawn vehicle utilized in an exceptionally severe rural service covering a distance of 40 miles, by a motorcycle and side car attachment, the latter comprising a hamper for carrying letters and parcels.

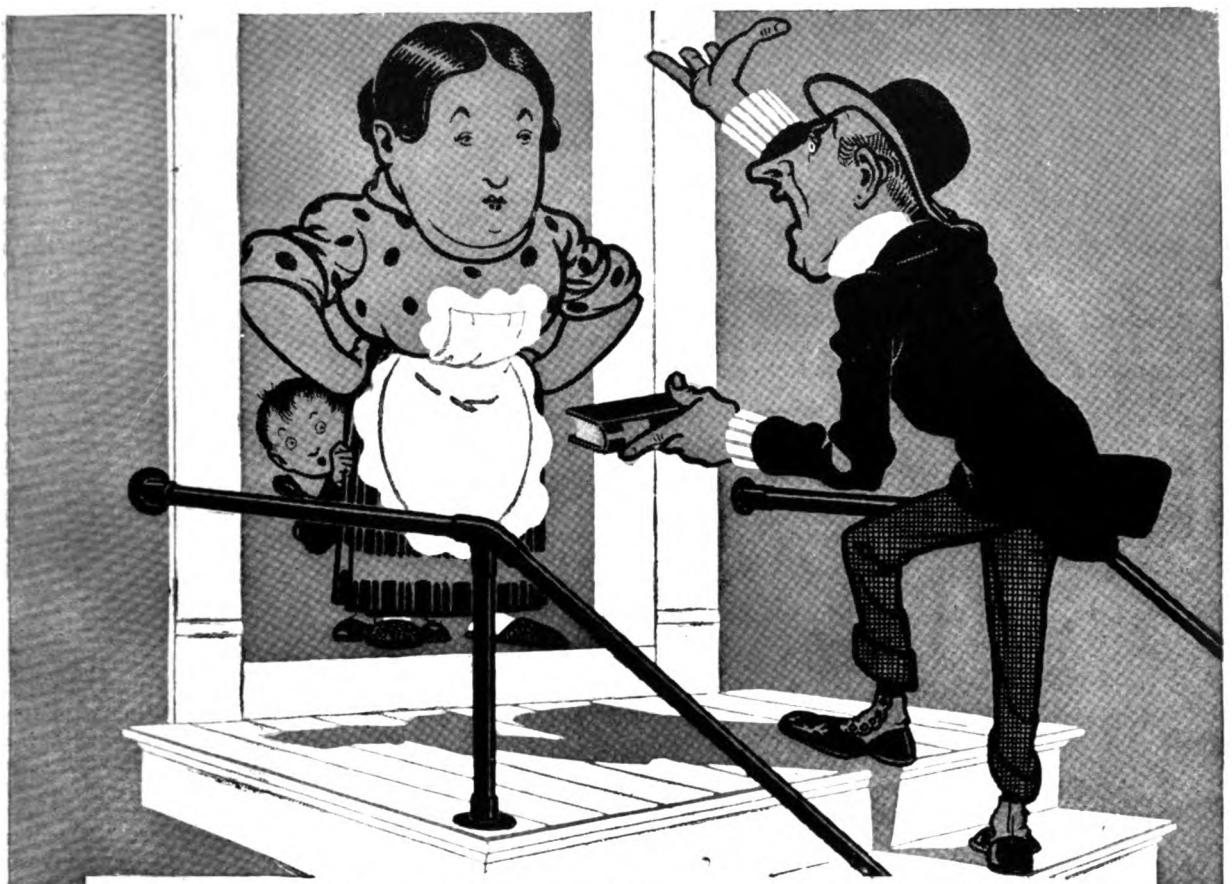
★

Although from the standpoint of features which had not been exhibited elsewhere, the annual Scottish automobile show in Glasgow in January, presented nothing new, it was of interest principally because it gave the people of Scotland their only opportunity to inspect the various 1912 offerings in an organized exhibit. It should be remarked that the holding of the display in Glasgow was a new departure, inasmuch as the Scottish Automobile Club, under whose auspices the event was arranged, always has staged the exhibits in Waverley Market, Edinburgh, in the past.

America was well represented, there being six makes shown by Scottish agencies. Of course, no British display would be complete without the White, which has gained an enviable reputation in Great Britain. The Ford also is an old name at Scottish shows. The Mitchell was displayed by five models, the Flanders by three and the E-M-F by two. The Bedford appears to be the English name for the Buick, and is produced in the Bedford works of the General Motors Company.

★

The Austrian military budget for 1912 includes an item for supplying the entire Austrian army with automobiles as a means of transport. Inasmuch as there are 12 army corps of the Austrian-Hungary forces, it is easy to be seen that this item is of no small moment. Tests during the past year have convinced the officials that the most practical vehicle for the service required, taking into consideration the condition of the roads and bridges over which they must travel, is that of the two tons capacity. It is expected that the forthcoming bids will call for trucks of that size.



★

A business man in India has informed the American consulate that he is organizing a company for the operation of a freight and passenger service by means of steam wagons. Each wagon must not exceed three tons in capacity; weight 2.5 tons; width of tires, seven inches; length of wagon, 16 feet, out of which 4.5 feet are reserved for engine and driver's seat; width of wagon, five feet; height from ground, 2.25 feet; speed, 12 to 15 miles an hour. About 12 wagons with trailers are required.

We Don't Know How to Get More Than Our Goods are Worth

We don't *over-pay* when we buy and we don't *over-charge* when we sell.

We have always credited the *other man* with just as much common sense and just as much commercial judgment as we possess.

We had a *business* training before we had a *speedometer* training and it taught us that the way to make a *lot of money* is to make a *lot of goods* and a *very little* on each sale.

So we aimed at *output* from the very outset.

We built a *factory* that would give us output.

We believed that the automobile business would *grow* and that there was no *risk* in planning to grow with it.

We installed the *finest* machinery that money could buy, and when we could not find it good enough we had it made special.

We calculated that the day would come when speedometers would *have* to be *sold* at a *normal margin*. and when we found the exorbitant profits that were being charged, we figured that the time to start figuring down to bedrock was the *first day* that we went out for orders.

That's why *four cars* out of five carry *Stewart Speedometers*. Eighty per cent of car owners are so level-headed that they make sure they are getting the utmost for their money.

If the *Stewart* were not more accurate—were not built *stronger*, were not more *reliable*—somebody else would be selling *four* speedometers to our one.

There's no *test* like the test of *sales*.

Magnetic principle—jewel bearings—wearing parts hardened and polished—open dial—large figures—easily read—absolutely accurate—100,000-mile season odometer—100-mile trip register, can be reset to any tenth of a mile—guaranteed for five years—strongest flexible shaft drop forged swivel joint—noiseless gears.

"ALWAYS ON THE JOB"

nine vehicles of 40 to 50 horsepower, which are to be placed at the disposal of imperial guests from abroad.

★

The biscuit and chocolate concern of Beukelaer, Society Anonyme, Antwerp, Belgium, announces that it is in the market for the purchase of four open automobile trucks for the transportation of its goods. The platforms of these vehicles should be of the same height as the platforms of railway cars, and manufacturers are invited to submit specifications with their proposals.

★

Those who contemplate touring in Bavaria will be interested in the following information concerning the levying of tolls: Townships are authorized by law to levy a toll for the use of the roads belonging to them, and even to lease this right to a third person. The amount varies from 2.5 to 19 cents, and usually is levied both going and returning.

Because of the large number of townships, toll is levied on an average of six times in 25 miles. In many cases the charge is unreasonable, because the roads are very poor. Motorists are compelled to stop every little while to pay these few cents and wait for change, and heavy fines are imposed for failure to stop.

Most automobile maps published in Germany underline the towns where toll is levied, in red, and many clubs print special lists of such localities and advise their members to avoid them so far as possible.

★

A new headlight has been brought out by a firm in Bradford, England, and has been named the Diva, because of its similarity to a diver's headdress. It is announced that its use may be extended to include an application to signalling searchlights for the army and navy. It is spherical in shape and divided in halves, vertically. The front portion has a double convex lens in the centre, while the rear portion has four similar lenses, at the top, bottom and either side. The interior is nickel plated, and for illuminating purposes electricity is employed.

A bulb is placed in the exact centre of the sphere and the rays from the four back lenses are directed onto four circular mirrors, focused so as to obtain the maximum of light at an angle to throw the beams forward in a straight line parallel with that of the front lens, or otherwise as desired. The lamp is held in position by a special hinged gate or frame in front of the radiator.

The special advantages claimed are: That five times more light can be obtained from any given alignment; there is no glare as the driver approaches and draws to one side to pass; economy of upkeep, owing to there being only one electric light bulb of small power, and the exceptional penetrative power for driving through fog.

★

A report from an American consular office in Spain indicates that as the popularity of the automobile increases in that country, the buyers are being recruited more and more from the ranks of those whose incomes are moderate. The limousine and landaulet are the types most favored, and a reasonably low priced machine of either class would meet with a ready sale. Because American made cars are sold at prices under those obtained by Continental makers, there has been a growing tendency to purchase them, and the consular agent appears to be of the opinion that Spain will offer a splendid market in the near future.

★

According to the Brazilian Review, Rio de Janeiro, Brazil, a special committee of the Brazilian Chamber of Deputies has been studying the rubber question with a view to suggesting what measures should be taken to avert what appears to be an impending disaster. The conclusions of the committee take the form of a bill to be laid before Congress, the main lines of which are as follows:

Exemption from import duty on all utensils and material to be used in the extraction of seringa, caucho, manicoba and mangabeira. The provision of prizes for persons establishing new plantations of the above mentioned rubber trees. The founding of experimental and demonstration farms for the growing of seringa rubber in the Acre territory and in the States of Matto Grosso, Amanazonas, Para, Maranhao, Piauhy and Bahia, and of manicoba and mangabeira in Piauhy, Ceara, Rio Grande de Norte, Pernambuco, Bahaia, Minos Geraes, Sao Paulo, Goyaz, Parana and Matto Grosso.

FEDERAL AID HIGHWAY CONVENTION.

The good roads federal aid convention called by the American Automobile Association in Washington, D. C., recently placed itself on record as favoring the passage of a bill creating a national highways commission to consist of a chairman and 15 members, appointed by the President and Congress. The purpose of the commission is to be the study and investigation of the good roads problem from the viewpoint of the federal government's position, to prepare a plan for government participation, and to report its findings to the President not later than Dec. 1, 1913. The representation at the convention was extremely diversified, 38 states being represented, including 115 delegates named by governors of 23 commonwealths.

E-M-F GETS TIEDEMAN TROPHY.

During the progress of the first week's show at the Madison Square Garden the Tiedeman trophy, won by Frank Witt in an E-M-F car, made by the E-M-F Company, Detroit, during the Savannah meet of Thanksgiving week, was presented to Mr. Witt by Fred Wagner, official starter of the American Automobile Association. The cup was placed in the E-M-F space at the display. It will be remembered that the three E-M-F cars entered in this event finished with place, the first time in the history of American automobile racing that this result has been noted.

NEW FERRY FOR MOTORISTS.

April 1 the new automobile ferry of the Twin City Ferry Company across the East river, between Clason Point park in the Bronx and College Point, Long Island, will be open to the public. There has been an increasing demand for a ferry here, owing to the large number of automobilists who utilize Long Island's roads and those of the motor parkway. At present there is none between 92nd street and Rye. The new one will be operated the entire year.

RELATION OF MAGNETO TO ENGINE DESIGN. *

(By F. E. Moskovics.)

THE magneto manufacturer has had considerable annoyance to combat in the past, due to the fact that many engineers have not given sufficient thought to the correct disposition of the magnetos in their original designs. Some of this is adjusting itself automatically with the advent of the long-stroke motor, because inlet and exhaust manifolds are considerably higher than previously. But there still remains considerable room for work in this direction. These points, if considered in the first stages of motor design, will necessitate practically no additional work or cost and will certainly be of advantage to the user and in many cases to both the car and magneto manufacturer.

In considering the magneto in its relation to engine design, it might be well to make five classifications, as follows: First, there is the consideration of the proper location of the magneto, so that it will be free from excessive dirt, grit, water, oil, heat and other engine discharges; second, to so locate that the main parts of the magneto are accessible and visible, also not to obstruct or interfere with the accessibility of adjacent engine parts; third, accurate means of alignment with the driving mechanism—to eliminate undue wear on the universal joints, which in turn results in other disastrous strains, such as end thrust in the armature shaft, etc.; fourth, to so locate spark advance levers that they will operate freely and smoothly, giving full advance and retard without undue strains being set up; fifth, proper wiring of both primary and secondary and location of coils.

Location of Magneto.

Under the first head precaution should be taken that the magneto be so located that water or oil connections that might in time become leaky should not be close enough to cause trouble. Protection from the usual oil discharges from valve tappets and gear drive should be given. The enclosing of valve mechanism is curing much of this evil.

Care should be taken that the exhaust manifold is sufficiently clear of the distributor parts to absolutely insure their not being affected by that heat. Some magneto manufacturers are using a form of fire-proof distributor for that very reason, such as bakelite.

In motor layouts where the carburetor is on the same side as the magneto it is often situated dangerously near the magneto circuit breaker and the distributor. This practice is to be deplored for many reasons. The carburetor flooding directly on the magneto or allowing waste gasoline to collect near the sparking apparatus is frequently the cause of dangerous fires. This is especially the case with web-supported crankcase arms. It must always be borne in mind that most magnetos are supplied with an exposed safety gap which if surrounded by a combustible mixture will immediately cause fire.

Accessibility.

Under the second head the writer would strongly urge that great care be taken by the engineer that the parts necessary to properly time the motor be easily accessible without the necessity of any unusual acrobatics on the part of the operator. This refers especially to the universal joint and the breaker box. Forms of joints which allow variable and positive means of setting are strongly recommended, and if accompanied with explicit instructions for timing will avoid the usual demounting of the gear covers to shift those usually inaccessible parts. It is also urged that in those motors where the magneto and carburetor are on the same side, sufficient room be allowed to make easy the examination of the platinum points in the breaker box without the use of mirrors and other makeshift methods.

On some cars the magnetos are placed so low that it is impossible to get at these essential parts without the removal of the sodpan. In many instances, to properly inspect the magneto it is necessary to entirely remove it; and in such cases the car owner has been compelled to pay for many makeshift and improper adjustments or for the time expended in removing and again setting the magneto. If properly placed the adjustment would have been made quickly and easily by himself. It is therefore strongly recommended that the magneto drive be on the same plane horizontally as the crankshaft and if possible even higher, which will, of course, bring the breaker box into full view.

Alignment of Driving Mechanism.

Under the third head we come to probably one of the most prolific sources of trouble, due to either improperly designed joints or improper machining of the magneto base, or both. To this is due largely the noise in the magneto and magneto gears, also the eventual breaking down of the bearings supporting the armature shaft, especially in ball bearing magnetos. The ordinary type of Oldham coupling in which the female member has become worn tends to create end thrust in the magneto bearings which they were never designed to absorb. So great care should be taken in machining the magneto base plate to the exact height and then furnishing rigid means of securing the magneto and seeing that the joint used is one that under a little wear will not tend to create undue end thrust. The writer would strongly urge that all universal joint parts be carefully hardened and that the material used be one which will take a good coat of case hardening.

General Design of Base.

Under this head it might be well to call attention to the general base design. Manufacturers employing cast iron crankcases are strongly urged to make the magneto base up separately from the engine base and use a non-magnetic metal in its construction. Experiments have shown that with certain magnetos the use of a magnetic metal in the engine base has caused a loss of as much as seven per cent. in the magnetic flux, which in turn affects the total efficiency of the magneto and more glaringly in slow speed operation. The base should be designed to be rigidly supported and properly webbed to avoid vibration.

Locating Spark Advance Levers.

The fourth consideration is purely a case of mechanics. Many designers leave this matter in the hands of inexperienced men, with the result that the breaker box is often subjected to strains for which it

*Extract from a paper read before the January meeting of the Society of Automobile Engineers.

Digitized by Google

was not intended. Levers are often inadequate for the work in hand; proper regard is not paid to the levers, and often only a small part of the quadrant is used, and owing to an entire disregard of the law of the lever it is a matter of some inconvenience to advance and retard the breaker box.

Particular attention should be paid to the method of rotating the cam house, for if the force is not applied in approximately the same plane as the cam house bearings, there is a decided tendency toward undue sticking and consequent wear. In order to avoid cramping and stiff working of the control mechanism properly designed cranks and clevises, and ball knuckle joints are advised. If possible the control mechanism should be so arranged as to be easily taken down. Split pins are very easy to put in but often difficult to get out.

Wiring Location.

Too little attention has been paid to the extremely important matter of wiring. On the modern car the high-tension circuits are usually well placed, due to the fact that trouble in them is so self-evident and develops so early. The art has progressed to such a point that probably any suggestions on the disposition of the secondary wiring would be superfluous. But it is to be urged that it is equally important to carefully segregate and insulate the primary wiring if for no other reason than the fact that it takes a long time for them to give trouble, but when they do it is one of the most annoying things to locate in the motor car. They should be located in such position that they will be free from oil and gasoline drippings and the heat of the exhaust manifold and that vibration of different parts will not tend to chafe or wear them. It is also suggested that where the primary wires leave a rigid part, such as the dash, a sufficient length should be left slightly coiled to fully compensate for any motion between these parts.

With the advent of the acetylene and other starting devices of the internal combustion type the matter of the location of the secondary coil again becomes a subject of some import. Practically all ignition manufacturers supply weatherproof coils, but all are not heat or oil proof. Therefore, it is suggested that it would be good practise to so locate the coil that the heat of the motor will not affect it any more than is absolutely necessary and also that it be free from the oils, water, gasoline and other engine discharges. This will add considerably to the life of the ignition system.

Conclusion.

In closing it is safe to say that the magneto has arrived at a very high state of perfection, due mainly to careful specialization. Considering the work in hand, the instrument gives but little trouble and with the few points indicated, carefully watched the lot of the car owner will be made perhaps a little easier and the instrument itself will repay in longer life the slight expenditure of time necessary to accomplish these things. The manufacturer also will be well repaid now that car upkeep has become a considerable factor in his sales arguments. Many motors seem to be very carefully designed in all details except the magneto, which when installed appears entirely as an afterthought. Now that the magneto has become a permanent part of the motor it is felt that with these few suggestions the magneto manufacturer and the automobile manufacturer probably can work to a little better purpose and in combining their efforts work towards making the lot of the owner and repairman somewhat less complex.

GAGE WILL SELL COLES.

The Grand Central Palace show in New York City proved too much for the determination of William M. Gage, for the past year manager of the United States Hotel at Saratoga, N. Y., to retire permanently from the automobile business. For 12 years he was engaged in the sale of Mercedes and White cars, but he announced his retirement early in 1911. During the show above mentioned William L. Colt; president of the Colt-Stratton Company, of New York City, eastern distributor for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., offered him the position of sales manager in his company, and the offer was taken at once.

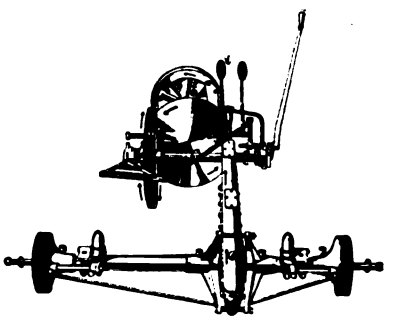
STEWART & CLARK MAKES COMPLAINT.

The Stewart & Clark Manufacturing Company, Chicago, has entered a complaint with the Interstate Commerce Commission at Washington, D. C., stating that the rate on speedometer equipment from Chicago to San Francisco and Los Angeles, Cal., is too high. At present first class rates prevail and the Chicago concern asks that a classification be made upon the material to include flexible brass tubing, sprockets, clamps and all metal parts except speedometer heads, as third class.

SYRACUSE CLUB ELECTS OFFICERS.

At the annual election of officers of the Automobile Club of Syracuse, N. Y., held recently, Hurlbut W. Smith was re-elected president for the 11th consecutive term. Other officials chosen were: First vice president, H. W. Chapin; second vice president, Alexander W. Chapin; secretary-treasurer, Forman Wilkinson; directors, E. L. Pierce, W. L. Brown, J. H. Valentine, J. C. DeLong and Dr. A. D. Babcock. Resolutions were passed requesting the state department of highways to complete several roads started. The club intends to post many signs during the coming season.

HARTFORD CLUB SEEKS NEW ROOMS.



Included in the business transacted at the annual meeting of the Hartford Automobile Club, Hartford, Conn., was the appointment of a committee to seek new quarters and the decision of the members to remain in the state association. The election of officers for the ensuing year resulted as follows: President, Col. Louis R. Cheney; vice president, Hiram Percy Maxim; secretary, William T. Plimpton; treasurer, Albert M. Kohn. Committee chairmen: House and entertainment committee, John G. Hawley; membership, Frank J. Knox; contest, S. A. Miner; rights and privileges, W. S. Schutz; good roads and signs, Willard A. Rice.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

No Gears!

Notice this transmission of the Cartercar carefully. You will see that it has absolutely no gears of any kind whatever. No matter how well gear transmissions are made they will strip—and howl. There are just two unit parts to the Cartercar Transmission—affording the maximum durability, silence and efficiency.

Cartercar

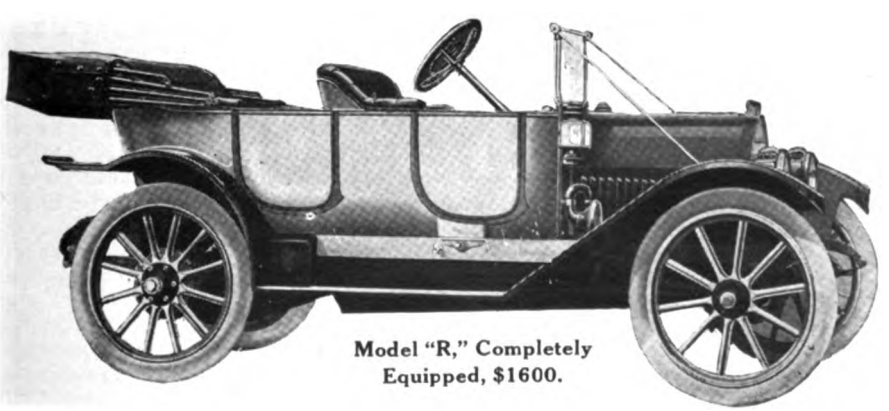
The Friction Disc running against the fibre faced wheel gives any number of speeds—all controlled with one lever.

This adapts the Cartercar to crowded streets. It will also go through any possible roadway. The tremendous leverage provided by this transmission at low speeds will take this car up a 50% grade and through sandy and muddy roads where a gear transmission would probably be stripped.

With such simple, easy control a boy or lady can drive a Cartercar as well as a man. The control is made more complete by three independent systems of brakes.

Every detail of the construction of the Cartercar is in keeping with the most advanced ideas of motor car building.

Chain-in-oil drive, full floating rear axle, three-quarter elliptic rear springs, long wheel base, large wheels and attractive design combine with the friction transmission to make the Cartercar the most pleasing car from every standpoint.



In winter and summer your Cartercar is always ready—no matter whether you wish to take a pleasant little drive or a long, hard run.

Equipment includes self starter, gas tank, top, top cover, speedometer, full lamp outfit, demountable rims, trunk rack, tools, robe rail, tonneau mat, etc.

If you want a car that will give you the utmost in service and enjoyment—that is adapted to all road conditions—and is easy for any one to drive—then you should know about the Cartercar. Let us send you complete catalogue.

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

HOT AIR FOR THE CARBURETOR.

Carburetion is an important factor in the proper operation of the hydrocarbon motor and the subject is being given more serious attention by the makers of the vaporizer than formerly when a higher grade of gasoline was marketed. While it is admitted that the present fuel is productive of more power, it is slower to vaporize and starting is consequently more difficult.

This is especially true in cold weather, and during

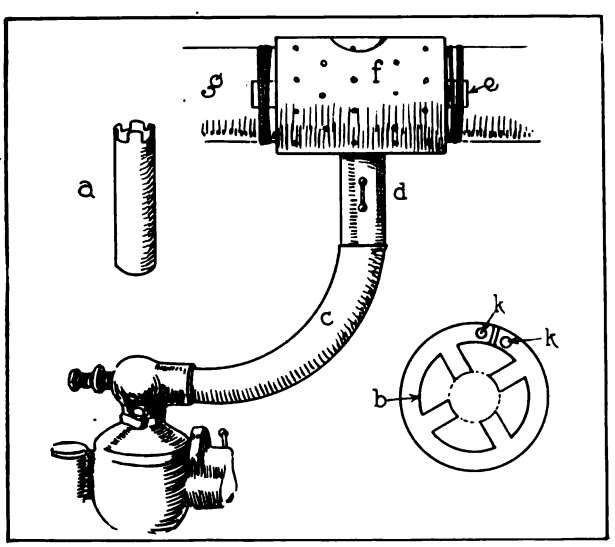

Fig. 1—Device for Supplying the Carburetor with Hot Air from the Exhaust Pipe or Manifold.

the past year there has been a growing tendency among automobile manufacturers to equip their product with a water jacketed carburetor. Others utilize warm air from the exhaust. Both systems make toward the same end, that of facilitating the vaporization of the fuel. The advantages of warming the mixing chamber are many. Not only is a better mixture maintained but a greater economy of gasoline is effected, both desirable features.

Although the majority of the new machines are fitted with devices for warming the carburetor there are many older cars which are not thus equipped, nor are they provided with a pan. Under the latter conditions the carburetor is drawing in cold air and foreign elements, both of which contribute toward trouble, and even in the summer the vaporizer should be protected. That more or less dirt is drawn in through the intake pipe was demonstrated by an analysis of the deposit on a piston head of a car which was not fitted with a pan. It was shown that a large percentage of the material was road matter.

It is a simple matter to fit a hot air device to a carburetor and at Fig. 1 is presented an inexpensive and easily made attachment which consists of a piece of rubber hose, an ordinary can and two pieces of wire. In selecting the can, one should be obtained that has not been opened by the usual methods as both ends are necessary in making the device. It is an easy matter to select one of the proper size and to empty its contents by cutting a small hole in the centre of one end.

A circle is then scribed on each end, this being of the same diameter as the exhaust pipe or manifold, depending upon which member is to be employed. Another circle is then marked, as indicated at b and with a pair of tin snips the metal is cut as illustrated, leaving four small ends. These are bent outward as shown at e.

A metal tube d, which will fit snugly into a piece of rubber hose, is cut at one end, as depicted at a and passed through the can, the ends of the pipe being bent over and riveted. If the large part be placed on the exhaust manifold it will be necessary to split the former to attach it.

The device is then passed over, or sprung open and placed on the exhaust member and drawn together by wire through the openings kk. The part f is then fastened securely to the exhaust pipe by wiring the extensions as shown at e.

The rubber tubing c should be clean and its walls sufficiently thick to prevent kinking. Garden hose of the wired type is preferable. One end of the pipe is slipped over the tube leading from the heating device and the other passed over the air intake of the carburetor.

A number of holes may be drilled in the heater to correspond to the opening of the vaporizer, or a small circle cut of the same diameter. The device

Digitized by Google

may be improved further by fitting a shutter through which the quantity of air admitted from the outside may be regulated. A butterfly valve also could be installed as shown at d to facilitate starting if the carburetor be not equipped with a similar device.

After attaching the heater the air inlet of the carburetor may require readjusting but this should not be attempted until after the motor has become warm. The apertures or shutter may be regulated until satisfactory results are obtained. In addition to facilitating carburetion the device will prevent dirt and mud being drawn into the carburetor.

FITTING A CLUTCH STOP.

It is not uncommon to note that some operators in changing gears cannot make the shift without the movements being attended by a more or less grinding noise. The designer of the modern automobile has overcome many of the gear changing troubles and if the operation be attended with noise it is usually the fault of the driver. There are, however, many cars which have seen considerable service and with some of these it is almost impossible to change speeds without a grinding of the pinions.

While there are several conditions which may be responsible for the noise, one of the most common is that when the clutch is withdrawn the member continues to spin, and if this inertia of the flywheel as it is called, be not overcome, difficulty will be experienced in making a quiet change. In order to effect a silent meshing the pinions to be engaged must rotate at approximately the same speed, and if one be turning faster than the other the slower member must be brought up to the same number of revolutions as the other, or vice versa. This subject was considered fully in recent issues of The Automobile Journal.

It is obvious that if the design of the clutch be such that the inertia of the flywheel cannot be overcome through proper operation not only will the changing of gears be attended with noise, but more or less wear will result upon the pinions, and continued abuse of these members will create serious trouble. It is poor practise to utilize the chamfered edges of the pinions as braking members to reduce their speed in gear changing.

In some types of cars difficulty is experienced in engaging the low speed when starting from a standstill. Sometimes this trouble may be obviated by cutting down the amount of mixture supplied by the carburetor; that is, the valve of the latter may be adjusted to slow the motor down to its minimum speed when running idle.

The inertia of the flywheel may be overcome, however, by fitting a clutch stop or brake, and at Fig. 2 are presented several practical designs adaptable to the cone or expanding type of clutch. The object of the stop is to retard partially or wholly the spinning of the clutch shaft and to enable the driver to change up or down as the case may be without grinding the pinions in the gearbox.

The stop depicted at A is suitable to a car having a cross frame member upon which is mounted the device. It consists of a .5-inch round rod which is threaded at one end, and fitted with a wooden block and leather pad at the other extremity. To the cross frame member is bolted a T piece and the latter is threaded to take the rod, which is held securely by lock nuts. By this arrangement the stop may be adjusted and any wear of the brake member taken up.

At B is presented another form of clutch stop. This consists of a piece of spring steel, one end of which is slotted to engage with the studs of the transmission housing, while the other is bent upward as shown in the sketch, and a piece of hard leather is riveted to the end. This method is preferable where the design of the car will permit of its use, as it is made easily and by means of the slot can be set accurately. Being constructed of spring steel it will give more or less and will not be so harsh in its action as the stop previously described.

Where the design is such that the stop cannot be placed upon a cross member or on the gearbox, the sub-frame may be employed, and at C is outlined a method of attaching the braking device. A plate is bolted to the frame and the former drilled to take two bolts, these being employed to lock the stop proper. The latter is constructed of spring steel and slotted to permit of adjustment for position as well as wear of the leather pad. In setting the device, the clutch is thrown out and the stop moved forward until it comes in contact with the periphery of the

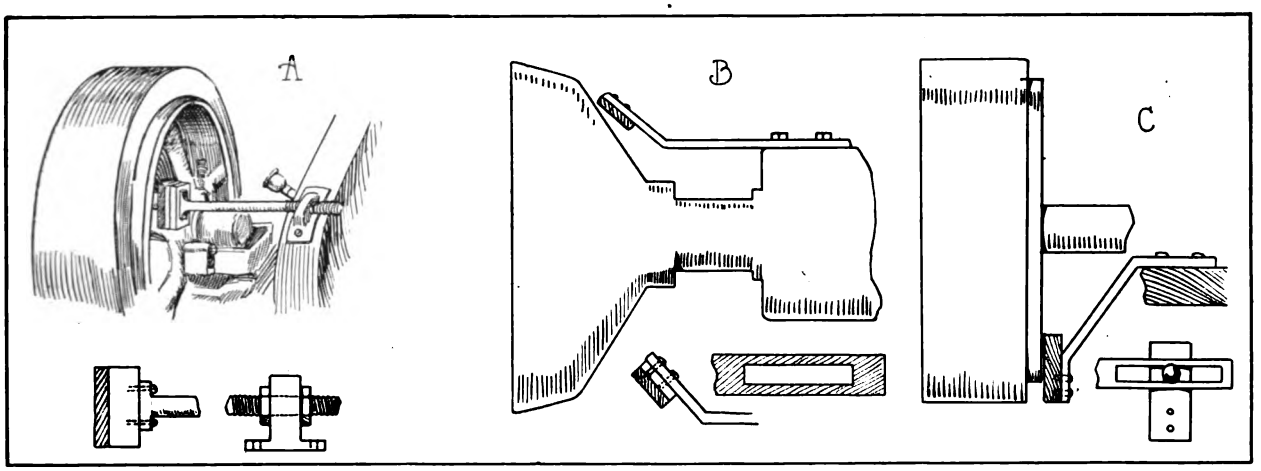

Fig. 2—Simple Forms of Clutch Stops: A, Adjustable Rod Attached to Cross Frame Member; B, Steel Spring Bolted to Transmission Case; C, Method of Fastening to Frame.

Digitized by Google

female member, and the bolts can then be locked securely.

In adjusting these devices it should be borne in mind that they should not be so set that a harsh engagement will follow. Their object is to slow down the spinning member to the required speed for meshing of certain pinions in the gearbox. In utilizing the stop in changing gears it will require but a short time for the driver to learn the "feel" and if properly adjusted and operated it will make changing up or down an easy matter and eliminate the undesirable grinding noise.

DIRECTORY AND MAP HOLDER.

Many motorists make it a practise to carry an automobile directory or road maps on the car while driving. Frequently a machine passes and it is desired to ascertain the identity of the owner. It is sometimes inconvenient to reach the book when it is carried under the seat or in the pocket.

At Fig. 3 A is shown a neat device made by a motorist and attached to the top of the coil box. The

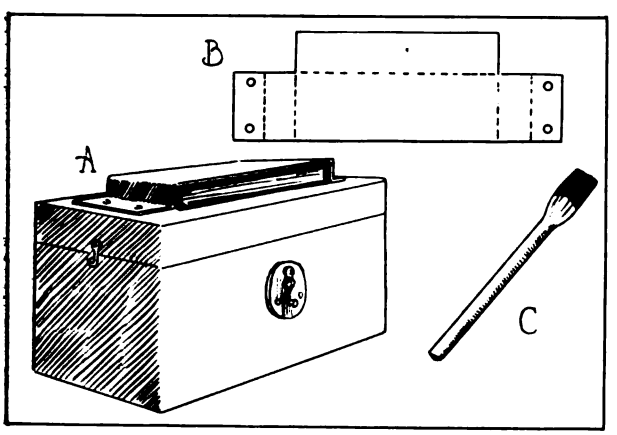

Fig. 3—Home Made Accessories: A, Directory or Map Holder Made from Sheet Copper; B, How the Metal Is Cut, C, Spark Plug Brush Constructed of Tubing and Bristles.

material was sheet copper and at B is depicted the method of its manufacture, the dotted lines representing the lines of bending. In preparing the metal the thickness of the book or map should be ascertained and the copper cut accordingly. It is fastened to the coil box by small brass screws or it may be attached to any other convenient place.

HOME MADE SPARK PLUG BRUSH.

For cleaning dirty spark plugs a brush with stiff bristles is best, and while these may be purchased for a small sum at any accessory house one may be made without any expense. Around the garage or house usually will be found an old brush which is worthless. Enough of the bristles are cut off to fill the ends of an old piece of a .25-inch or larger copper or brass tube which may be procured from the scrap heap. The metal is then flattened with a hammer and the result is as depicted at C. Being thin the brush will remove dirt between the points of the plug.

STARTING A COLD MOTOR.

Some owners complain of difficulty in starting the motor of a model T Ford in extreme cold weather. This is not the fault of the design, but a trouble experienced by operators of other cars in winter, and is due to the heavy fuel now being employed. These troubles did not exist when the automobile industry was in its infancy and the writer seldom experienced difficulty in starting a motor that had been exposed to a temperature below zero.

A method suggested by a repair man who has had considerable experience with this car, is employed by a number of operators. It consists of screwing down the adjustable member on the dash thereby cutting off the supply of fuel to the needle valve, and then cranking the motor smartly, several times. The needle valve is then opened two or more full turns, the carburetor flooded by priming, and when the engine is again cranked it usually will start easily after which the vaporizer may be adjusted.

RADIATOR HINTS.

Some motorists are more or less careless in the use of anti-freezing solutions. A common error is to believe that after filling the radiator with an alcohol or other solution further attention is not necessary. Tests should be made from time to time to ascertain if the solution be of the proper strength, as alcohol evaporates easily, especially if the motor be operated on a mild day.

It is an excellent plan to empty the anti-freezing mixture from the circulating system, and flush out the latter with clean water. It will be noted that the solution has a reddish color, due to a deposit similar to brickdust. This should be allowed to stand until the sediment settles at the bottom of the container, then if the fluid is poured out carefully, the greater part of the dirt will remain in the bottom of the vessel. It should not be allowed to collect in a radiator, as in time it will seriously affect the circulating system.

PROPER USE OF TIRE CHAINS.

Many drivers believe that tire chains will always prevent skidding and are careless in fitting these devices to the traction wheels. Properly used, tire chains give efficient service, but when improperly adjusted they impose a severe strain upon the rear construction of an automobile. The chains should be snug, not loose, for when the latter condition exists the wheels will skid some distance before the slack of the chain is taken up. The result is a violent shock to the rear mechanism, and the car may continue to skid because of the momentum attained.

SCRATCH AWL FOR FINE WORK.

A common sewing needle inserted in a suitable handle makes an excellent scriber for accurate work. It is so cheap that regrinding is unnecessary. When dull it can be replaced by a new one. The point on the needle is ground by an expert, and is far superior to anything made by the ordinary machinist.

WHY PEDALS WEAR SHOES.

Those who do considerable driving in crowded traffic of the cities operate the clutch and brake pedals considerably more than the average driver, and in the continual contact and rubbing between the metal and the leather the latter suffers most; in fact, a pair of light soled shoes are soon reduced to a state where repairs are necessary. Obviously the remedy would be to employ heavy soles, but many object to these, as they claim they cannot "feel" the pedals. A driver whose work is mostly in the city treats the soles of his foot apparel in the same manner as the leather of the clutch by dressing them with castor oil, applying several coats and allowing the lubricant to soak in. This not only softens the leather but adds to its wearing qualities. The soles of new shoes may be similarly treated.

A VALVE LIFTING KINK.

The amateur in attempting his first removal of a valve in preparation for grinding, is often bothered in lifting it high enough to be grasped by the fingers. It may be operated easily by inserting the tang of a file in the slot of the valve stem and moving it upward as far as it will go, then holding the stem with the point of a screw driver while another lift is made with the other tool.

HAYS GAS ANALYSIS INSTRUMENT.

A device for testing the mixture of a carburetor as well as for making an adjustment of that member, has been brought out by the Combustion Appliances Company, Rogers Park, Chicago. It is the invention of Joseph W. Hays, the well known combustion engineer, and is known as the Coapco special gas analysis instrument.

Being very compact the device may be carried on the car while the mixture is being examined, and it is held to be so simple that it may be operated by a novice. Its principle consists of taking a sample of the burned gases and these are analyzed by the instrument instantly, the amount of carbon dioxide and carbon monoxide being registered by its mechanism.

When gasoline is burned properly in the cylinder of a motor, the resulting product from the combustion of the carbon is carbon dioxide, while that resulting from the hydrogen is water vapor. When combustion is incomplete, carbon monoxide will be present and there also may be hydrogen and perhaps certain hydrocarbon gases. Both carbon monoxide and hydrogen are highly combustible gases and when found present in engine exhaust, indicate a decided waste of fuel.

The Hays instrument checks the amount of these products as follows: A short piece of gas pipe or brass tubing is inserted in the muffler or exhaust and the instrument suspended. After the motor has been started a sample of the exhaust is taken and its condition noted readily. The device may be utilized when the car is being operated on the road by placing the analyzer in the tonneau, and by means of tubing conveying samples thereto. This arrangement permits of examining the mixture under varying conditions, an important factor in the adjustment of carburetors. By it the adjustment troubles are eliminated as with an accurate record obtainable of the proportions of air and gas being employed, a new or old vaporizer may be set very quickly.

BOSTON MOTOR BOAT SHOW A SUCCESS.

The ninth annual motor boat show held at Boston recently was noticeable for the large display of motors, these embracing both two and four-cycle engines. The event was well attended and a high grade of exhibits marked the display. Among those represented were: Havoline Oil Company, New York City; K-W Ignition Company, Cleveland, O.; Connecticut Telephone & Electric Company, Meriden, Conn.; Apple Electric Company, Dayton, O.; Indian Refining Company, New York City, and Wolverine Lubricants Company, New York City.

NEW GLASS FOR WINDSHIELDS.

According to Charles F. Splitdorf, New York City, maker of ignition specialties, a new glass for windshields has been brought out by a firm of French glass makers. It is produced by a secret process and its thickness and care in construction are the principal essentials. It is about .75 inch thick, and on test resisted the impact of a 10-pound weight thrown from a distance ranging from 10 to 20 feet, with no other damage than a small hole less than two-fifths of an inch being made in the glass.

REMOVES WALL TO EXHIBIT PREMIER.

Exhibiting automobiles in lobbies of hotels is a practise not alone confined to New York City. John F. Turk, Rochester, N. Y., agent for the Premier line, made by the Premier Motor Manufacturing Company, Indianapolis, Ind., made arrangements to show a seven-passenger Premier in a hotel at Rochester during a show in that city. It was found that it would be necessary to remove a wall of the building to permit the entrance of the car, and this was done.

COLE WITHDRAWS FROM RACING.

Following the lead of many automobile manufacturers it is said that the Cole Motor Car Company of Indianapolis, Ind., will not re-enter the racing field in 1912. Although no official announcement has been made it is said that the funds which have been employed for racing purposes will be utilized in connection with a plan in the service promotion departments.

The Henderson Motor Sales Company, general sales agent for the company, has concluded a plan for organizing a corps of expert factory mechanics and it is intended to have these men travel all over the country in the interests of Cole agents and owners. The experts will visit the agencies and service stations and explain the technical points to the workmen.

Claim Freight Rates Are Excessive—The National Association of Automobile Manufacturers was represented before the Interstate Commerce Commission at Washington, D. C., recently, alleging excessive freight rates on motor cars by all railroads east of the Mississippi and north of the Ohio rivers.

IN THE Commercial Vehicle Field

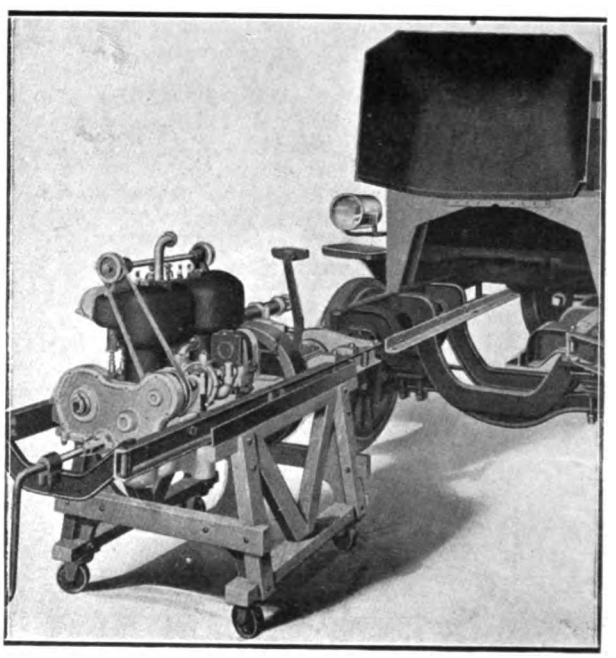
New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

SPECIAL FEATURES AT THE SHOWS.

As a whole the two displays of commercial vehicles at the recent New York shows revealed but little in the nature of radical mechanical changes, although a number of new models were shown for the first time. The general impression was one of decided progress in construction, but this was more particularly with reference to so-called minor details. However, there were a number of new features in design and body work which will admit of brief comment.

From the first there has been a decided tendency toward providing for complete accessibility of the power plant. This has been accomplished in various ways, but there appears to have been decided progress along this line within the past few months. In this attempt to solve a problem, another has entered into the consideration; namely, that of supplying the possibility of ready removal and replacement in cases where it is desired to operate a fleet of commercial vehicles, the owner purchasing an extra power plant to be placed in service during the time required for making necessary repairs. Special attention may be directed to a few of the designs exhibited.

Accessibility of Power Plant.

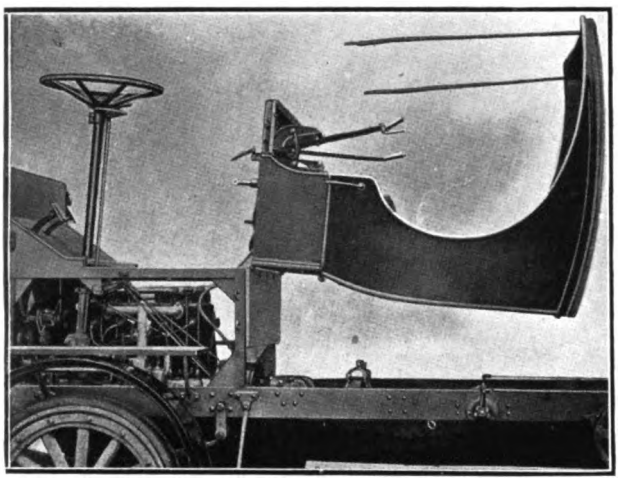


The Knickerbocker, a new truck displayed at the Grand Central Palace by the Knickerbocker Motor Truck Company, New York City, presented a somewhat simplified arrangement, in which provision is made for withdrawing the motor through the front, as a drawer is withdrawn from a desk. The radiator, which is of the honeycomb type, is suspended on springs or stanchions attached to or supported on the bumper. The latter is hinged so as to swing open carrying radiator clear, and permitting full access to the motor, which is mounted on a hickory sub-frame.

The Grabowsky, made by the Grabowsky Power Wagon Company, Detroit, and shown at the Madison Square Garden, has a similar provision for accessibility. The motor, transmission and clutch are mounted as a unit on a sub-frame, which is removable bodily from the chassis through the front. The short hood is hinged at the top, and the front cross bar at the left. These being opened, the power plant unit is so arranged that it slides in and out like a drawer. A wooden horse, on which is mounted a pair of rails registering with those carrying the motor in the chassis, is rolled into place and the work of removal thus becomes a most simple matter.

Tilting or Removable Seats.

A number of makes offer a tilting seat, with which it is possible to expose the power plant without disturbing the load. The Speedwell, made by the Speedwell Motor Car Company, Dayton, O., tilts the entire seat and side panels to the side. The Autocar, the product of the Autocar Company, Ardmore, Penn., folds the seat and floor boards upward. Several others tilt the seat backward, and among these may be mentioned the new Pope-Hartford, made by the Pope Manufacturing Company, Hartford, Conn., in which the seat and floor boards are hinged separately, permitting the turning of one or both as the operator desires.



The new six-ton Knox, made by the Knox Automobile Company, has the motor located in the cab, as with the Morgan, Hewitt and Garford. The latter is made by the Garford Company, Elyria, O., and this particular feature is not found on all models. With the smaller cars, provision is made for lifting the hood and drawing the motor out the front. With the

Illustrating Accessibility of Grabowsky Power Plant.

Digitized by Google

larger sizes, however, it is possible to make adjustments in the cab without leaving the seat, as, of course, is true also of the other makes utilizing this

Tilting Seat Exposing Power Plant on Pope-Hartford.

method of location for the power plant.

The Decatur, made by the Decatur Motor Car Company, Decatur, Ind., goes a step further. The body is held in place by four bolts, and above this are located the dash and seat units, the former comprising the radiator, dash, floor boards, clutch and brake pedals, foot throttle, gasoline tank, side panel locks, change speed lever and emergency brake control. This also is held in place by four bolts, as are the seat and side panels. The radiator is hinged at the side, so as to open like a door. If it be desired to remove the entire power plant, the loosening of four bolts permits the seat unit to be lifted off, and loosening four more bolts allows the removal of the dash unit. This makes if possible to replace the motor without affecting the load.

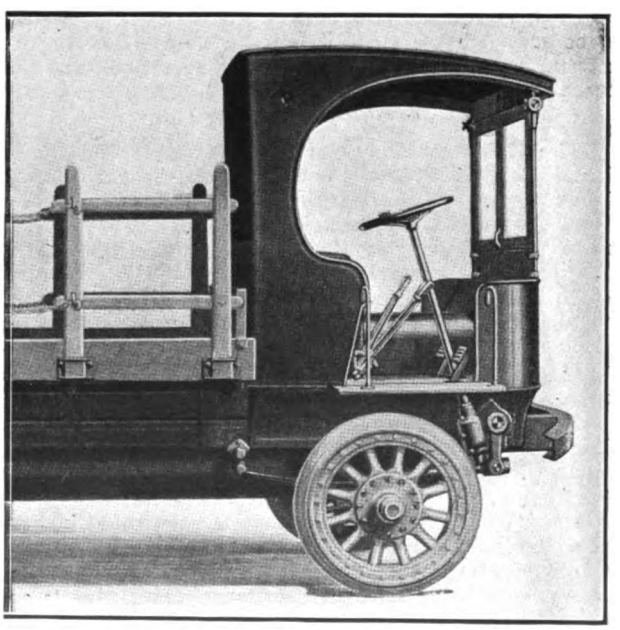
The five-ton Lozier, a new product of the Lozier Motor Company, Detroit, makes provision for lifting the floor boards and turning the seat out of the way, or these may be entirely removed and the power plant exposed for thorough inspection. The sub-frame is hinged at the rear end to a cross frame member, while the forward end rests on independent auxiliary springs. The removal of four bolts in front and two in the rear enables the entire power plant, consisting of motor, cooler, clutch, transmission, steering wheel and driver's seat, to be taken from the chassis.

This is by no means a complete list of the various methods employed, but will serve to illustrate the attention that is being paid to this important feature.

Location of Driver and Levers.

Another suggestion as to the trend of design has to do with the location of the driver and the placing of operating levers. This also has a strong bearing on the matter of accessibility, inasmuch as there is a division of opinion as to whether or not it is possible to place the motor under the seat or floor, thereby securing additional carrying space in the rear of the seat, and at the same time providing for easy removal or adjustment of the power plant. As has been shown, this problem has been met in a variety of ways.

Considering now, the proposition of left or right hand control, it is significant that many of the concerns which favor the right hand location of driver in pleasure car manufacture have adopted the opposite in commercial vehicles. With some of these the control levers are placed at the left as well, though it is possible that a majority prefer the centre location for these.



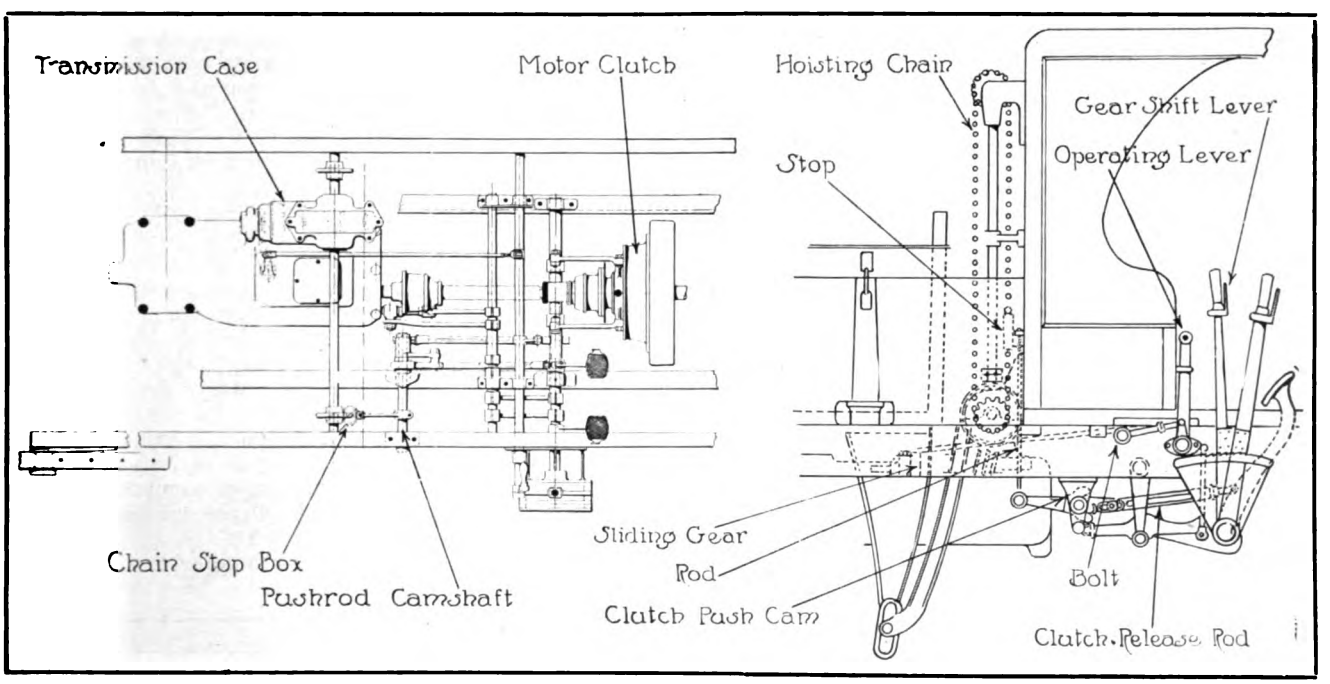
Other Mechanical Details.

Several new transmissions were shown, and very many cars displayed were equipped with some form of governor. Self-starting devices were not numerous, although it is understood that several makers are at work upon designs which will be placed in the market soon. The worm and worm wheel drive of the Pierce-Arrow, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., was the only device of this nature at the 1911 exhibits, but this year the Grand Central Palace show brought out two others, although but one of them was shown. These were on the Newark, made by the Newark Automobile Manufacturing Company, Newark, N. J., and the Rowe, the product of the Rowe Motor Company, Coatesville, Penn. Both are new makes, and the latter offers the worm drive as an option only.

The matter of body design has been given decided attention. The first glance about either exhibit would seem to indicate that special interest attached to brewery wagons and dumpers, although of course, general utility vehicles with express bodies were in the majority. Some of the dumpers disclosed decidedly ingenious operating devices, and deserve more than passing mention.

Mack Dumping Body.

The International Motor Company, New York City, showed a seven-ton Mack truck, with a distinctly new and novel arrangement for dumping. The hoisting device is mounted on special braces fitted to the back



Location of Motor in the Cab on Five-Ton Garford.

of the cab, and the mechanism is operated by means of a transverse shaft directly beneath and in the same plane as the upper cross shaft. This is driven from

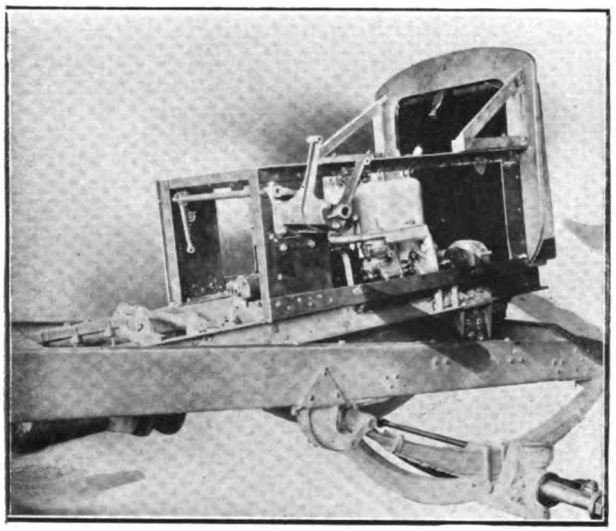
Digitized by Google

a small countershaft, situated in the transmission, by means of a worm and worm wheel, and this small shaft is in turn operated by a sliding spur gear, which meshes with the second speed gear on the main transmission countershaft, when the hoist is to be used. When the sliding spur gear is thrown into mesh, the driving dog for the main countershaft gear is thrown out, which makes it impossible to move the vehicle while the body is being raised. The latter, however, can be stopped in any position, and the truck driven over the road without the body being drawn back to its original position.

Driving into position for dumping, the operator moves the small hand lever at the right of the seat forward and downward, bringing a sliding gear into mesh with the second speed gear and at the same time disengaging the intermediate gear clutch. The gear shifting hand lever will be moved into the second speed, and the clutch let in, when the body immediately will begin to ascend. When in extreme upward position, the clutch automatically is thrown out by means of a stop on the hoisting chain, which prevents the lifting arm being drawn over centre.

Sketch Outlining Features of New Self-Dumping Body on the Mack Truck, Operated by Motor Without Leaving Seat.

To lower: The reverse is engaged, and the clutch let in, when the body begins its descent. As before, the clutch automatically is thrown out, just before the body reaches the frame, which prevents the former coming down hard upon the latter. The small hand lever is pulled back into position and the driver is free to resume his journey for another load. The whole operation takes about 20 seconds. In the device shown the tail gate was operated automatically, although it is possible to obtain this for hand operation if desired. With the equipment as displayed, it is possible to unload the entire contents of the vehicle without leaving the seat, simply by moving the hand levers and depressing the clutch pedal.



Sampson, Morgan and Gramm.

The Mack was shown at Madison Square Garden, as was the Sampson dumper brought out by Alden Sampson Manufacturing Company, Detroit. In this the dumping arrangement is decidedly new, a cylinder behind the driver's seat serving to raise and lower the carrying receptacle by means of compressed air. This air is stored under pressure of 100 pounds in a tank on the rear end of the chassis frame, a single-cylinder pump being operated from the change gear mechanism. This compressor may be connected directly to the pneumatic hoist, in case the storage tank should become punctured or the air line should develop a leak. A Westinghouse brake, operated from the seat, controls the admission of air to the cylinder. The end gate is so arranged as to open automatically, so that the entire operation of dumping the load may be performed without the driver leaving his seat.

Still another novel dumper was exhibited in the Morgan, made by the Morgan Motor Truck Company, Worcester, Mass. Strictly speaking, this is not a dumper in the usual sense of the term. The body and load remain stationary, the coal or other material being discharged through a metal chute by means of an Archimedian screw. Power to operate this is conveyed from the motor through a change gear mechanism, in which an extra gear and a shaft lead to a chain wheel mounted on the side of the chassis. A much larger wheel is mounted on the end of the conveyer shaft opposite to that on which the chute is attached to which it is fastened by a key. The withdrawal of this key permits the chain and wheels to rotate idly while the truck is being driven. When the load is drawn into position, the operator slips the key into place, when the motor turns the screw and the coal is forced out through the chute.

Of the dumping bodies at the Grand Central Palace that shown on the Gramm, made by the Gramm Motor Car Company, Lima, O., was of special interest. In this a nickel steel pinion keyed into the rear end of the propeller shaft engages with either one of a

Digitized by Google

Method of Mounting Motor in the New Lozier Truck.

pair of meshed gears of the same size hung in a pivoted cage. One of these communicates to a universal shaft extending forward to a point just behind the seat, driving the gears of the body actuating mechanism. The cage is connected by a lever at the driver's seat mounted on a quadrant, the three positions of which give forward, reverse and neutral movements. Incorporated in the mechanism is an irreversible worm and wheel, which holds the body in any positon when the control gears are shifted into neutral.

The winding drums for raising are located immediately back of the seat. Chains from these extend upward and over sheave wheels supported on a derrick, thence downward to the lower end of two upright legs on the front of the body, where they are secured by means of steel fastening brackets.

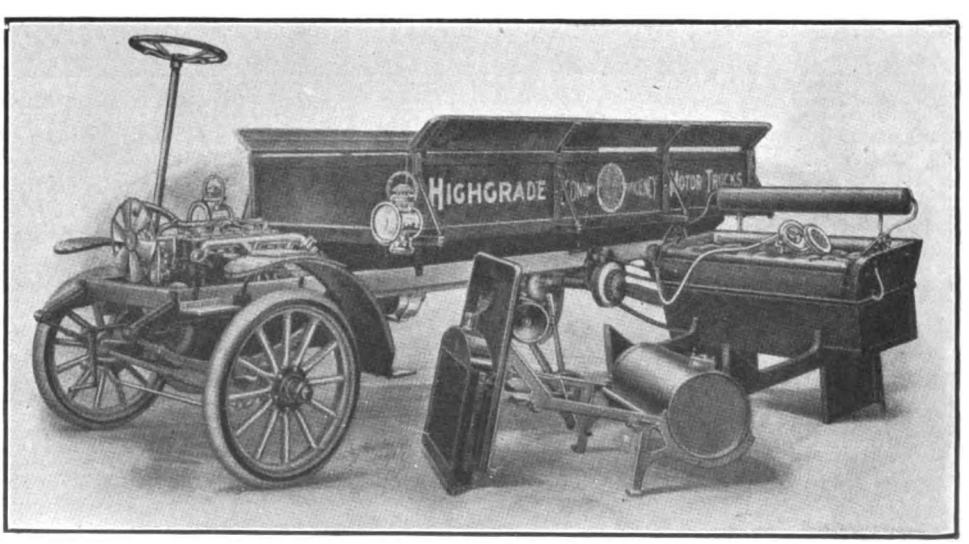
KNOX PUMP PROVES SATISFACTORY.

During a recent big fire in Richmond, Va., opportunity was had to demonstrate conclusively the superiority of the modern motor driven fire apparatus over the old type. For 13 hours a big Knox pumping engine, made by the Knox Automobile Company, Springfield, Mass., kept two streams of water working on a fire practically without intermission and within a few minutes after its return to quarters it was ready for another call.

The only attention needed was supplied by the chauffeur, who also was engineer and mechanician. Throughout the entire time the engine was in service, from just before 6 in the evening, until ordered back to the station by Chief Joyce at 7 the next morning, this man occasionally poured a bucket of gasoline into the tank and went over his machine with an oil can.

The steam fire engines competing with it during the same period, required two men in attendance, an engineer and a fireman. Their total consumption of fuel was more than 25 tons of steam coal, while the bill for running the gasoline pump at full speed for 13 hours was $4.50.

REORDERS FOR GENERAL VEHICLES.



The General Vehicle Company, Long Island City, N. Y., maker of General Vehicle electric trucks, had a decidedly successful month during January, as is evidenced by the sale of 158 machines. Several of these were reorders, among them being the following: Jacob Rupert, 21, making a total of 72; Peter Doelger, eight, making 47; Muehlback, seven, making 10; Commonwealth Edison, nine, making 15. Some large initial orders also were placed, including the Schaefer Brewing Company with eight, and the General Baking Company with 10. Sixty-nine per cent. of the concern's 1911 business was reorders, and Feb. 1 found it with 671 trucks in the hands of 25 customers alone.

SAMPSON TRUCKS SAVE MONEY.

It will be remembered that the officials of Kansas City, Mo., purchased six Sampson trucks, made by the Alden Sampson Manufacturing Company, Detroit, about a year ago. Three of these were of two tons capacity and the remainder of three tons. All were placed in service with the street cleaning department.

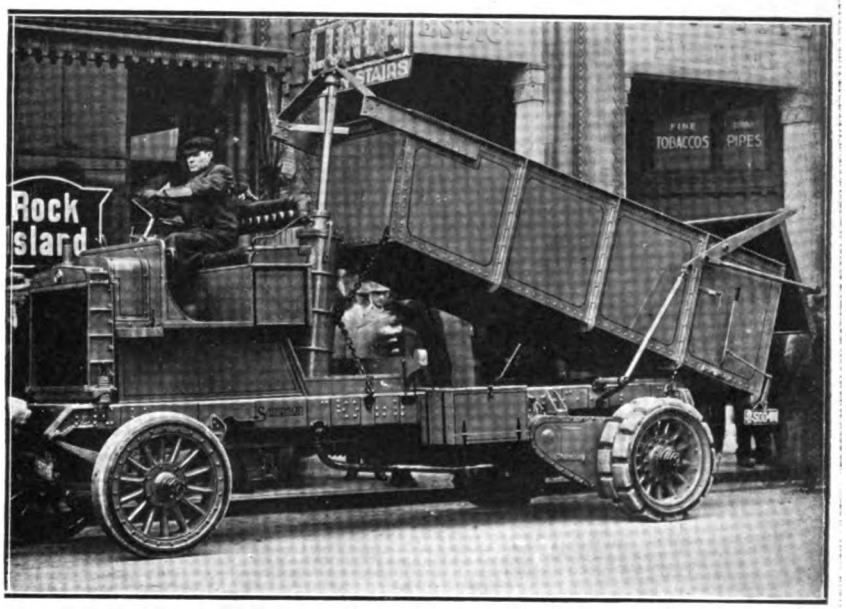
Recently, Commissioner W. C. Weaver reported that each of these machines displaced from seven to nine horse drawn wagons, and that the average cost for maintenance was $125.25 a month, as compared with $960 for the horsed equipment. These figures do not include depreciation or tire renewals.

The two-ton cars are utilized in collecting cans of

Decatur Seat and Dash Units Dismounted to Illustrate Acces sibility of Power Plant.

Digitized by Google

street cleanings, which are dumped, and often they are called upon to assist the fire department in cases of emergency. Two of the larger vehicles are employed in hauling asphalt, crushed rock, sand and paving materials, these being fitted with self-dumping bodies. The sixth machine is used in general street repair work, carrying laborers, tools, material, etc.



BALDWIN COMBINATION TIRE.

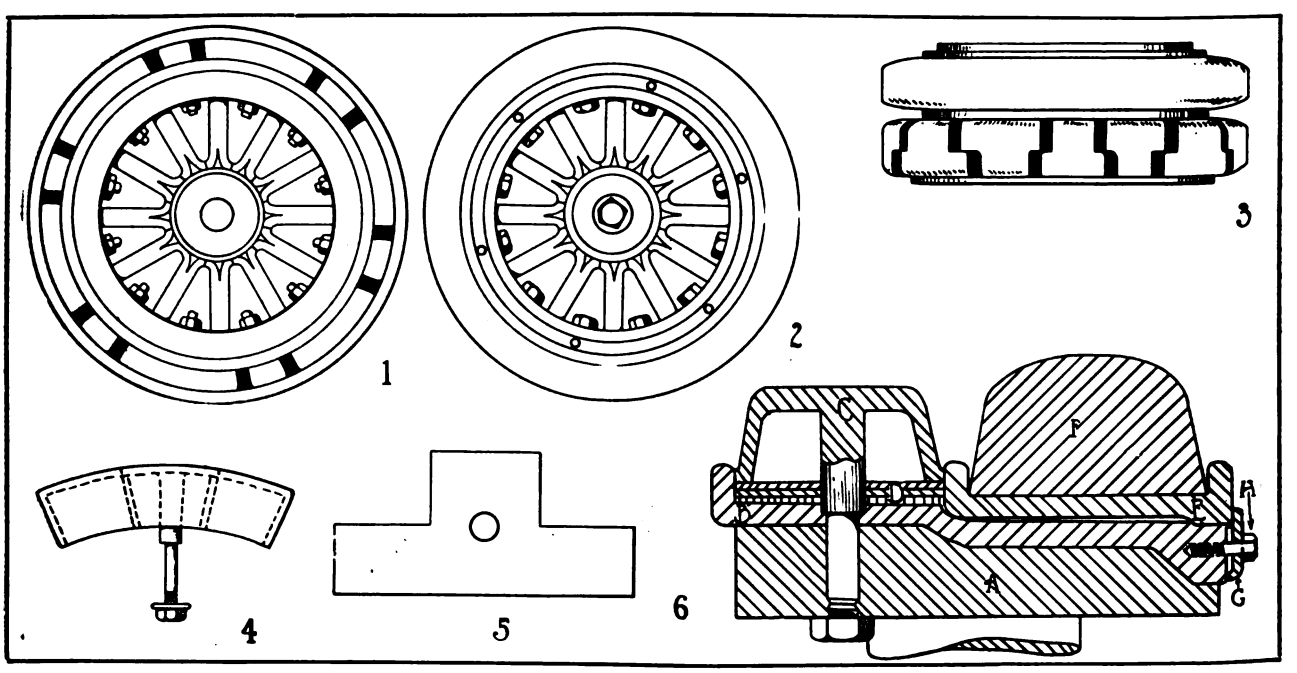
L. F. N. Baldwin, Providence, R. I., who is noted as a racing driver, and is one of the best known motorists in America, has invented a sectional steel tire which he claims possesses qualities that particularly adapt it to heavy vehicle service and which, he maintains, can be adapted to any rim now in use. This tire is designed to be used in combination with solid shoes of the present types, Mr. Baldwin claiming for his invention that it will minimize the wear and greatly prolong the life of the rubber tire used with this device. The tire is unique in that it may be adapted to conform to the reduction in size of the rubber shoe through wear and that the diameter of the wheel as a whole may be varied as desired. This is accomplished by using metal liners or shims between the block and the rim. By these the external diameter of the tire may be increased or lessened, a process that requires but little time.

As may be known, rubber and rubber compositions cannot be compressed, but can be distorted. Under the pressure of loads and driving stress any solid tire will change its form and the tendency is for the material to be forced from the actual place of contact of the tire and the ground or paving on which it stands. As the tire wears the resiliency from the elasticity of the rubber compound is lessened because there is a reduction of material. Because of the rear wheels carrying the greater part of the load as well as transmitting the power the tires wear more rapidly than the forward shoes, for which reason dual tires were adopted. Mr. Baldwin claims for his invention that the steel shoe carries the load and resists the wear, and the rubber shoe affords the traction necessary. He holds that on ordinary unpaved roads there is no need of carrying the load on rubber alone and that on paving traction is a condition more required than a cushioning effect or the reduction of noise. The steel tire is to be used with the surface slightly lower than the normal face of the rubber shoe so that under compression the rubber and steel surfaces will contact with the road surface. With the weight of the load largely carried by the steel tire he claims economy in that there is reduction of the rubber surface a half, while the combination insures traction under all conditions of service.

The tire blocks may be made of any metal desired, but manganese steel is a probable material because it may be cast and it has unusually enduring qualities. As will be noted at Fig. 3 and Fig. 4 the blocks are formed so that when installed there is a space between the ends, which is to provide for the reduction of the external diameter of the tire. This space will vary from an inch to an inch and a half in width and it will afford traction on all unpaved roadways where the blocks contact with the ground. Reference to Fig. 6 shows a cross section of a block, which is cored to secure lightness. The blocks are secured to the rim and felloe by bolts cast integral with them. The blocks are so located that the bolts are about midway between each spoke. They are secured by nuts and lock washers or other device.

The method of installation is to fit a special rim to the wheel, the form of which is illustrated at Fig. 6, and this is shaped with a flange at the inside. Against this flange the shims are placed, and on these shims the block, the same bolt that retains the block retaining the shims. The channel section carrying the rubber tire is installed as is any solid wheel shoe,

Pneumatic Dumping Device Displayed at the Sampson Exhibit.



one flange of the channel holding the block rigid against the wheel rim flange. When a new installation is made the surface of the rubber tire is about an eighth inch above the steel blocks, or a quarter inch more in diameter. As the rubber is worn a shim may be removed from beneath each block, and the shims may be of any thickness that practise will dictate, so that the diameter of the steel tire is uniformly reduced until a point is reached where the rubber tire is no longer serviceable.

With the rims now the vogue the blocks may be installed by drilling the rim and felloe for the retaining bolts and the blocks may be retained against the rim flange of the rim by the channel of the rubber shoe. The wheel felloe and rim may be made any thickness and width that is desirable and the width of the steel tire whatever proportion is necessary to yield the best service. The rubber shoe is mounted on the outside of the rim to facilitate ease in installation or removal. It is not believed there will be occa-

Digitized by Google

sion to remove the blocks unless for the reduction of diameter by the thickness of a shim as necessitated by the wear of the rubber shoe. The construction has the merit of cheapness and endurance and it is held by the inventor that the tires, when used wherever dual shoes are installed, will yield equal results so far as riding qualities are concerned, will give far greater mileage for the rubber tires, thus lessening the expense from one point of view, while the metal castings, after the first equipment, will be useful for a considerable period—perhaps several years.

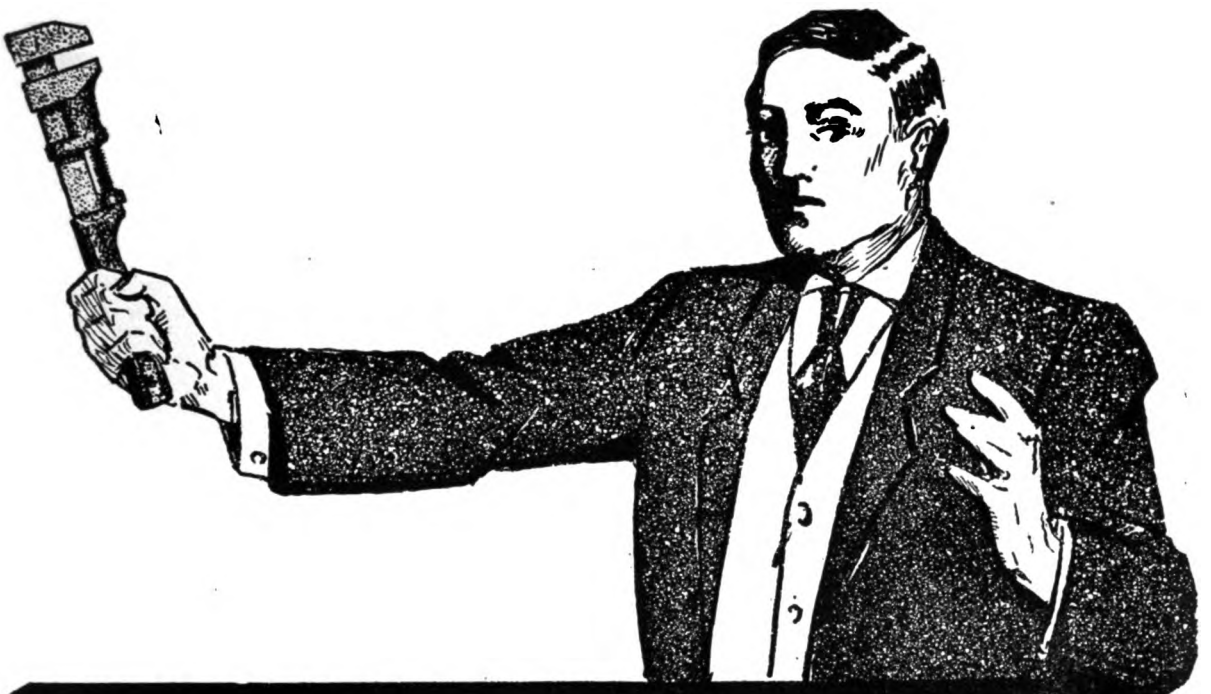
The descriptions of the detail drawing are: Fig. 1, side elevation of wheel, showing side of sectional blocks retained by bolts through the felloe. Fig. 2, reverse elevation of wheel, showing rubber shoe retained by flange and bolts or cap screws. Fig. 3, plan or top view of tire assembly, showing blocks and spaces. Fig. 4, side view of steel tire block, the dotted lines indicating the core. Fig. 5, plan view of steel shims. Fig. 6, cross section of tire assembly with these components: A, wooden wheel felloe; B, steel tire or wheel rim; C, cored steel block and retaining bolt; D, shims between steel block and wheel rim; E, demountable channel carrying rubber shoe; F, rubber tire; G, retaining flange or ring; H, retaining bolt.

The Baldwin Combination Steel Block and Rubber Tire for Service Wagons.

NEW WHITE SERVICE BUILDING.

The new service building of the White Company, Cleveland, O., maker of White pleasure and commercial vehicles, in New York City, has been opened at West 57th street, between 11th and 12th avenues. The location is held to be ideal for this purpose, owing to the fact that it is in the centre of the district in which a large number of industrial transports are operated.

The structure is a one-story building, but has a floor space of 25,000 square feet, due to its construction. No posts or pillars are employed, the roof being supported by trussed work. Overhead lighting is secured by means of large skylights. The department for maintenance and repair is very complete and comprises a modern machine shop, carpenter shop and a large stock room for a full line of White parts.



VELIE TRUCK IN WINTER RUN.

Having occasion to deliver a Velie speedster in Milwaukee, Wis., the Velie Motor Vehicle Company, Moline, Ill., decided to utilize one of the three-ton trucks made by it, thereby demonstrating the practicability of Velie commercial cars for winter service and in competition with the railroads. The pleasure vehicle was mounted on the power wagon and the 124 miles between the Chicago branch and Milwaukee were covered without trouble, a night stop being made at Racine, Wis. Throughout the journey an average speed of 10.2 miles an hour was maintained, despite the extreme cold and heavy roads, due to recent snows. The fuel consumption was about 4.1 miles to the gallon.

REO PAYS FOR ITSELF.

R. M. Owen & Co., New York City, distributor for the Reo Motor Truck Company, Lansing, Mich., reports that a Reo light delivery wagon sold six months ago by R. E. Ingersoll, metropolitan agent for this line, has covered 4553 miles and made 3773 stops, at a total cost for gasoline, oil and repairs of $78.86. The average figures out at about 1.75 cents a mile. During this service the car has earned $900.54, or some $150 more than the original cost of the vehicle. In addition, it is pointed out that the vehicle was able to maintain its regular schedule during snowstorms and under other conditions in which horse drawn equipment would have been seriously handicapped.

RECENT MOTOR VEHICLE PATENTS

Emergency Tank Device.

Letters patent have been issued Edward C. Smith, San Diego, Cal., for a gravity feed emergency fuel device for motor vehicle. It comprises a gasoline container mounted under the hood and near the radiator, and of peculiar shape, being flat on one side and curving to a point at the lowest end. A pipe is led from the vessel to the carburetor and interposed in the line is a stop cock which is operated by means of a rod extending upward and through the dash to a position convenient to the operator. Another pipe leads from the upper portion of the auxiliary tank to the main supply line and is connected thereto. The pipe leading to the extra vessel is fitted with a check valve its object being to allow the fuel to flow from the regular tank by gravity to the auxiliary member, but not back into the former. The small container is automatically filled by gravity as the main member is considerably higher and the fluid flows through the usual channels to the extension and thence to the emergency vessel. Here it is held by the stop cock until required. The auxiliary tank is fitted with a safety valve also a wall with air spaces to protect its contents from the heat of the motor, as well as to provide a circulation of air. It is claimed of the device that in addition to providing emergency fuel a flow of gasoline may be furnished to the carburetor with the car operating on unusually steep grades.

Emergency Spring Device.

Broken springs are not uncommon and among the devices intended to make a temporary repair is the invention of George S. Spreyer, Canon City, Col., to whom a patent has been issued. It differs from the usual construction of these appliances inasmuch as the leaves of the springs are riveted together at the centre, although the members bear loosely upon one another. The ends of the springs are so spaced apart that when clamped together they form a resilient spring end. An upturned extension is provided at one extremity while that of the opposite end is equipped with an eye and means are adapted to bear on the upturned extension and pass through the eye for securing the ends of the auxiliary spring on opposite sides of the line of cleavage in the vehicle spring.

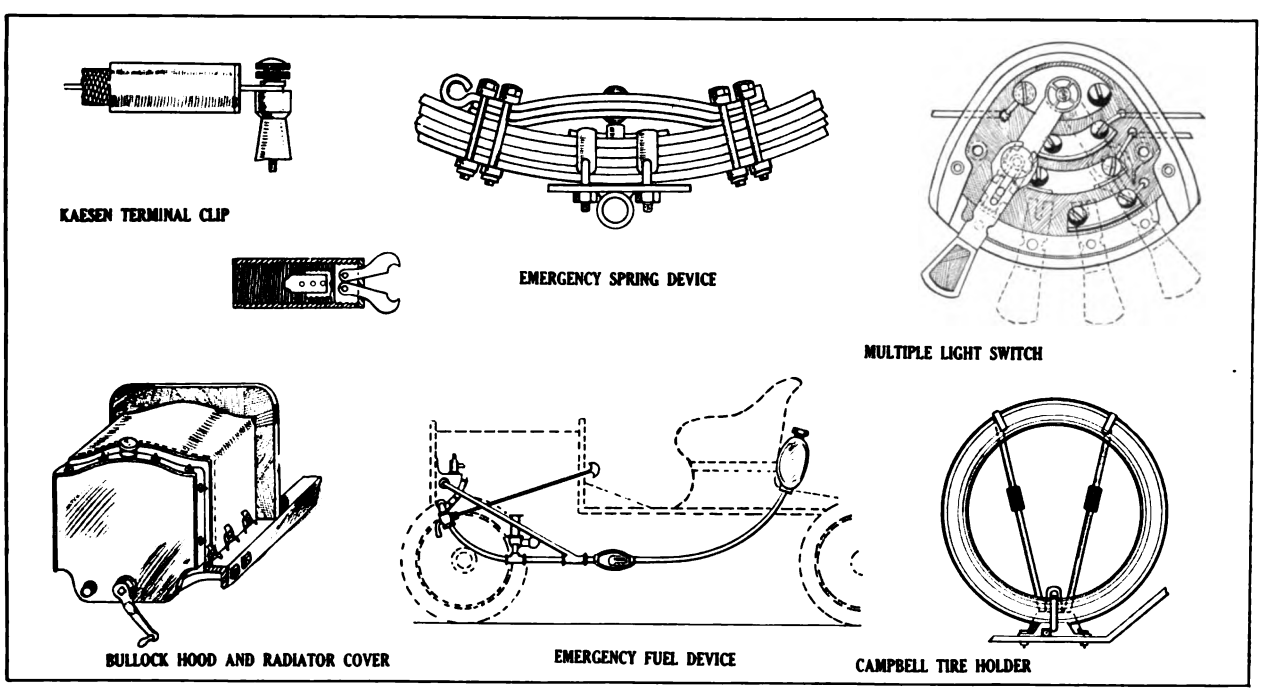
Multiple Electric Switch.

A patent has been granted to Edward E. Taylor and David H. Elkins, Amesbury, Mass., assignors to William Gray of the same place, for a multiple electric switch for lighting purposes. The device is similar in construction to the usual ignition members, being fitted with a throw lever which is pivotally mounted but so arranged that three movements are provided from right to left in operation. The first lights the side and tail lamps; the second, the head and tail members, and the third, all five lamps, this arrangement providing means for lighting the different members at the will of the operator. This is accomplished by means of three separate insulated contact pieces within the switch housing, two of the contact members having a continuous unbroken surface, while the third has a base and two separate curved surfaces located in the same arc of a circle. The spring lever is fitted with contact pieces of spring metal. The wire from the battery is led and attached to the terminal forming the retaining member of the lever and a single lead from each of the three contact members to the tail, side and head lamps, respectively, any group of which may be lighted or extinguished, as previously outlined.

Tire and Trunk Holder.

Many motorists object to attaching brackets to the body of the motor car for the purpose of fastening the extra tire and trunk. A patent has been issued to Archibald U. Campbell, Toledo, O., for a combined tire and trunk holder which obviates the use of body attachments, and in addition is adjustable permitting the retention of different sized shoes, a feature which will appeal to motorists when exchanging their machine for one equipped with larger or smaller tires. The locking device consists of a base block which is attached to the running board and provided with a movable lug which rises from the inner side and extends outwardly and downwardly over the tire, and means are provided for locking the bar to the base member in the usual manner. Two telescoping arms are attached at one end to the base block extending upwards, and are provided with curved ends for the purpose of securing the shoe. The design is such that a tire cannot be removed by forcing it away from the upper supports as the lower part of the shoe is held securely by the locked lug. In addition it is claimed that a tire may be removed or replaced in a few seconds as there are no straps to unbuckle, the operation involving merely unlocking the lug.

Electric Wire Terminal.



A device for the purpose of connecting electric conductors with spark plugs in internal combustion engines, although the appliance is not limited to spark plugs in its scope, has been patented by Julius Kaesen of New York City. It is claimed that by it a connection may be made quickly and securely to the central electrode of a spark plug or binding post of any telegraph or electrical instrument, and that its construction is such that it cannot work loose. It comprises an internally screw threaded sleeve and an externally screw threaded member is said sleeve with its threads in engagement with the former, also a fastener at the inner end of said body for the conductor. A pair of jaws are pivotally mounted to the inner member. In attaching the device the outer sleeve

Digitized by Google

is unscrewed and moves backward allowing the jaws to expand. To fasten the latter, the sleeve is rotated in an opposite direction, which movement closes the jaws firmly upon the electrode or binding post as the case may be. The device for attaching the wire consists of a strip riveted to one side of the inner member and extending beyond is bent over and doubled upon itself to produce, with a screw, the fastener proper.

Hood and Radiator Covering.

A covering for the radiator and hood of a water-cooled motor car, the design of which is such that one or both parts may be protected from the cold or elements, has been invented by Calvin Bullock of Denver, Col., to whom a patent has been granted. It comprises three parts; namely, a body member for covering the hood, a relatively narrow strip for the top and sides of the cooler, and a third or cap member for the exposed end of the radiator. The third member is designed for use in cold weather and is fastened to the narrow strip by a form of curtain fasteners which makes for easy removal. The hood member is held in place by straps fastened to buckles attached to the side board members of the frame. When utilized in the summer the hood device is intended to prevent water and moisture reaching the power plant.

Some Patents Applicable to the Motor Car and of Interest to Owner, Maker and Manufacturer of Parts.

MAYNARD HEADS UTICA CLUB.

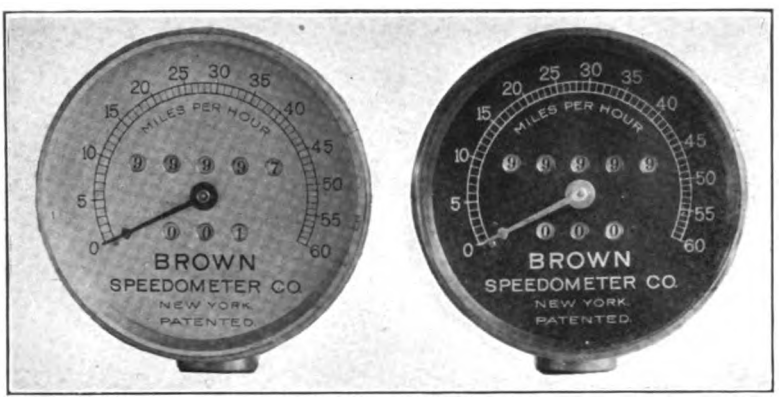
At the annual meeting of the Utica Automobile Club, Utica, N. Y., held recently, the membership was stated to have been almost doubled during the past year. The election of officers resulted as follows: President, Arthur B. Maynard; first vice president, Frederick T. Proctor; second vice president, Perle W. Harter; secretary, John M. Ross; treasurer, Charles W. Wicks; directors, Edgar B. Odell, Charles H. Yates, F. W. Bensberg, Ray P. McLoughlin, Tom W. Johnson, Russell Wheeler, Harry W. Roberts.

COLE COMPANY DROPS FIGURES.

Following the policy of the majority of motor car builders the Cole Motor Car Company, Indianapolis, Ind., has dropped the figures "30" and "30-40" which have been used after the trade name of its car, the Cole. These figures which signified the horsepower of the motor had a value from an advertising standpoint, but it developed they were confusing to some extent.

DEMOUNTABLE RIMS FAVORED.

That there is a growing tendency to fit cars with demountable rims was evidenced at the New York shows, and this practise was by no means confined to the high priced cars. According to the Firestone Tire & Rubber Company, Akron, O., 162 of the 227 automobiles at the Madison Square Garden show were thus equipped. At the Grand Central Palace display 90 of the 146 vehicles had similar fittings, and the Firestone predominated. This was also true of trucks, 20 of 82 power wagons at the Palace exhibit displaying removable rims.



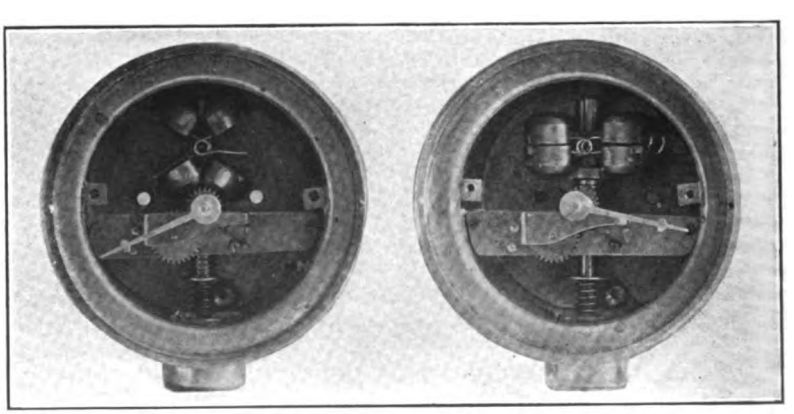
Change Santa Monica Race Dates—The dealers' association of Los Angeles, Cal., which has the management of the Santa Monica races, has changed the date from May 11 to 4. The events will be at 202 and 250 miles.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

Digitized by Google

THE NEW BROWN SPEEDOMETER.

THE Brown speedometer, a speed and distance indicator recently placed in the market by the Brown Speedometer Company, has a number of especially interesting mechanical features that are claimed to insure for it qualities that make for unfailing accuracy and endurance. This instrument is produced at the factory at New Britain, Conn., which has been equipped with the highest class machine facilities, and by workers specially skilled in accurate and exacting work.



Brown Speedometers: At Left the Original Dial, and at Right the New Brown Dial, Illustrating the Ease of Reading the Latter and Wide Sweep of the Indicating Hand and the Long Speed Scale.

In general appearance the Brown speedometer does not differ from other instruments of this class. Three types are made which differ only in that the maximum of registration is 60, 80 and 100 miles an hour respectively. All have four-inch dials. The indicator hand is mounted in the centre and has a sweep of 240 degrees of a circle from zero to maximum. There are two registers for distance, the upper recording to 99,999 miles, and the lower to 99.9 miles, they being respectively season and trip records. The trip register may be set at zero by a push button at the side.

The models now produced are unique in that they have brown dials with the scale and characters made by the metal of the dial plate itself exposed through the enamel, the indications being made by the white metal hand. The readings of the registers are from black figures on white backgrounds exposed through the ports in the dial face.

The odometer register is claimed to be the only type made in which it is impossible to make any change save through the movement of the mechanism, so that it is proof against tampering or possibility of any of the train of gearing being changed by accidental jar or shock. The mechanism is decidedly ingenious. On the main shaft of the instrument is a worm gear which engages with a pinion on the odometer driving shaft. On this driving shaft, as shown at Fig. 1, is a ratchet having an eccentric motion. The ratchet end is carried in a clip that maintains it in correct relation to the teeth of the first pinion of the train of trip indicator gearing. A dog or pawl attached to ratchet arm by a spring prevents any movement of the pinion unless made by the ratchet arm. No matter whether the driving shaft is turned forward or backward the eccentric-driven ratchet arm always moves the pinion in one direction. It cannot be reversed. This insures that any movement of the car will be indicated on the register in tenths of miles, and any movement will be registered on the speed scale.

In the odometer semi-Geneva gears are used. As will be noted from Fig. 2, which shows the season's mileage register train, there are six of these gears, five in one line, these carrying dials with numerals from 0 to 9 inclusive. The large cam that actuates this train is driven by the pinion engaging with the arm of the ratchet. This camshaft also carries the gear that drives the pinion that operates the trip odometer. By noting Fig. 2 it will be seen that each gear or star wheel is held by a dog and the first dog is held by a spring retained pawl. The disc in connection with each gear is notched and when one end of the dog retaining this gear engages with the notch the other end of the dog is moved outwardly so the gear may be moved one tooth by the engaging cam. To describe this another way would be to say that the cams actuating the registers move by tenths the star wheels carrying fingers that engage with the star wheels on the unit of the season and trip registers. The timing is such that a pawl drops into a notch on the disc of the first wheel of the season register and the cam carries the second wheel forward one figure or tenth at each complete revolution of the first wheel. Then the dog is pushed out of the notch in the disc and the wheel is securely locked.

Brown Speedometer Governor: At Left Is Shown the Speed Indicating Hand at Zero and the Compound Weights Widely Separated; at Right the Hand Is at Extreme of Speed Scale and the Weights Are Closed Against the Springs Between Them.

Digitized by Google

The entire train of gears or wheels is locked by the action of the pawl and spring holding the first wheel. The trip register may be reset to zero at any time by a release.

Another feature is the governor, of the centrifugal

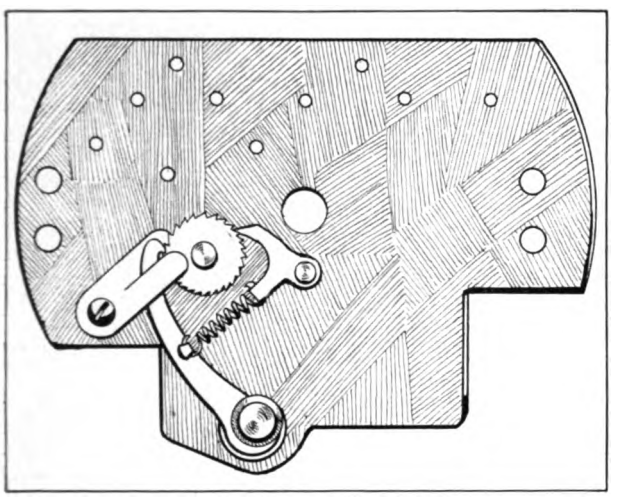


Fig. 1—Bottom of Odometer Plate of Brown Speedometer, Showing the Eccentric Ratchet Arm Actuated by Odometer Driving Shaft and the Pawl-Retained Odometer Driving Pinion.

type, which is shown in the positions of zero and maximum by the removal of the dial and the odometer plate. This governor is carried on a shaft mounted in ball bearings at the top and bottom of the case, the lower bearing being screwed into the boss at the base and secured by a lock nut. Above the bearing on the shaft is the worm that operates the odometer, and above this is a disc oil shield that prevents lubricant from the bearing reaching the mechanism of the instrument. Resting on this shield when idle is a bronze rack on a sleeve that slides on and revolves with the shaft. Across the case may be noted the handstaff frame that carries the handstaff. On this handstaff is a pinion that meshes with a gear mounted on the frame, which in turn drives a shaft that parallels the handstaff. On this parallel shaft is a pinion that meshes with the revolving rack. As the revolving rack moves on the governor shaft it turns the pinion of the parallel shaft and this in turn through the gears and pinions swings the handstaff that carries the indicating hand.

The governor is four weights in compound form, so-called. It is connected with the revolving rack, there being a collar on the rack and between this collar and the governor is a helical spring that normally forces the rack downward on the shaft when the instrument is idle. The upper end of the governor shaft carries a cross shaft or pin, the end of the revolving rack sleeve being slotted to allow movement up and down on the governor shaft. The cross shaft ends are tapered and on these ends are mounted four connecting arms which carry the four semi-circular governor weights, which normally are at extreme height and depth, being kept separated by four calibrated springs. The upper end of the governor shaft is mounted on a ball bearing fixed in the case.

As the governor shaft is revolved the centrifugal force throws the weights outward and consequently nearer together. The revolving rack is carried upward on the governor shaft and the pinion on the parallel shaft is partly revolved, the shaft, through the gearing, moving the handstaff and the indicating hand. At the same time the worm gear on the governor shaft actuates the odometer mechanism.

Extreme care is observed to secure endurance, the pinion operating the revolving rack being of steel, cut and hubbed to secure exact uniformity and smoothness of finish. The main wearing parts in contact are steel and bronze. Every component is produced under closest inspection, and the steel parts are hardened and ground, while the revolving racks are finished in watch lathes. In the assembly the odometers are tested in series against a standardized plate, the test being usually a registration of about 1000 miles, driven at a speed of 85 miles an hour. This is sufficient to develop any defects. In standardization the registers are subjected to severe work, one being noted recently that had been driven 90,952 miles at a speed of 85 miles without perceptible wear.

The governor is adjusted by calibrating the springs. This is done by a standardized instrument driven constantly to indicate a speed of 30 miles an hour. This means a uniform speed of the electric motor during the test. The governor under test is driven off the same motor shaft and by varying the diameter of the driving pulley the instrument is required to show the exact ratio of increased or decreased speed the variance of the driving wheel bears with reference to the driving wheel of the standardized indicator. Any necessary adjustment can be made through change in the springs spreading the governor weights. That is to say, the spring resistance may differ substantially but each instrument must register correctly at all speeds. After the governor is calibrated the odometer plate and dial are attached

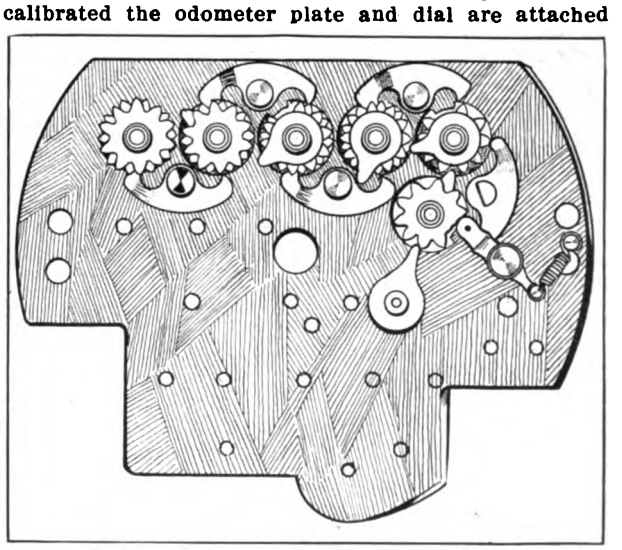

Fig. 2—Top of Brown Speedometer Odometer Plate, Showing the Train of Semi-Geneva Gears of the Season's Register Driven by Cam, and the Pawl and Dogs That Securely Lock the Gears Against Any Movement Not Mechanically Provided For.

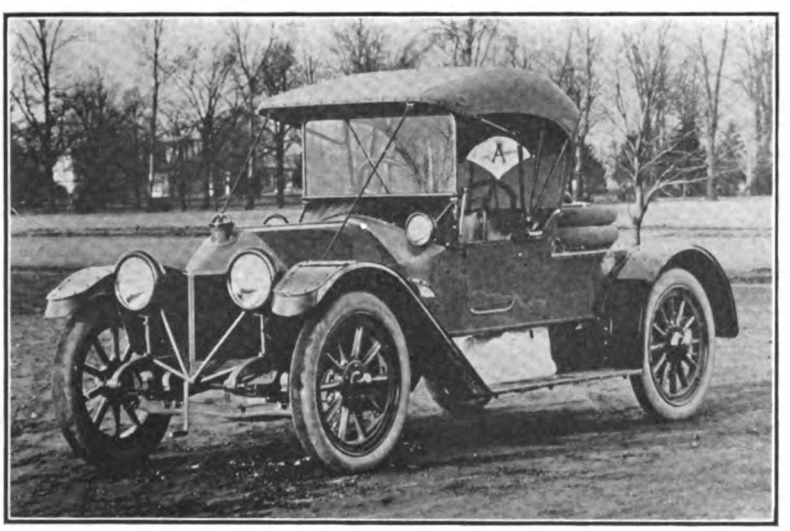
and the whole is enclosed in a heavy drawn brass case and enclosed with a drawn brass ring bezel into which the glass dial cover is spun securely.

The instrument is driven by a high grade flexible shaft with a specially made swivel joint and a spe-



Digitized by Google

cially cut pinion and a driving gear that is attached to the wheel spokes. The shaft pinion is carefully hubbed that each may be exact and certain in its relation. The entire assembly is finally inspected and prepared for shipment. The manufacturing is under the supervision of a mechanic of long experience in speedometer production and the instrument as sent out is guaranteed to be perfect and to give complete satisfaction.

DICKSON SUGGESTS NOVEL PLAN.

George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, Ind., manufacturer of National cars which hold the world road race record, makes a novel suggestion regarding a race for stock cars. "What I would like to see," he says, "is that the American Automobile Association ask the manufacturers for a list of our dealers. Then unknown to us, this official body might drop in on these dealers, and select a car off the floor. Let them do this at three or four different cities without our knowledge. Then allow them to enter the machines in a race and the result will answer all questions about stock cars.

"Although we have won races with stock models, every now and then we find someone who questions our honesty, and although we refer them to the American Automobile Association, still they are inclined to doubt that a stock car could hold together and perform as well. If we could get the kind of a contest I have outlined, I have no doubt as to the result."

Wedge Shaped Radiator Which Not Only Reduces Wind Resistance, But Adds to the Appearance of the New Abbott-Detroit Roadster.

PHYSICIANS FAVOR MOTOR CARS.

According to the United States Motor Company, New York City, the medical profession not only heads the list of those who utilize automobiles in their vocations, but there is a comfortable margin between its figures and those of the nearest competitor. It is estimated by the Maxwell-Briscoe Motor Company that there are 51,000 Maxwells in service at the present time and that 16,527 are used by physicians. The latter are quick to realize the advantages over the horse drawn equipment, as the motor car has greater speed, endurance and is cheaper to maintain than a number of animals.

COLE WESTERN AGENTS CONVENE.

Continuing an established practise of holding meetings at which their various representatives may have an opportunity of discussing the methods of furthering the sales of Cole automobiles, the second annual smoker of the western agents of the Henderson Motor Sales Company, distributor for the Cole Motor Car Company of Indianapolis, Ind., was held in the Hotel Lexington, Chicago, recently. The event was well attended and many interesting addresses pertinent to the occasion were made.

ATTRACTIVE ABBOTT-DETROIT ROADSTER.

A certain percentage of the power of a motor is consumed in overcoming the resistance of the wind and to reduce this loss designers have brought out new types of bodies, the lines of which are not only attractive but add to the speed of the automobile. This feature has been incorporated in the design of the Abbott Motor Company, Detroit, which concern manufactures a roadster fitted with a racy appearing radiator as will be noted in the accompanying illustration.

The cooler is wedge shaped and the filler cap is of ample proportions and sets off the design. A feature of the radiator is that its construction protects it from possible injury, inasmuch as it is safeguarded by four substantial rods which form the starting crank support. The machine is equipped with fore doors and the design of the top and windshield is such that the occupants are fully protected from the weather. Liberal fenders and splash shields protect the passengers as well as mechanism and add their full value to the attractive appearance of the vehicle.

STUTZ ENTRY NAMES DRIVERS.

The Ideal Motor Car Company, Indianapolis, Ind., which has entered two Stutz cars in the second annual 500-mile race in that city, will entrust the machines to the care of Leonard Zengel and Gilbert Anderson with William Knipper as a relief driver. Zengel is well known in racing circles having formerly piloted Chadwicks and Nationals. He started 13 times last season winning nine firsts, three seconds and one third, finishing with place in every contest.

ANNUAL RUBBER PRODUCTION.

According to the United States Tire Company, New York City, the annual production of rubber is about 75,000 tons. Half of this is utilized in the manufacture of automobile tires and accessories.

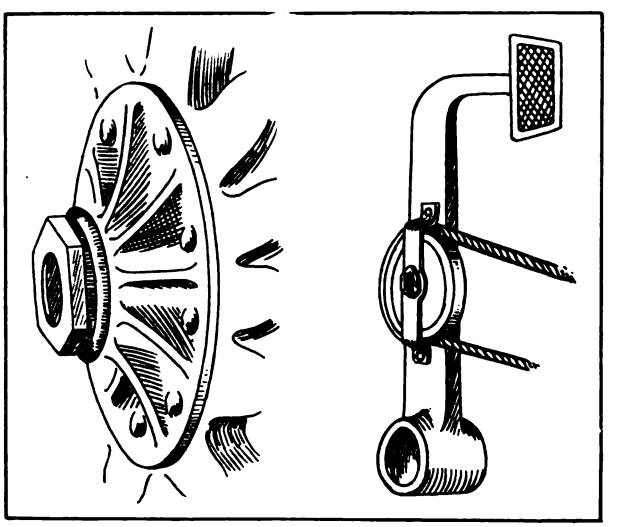
PECULIARITIES IN FOREIGN DESIGN.*

(By William Guy Wall.)

The majority of American engineers are familiar with the general design of foreign cars. There are a few minor details, however, which are not only interesting but worthy of discussion. The only difficulty lies in picking out those which have not been described in the trade papers.

One of the most noticeable features is the broad nosed admission cams. In fact, in several instances the foreign manufacturers are using identically shaped cams for both intake and exhaust and allowing the period of opening to be the same. In a few exceptional cases this is done by the closing of the exhaust late and the opening of the admission early, so that they overlap, which is a poor thing in making an easy starting engine. In most instances a greater lag is given to the admission valve, not closing it in some cases until 55 to 60 degrees past centre. Of course, most of their engines being small and running at high speed, this works out very well, and is also beneficial, as is well known, for motors in racing cars. But for large motors which run at comparatively slow speeds it evidently is not good practise. Most of the cams noticed had straight, though not tangential, sides, while a few were under-cut, or laid out with a constant accelerating curve. Ease in grinding is very much in favor of the straight sided cam, especially so when such methods of grinding are used, as is the case with one large concern which makes use of a surface grinder and turns the camshaft back and forth by hand, not grinding the nose at all.

A number of engines have valve lifter levers, between the cams and tappets. These were used to quite an extent on American cars several years ago, but in most instances have been abandoned. There may be a revival of this practise, however, as great claims are made for it, as to advantage in producing quietly operating poppet valves.



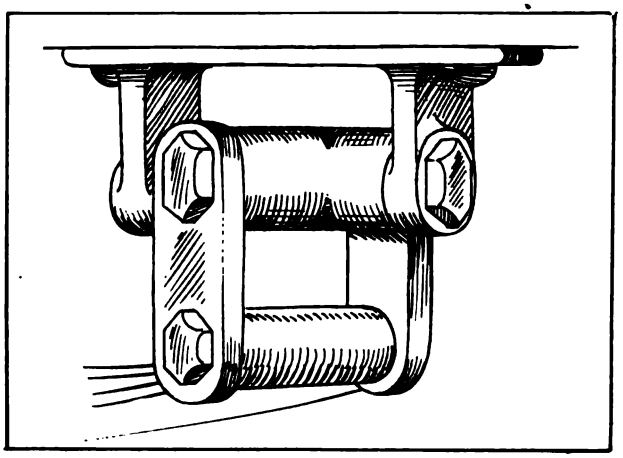
The use of rather narrow piston rings is very noticeable, especially on the Continent. While narrow piston rings are without question an excellent thing as far as holding compression is concerned, as the ring conforms to the slight inequalities of the cylinder, at the same time it is a very questionable proposition as far as durability is concerned.

The water jacketing of the intake pipe occurs on a number of foreign cars. This is generally accomplished by making a double pipe of copper and necessarily increases the expense, but is without doubt a good thing.

Several manufacturers are using on their engines a combination strainer and cooler for the lubricating oil. Most engines have strainers for the lubricating system, but the idea of cooling the oil as it is continually circulating in the crankcase is something which has received very little attention on this side. One company in particular has a very simple device consisting of a ribbed sheet metal retainer made in the form of a radiator, which no doubt lowers the temperature of the circulating oil a number of degrees.

In the use of the silent chain for driving camshafts, which is very extensive, no good way seems to have been devised to take up the slack due to elongation. The chain manufacturers claim that the chain readjusts its pitch centres to a slight extent, taking up the wear by riding higher on the gear teeth. This is not sufficient, however, to be of much practical value. Some are using an eccentric around the bearing of the magneto gear, taking up the stretch of the chain by this means. Of course, this necessitates either the moving of the magneto every time this is adjusted, or else allowing the magneto to get out of line with the driving shaft, which is hardly permissible. Others use an idler gear to take up the elongation. A non-adjustable arrangement is practically out of the question when the necessary accuracy which is required for the chain is considered.

An ingenious contrivance is used by the Itala in its rotary valve motor to equalize the pressure on this valve. This is accomplished by making a recess in the opposite wall and having a small hole, about .125 inch in diameter, project directly through the rotating member, so that during the explosive stroke the pressure is nearly equalized around the entire valve.



Ribbed Hub, at Left; Brake Equalizer Attached to Pedal, at Right.

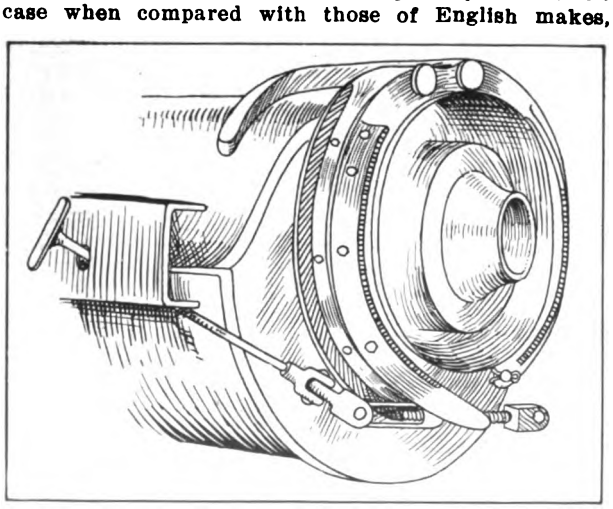
There have been a good many comments made on the Daimler's practise of chilling the inside of the cylinders when they are cast and finally grinding them so as to eliminate most of the chilled portion. This no doubt has a tendency, as it is claimed, to make a closer grained casting, but seems rather dangerous in practise on account of the possibility of varying differences in hardness, due to different depths to which the iron would be chilled; for any spots in the cylinders at this point, which were harder than the surrounding metal, would undoubtedly score the pistons.

The use of drop forgings, or, as they are called over there, steel stampings, for pistons, as used on the Lanchester engine, seems rather an expensive propo-

*Extract from a paper read before the January meeting of the Society of Automobile Engineers.

Digitized by Google

Unconventional Form of Spring Shackle.



sition, due to the amount of machine work necessary, and also questionable as to the frictional qualities of the metal, and cannot be compared with what another manufacturer is doing in the use of malleable iron, which seems to be giving very good results, and allows the piston to be made very light.

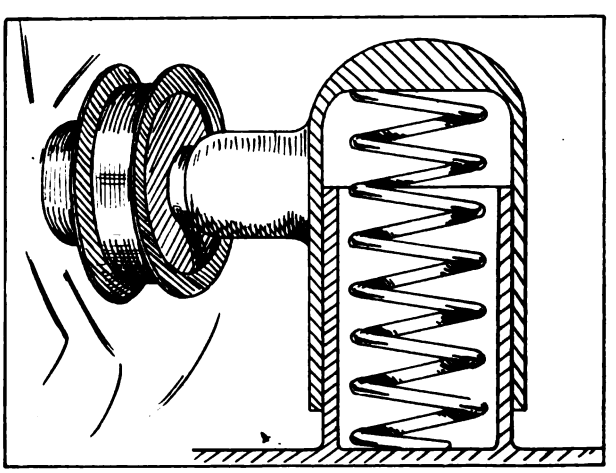
The idea of placing the carburetor in the bottom of crankcase surrounded by oil, as is done on the R. E. P. aeroplane motor, looks as if it might be a possible solution of the great question of keeping the gasoline vapor at a uniform temperature.

The valve springs on a great majority of the motors are enclosed. In some cases the design is such as to make them readily accessible, while in others it looks as if it would be next to impossible to remove them when necessary.

Considerable ingenuity is being used in devising means to do away with the H slot arrangement in shifting selective transmission gears. One firm partially accomplishes this by the use of a large cam arrangement in its transmission case, which, working with a single lever backward and forward, carries the sliding gears through all their different operations. The advantage of this device is rather questionable.

As is well known, the transmission gears in Continental cars are very narrow; especially is this the case when compared with those of English makes,

Method of Adjusting Brake by Hand Lever.



which approximate more nearly our own. The narrow face gear is very hard to make so that it will run quietly, as the pressure a square inch on the teeth has to be much higher than if the gear were wider.

In regard to the design of rear axles the inaccessibility of the gears when bevel gears are employed is very noticeable, as most of the gearcases are split through the centre and the halves bolted together, so that there is no possible way of looking into these cases or adjusting the gears without taking the axle from under the car.

A noticeable thing is the elimination to a great extent of the distance rods running from the rear axle to frame; most cars driving through the springs with the assistance of a torque member, or when this is not the case through a centre torsion tube surrounding the driving shaft and fastened to a well-braced cross member in frame back of transmission.

A great majority of manufacturers are using metal to metal brakes, some of them going so far as to use cast aluminum lined with cast iron working against iron shoes.

An idea worthy of note found on some cars is the

Spring Tensioning Device for Fanbelt.

use of radial ribs on the outside flanges of hubs to strengthen them. This no doubt fulfills its mission but makes a hub which is very hard to clean and paint.

The use of a bolt in each spoke where wood wheels are employed is met with quite frequently. While this may be correct in theory, it has a tendency to weaken the spokes, due to cutting away so much of the wood.

It is very easy to see by inspecting the front axles of different cars which manufacturers have had racing experience to any extent. All of those who have been racing for several years past use steering arms without shoulders, whereas those who have had no experience in racing generally have shoulders on these arms where they go into the knuckles. The latter construction tends to concentrate the vibrations at one point and will eventually cause them to crystallize and break. The Renault has a very excellent design at this point, but fairly expensive, this consisting of a long tapered square on the end of the arm, which projects through a corresponding square in the knuckle and is held in place by a large nut. The change from the round main portion to the square section is very gradual so as to leave no shoulder.

Digitized by Google

The Renault idea of placing the radiator back of the engine has been followed by a number of manufacturers on the Continent; whereas a few others have used this position in which to place the gasoline tank. The idea of the gasoline tank in the dash, however, is subject to considerable criticism on account of making it much more difficult to put coils and other equipment on this part of the car.

Most manufacturers are coming to the use of very large diameter universal joints in their shaft drive between transmission and rear system. There also seems to be a decided tendency to make sharp pointed or oval fronts of radiators and to slope the bonnets at a very sharp angle so as to eliminate wind resistance. This is especially noticeable on two makes of cars which claim very high speed.

There are a great many details of cars made abroad which could be mentioned, some of them useful and others of questionable value; among them such things as: Oil filler cast on back end of rear axle case; the use of herring bone or double spiral main gears in transmission; brake adjuster on transmission brake made so that the adjusting rod goes through side of frame; fanbelt tighteners; a cheap brake equalizer, consisting of cable running over a pulley on brake pedal; different forms of couplings for magneto; the idea of attaching speedometers to the driving shaft instead of to the wheels; and a coiled spring covered with wire netting for use in filling the trimming on arm rests and where rolls are used in the upholstering.

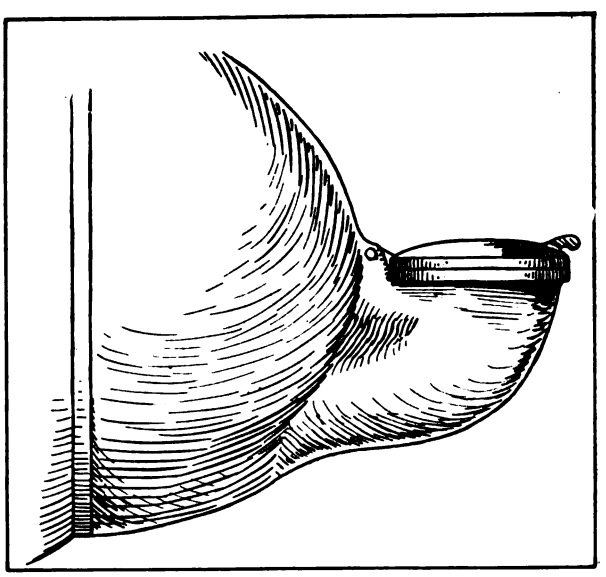
A word might be said in regard to motor starters, which seem to be extremely scarce. With the exception of two manufacturers using compressed air startters, one of them returning the compressed air from the tank to the cylinders, and the other using a small motor for turning the engine and a mechanical starter on one make of car, there seem to be no forms used.

STODDARD RESIGNS AS VICE PRESIDENT.

Announcement is made by the United States Motor Company, New York City, that C. G. Stoddard has resigned as vice president but will continue as a director of the company. O. S. Goan succeeds Mr. Stoddard as chairman of the operating council which comprises the heads of the various departments. J. W. Stoddard, father of C. G. Stoddard, continues as a director of the organization.

ISSUES BALL BEARING DATA.

The New Departure Manufacturing Company, Bristol, Conn., is mailing the trade a new 76-page catalogue containing information of a technical nature of value to engineers. The book is profusely illustrated and may be obtained from the company upon request. The latter suggests that applications be made upon the letter heads of the concerns they represent.



British Engineers to Visit France—The British automobile engineers will not visit this country during the present year as arrangements have been concluded to make a trip to France instead.

Advocate uniform motoring laws in the interests of pleasant and profitable interstate touring.

MICHIGAN CAR WELL REPRESENTED.

The automobile industry is keenly interested in the rapid progress being made by the Michigan Buggy Company, Kalamazoo, Mich., maker of the Michigan "40." This concern is one of the largest manufacturers of high grade carriages in this country and its product is known throughout Europe as well. In the last quarter of a century the company has built up a selling system which includes a large army of dealers and which is conceded to be one of the most comprehensive and economically operated selling plans of the age.

When the first Michigan automobile was completed two years ago there were 10,000 representatives of the company ready to absorb the entire output as years of satisfactory dealing with the company had taught them that the new vehicle would be in keeping with the policy of the maker of carriages. Orders were received from remote sections and many of these were

Rear Axle Housing Grease Filler.

accompanied by letters of encouragement and promises of support. One well known dealer ordered 200 machines without having seen a catalogue or the car.

Having a perfected selling plan, this expense was a negligible quantity with the Michigan concern and enabled it to place a motor vehicle upon the market in which was incorporated money which otherwise would have been expended in introducing the new production.

BURMAN TO RACE AT NEW ORLEANS.

The feature of the race meet at New Orleans, La., Feb. 17 and 18, will be the appearance of Robert Burman with his 300 horsepower Blitzen Benz, who will endeavor to lower the track record. Other cars expected to compete include: E-M-F, Ohio, Case, Halladay, Ford, Fiat and Cino. At the conclusion of the events Burman expects to try out his new machine on the beach at Daytona, Fla.

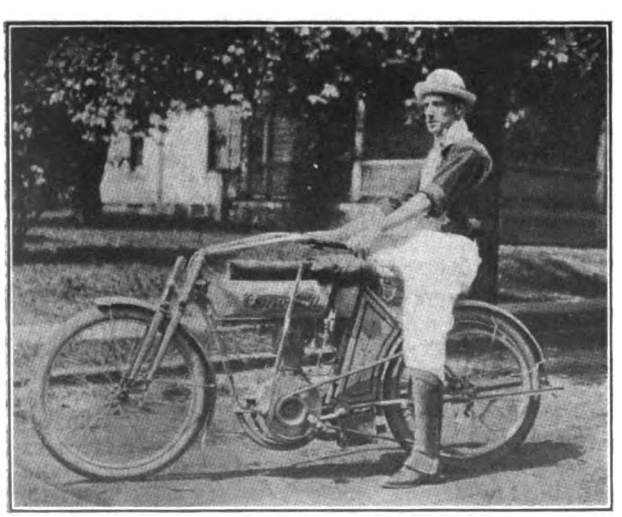
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

New Members for January.



The official report of Dr. G. B. Gibson, secretary-treasurer of the Federation of American Motorcyclists for January, shows a grand total of 402 new names for the month. These were divided by districts as follows: Lake, 107; Southwestern, 98; Atlantic, 67; Gulf, 31; Pacific, 27; Central, 25; New England, 16; Peninsular, 15; Insular and Canadian, three each.

The new members were classified according to states as follows: California, 104; Ohio, 47; Pennsylvania, 34; Washington, 25; Texas, 21; New York, 20; Michigan, 19; Indiana, 15; Missouri, 14; Iowa, 12; Massachusetts, 10; Maryland, 10; South Carolina, nine; Louisiana, nine; Kansas, nine; Panama, nine; Illinois, six; Wisconsin, six; Connecticut, four; New Jersey, three; Florida, three; Canada, three; Colorado, two; Nebraska, two; New Hampshire, Vermont, North Carolina, Georgia, Alabama, Mississippi, Minnesota, South Dakota, Arizona, New Mexico, Montana and Oregon, one each.

Motorcycles at Chicago Show.

There were the same number of makes on display at the Chicago show as at New York. The Wagner, made by the Wagner Motorcycle Company, St. Paul, Minn., was the only one not seen at New York, and the M-M, made by the American Motor Company, Brockton, Mass., which was represented in the metropolis, displayed at its new salesrooms, 2724 Michigan avenue, instead of at the Coliseum annex. The remainder of the list follows:

Emblem, Emblem Manufacturing Company, Angola, N. Y.; Indian, Hendee Manufacturing Company, Springfield, Mass.; Flanders, Flanders Motorcycle Company, Pontiac, Mich.; Excelsior, Excelsior Supply Company, Chicago; Harley-Davidson, Harley-Davidson Motor Company, Milwaukee, Wis.; Henderson, Henderson Motorcycle Company, Detroit; Minneapolis, Minneapolis Motor Cycle Company, Minneapolis, Minn.; Merkel, Miami Cycle & Manufacturing Company, Middletown, O.; New Era, New Era Auto Cycle Company, Dayton, O.; Pierce, Pierce Cycle Company, Buffalo, N. Y.; Pope, Pope Manufacturing Company, Hartford, Conn.; R-S, Reading Standard Company, Reading, Penn.; Thor, Aurora Automatic Machinery Company, Aurora, Ill.; Yale, Consolidated Manufacturing Company, Toledo, O.

Caleb H. Johnson of St. Marys, O., and His Emblem.

Happy with His Emblem.

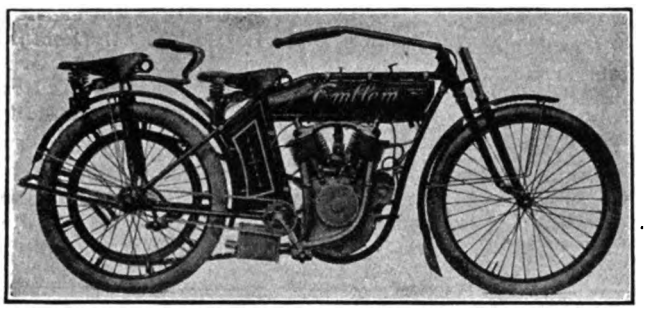
An accompanying illustration presents Caleb H. Johnson of St. Marys, O., and his Emblem motorcycle, made by the Emblem Manufacturing Company, Angola, N. Y. Mr. Johnson has missed riding very few days this winter and says he takes more comfort out on the road with his mount than in any other form of enjoyment he could devise.

Motorcyclists Ride to Dance.

The San Jose Motorcycle Club, San Jose, Cal., recently gave a dance in that city, and among the guests were a number of riders from San Francisco and Oakland, who covered the 50 miles between cities on their machines.

Rhode Island Club Officers.

At the February meeting of the Rhode Island Motorcycle Club, Providence, R. I., the following officers were elected for 1912: President, E. E. Ryder; vice president, I. C. Hylisted; secretary-treasurer, W. L. Medhurst. The road officers and committees will be appointed at the March meeting. At that time plans for the coming season will be made, starting with the annual smoker.



Chicago Dealers Organize.

During the latter part of January, the motorcycle dealers in Chicago decided to combine efforts in a campaign which shall result in a decidedly increased business during the coming year. P. B. Whitney, manager of the Indian wholesale branch, presided at the organization meeting, at which the Chicago Motorcycle Dealers' Association was formed with the following officers: President, H. W. Angsten of the Angsten-Koch Company; vice president, R. C. Crist

EMBLEM MOTORCYCLES

"They are Different because they are Better"

Everything that is best in modern motorcycle construction is incorporated in Emblem Motorcycles for 1912. Almost every motorcycle boasts of some of these improvements—Emblem Motorcycles have them all, including the Free Engine Clutch. Compare the entire line of Famous Sturdy Emblem Motorcycles with any other first class make and you will see the great difference in price, and at the same time more dollar-for-dollar value than in any other make of motorcycle manufactured. The 1912 EMBLEM is racy looking, possesses unlimited speed and reserve power and is built to withstand the roughest possible service, because nothing but the finest material possible to buy enters into its construction. If we have not an agent in your town and you are the right sort of enthusiast, write today, we may need you to represent us.

EMBLEM MANUFACTURING COMPANY
Dept. D.
ANGOLA ERIE COUNTY NEW YORK

of the Edwards-Crist Company; secretary, F. D. Freeman, Cook county agent for the Thor, and treasurer, R. P. Miller, Excelsior agent. A board of directors, consisting of 11 members, each representing a different make of machine, was selected as follows: J. E. Edwards, Indian; J. V. Turley, Thor; C. H. Lang, Harley-Davidson; Fred I. Huyck, Merkel; A. S. Clausen, Yale; I. H. Whipple, Flanders; Guy M. Greene, M-M and Eagle; L. J. Leonard, Excelsior; A. J. Musselman, American; R. R. Hill, New Era, and H. E. Halbert, R-S.

Columbus Wants F. A. M. Meet.

The Columbus Motorcycle Club, Columbus, O., has begun an active campaign for the 1912 assembly of the Federation of American Motorcyclists. It is announced that the club now has a membership of over 200 and will make this more than 300 before July 1. The track is a one-mile oval, dirt, but regarded as exceptionally safe. W. H. Snyder, president of American Machine Company, agent for Emblem motorcycles, is chairman of the committee in charge of the campaign and promises to secure the convention, if possible.

Latest Registered Repair Shops.

The following registered repair shops have been added to the list recently published: John Steele, 165 Paterson street, Paterson, N. J.; J. B. Quinn, 201 Ridge street, Fall River, Mass.; Whipple & Forman, 51 Genesee street, Auburn, N. Y.; C. J. Mitchell, Temple, Tex.; W. A. Myers, Williamsport, Penn.; P. M. Thompson, 826 Dodge street, Lake Geneva, Wis.; Sonneborn's Sons, 713 Main street, Laporte, Ind.; Apex Bicycle Company, 12 12th street, Portland, Ore.; Fred Strowbridge, 324 West Dominick street, Rome, N. Y.; G. A. Allen, 44 Church street, Livermore Falls, Me.; Baltimore Gun & Bicycle Works, 336 West Second street, Albany, Ore.; Turlock Cyclery, Turlock, Cal.; Wolverine Auto-Cycle Company, 59 South Jefferson avenue, Battle Creek, Mich.; C. A. Sherman, Middleboro, Mass.; Garrison Motor Company, 454 Monroe street, Memphis, Tenn.; F. P. Fentress, 247 Commerce street, Tacoma, Wash.; Greenough & Greenough, 24 King street, Charleston, S. C.; A. J. Gladwell, 207 South Main street, Lima, O.; Motorcycle & Supply Company, 42 Walton street, Atlanta, Ga,; Charles S. Cobb, South street, Plainville, Mass.; Kenton Motorcycle Company, 122 South Detroit street, Kenton, O.; Petmecky Company, 505 Congress street,

Austin, Tex.; P. J. Arbuckle, 813 Ninth street, Greeley, Col.; American Motor Company, 2724 Michigan avenue, Chicago; Consolidated Manufacturing Company, 145 Michigan avenue, Toledo, O.; D. & M. Hardware Company, Hortonville, Wis.; A. L. Johnson, 311 North Fourth street, Rockford, Ill.; R. I. Davis, 911 West Broadway, Louisville, Ky.; R. L. Howell, 17 North street, Danville, Ill.

It is anticipated there will be considerable touring during the coming season, and as F. A. M. members are entitled to certain discounts and other courtesies from the official repair shops, it is suggested that riders file away these lists for future reference.

Providence Club's Annual Banquet.

The annual banquet of the Providence Motorcycle Club was held in Perkins' restaurant, Providence, R. I., Jan. 28, with President E. L. Buffington as toastmaster. The menu was distinctly original, comprising the following delicacies: Olives a la John Kay, Blue Streak celery, roast saddle (spring chicken), T. T. mashed potatoes, boiled onions a la P. M. C., Big Four mashed turnips, hot butt end rolls with hard grease, magneto pineapple tapioca pudding with carburetor whipped cream, assorted side car ice cream, race track cheese, Swenson coffee, gasoline, medium oil and ignition cigars.

B. A. Swenson outlined the coming events of the club, starting with the herring run to Taunton in April, and W. A. Bardgett of Buffalo, N. Y., spoke very encouragingly concerning the revival of racing in that city. Others who spoke were: W. W. Scott, F. E. Domina, Thomas G. Mulgrew and William L. Hughes, Jr. An interesting programme of songs was rendered by Misses Bertha Baker, May Murray and Ada Kimball, assisted by Mrs. Alice L. Smith as accompanist.

Those present included: John J. O'Connor, New York; W. A. Bardgett, Buffalo; George F. Fleurant and F. L. Pond, Woonsocket; Joseph F. Leddy and Clifford Frazier, Pawtucket; Charles W. Rayhill, Warwick; Charles J. Ephriamson, Natick; David R. Clark, Cranston; E. L. Buffington, W. W. Scott, H. E. Winslow, Albert B. Carlson, Edward Lutz, John Kay, A. V. Howe, B. A. Swenson, E. O. Spencer, W. D. Burt, A. R. Magee, Eli Domina, George W. Hayden, J. E. Pierce, W. L. Hughes, Jr., J. G. Edwards, F. Labonte, G. Koener, Clarence Loftes, F. E. Domina, C. H. Westcott, L. P. Witcher and H. H. Smith, all of Providence.

Racing Results at Tampa.

The Tampa Motorcycle Club, Tampa, Fla., held a race meet in that city, Jan. 19, in which three events were run off with excellent results. Albert Nowlin on an Indian and John Marsicano on an Excelsior exchanged places from first to last in the seven-mile race. The summary follows:

Members of the Providence Motorcycle Club and Invited Guests at the Annual Banquet in Perkins' Restaurant, Providence, R. I.

Seven miles, professionals—First, Nowlin, Indian; second, Marsicano, Excelsior; third, Johnson, Indian; time, 9:04.2.

Fifteen miles, professionals—First, Marsicano, Excelsior; second, Nowlin, Indian; third, Johnson, Indian; time, 19:08.

Five miles, professionals—First, Johnson, Indian; second, Torres, Harley-Davidson; third, Malone, Harley-Davidson; time, 6:52.4.

New Curtiss Sidecar.

The Curtiss Motor Company, Hammondsport, N. Y., announces its intention of marketing a sidecar of original design, which is expected to be very easy riding and to sell for a moderate price. This makes the third sidecar to be placed on the American market, the others being the imported design brought over from England by the Hendee Manufacturing Com-

Digitized by Google

pany, Springfield, Mass., and that produced by the Majestic Manufacturing Company, Worcester, Mass.

Rides Indian to Milwaukee.

Carl A. Leander of Chicago, an Indian rider of some note, recently undertook a little winter trip of practically 100 miles from that city to Milwaukee. Until reaching Kenosha, Wis., he found the roads fairly good, but between that point and Racine, they were badly drifted. The last 24 miles from Racine to Milwaukee, presented decidedly strenuous travelling, but the entire run was made without mechanical difficulty.

Indians in Police Service.

During the last few years numerous cities have equipped their police departments with motorcycles, many of them selecting Indian machines, made by the Hendee Manufacturing Company, Springfield, Mass. The accompanying illustration shows several members of the Canadian mounted police, stationed at Winnipeg, Manitoba, and equipped with motorcycles of this make. The modern method of transportation seems to have been carried to this picturesque organization, which looks decidedly unfamiliar with its new mounts.

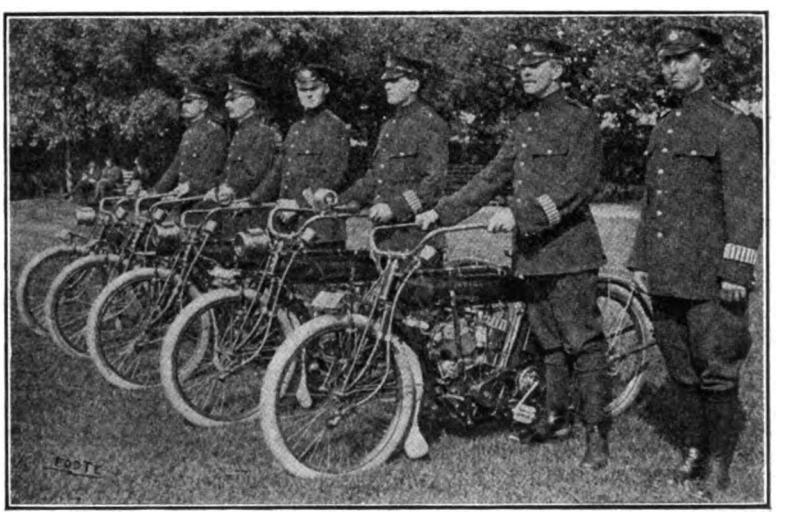
Boston Club Holds Banquet.

Forty members of the Boston Motorcycle Club enjoyed a banquet at the Copley Square Hotel in Boston, Jan. 27. Dr. R. L. Colson presided as toastmaster and called upon a number of those present for short speeches. Plans for for the coming season were laid, and it is announced that 1912 is to be the biggest year the organization ever has known.

Where Emblems Are Manufactured.

An accompanying illustration presents the factory of the Emblem Manufacturing Company at Angola, N. Y., where the Emblem motorcycle is produced. The business conducted by this concern has been increasing very materially during the past few years, until it has proven something of a problem to keep up with the orders. The entire structure is given over to the production of motorcycles and bicycles, and has abundant shipping facilities.

Baxter Moves Excelsior Agency.



Hirah G. Baxter, Providence, R. I., agent for Excelsior mounts, has found it necessary to remove from his old location to more commodious quarters at 172 Washington street, corner of Snow, where he will have better facilities for handling both the sales and repair ends of the business.

Keene Riders' Annual Show.

For three years the Consolidated Motorcyclists of Keene, N. H., of which C. C. Wilber, formerly vice president of the Eastern District, Federation of American Motorcyclists, is the moving spirit, have held a successful automobile and motorcycle show in that city. The fourth annual event will be held Feb. 21-23, and it is anticipated that it will prove an even greater success than its predecessors.

New Officers for R-S.

At the meeting of the directors of the Reading Standard Company, Reading, Penn., maker of R-S machines, last month, the following officers were elected for the ensuing year: President, Abner S. Deyshar; vice president, Jacob B. Fricker; secretary, William F. Remppis; treasurer, John M. Hill.

Members of the Canadian Mounted Police Stationed at Winnipeg, Man., and Their Indian Mounts.

Pope Agency in Rhode Island.

The Pope machine, made by the Pope Manufacturing Company, Hartford, Conn., will be handled in the future by the Rhode Island Motor Car Company, Providence, R. I., which has had the agency for the Pope-Hartford cars, made by the same concern, for a number of years.

Mercier Re-Enters Racing Field.

Fred Mercier of New York City, who last fall announced his intention of retiring from the racing field to open a repair shop, will ride an Excelsior in racing events during 1912. He has abandoned the repair shop plan to take the management of the Central

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head, as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

Motorcycle Company, 1220 Bedford avenue, Brooklyn, N. Y., which handles Flanders and Excelsior mounts. Mercier formerly rode an Indian.

Club Notes, Here and There.

Millstone, N. J., is still grinding out prospects for a new 100 per cent. F. A. M. club, and B. M. Dooly is duly on the job.

E. Frank Winfield, who has the happy faculty of organizing a motorcycle club wherever he lives, recently removed to Grand Junction, Col., and reports that he will soon add another affiliated club to the list.

New clubs recently affiliated with the F. A. M. include the following: Turlock, Cal., No. 217; W. G. Cooper, secretary, 12 members. Tacoma, Wash., 218; A. F. Hoska, Jr., 1807 Pacific avenue, 21. Quaker City, Philadelphia, Penn., 219; W. A. Stark, 2512 North Gratz street, 27.

Wauchope Bros., enthusiastic motorcycle dealer in Lodi, Cal., the components of which are members of the Stockton Motorcycle Club, proposes to celebate its sixth anniversary in business by organizing an affiliated club. The date set for the accomplishment of this purpose is about the first of April.

Leon F. Riche of Great Barrington, Mass., reports local conditions as favorable for organizing an F. A. M. club early in the riding season. There are about 40 local riders in the immediate vicinity, many of whom have signified their desire of joining a club for the benefits which organization affords them aside from sociability and companionship.

C. A. Jenner, physical director of the Brush Union high school, Brush, Col., is an enthusiastic motorcyclist, and reports that local road and other conditions are exceptionally fine for the sport in his vicinity. He has it in mind to organize a local club in order that sight-seeing runs and short tours may be the more enjoyable.

Henry Fisher of Southold, N. Y., believes in sociability, clean sport and companionship in motorcycle trips and tours, and is working for the organization of a local club in that town.

The Dayton Motorcycle Club was organized recently in Dayton, O., and has plans under way for securing a suite of rooms for headquarters.

The Madera Motorcycle Club, Madera, Cal., intends to construct a one-mile track in the vicinity of that city in the near future.

The Charleston Motorcycle Club, Charleston, S. C., is planning a series of races for Washington's Birthday.

The Galveston Motorcycle Club, Galveston, Tex., is planning to locate its clubhouse on an island.

The Newark Motorcycle Club, Newark, N. J., is arranging an endurance run for Memorial Day. The proposed route will cover 250 miles.

The Columbus Motorcycle Club, Columbus, Ga., is contemplating a race meet in the early spring, and expects entries from Savannah and Atlanta.

The Atlantic City Motorcycle Club recently held its annual banquet, at which 20 members sat down to well filled tables. The officers of the organization are: President, Albert C. Stephany; vice president, William Haenline; secretary, William F. Specht; treasurer, William Shannon.

The Maryland Motorcycle Club, Baltimore, Md., has selected the following officers: President, Frank O. Boyd; vice president, August Zimmermann; treasurer, William Wood; secretary, Elmer Snyder; captain, W. S. Standiford; first lieutenant, William F. McCauley; second lieutenant, Herbert Stubbs.

The following officers have been elected by the Chattanooga Motorcycle Club, Chattanooga, Tenn.: President, O. G. Von Long; vice president, Wells Boyd; secretary, Jesse J. Lesh; road captain, Edward Marler.

Factory of the Emblem Manufacturing Company, Angola, N. Y., Where the Well Known Emblem Motorcycles Are Produced.

$25,000; incorporators, Joseph J. Dwyer, John F. Dwyer, Thomas H. Roche.

Maxim Tri-Car Manufacturing Company, Morgantown, W. Va.; capital, $50,000; incorporators, Harry R. Warfield, Joe K. Buchanan, John L. D. Streator, H. B. Long, A. A. Hall.

Lexington Company of New England, Portland, Me.; capital, $10,000; president and treasurer, George E. Fogg.

Panwood Manufacturing Company, Grand Rapids, Mich.; capital, $60,000; incorporators, Fred Z. Pantlinf, Harold B. Woodcock, Robert G. Woodcock.

Keystone Garage Company, Chicago; capital, $2000; incorporators, Charles C. Loucke, Ephraim E. Atwood, Burell J. Cramer.

The Bernhard & Turner Automobile Company, Des Moines, Ia.; capital, $60,000; president and treasurer, J. C. Bernhard; vice president and secretary, Jay Turner.

GARAGE AND DEALER.

The Shafer Motor Car Company, Rochester, N. Y., has been formed and will handle the Cole line, made by the Cole Motor Car Company, Indianapolis, Ind.

The Scott County Mercantile Company, Davenport, Ia., has taken over the stock and business of the Buck Auto, Carriage & Implement Company. H. H. Derrough will

Handsome and Commodious Quarters of American-Marion Sales Company New York City.

continue to have charge of the motor car department of the concern.

C. B. Snyder is the manager of a new concern formed at Spokane, Wash., under the name of the Spokane Cole Motor Car Company, which company will handle the Cole line.

J. P. McCullom of Carthage, Ill., has purchased the Santa Fe Trail Garage at Dodge City, Kan. He will continue to handle the Cole product.

The Metropolitan Motor Car Company, Ltd., Vancouver, B. C., is the new name of the Pacific Garage & Auto Company. Mr. Boothby is the manager of the company.

The Butler Sales Company, Waterloo, Ia., has established headquarters on Park avenue and will handle the Colby cars, made by the Colby Motor Company, Mason City, Ia.

The E. E. Loving Auto Company, Memphis, Tenn., agent for the Cole line, has moved into new quarters at 289 Court avenue. The new building is two stories in height, of fire proof material and capable of housing 50 machines.

Harvey Parker, the well known tire man of Worcester, Mass., who recently secured the agency for the Palmer-Singer line, made by the Palmer & Singer Manufacturing Company, Long Island City, N. Y., is visiting the factory to acquire a mechanical knowledge of the car. He will return over the road with a demonstrator.

The Carhart Motor Company, Oklahoma City, Okla., has established two new branches, one at Guthrie and and another at Muskogee. Blake & Varley will have charge of the former and H. A. Benefiel of that at Muskogee. The company represents the Overland line, made by the Willys-Overland Company, Toledo, O.

Leonard Zengel, the well known racing driver, has associated himself with Thomas A. Phillips in the Phillips Motor Car Company, 324 West Third street, Dayton, O. The company plans the erection of a fine concrete garage, and will handle the Stutz, De Tamble and Fiat.

A. W. Trevor and W. E. Snider of Rock Island, Ill., have formed a partnership to handle the Stearns-Knight machine.

Russell P. Taber, Hartford, Conn., for several years agent for the Reo line, made by the Reo Motor Car Company, Lansing, Mich., has opened an agency at Waterbury, Conn., which will be in charge of Carl Humphrey and Samuel W. Taber. A garage and repair shop will also be maintained.

J. W. Naughton, Ware, Mass., has completed a structure on Pleasant street and will conduct a repairing business.

The Kentucky Motor Car Company, Cincinnati, O., of which Paul Hesser is at the head, expects to occupy new quarters at Park place and Scott street where a fire proof garage is being erected.

Brown, Thomson & Co., Hartford, Conn., has taken the agency for two lines of electrics in addition to gasoline automobiles. These are the Rauch & Lang and Standard.

The Buffalo Automobile Trade Association, Buffalo, N. Y., has elected the following directors to serve for the ensuing year: Ralph E. Brown, John J. Gibson, Charles F. Monroe, George Ostendorf, William Densmore, Gustave Miller and E. C. Bull.

The Osen & Hunter Auto Company, San Jose, Cal., has changed its name to the Osen-McFarland Auto Company. The company which is located at First and James streets, has a branch at San Francisco. O. C. McFarland has succeeded to the interests of A. E. Hunter.

The United Motor Car Accessory Company, a concern organized recently at Sioux City, Ia., will occupy sales and store rooms at Sixth and Nebraska streets. Ernest Shultz will be manager.

The Cunningham Auto Company, Des Moines, Ia., has taken over the state agency for the Clark line, made by the Clark Motor Car Company, Shelbyville, Ind.

The Des Moines Garage Association, organized recently at Des Moines, Ia., elected the following officers at a recent meeting: President, J. C. Bernard; vice president, L. H. Tietge; secretary, V. G. Claiborne; treasurer, S. Johnson. The membership of the organization includes practically all of the automobile, garage and accessory men of the city. The purpose of the association is to establish uniform prices for labor, etc.

The Ford Motor Sales Company, Harrisburg, Penn., has leased the building at 906 Market street, formerly occupied by the Capital City Garage and will remodel the structure.

The Riddell Auto Company, Des Moines, Ia., distributor in central Iowa for the Overland line, has added C. B. Peironnet and R. P. Walston to the selling staff.

The Roberts Garage, Pleasant street, Northampton, Mass., has taken the agency for the line manufactured by the United States Motor Company, New York City, which includes the Brush, Maxwell, Stoddard-Dayton and Columbia, and Sampson trucks.

George T. Butterfield of Medford, Mass., and F. H. Jordan of Boston, have purchased the building and business of the Tudor Garage Company, Chelsea, Mass. The new owners are experienced automobile men. The top floor of the building will be utilized for the manufacture of the Jordan demountable rim.

The Schacht Motor Sales Company is announced as successor to the Siegmund Motor Car Company at Los Angeles, Cal. The new concern will handle the Schacht line, made by the Schacht Motor Car Company, Cincinnati, O.

The Westcott Motor Car Company of Little Rock, Ark., has been organized and will locate on Main street. H. M. Westcott is president, Irving Hirsch vice president and secretary, and Henry Fletcher treasurer. The concern will handle the Westcott line, made by the Westcott Motor Car Company, Indianapolis, Ind., and will

Digitized by Google

distribute for the States of Arkansas, Tennessee, Oklahoma, Texas, Alabama, Louisiana, Florida and Mississippi.

Charles E. Riess & Co., New York City, general distributor of the Marion automobiles, received an order recently for 10 Marion cars to be shipped to South Africa.

Harry D. Miller, formerly of the Bridgeport Vehicle Company, has joined the sales force of the Blue Ribbon Garage Company, Bridgeport, Conn.

The Howard Automobile Company, Los Angeles, Cal., has opened its new warehouse at 1701 San Fernando street. The building has 10,000 square feet of floor space, a private driveway and spur track for loading platform, and will be equipped for quick handling of automobiles.

WITH THE MANUFACTURERS.

D. Kirke Moore, formerly of Buffalo, N. Y., has accepted the position of general sales manager of the Western-Mott Company, Flint, Mich., but will retain his interests in the American Distributing Company. He is well known to the automobile industry having been engaged in the manufacture and sale of axles, wheels, transmissions and steering gears.

The Colby Motor Company, Mason City, Ia., will enlarge its factory and increase the number of workmen, according to an announcement made by the officers of the company.

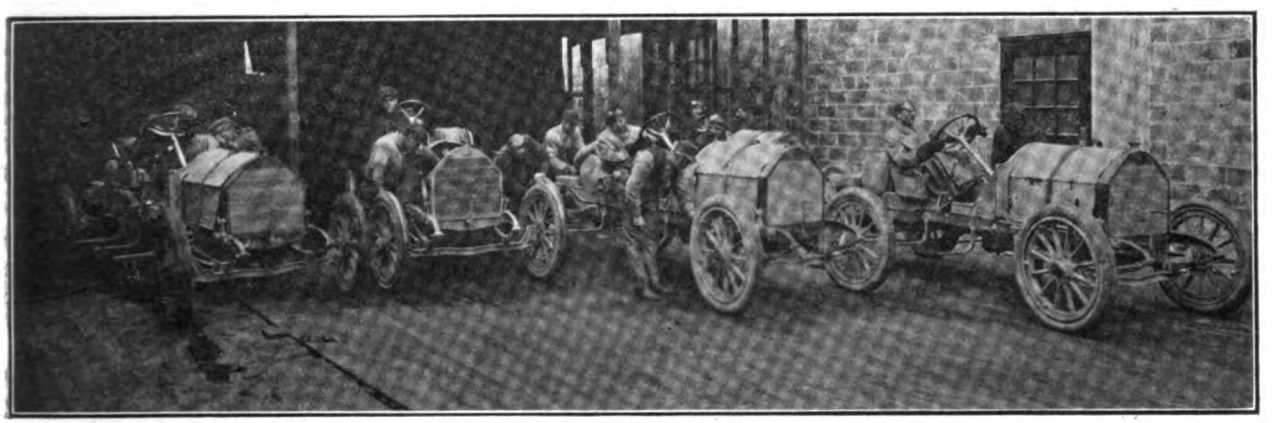
The Stevens-Duryea Company, Chicopee Falls, Mass., has decided to begin the construction of a new plant and has acquired 40 acres of land in East Springfield, Mass., located on the Athol branch of the Boston & Albany railroad and the new Hampden branch of the New York, New Haven & Hartford line. The first building to be erected will be four stories in height, 500 by 80 feet, containing a floor space of 160,000 square feet. This structure will be ready for occupancy about June 1. Other buildings will be completed soon thereafter.

The Cleburne Auto Manufacturing Company, Cleburne, Tex., announced at a meeting of the directors held recently that prospects were bright, as the first machine manufactured had withstood successfully a thorough testing under varying conditions.

The White Company, Cleveland, O., has established a large agency in Buenos Ayres and several sub-agencies in other parts of the Argentine Republic. The company is pleased with the prospects for commercial vehicles in place of the primitive methods now employed on the large coffee and sugar plantations.

The Maxwell-Briscoe Motor Company's immense plant at Tarrytown, N. Y., is located on the Hudson river which body of water froze recently sufficiently to permit the use of ice boats and motor cars. Testers at the factory took advantage of this to try out the Maxwell cars, and in the accompanying illustration is depicted a fleet of 15 machines about to start on a day's testing. The smooth surface of the ice permitted of great speed and the drivers thoroughly enjoyed the novel conditions.

The Cole Motor Car Company, Indianapolis, Ind., subjects each and every Cole chassis to a severe test before the body is fitted and the machine painted. In and around the city the small army of testers may be seen daily driving their automobiles over the worst kind of roads, some of which are soft clay. After being tried out on the roads they are given a speed test. In the accompanying illustration is shown a group of testers about to start for a day's work.



The American-Marion Sales Company, New York City, which handles the Marion and American cars, is established in commodious quarters at Broadway and West 63rd street. In the illustration appended herewith is shown the four-story building which houses the product of the American Motors Company, Indianapolis, Ind., and Marion Sales Company of the same city.

A. R. Rousseau, well known to the automobile industry, has been appointed western sales manager of the Imperial Motor Car Company, Jackson, Mich., with headquarters at 2216 Michigan avenue, Chicago. He was formerly connected with the executive forces of the General Motors Company.

The Maytag-Mason Automobile Company, Waterloo, Ia., has been reorganized and will be known in the future as the Mason Motor Company. The business will be conducted by H. W. Hayden, W. B. Wallace and E. R. Mason.

The Studebaker Corporation, Detroit, announces the appointment of Philip E. Hawley to take charge of the New England business of the concern. Mr. Hawley, who is well known to the automobile trade, will make his headquarters at Boston, where he will have entire charge of the wholesale business for this section.

The Henderson Motor Sales Company, distributor for the Cole Motor Car Company, Indianapolis, Ind., has appointed the following new Cole agencies for the State of New York: Peterman Motor Sales Company, Jamestown; R. L. Cooley, Batavia; William R. Hopkins, Bath; North Avenue Garage, Fiskkill-on-the-Hudson; J. Harry Cook, Cooperstown; Dewar & Diefendorf, Oneonta.

A Group of Testers About to Start from Factory of Cole Motor Car Company, Indianapolis, for a Day's Trip Over All Kinds of Roads and Hills.

The Velie Boston Branch of the Velie Motor Vehicle Company, Moline, Ill., announces that Amos J. Shorey will handle Velie pleasure and commercial vehicles in Waterville, Me. Tucker & Palmer of Tarrifville, Conn., will act as sub-agent for the J. T. Curtiss Company of Simsbury, Conn., Velie representatives in western Connecticut.

The Pacific Coast Borax Company, 100 William street, New York City, is marketing a product for both chauffeur and owner called "Grime-off." It is made in powder form and packed in a convenient can fitted with a sifting top, a sanitary feature which will appeal to users.

The Connecticut Telephone & Electric Company, announces the opening of an office, stock and show room at 231 West 54th street, New York City, where a complete stock of Connecticut ignition devices will be carried.

Ernest L. Gould, superintendent of the service department of the Velie Boston branch, left recently for a visit to the factory at Moline, Ill. He will visit the Chicago branch while en route.

The Ohio Motor Car Company, Cincinnati, O., announces that Breisario E. Diaz of Cartegena, Colombia, South America, who visited the factory recently, will handle the Ohio line in his country.

MANY ABBOTT-DETROIT SALES.

Evidently the Mississippi valley is to see a large increase in the number of cars sold during the coming season. Among the recent orders reported from that section are those ranging from 35 to 250 cars from the following agents of the Abbott-Detroit line, made by the Abbott Motor Company, Detroit: W. L. Huffman Automobile Company, Omaha, Neb.; Tremain & Rankin Auto Company, Rock Island, Ill.; Tjaden Auto Company, Wellsburg, Ia.; Robertson Motor Car Company, Minneapolis, Minn.; Kaw Valley Auto Company, Kansas City, Mo.; M. M. Baker & Co., Peoria, Ill.; Johnston Motors Company, Des Moines, Ia.; J. W. McKay, Grafton, N. D.; Oskaloosa Vehicle & Auto Company, Oskaloosa, Ia., Burney Bird Auto Company, St. Paul, Minn.; Fischer Motor Car Company, Quincy, Ill.; A. F. Schrup & Co., Dubuque, Ia.; Barclay-Morton Auto Company, Mason City, Ia., and Bates-Odenbrett Auto Company, Milwaukee, Wis.

REO USES GOODYEAR TIRES.

In line with the many other refinements of detail in the equipment of Reo the Fifth, the latest creation of R. E. Olds of the Reo Motor Car Company, Lansing, Mich., R. M. Owen & Co., New York City, general distributor for the Reo line, announces that this car will be fitted with the Goodyear No-Rim-Cut tires, made by the Goodyear Tire & Rubber Company, Akron, O. As is well known these tires are claimed to be 10 per cent. oversize, a feature which is held to add from 20 to 25 per cent. in the mileage obtained.

MANY VELIES SOLD IN MAINE.

What is claimed to be the largest sale of automobiles ever made in the state of Maine was closed during the progress of the Bangor show, according to Harold D. Bornstein of the Velie Boston branch. This contract included Velie pleasure and commercial cars, made by the Velie Motor Vehicle Company, Moline, Ill., and the sale was made through the agency of Amos J. Shorey.

DALLAS WANTS VANDERBILT CUP RACE.

The Dallas Automobile Club, Dallas, Tex., is said to be laying plans to secure the annual Vanderbilt Cup race, although Savannah, Ga., has by no means relinquished its claims to the event. In the near future, the club proposes to lay an official communication before the contest board of the American Automobile Association, asking for a sanction and presenting possible routes over which the race may be run.

TUTO HORNS FOR KING GEORGE.

Six of the automobiles made especially for the use of King George V at the coronation durbar at Delhi, India, were equipped with Tuto horns, made by the Dean Electric Manufacturing Company, Elyria, O. In construction and equipment these cars were most luxuriously appointed, and that the American horn was selected is not only very gratifying to the maker but to all motorists in the United States as well.

HALLADAY AGENTS BANQUET.

During the progress of the pleasure vehicle show in Chicago, the Streator Motor Car Company, Streator, Ill., tendered a banquet to the Halladay agents and distributors throughout the West and Middle West in St. Hubert's English grill. Over 100 persons were present, and speeches were made by the following: John C. Barlow, president of the company; C. A. Bruce, manager; B. F. Anger, engineer; P. W. Suler of the sales department; Charles F. Bates, manager of the Brooklyn branch; H. Earl, Fairfield, Ia.; Charles M. Hayes, manager of the Chicago branch; F. S. Van Verghten, Hastings, Neb., and others.

AUTOMOBILES IN THE YUKON.

Whether or not the recent visit of Dr. C. G. Percival with the Abbott-Detroit "Bull Dog" to the Alaskan and Yukon regions has anything to do with the plan, Consul G. C. Cole of Dawson, Can., reports that a movement is under way looking toward the establishment of a motor car mail line between Dawson and White Horse. About two years ago a large automobile was used successfully in Dawson, and last winter the White Pass & Yukon Route Company, which operates a 330-mile stage line between White Horse and Dawson, tried a motor car, but without success. In order to prove satisfactory the tread of the machine should be such as to conform with the sled track, as between Oct. 1 and April 30 snow usually remains on the ground to a depth of two feet, or more. The time now consumed between White Horse and Dawson is from five to eight days, with relay stations at 20-mile intervals. With an automobile it is estimated that the distance could be covered at any time of the year within two days.

SAVANNAH RACES COST $50,000.

An itemized report of the receipts and expenditures for the Grand Prize, Vanderbilt Cup, Savannah Challenge and Tiedeman Trophy races of last November has been made to the Savannah Automobile Club, showing that the total receipts were $54,120.74, and the expenses about $50,436.80, leaving a balance of $3683.94 to be turned over to the state militia which patrolled the course.

NEW BUILDING FOR REPUBLIC TIRES.

The new Calendar building, now under process of erection for Republic Rubber Company, Youngstown, O., maker of Republic tires, is to be one of the most thoroughly up-to-date structures of its kind in America. It is to be of steel and brick, fireproof, saw tooth construction, and will be 200 by 85 feet, with eight 25-foot bays. Each piece of machinery is to be finished in white enamel. The hardwood floors will be oiled and the walls plastered and painted in oil colors. The hot water system of heating will be employed and every square foot of floor and wall space will be protected by an automatic sprinkler system.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

TEXACO MOTOR PRODUCTS.

Among the new products displayed at the recent shows were those of the Texas Company, 17 Battery place, New York City and Houston, Tex. These include Texaco motor oils, light, medium and heavy; transmission lubricant, cup grease, etc., for the lubrication of all classes of internal combustion motors, and particularly those used in automobile and motor boat service. Three features are claimed for these lubricants:

First, they have zero cold test, and are guaranteed not to congeal above that temperature. This is held to make them especially adaptable for cold weather use, as they will not freeze in the crankcase or force feed pipes, or interfere with the working of the motor after it has been stopped for some time while exposed to the cold.

Second, they do not deposit any kind of hard, flinty carbon at any time in the cylinders or on the spark plug of the motor. They are claimed to have a somewhat lower flash than the average, and will burn up completely in the combustion chamber, passing out with the exhaust. It is added that in case too much oil is used or, for some reason the entire quantity of oil in the combustion chamber is not entirely burned up, any deposit which is left is of a soft, sooty nature, which can be wiped off readily with a cloth.

Third, being somewhat heavier in body at ordinary temperatures, it is held that there is better lubrication of bearings, and the film around the piston rings in the engine maintains a higher compression.

CONTEST DATES ASSIGNED.

The contest board of the American Automobile Association has issued sanctions for the following events: Feb. 17-19, E. A. Moross, track events, New Orleans, La.; Feb. 22, Kern County Auto Racing Association, road race, Bakersfield, Cal.; May 15-17, Chicago Motor Club, commercial vehicle run, Chicago, Ill.; May 30, Indianapolis Motor Speedway Association, 500-mile race, Indianapolis speedway; June 20, Chicago Motor Club, Algonquin hill climb; Aug. 8-10, Galveston Automobile Club, beach races, Galveston, Tex.; Sept. 2, Indianapolis Motor Speedway Association, race meet, Indianapolis speedway; Oct. 7-11, Chicago Motor Club, reliability tour, Chicago.

Other proposed events, dates for which have not been assigned officially as yet, are: March, track races, Montgomery, Ala.; March 4-8, reliability tour, Houston, Tex.; April 27, speedway meet, Los Angeles, Cal.; May 30, track events, Salem, N. H.; June, reliability run, St. Louis, Mo.; July 4, track events, Petersburg, Ind.; July 4-6, beach races, Old Orchard, Me.; July 4-5, track events, Taylor, Tex.; July, road race, Riverhead, L. I.; July 15, reliability tour, Wisconsin State Automobile Association; Aug. 23-24, Elgin road races; September, track events, St. Louis, Mo.; Oct. 5, Fairmount Park road race.

ANOTHER KNIGHT CAR COMING.

Official announcement of the organization of the Edwards Motor Car Company by C. G. Stoddard and H. J. Edwards was made at the automobile show in Chicago. Mr. Stoddard formerly was vice president of the United States Motor Company, and Mr. Edwards was chief engineer of the same concern. The announcement is followed by a positive statement that the new company will market a new pleasure car fitted with a Knight motor, and a full line of commercial vehicles.

It is definitely known that Mr. Stoddard has an option on an American license to utilize the Knight type of sleeve valve engine. He has great confidence in the skill of Engineer Edwards and believes that the new models to be put out under his direction will be a distinct success, both in the pleasure and commercial fields. Mr. Stoddard's resignation in no way affects his holdings in the United States Motor Company, with which he remains as director, and his withdrawal from the vice presidency does not change the position of the Dayton Motor Car Company, maker of Stoddard-Dayton cars, in the larger organization.

STUTZ SCORED FIRST PLACE.

The Ideal Motor Car Company, Indianapolis, Ind., maker of Stutz cars, points out that two of these cars were the first entered for the 500-mile race on the Indianapolis speedway, Memorial Day, and not those of another make, as previously announced in these columns. The two Stutz machines will be piloted by Leonard Zengle, who was at the wheel of National cars last season, and Gilbert Anderson, who drove the first Stutz made, in the Memorial Day race of the same distance over the same course last year.

ARISTOS COMPANY EXPANDING.

As the first step in its campaign to cover a large portion of the country with its branches, the Aristos Company, 250 West 54th street, New York City, which handles the Disco self-starter, Mondex shock absorber, Mondex muffler, etc., has purchased the business of J. H. Palmer in Chicago. Mr. Palmer formerly handled the Disco product in the Middle Western metropolis, and will continue as manager of the new Aristos branch, which will be located at 1501-05 Michigan avenue.

ELMIRA CLUB ELECTS OFFICERS.

At the recent annual meeting of the Elmira Automobile Club, Elmira, N. Y., the following officers were elected: President, M. Doyle Marks; vice president, Arthur Clinton; secretary, M. R. Ellis; treasurer, F. E. Robbins. Plans were laid for attending the forthcoming show of the Elmira Automobile Dealers' Association in the local armory Feb. 27-March 2.

WOULD LIGHT STATE ROADS.

Senator White of the New York Legislature has introduced a bill asking for an appropriation of $25,000 with which to experiment in the lighting of state roads. It is estimated that it would not cost in excess of $400,000 to illuminate the entire highway between New York and Buffalo, by way of Albany. In addition it is claimed that it would be possible to sell electric lighting to farmers and others on the way, so as to reimburse the state in a measure.

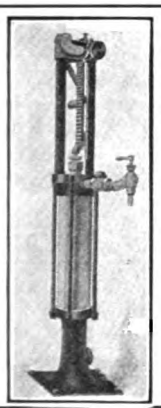
Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

Digitized by Google

NEW YORK SHOW A WEEK LATER IN 1913.

The principal business at the annual meeting of the National Association of Automobile Manufacturers in Chicago, aside from the election of officers, was the decision to conduct the only New York show of 1913 a week later than this year. This means that the pleasure vehicle section will open the evening of Jan. 11 and continue until Jan. 18, and that the commercial car division will be held from Jan. 20 to Jan. 27. The Chicago show, also will be pushed ahead a week, the dates being Feb. 1-8 for the pleasure vehicle section and Feb. 10-17 for trucks.

The decision to hold but one show was forecasted some little time since.. It is impossible to tell where the event will be staged, because the present situation does not permit of telling whether the Madison Square Garden will be torn down or the new Grand Central Arena will be constructed at that time. Whatever the result, there will be but one display and that will be under the direction and management of the National Association of Automobile Manufacturers, and the makers of all cars will be invited to make exhibit.



The election of officers resulted as follows: President, William E. Metzger, Metzger Motor Car Company; first vice president, Benjamin Briscoe, United States Motor Company; second vice president, H. O. Smith, Premier Motor Manufacturing Company; third vice president, S. T. Davis, Jr., Locomobile Company of America; secretary, R. D. Chapin, Hudson Motor Car Company; treasurer, H. H. Rice, Waverley Company; general manager, S. A. Miles; assistant manager, J. S. Marvin; counsel, Charles Thaddeus Terry.

MORE CAPITAL FOR NEWTONE HORNS.

In order to meet the increasing demand for Newtone electric horns, the maker, the Automobile Supply Manufacturing Company, Brooklyn, N. Y., has prepared papers for an increase in its capital stock to $500,000. The concern has secured additional floor space, and has equipped its enlarged plant with the most up-to-date machinery, thereby making it possible to employ several hundred workmen, who are now working overtime. It is claimed that this company has the largest plant in America devoted to the production of automobile horns.

"BULL DOG" AT CHICAGO SHOW.

One of the interesting exhibits at the Chicago show was the Abbott-Detroit "Bull Dog," which arrived in that city from New York in charge of Dr. Charles Percival after a three days' trip over the road. The total distance now travelled by the car is 42,115 miles. In spite of heavy snow in New York State the machine came through on scheduled time. From Chicago, Dr. Percival will strike south through Indianapolis, Ind., Columbus, Dayton and Cincinnati, O., attending the shows in these cities, after which he will make his way East to visit the exhibtion at Boston.

ALTHO not in the Garage Building, Selling or Planning business, our wide experience in the exclusive equipment business has led us into every quarter of the globe where we have consulted the world's greatest architects, solving some of the most difficult problems, in providing shelter for one or any number of Motor Cars, **at total building costs from $35 to $3500.** We carefully compiled this valuable data on account of its rare educational value in this comparatively new field, and while the work could not possibly be duplicated under an expenditure of Thousands of Dollars, we will distribute this entire work, together with one complete set of the Garage Beautiful, **working plans absolutely free of cost** to all active or prospective Motorists who are willing to pay for the mailing expense, **Only Ten Cents,** coin or stamps. These Working Plans are complete in every detail and designed to meet a flexible range of requirements both as to size and building material to be chosen, from a construction of wood siding to concrete, at cost estimates to correspond. Our one and only object in doing this is in hope of incidentally acquainting you with our equipment for present or future emergencies, and the expense of this **Free** offering will be charged to our advertising account. Understand, we make this unprejudiced gift absolutely with the fame of our name at stake, and in no way further obligate or annoy you, as we are not in business for such purpose. To any one unable to fully appreciate the value of this exclusive set of plans, worth alone Twenty-five to Fifty dollars, to say nothing of the **innumerable other plans suggested,** we certainly prefer your returning them to us so we can give back your Postage Money at once and send plans to another applicant, as our supply, or sincere motive, will not justify a waste.

Since 1894 the standard of Europe and America

HERE IS ANOTHER OF OUR THOUSANDS OF TESTIMONIALS:

I wish to add my testimonial to the splendid qualities of the Herz Plug. I have been using Automobiles in my practice constantly for eight years and of all the best grade of plugs that I have used "The Herz" is the **only one** that is absolutely unbreakable, soot and oil proof and absolutely reliable. I have just taken out a set of Herz Plugs that have been used for 13,000 miles. They have never missed an explosion and are as clean as the day I put them in. The only discernible effects of this 13,000 miles use is a slight pitting of the core at the spark points. No other plug for me. Very truly,

Nov. 15, 1911. (Signed) B. W. Dawley, M. D.

The Hardest test of All is the Test of Time

MONOGRAM OIL

Has been continually successful under one brand name for years.

It has been used by over 90% of winners of the important long distance road and track automobile races held in this country during the past eight years.

Why experiment with oils that have not proved their worth or why use practically unknown brands when by asking for **MONOGRAM** you will secure an oil that is

"Best for YOUR Engine"

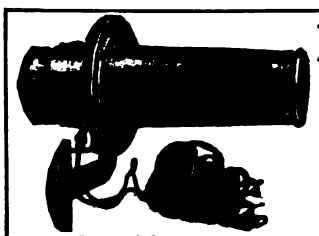
THE BEST LUBRICANTS
FOR YOUR CAR
HARRIS
TRADE MARK—REG. U.S.PAT. OFF.
OILS

The efficiency of an automobile engine depends largely on the QUALITY of the lubricants used.



HARRIS OILS are best for automobile use. They are made of the finest material—adapted to automobile engine use. The soot-deposit forming ingredients are eliminated to the greatest possible extent.

They add power and speed, have "body" and flow freely. Try HARRIS OILS. Prove to your own satisfaction that they are best.

If your dealer does not sell HARRIS OILS, send us 80 cents for 1 gal. can, or $3.75 for 5 gal. can and we will send same prepaid.

A NOISE ANNOYS

Stop that noise; get away from friction and wear; there's no need of these drawbacks to motoring. An adequate lubricant greatly reduces friction and gives you the full driving power of your engine.

It's your gears that you must look to for successful motoring, and it's a "gear" oil you MUST have. Only

INVADER GEAR OIL

is "adequate"—made for gear needs. Tests have proved its superiority, and testimony its popularity. Up-to-date dealers and owners are its enthusiastic users for sliding gear transmissions, differential gears and front gears where a heavy lubricant is required.

WHEN at the Show be sure to see the Truffault-Hartford demonstrated. This is the shock absorber, one hundred percent perfect. Of the great variety of fine cars exhibited at the Show, the larger part are factory-equipped with the

Truffault-Hartford SHOCK ABSORBER

You should know the immense advantages of having this equipment—the advantages in Comfort, Safety and Economy.

There is much to learn from the simple, practical demonstrator we are displaying at the show. For instance:

How your car can be made to ride smoothly over the roughest road,

—*how* your tire bills may be diminished by cutting out the jounce and bounce caused by uncontrolled springs,

—*how* you can keep your car young by eliminating vibration, the most hurtful factor in motoring.

You owe it to yourself and to your car to see this demonstration.

✱ the oil that lubricates most ✱

GARGOYLE

Mobiloil

A GRADE FOR EACH TYPE OF MOTOR

ARE YOU USING THE PROPER OIL ON YOUR CAR?

You can reduce your automobile upkeep expense by giving intelligent study to the question of lubrication, which is a neglected but very important factor affecting the economic operation of an automobile. Improper and therefore ineffective lubrication is most largely the cause of automobile depreciation. Experienced users of automobiles appreciate the benefits of scientific lubrication and the great saving in depreciation and economy of operation derived therefrom. Business concerns of the greatest magnitude, where comparative tests have been made, concede the superiority of Mobiloil for motor truck lubrication.

If oil saves power, it follows that
one oil saves more power
than another.

Maxwell

It pays dividends in Health renewed Energy and added Income

THE conservative thinking man has long recognized the benefits of owning a motor car—but has hesitated to seek them because of the COST. His real bugaboo has been operating and up-keep cost.

Maxwell cars have proved that these costs need not be high. Thousands of Maxwells are today used in businesses where they must pay for themselves to be justified. Now the Maxwell "Mascotte" brings the initial cost of a real FAMILY CAR down below $1000—makes it possible to buy a car—

Big enough to be used by all the family—

Powerful enough to meet every demand made upon it—

Stylish enough to be proudly owned—

And at a price that formerly only bought a runabout and frequently an inferior machine.

We urge your careful investigation of the MAXWELL "MASCOTTE" and consideration whether it will not pay dividends to you.

We would be glad to furnish any information you may wish. Simply say on a postal, "Mail Books."

Digitized by Google

"Mascotte"

Reputation and Responsibility guarantee $980

extraordinary value at this exceptionally low price

These facts, easily demonstrated, justify Maxwell reputation—Fifty-one thousand Maxwell cars running! 91% of the cars made seven years ago still in active daily use! Sixteen thousand Maxwells owned by physicians, who require the most exacting service and cannot brook delays! Surprisingly low up-keep and operating cost recorded by all Maxwell owners!

This necessarily means responsibility—Fourteen factories, employing fourteen thousand men! Aggregate annual output, 52,000 cars of five well-known makes—each the recognized leader in its price classification! Forty-five branch houses and dealers everywhere to take care of cars in the hands of owners!

This is the explanation of the Maxwell "Mascotte" at this price—Everything that vast resources and complete organization can do to reduce purchasing, manufacturing and selling expense and so make possible extraordinary value at an exceptionally low price.

Analyze these features — A ventilated, fore-door, flush-side, five-passenger body with lines and proportions that speak for themselves. A 25 horsepower, four cylinder motor. Dual ignition, sliding gear transmission, multiple disc clutch, shaft drive, full-floating rear axle. Irreversible steering gear, double acting brakes, long resilient imported steel springs. 32-inch wheels and 104-inch wheelbase. Finished in blue-black with gray wheels, upholstered and appointed with every provision for comfort. Equipped with magneto, generator, two gas lamps, three oil lamps, horn, tool kit, jack, pump, tire repair kit, tool box, foot and robe rails. Price $980, f.o.b. factory, top extra. The value is apparent.

Compare it with other cars—At the New York and Chicago Automobile Shows—the two national shows at which all makes of cars are represented — the Maxwell "Mascotte" was conceded to be the most striking car exhibited. In beauty and style, in equipment and appointment, in workmanship and in finish, it was generally favorably compared with cars costing almost double its selling price. In design, it followed established Maxwell principles that have proved themselves in the extraordinary Maxwell record. The reputation of the Maxwell and its recent sweeping victory in the Glidden Tour, guarantee its long life and service. What more can you ask in a car?

There are experienced motorists buying new cars every day who have not the slightest misgivings about getting service for every dollar they have invested,

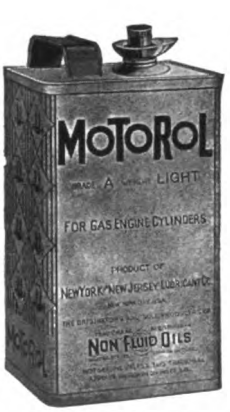
because

They have learned their lubricating lesson and they buy

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE

NON-FLUID OIL

for bearings, transmissions and differentials and



MOTOROL

"It suits because it doesn't soot"

for cylinders---with the same idea of buying recognized standards as in buying gasoline.

Experience will teach you as it has taught these motorists and as it has taught the seventy odd motor car manufacturers who recommend NON-FLUID OIL.

We would like to have you read a book called "Lubrication of the Motor Car," which we believe is the most complete and most helpful of its kind. IT'S FREE.

Non-Fluid Oil, a pure mineral oil lubricant, wasteless, clean, unaffected by temperature. Lasts twice as long as greases and compounds.

Motorol, the cylinder oil with the most lubricating "body" and the least carbon.

Send me "Lubrication of the Motor Car"

Overland

ALL of the standard popular priced cars are represented in this issue. This gives you a splendid opportunity to make a few comparisons of motor car values and to verify our claims, that in an Overland car you get more real car for less money than in any other machine on the market.

¶ For example—take our Model 61. This car has a big 45 horsepower motor. Is a five-passenger touring car. The wheel base is one hundred and fifteen inches. The axles are fitted with the finest Timken bearings. The transmission is fitted with F & S annular bearings. The pressed steel frame has a double drop. The handsome body is finished in rich Brewster green trimmed with heavy nickel plate. The lamps are dead black and nickel plated. The magneto is a Bosch. This car is priced at $1500. Have you ever seen its equal for less than $2000?

¶ Our interesting factory book explains why the greatest organization in the business can make these fine cars to sell at such remarkably low prices. Write for a copy. Please ask for copy K42.

The Willys-Overland Company, Toledo, Ohio.

Model 61—$1500

Wheel base, 115 inches; body, 5-passenger fore door touring; motor 4 3-8 x 4 1-2; horsepower, 45; Bosch magneto; tires, 34x4 inch, Q. D.

THE sound, healthy growth of appreciation of Speedwell Motor Cars denotes the enduring goodness of these cars.

Sensational mechanical innovations which catch popular attention and then die the death of the impracticable have never found place on Speedwell Cars.

Every Speedwell is rational through and through.

Riding comfort, power, good looks, long life— these are factors that count.

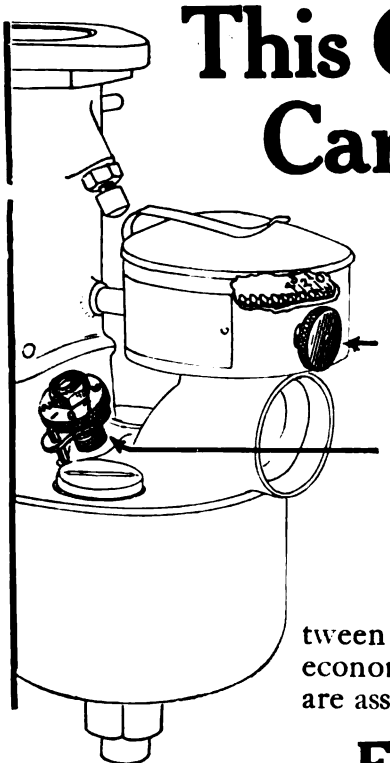
Literature upon request.

The Speedwell Motor Car Company

80 Essex Avenue, Dayton, O.

*STANDARD EQUIPMENT

Self Starter,
Full cape top and boot,
Glass front,
Demountable rims,
Gas tank and full lamp equipment,
Tool kit,
Tire kit,
Etc., etc.
One standard chassis---4 cylinder, 50 H. P.; 123 inch wheelbase; 36 inch wheels.



*Equipment as given applies to all models except roadsters and limousine, which vary slightly in their standard equipment.

Model F-Special, 7 passenger
$2900, with full equipment

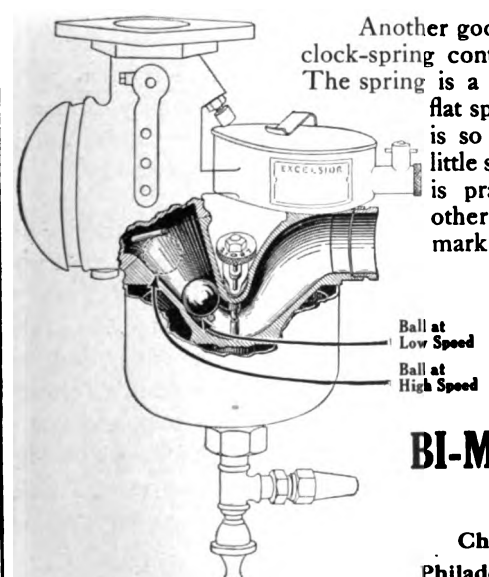
This Carburetor is Worth Careful Investigation

ONLY TWO ADJUSTMENTS

Simple as setting an alarm clock—and as easy. The table insures absolute correctness.



The great advance in The Excelsior Carburetor over others is due to one fact. Simplicity—and with it efficiency—have been developed in the Excelsior to a point no other carburetor has ever attempted. Only two adjustments are used and these are fitted with numbered dials and a printed table, which makes adjustment as simple—**for anyone**—as the setting of an alarm clock. Once adjusted, "the ball in the tube" takes care of the mixture, automatically giving the proper proportion of gas and air at all speeds between high and low. Thus economy and motor-efficiency are assured at all times.

EXCELSIOR CARBURETOR

"The ball in the tube does it."

Another good feature of the Excelsior is the clock-spring control of the Auxiliary Air Valve. The spring is a hardened, uniformly tempered, flat spring of an expensive quality. It is so placed and used as to be under little strain and its durability, therefore, is practically limitless. These and other points of superiority have enabled The Excelsior to set a new mark both in efficiency and economy.

"THE BALL IN THE TUBE DOES THE REST."

After adjustment the ball regulates mixture at all intermediate speeds.

Send for our booklet No. 6. and get the whole story about The Excelsior.

DUPLEX EXTERNAL BRAKES

Are the best brakes that the industry produce. Made by brake experts. They act instantly, whether car goes forward or backward.

Nothing is so necessary as "quick-acting" brakes. You often need them in an emergency. The DUPLEX never fails.

Get DUPLEX brakes for your car. If you're having brake troubles, install them. See what it feels like to have a set of brakes that work when you want 'em to work.

We make special brakes to order. Send us your specifications. Ask for prices.

TRADE MARK Raybestos REG. U. S. PAT. OFF.

This famous brake lining is used everywhere. It has the highest co-efficient of friction. It is practically oil and waterproof. As for wear! Well, it wears and wears and wears. It's made of the finest asbestos specially treated, woven with copper wire.

Dont buy the imitation. Every foot of RAYBESTOS is stamped with our trade-mark. This protects you and your car. See that it appears in the RAYBESTOS lining the dealer sells you.

It makes brakes "grip" with the grip of a bulldog. Line your brakes with RAYBESTOS and they won't slip. You find it on all the good cars. Ask your dealer, manufacturer or supply man.

Send for particulars. Get some of this lining for your brakes. Your dealer has it in all sizes.

GYREX · THE MIXER ·

Is a little gasolene mixer that fits the intake pipe. It spins around as the gasolene and air is drawn through and thoroughly "mixes the mixture."

It does what the best carburetors can't do. It delivers a perfect mixture, thoroughly diffused, to the cylinders — that's what is needed in cold weather.

We will send it on trial. Send us $3.00 and we will mail you a GYREX, and if it does not PROVE its worth you can return it within ten days and your money is cheerfully refunded. Send name, model and year of your car, or inside diameter of intake pipe at carburetor flange. Get a GYREX when you visit the shows.

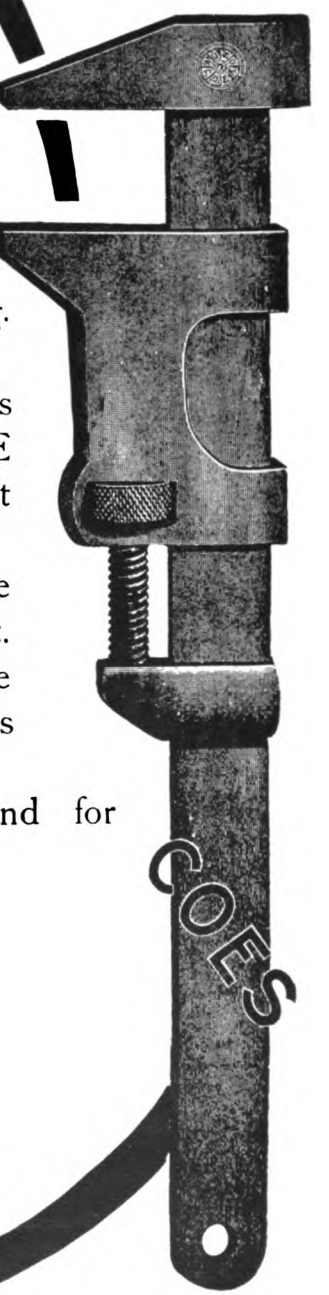
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

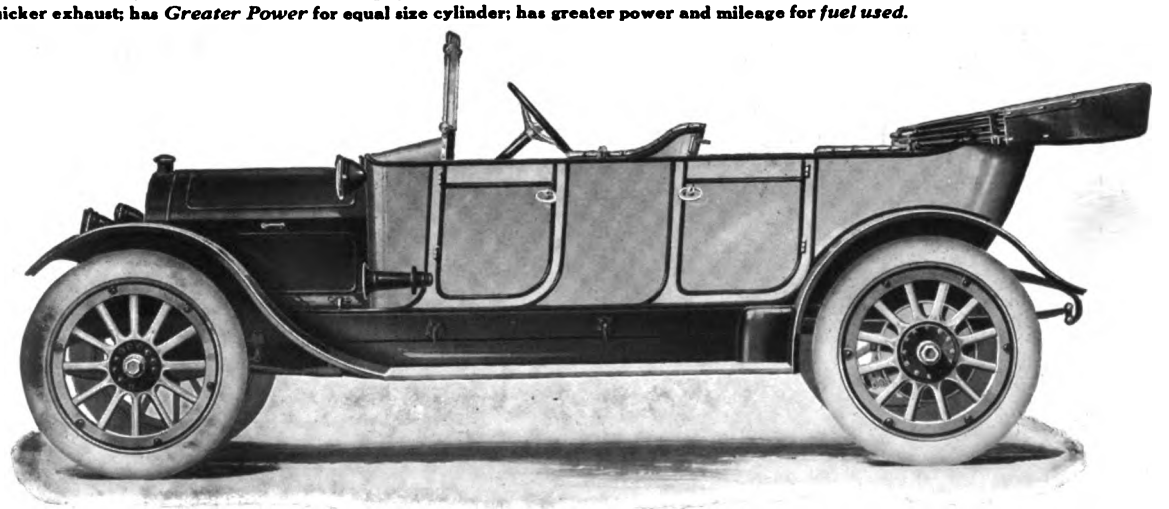
Atlas-Knight

Proven by the most exhaustive test to be the Best Type of Automobile Engine.



Adopted by the Atlas Company because of its wonderful record and remarkable success with the leading European manufacturers, the Daimler in England, the Mercedes in Germany, the Minerva in Belgium, the Panhard in France, and many others.

THE KNIGHT ENGINE IS THE ENGINE USED BY THE ROYALTY AND NOBILITY OF EUROPE

Including the King and Queen of England, the Czar of Russia, the Empress of Russia, the King of Spain, the King of Belgium, the Crown Princess of Sweden, etc. More than ten thousand Knight engines now in use giving new pleasure and delight to motoring.

ADVANTAGES OF THE Atlas-Knight OVER THE BEST TYPE OF POPPET-VALVE ENGINES

SILENCE under all running conditions; greater *smoothness* in running and absence of vibration; *positive* action of working parts; loses none of its power, silence or smooth running qualities with *years of continuous* service; admits *Larger Charge* and has freer and quicker exhaust; has *Greater Power* for equal size cylinder; has greater power and mileage for *fuel used.*

Atlas-Knight Five-Passenger Touring Car.

SPECIFICATIONS

ENGINE—Atlas-Knight, four-cycle, four-cylinder, cast in pairs, 4½" bore, 5½" stroke. Equipped with electric seat-starter.
HORSEPOWER: Fifty at twelve hundred revolutions.
CARBURETER—New Multiple Jet Stromberg with adjustment on steering wheel.
CLUTCH—Three-plate, faced with raybestos.
TRANSMISSION—The transmission case is part of the rear axle housing. Three speed selective.
REAR AXLE—Full-Floating flange-type; the differential gears are chrome vanadium steel.
WORM-DRIVE—The worm-drive is used to eliminate the continuous grind and noise of the bevel gear drive: it is constructed according to the latest European practice where the worm-drive is now accepted as the best.
FRONT AXLE—Timken, drop-forge, with Timken adjustable roller bearings in the wheel hubs and in the steering head.
BRAKES—Two sets double-acting internal and external, mounted on rear wheel hubs.
SPRINGS—Rear: very long, flexible, three-quarter elliptic, 2½-inches wide.
WHEELBASE and TREAD—Five-passenger 130-inch. Seven-passenger 140-inch. Tread 56 inches.
TIRES and RIMS—Demountable rims, 37"x5" tires.
STANDARD EQUIPMENT—One extra universal demountable rim, imported silk mohair top with dust cover, adjustable glass wind-shield, Stewart speedometer, trunk-rack, tire holder, coat and footrails, cocoa matting, complete tool and tire outfit, complete electric light equipment, including headlights and lights in rear tonneau and on dash.
LIST PRICE—$3500.00, five-passenger, completely equipped. $3700.00, seven-passenger, completely equipped.

K-R-I-T

"Ask the Kritical Man"

A Car which at $900 sells against cars of the $1500 class.

Model "K" Five-Passenger Touring Car—$900 F.O.B. Detroit. Seats five with comfort. 106-inch wheelbase. Tires 32 x 3½ inches, front and rear. Equipped with top, complete with side curtains and top cover, windshield, three oil lamps, two gas lamps and generator, demountable rims with spare rim, horn, tool kit with jack and tire repair outfit with pump.

The K-R-I-T possesses features, and a high degree of serviceability and staunchness that justify the dealer in comparing it with cars of higher price.

Cars of lower price you will find in plenty—but not cars of the class and type to which the K-R-I-T justly belongs.

Shown side by side with some of the admirable little cars of approximate price, the K-R-I-T immediately leaps forward into a larger and better class.

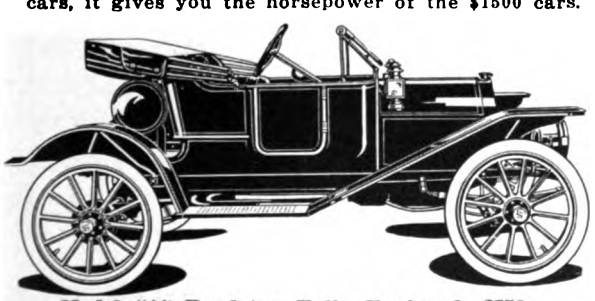
The discrepancy in their comparative proportions so immensely favors the K-R-I-T that you can discern the difference at a single glance.

Again—shown side by side with representative cars of the $1500 class it does not drop an inch in your esteem and approval.

It has much that the former has not and all that the latter possesses.

In place of the 12 to 15 horsepower of the low-priced cars, it gives you the horsepower of the $1500 cars.

Instead of the cramped and narrow seats of the former, it gives you the wide and roomy seats of the latter.



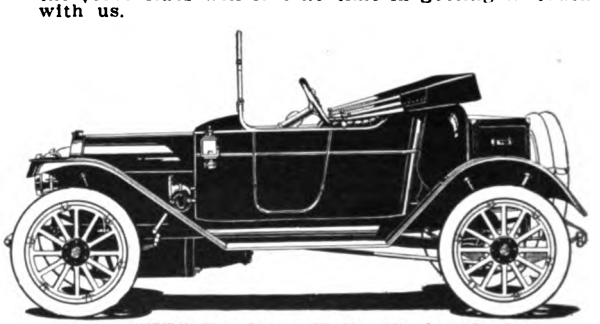
It is a graceful car; it is a good looking car; it has dash and style, and individuality.

The $1500 car cannot outdo the zealous service which the K-R-I-T will render continuously from one year's end to the other.

Neither in appearance nor in performance do you ask a man to be satisfied with a lesser degree of efficiency and excellence because of the lower price of the K-R-I-T.

Its right to rivalry with cars of a higher price you can appreciate only when you have viewed its generous proportions and tested the splendid possibilities of the K-R-I-T ball-bearing unit power plant.

The dealer who realizes the splendid opportunity offered by a car that he can sell in competition with the $1500 class will lose no time in getting in touch with us.



Model "A" Roadster, Fully Equipped—$750.

Equipment includes three Oil Lamps, two Gas Lamps, Generator, Top with Side Curtains and Top Cover, Brass Bound Windshield, Horn, Tool Kit with Jack and Tire Repair Outfit with Pump.

This model is equipped with Clincher Rims and 32 x 3" tires.

Rumble Seat furnished with Model "A" Roadster $15 additional.

Model "KR" Roadster, Fully Equipped—$900.

Equipment includes three Oil Lamps, two Gas Lamps, Generator, Top with Side Curtains and Top Cover, Brass Bound Windshield, Horn, Demountable Rims with spare Rim, Rear Tire Holders (adjustable for one or two tires), Trunk with capacity for two suit cases. Tool Kit with Jack and Tire Repair Outfit with Pump.

"The Easiest Riding Car in the World."

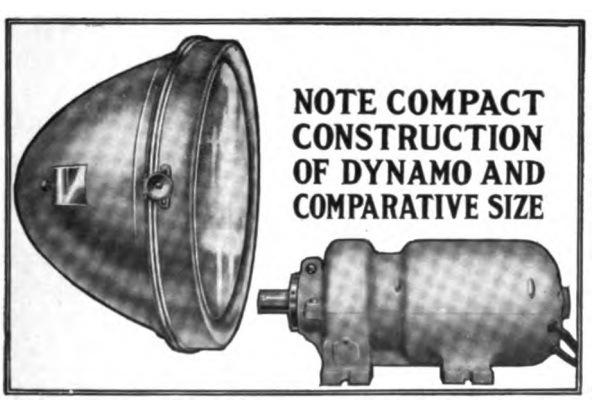
GRAY & DAVIS



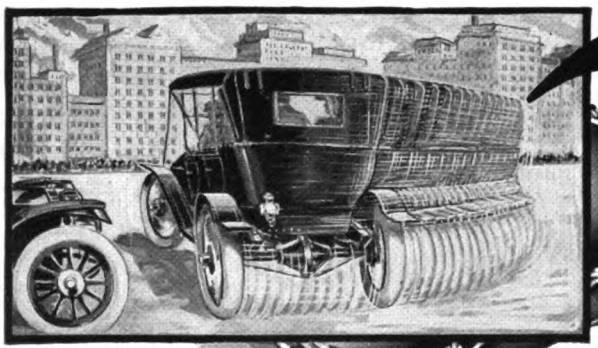
LIGHTING DYNAMO SYSTEM.

The world's greatest automobile lighting system is the GRAY & DAVIS Dynamo. It lights lamps, charges batteries and furnishes all necessary auxiliary current— yet it is not a mere battery charger like the "ordinary" electric system.

SEE THIS DYNAMO AT THE SHOW

Don't miss it. As usual it was the "shining light" at the New York and Chicago shows. It is Standard Equipment in all Peerless and Columbia-Knight cars—and optional on most good cars.

Tell your dealer you want this system on your new car. Do not accept a substitute or an imitation. Get the best—get GRAY & DAVIS and insist upon having it —just say "I want the GRAY & DAVIS Dynamo." Your dealer will get it for you.



Write for Catalog.

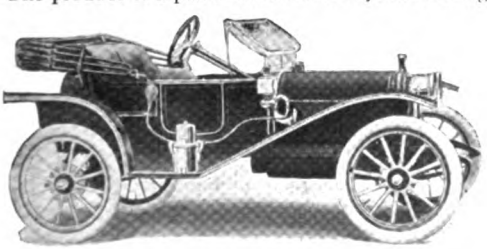
Hupmobile

Hupmobile Long-Stroke "32" Touring Car—$900

F. O. B. Detroit, including equipment of windshield, gas lamps and generator, oil lamps, tools and horn. Three speeds forward and reverse; sliding gears. Four cylinder motor. 3 1-4 inch bore and 5 1-2 inch stroke. Bosch magneto. 106-inch wheel base. 30 x 3 1-2 inch tires. Color—Standard Hupmobile blue.



NOT AN ORDINARY $900 CAR BUT A $900 HUPMOBILE

Not an ordinary $900 car either outwardly or inwardly, as the picture and summary of special features will quickly disclose.

A car of infinite refinement, which proves conclusively that a low price need not be accompanied by crudity of construction.

The product of a plant which has always looked higher than its own price for inspiration---which has always sought to give the most in merit; not merely the least in price.

A result made possible by a skilled organization held intact since its inception under the leadership of E. A. Nelson, who designed the original Hupmobile; by shop-generalship of the highest order, striving continually to surpass its own previous ideals.

HUPMOBILE RUNABOUT---$750 F. O. B. Detroit. Including top, windshield, gas lamps and generator, three oil lamps, tools and horn. Four cylinders, 20 H. P., sliding gears, Bosch magneto.

HUPMOBILE ROADSTER—Chassis same as World-Touring Car—**$850** f. o. b. Detroit.

HUPMOBILE COUPE—Chassis same as Runabout, **$1100** f. o. b. Detroit.

HUPP MOTOR CAR COMPANY,
1268 Jefferson Ave. Detroit, Mich.

$2500 Features in the $900 HUPMOBILE

Small-bore, long-stroke motor; cylinders cast en bloc; valves enclosed; three-bearing crankshaft; bronze bearings lined with Babbitt; transmission gears large enough for a 40 H. P. car; full-floating rear axle of extreme strength; multiple disc clutch with 13-inch plates; imported Coventry chain to drive cam shaft and magneto; Hyatt and F & S imported annular high-duty roller bearings in the transmission; Bower high-duty roller bearings on the wheels; standard imported Bosch magneto.

Best For Your Car

HARRIS

TRADE MARK-REG. U. S. PAT. OFF.

OILS

In 1 gallon and 5 gallon cans. If your dealer don't sell HARRIS OILS, send 80 cents (1 gallon) or $3.75 (5 gallon) and we will send same prepaid.

In barrels. When you buy oil at the garage—be sure it's HARRIS OIL.

The Reasons Why!

We pay a premium---in order to secure Premium quality---the highest grade of Pennsylvania Crude which is the basis of HARRIS OILS.

Right at the start we have the proper foundation for our product. Every process of manufacture is carefully watched and inspected.

The soot-deposit forming ingredients are removed to the greatest possible extent---therefore it is impossible to secure higher quality.

HARRIS OILS are ALL lubrication. Our customers tell us that they get more mileage and better service for less expense with HARRIS OILS.

We know there is nothing better. We want you to use HARRIS OILS---they are a revelation to motorists who have been using ordinary lubricants.

See Us at the Boston Show

Let us tell you more about HARRIS OILS. See our engine in motion and the gears running in HARRIS Trans-Compound, a practical illustration of the remarkable quality of HARRIS Products. Dealers please drop in. We've an interesting proposition. HARRIS OILS are sweeping the field. Motorists everywhere are alive to their superior quality. If you don't handle HARRIS OILS you're overlooking America's leading brand.

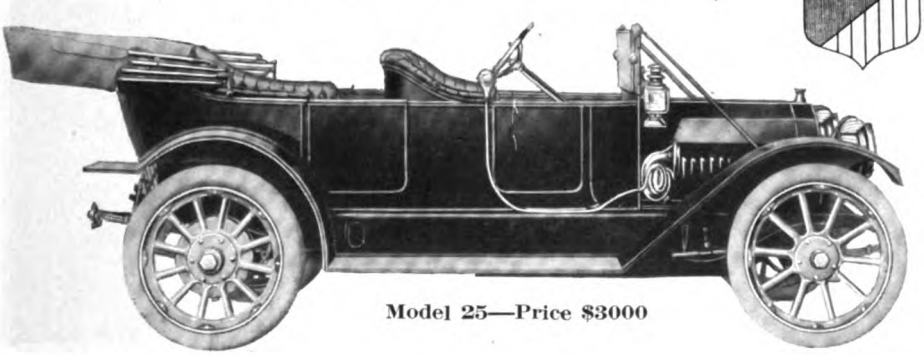
Still More Evidence of the Big Possibilities in

THE Marquette

THE Automobile Shows have clinched the standing of the Marquette. No car could arouse so much interest, with both dealer and consumer, unless it possessed that unusual merit which becomes most conspicuous when subjected to the critical inspection of Show visitors.

We believe it has been proved that the Marquette stands without a rival; for, price and car considered, this machine has created a new class in the high-grade automobile field.

The Marquette is the product of improved factory facilities and scientifically applied construction experience. These are expressed with unmistakable accuracy in every line and principle, with many touches of refinement which lift it to a par with the world's highest-priced cars. The Marquette is at once a car of strong artistic appeal and absolute dependability of performance.



The big, up-to-date Marquette plant is operated under the direct supervision of General Motors Company—a fact which insures the backing and support of a large, permanent organization, planned and equipped to co-operate with dealers to the utmost in prompt, efficient service to customers.

The line comprises five handsome models, from the smart, speedy, two-passenger "Challenger" to the magnificent seven-passenger type; prices, $3000 and $4000; complete equipment, including electric light generator.

A few high-class agencies still open.

See the Marquette at the Boston Show

All Models also on display at the Marquette Boston Showrooms, 733 Boylston Street.

Model 25—Price $3000

Mr. Dealer, You know

You know that all oils are **not** alike. You know that there is as much difference between oils as there is between cigars.

Surely, **you** know the value of a perfect lubricant. Why not impress the need of it upon the car-owner? Most owners will gladly pay a little **more** for oil—when they understand **why** they are paying it.

PANHARD OIL

It is refined from the best oil in the world—Pennsylvania Crude. Will not carbonize unless fed too freely. Always keeps its body at high temperatures.

It's a profit-producer for the dealer. The uniform quality of Panhard Oil sends the user back for more—and assures you of sales and re-sales—today, tomorrow, next month and next year.

Wherever there are automobiles there is a latent demand for Panhard. There's money for you in stirring it up. We are advertising Panhard in the best general and trade papers of the country. Our list includes:

Saturday Evening Post
Collier's
Literary Digest
Life
Review of Reviews
Motor
Cycle and Auto Trade Journal
Motor Print
The Automobile Journal
Auto Dealer and Repairer
Motor Boat

Why not reap the benefit of this advertising? Stock Panhard oil. Display Panhard signs. Best of all, **tell** your customers you have it.

Write today for our special proposition.

The Gilbert Tire Case

Made in all standard sizes, styles and colors from high grade materials.

Furnished with Teel patent water-shed construction which makes case absolutely waterproof.

Can be easily and quickly put on and removed. Occupies small storage space. Fastened with snap buttons.

We manufacture tire cases, inner tube bags and cases, lamp covers, dunnage bags, storm aprons, dust covers, spark-plug cases, pocket tool cases, racing bonnets, tool kits, robe rail boots, carburetors, rolls for tire irons, tire sleeves and patches, magneto covers and many other articles of everyday use to motorists.

We are the oldest firm manufacturing the above-mentioned specialties in the United States; we also have the largest factory in the world devoted to this line of work. We originated such articles as spare tire covers, spare tire brackets, etc., long before other manufacturers followed our lead.

Remember we *can* and *do* sell better goods at lower prices—all this on account of our superior manufacturing facilities and knowledge of the business.

When ordering these accessories be sure to specify Gilbert. Do not allow the dealer to substitute.

If your dealer will not supply you, then order from us direct. Catalogue on request.

The Only Car Built with a Faultless and Complete Electric System for Starting, Ignition and Lighting

Inter-State

THE Inter-State Electric System, on Models 40 and 50, performs all the hard work of starting, regulating and lighting the car, leaving the driver free for enjoyment and making motoring a pleasure instead of work, a satisfaction instead of worry, and a comfort instead of inconvenience.

The Inter-State Electric System doubles the use of the car. A woman can drive the powerful Inter-State as easily as she can handle an electric coupe. Without moving from the driver's seat or shifting gears she starts the engine with a turn of the switch; regulates the mixture by a simple movement of the lever on the steering column; lights any or all of the lights—front, side, rear—by merely turning a small button. It is not even necessary to bend over to get the Inter-State under way and under perfect and absolute control. This entire mechanism is automatic and so simple that it can be called fool proof.

The Inter-State has the greatest improvements, the greatest conveniences, the greatest luxuries in features and equipment ever brought together and built into a magnificent, powerful and reliable car. It is truly the ***only*** complete car.

Models 40, 41, 42—40 H. P. Long Stroke Motor, **$2400.** Models 50, 51, 52—50 H. P. Long Stroke Motor, **$3400.**
The equipment consists of ***every*** accessory needed for luxurious motoring—in other words the ***first*** cost is the only cost.

Also two moderate priced cars with self starter and of Inter-State quality

Model 31-A—40 H. P. Long Stroke Motor, - - **$1750.** Model 32-B—40 H. P. Long Stroke Motor, - - **$1700**

Write today for Art Catalog—which describes the famous Inter-State Models, giving all details of their wonderful construction and perfect equipment.

DEALERS: **The Inter-State line gives unequalled value to the buyer who wants a moderate or a high-priced car—write or wire (our expense) for agency.**

Jackson

In power, size, equipment—
The Jackson gives you more

Where, save in the Jackson "42," will you get full 40 horsepower, 118 inch wheelbase, 34x4 inch tires, full elliptic springs, windshield, top, gas tank, etc.---all for **$1500 ?**

Compare the Jackson "42," part for part, with any other car at $1500.

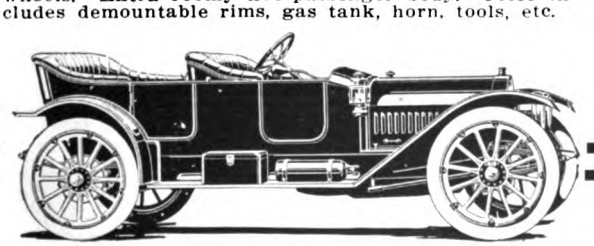
See if you can buy in any other car of moderate price all the elements that make for efficiency, comfort, safety and satisfaction.

Make the comparison actual, if you can.

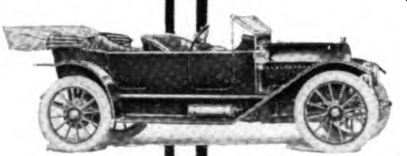
It will convince you that in power, size, equipment---the Jackson "42" gives you an extraordinary $1500 worth of value.

In the Jackson "52"---a full fifty horsepower motor, 124 inch wheelbase, 36x4 inch tires and full elliptic springs---for **$1800.**

In the Jackson "32"---a full thirty horsepower motor, 32 inch wheels, 110 inch wheelbase and full elliptic springs---for **$1100.**



The Jackson always gives you more.



Send a postal for illustrated catalog and nearest dealer's name.

Jackson Automobile Company

1203 E. Main Street, Jackson, Mich.

Model 52—$1800.
Fifty horsepower, four cylinder motor; 124 inch wheelbase; full elliptic springs, front and rear; 36 inch wheels. Extra roomy five-passenger body. Price includes demountable rims, gas tank, horn, tools, etc.

"Firestone"

Tires hold the world's record for durability and speed.

FIRESTONE'S WAY of getting extra mileage out of a tire, is to build extra mileage into it.

That is why "Firestone" Tires cost considerably more to build than others—stouter construction, more durable rubber, more rigid inspection—and why they have never had an off-year.

The small price difference commanded by "Firestone" Tires over tires made the ordinary way is paid back, many times over, in extra miles of service.—the Most Miles per Dollar of cost.

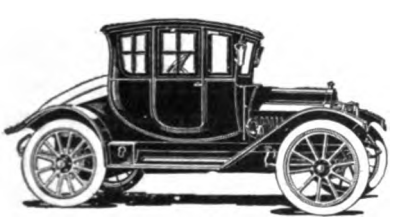
Friction Transmission Cartercar Self Starter, Certainly

Five passengers—$1600.
Completely equipped.

Seven passengers—$2100.
Completely equipped.

The big feature of the Cartercar—in winter and summer—is perfect service

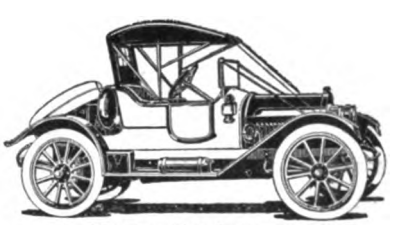


No matter how bad the weather or how far you wish to go—your Cartercar will give just as good service as under the most perfect conditions.

The patented Friction Transmission gives a pulling power amply sufficient to take the car through bad, muddy and sandy roads and even up 50 per cent. hills. For many years this transmission has given great satisfaction to thousands of Cartercar drivers.

The self starter eliminates all bother in starting. It makes winter driving especially delightful. You have any number of speeds with the Cartercar, easily and noiselessly controlled with one lever.

This easy control, with three strong brakes, makes the car extremely safe for anyone to drive. The patented Chain-In-Oil Drive is another excellent feature. It is absolutely noiseless—is the most economical means of transferring power—and requires no attention except an annual replenishing of the oil. Grit and sand being kept out, there is practically no wear on the chain.



The full floating rear axle is another great improvement. The axle shafts can be taken out without bothering the differential—or even jacking up the car.

Colonial Coupe—$1700.
Completely equipped.

Three quarter elliptic rear springs — Prest-O-Lite tank — and many other excellent features. Five good models, touring cars, roadsters, and coupes at from $1200 to $2100.

LET US SEND YOU COMPLETE INFORMATION REGARDING THIS EXCELLENT CAR.

A Classy Roadster—$1500.
Completely equipped.

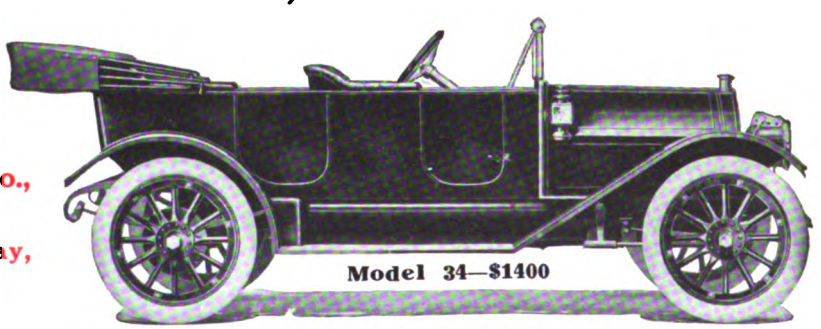
Six Big Features

Imperial



Everything that is best in modern automobile construction is incorporated in **Imperial** Cars for 1912. Almost every make of car boasts **some** of these—**Imperial** Cars have them **all.**

Self Starter

Four Real Doors
Center Control

Silent, Enclosed
Power Plant

Specifications are not everything, yet point for point every **Imperial** Model is the head of its class when actual value is set beside price. **Measure them up.** We challenge comparison. Style and graceful lines are not everything—speed and power are not everything---comfort and easy riding qualities alone do not make a car, yet you will find no more handsome design, no greater motor efficiency, no more luxurious upholstering and big, roomy bodies in cars costing **one-third more,** than you will find in **Imperial** cars at these astonishing prices. Behind this sterling worth, as judged by figures, lie the **actual accomplishments** and the wonderful victories of the **Imperial** cars in endurance contests. These public tests have time and time again proved the **Imperial** the best for **reliability** and **dependability,** when compared with a score of other cars—some costing three times as much. Five **first** awards in the past **five** months have strengthened the record of the **Imperial** as the car for **use,**---for **wear**—the car for **economical investment.**

AIR COMPRESSOR OUTFITS FOR GARAGES and VULCANIZERS

Electric Driven Portables. Belt and Electric Driven Stationary Outfits. Automatically Controlled Electric Outfits.

OUR SPECIALTY is manufacturing small air compressors EXCLUSIVELY.
OUR GUARANTEE is More Air, Higher Pressure, with Less Horse Power and mechanical construction as good as any automobile engine made.

Our No. 50 PORTABLE GARAGE Outfit we Guarantee Practical and Efficient.

The Motor is 1-4 H. P. and operates from any convenient light socket.

The No. 50 Portable Outfit

The TANK is large and holds enough air at 135 lbs. pressure for 25 ordinary tires.

Hose is fitted with Tire Pressure Register, insuring proper tire inflation.

Weight 250 lbs.
Height 32"
Floor Space 36 x 16"

When taken from shipping crate it is ready for instant operation.

NO PIPING—NO WIRING
NO LEAKY JOINTS—NO TROUBLE

For Alternating Current $145.00. For Direct Current $130.00

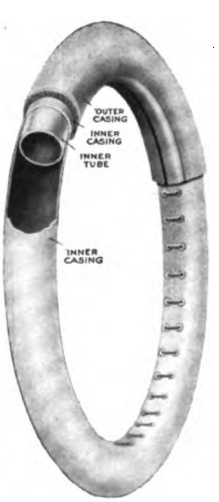
OUR BELT DRIVEN COMPRESSORS

NO. 101 VERTICAL COMPRESSOR, 1 1-4 cubic feet per minute, 130 lbs. pressure, 1-3 h. p. **$22.00**

Our NO. 102 VERTICAL COMPRESSOR 2 1-2 feet per minute, 130 lbs. pressure, 1-2 h. p. **$38.00**

Larger sizes up to 15 cubic feet per minute, belt, or electric driven, suited to the requirements of any man's garage, at correspondingly reasonable prices, and with our guarantee of absolute satisfaction.
NO MATTER WHAT YOUR REQUIREMENTS ARE WE CAN GIVE YOU JUST WHAT YOU NEED.
If your equipment is out of date and unsatisfactory, Tell us your troubles,—We can fit you up right.

BRUNNER MANUFACTURING CO., Utica, New York



"JUST POUR IN SE-MENT-OL"

No removing of radiator No soldering.
Se-ment-ol finds the leak, and fixes it in fifteen minutes
Non-injurious.

Never be without it in your car
Price 75 cents
Up-to-date garages carry it
If yours hasn't it, write direct to
The Northwestern Chemical Co.
Marietta, Ohio

Blowouts—Punctures

Users of Auto Inner Casings are never bothered.

The most remarkable and satisfactory tire protector ever sold.

The only one which will actually reduce tire expense per mile.

Mea

MAGNETO

What does Mea Offer ?

¶The following advantages impossible with a horse-shoe magneto:

Seventy per cent. (70%) actual range of timing.
Spark of absolutely the same intensity throughout entire range.
Greatly increased flexibility, power and efficiency of motor.
Easy start in full retard with one-quarter (1-4) turn of crank without possibility of back kick.
Throttling down to as low speeds as on battery without sacrifice of maximum speeds.
Hill climbing on high gear.
Under overload conditions, "MEA" equipped cars can still run in high gear, increasing comfort and decreasing noise and vibration.

Why ?

¶Because in the "MEA" instruments the bell-shaped field magnets are advanced and retarded simultaneously with the timer, and the spark therefore occurs always in the most favorable part of the field. This guarantees equal heat value of the spark in every position of timing, no matter how large a range may be used or required.

Who is Using Mea ?

GERMAN MERCEDES	WHITE	RAYFIELD SIX	WILCOX
AUSTRIAN FIAT	KISSEL	RELIANCE	WRIGHT AEROPLANE
SAURER	SCHACHT	GRABOWSKY	BURGESS AEROPLANE
SIMPLEX	COLUMBUS BUGGY	MOGUL	CURTISS AEROPLANE

NEW DEPARTURE BALL BEARINGS

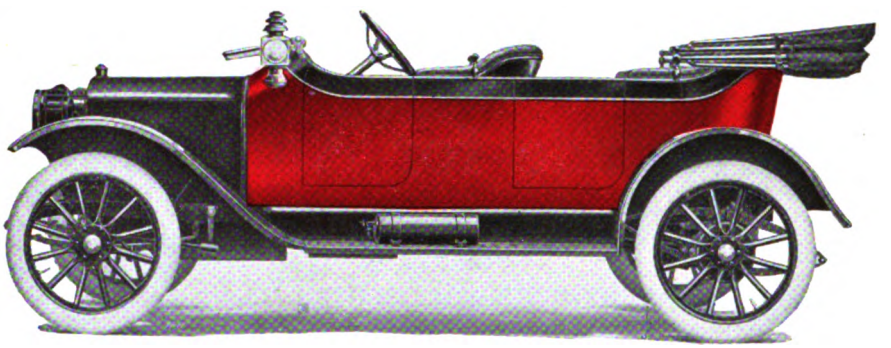
American Made for American Trade

Right here in New England, where American ingenuity, skill and energy have won triumphs that have become conspicuous in the industrial progress of the nation, history has again repeated itself.

The fact that ball bearings were first developed in Europe does not by any means carry that foreign bearings are now essential or superior. Americans, and particularly New Englanders, have never failed to successfully meet the demands of the American market in all metal products. We have emulated these American characteristics, and are today manufacturing ball bearings that are absolutely satisfactory. This is proved by the fact that they are successfully used in more than 60 per cent. of the motor cars manufactured in this country.

NEW DEPARTURE SINGLE ROW BALL BEARING

We therefore address New England manufacturers, and respectfully solicit the opportunity to consider with them the adaptability of the American made ---the New England made, New Departure ball bearings to their requirements.



The cooperation of our Engineering Department is at the command of all interested. Inquiries are invited, and will have thorough attention.

The New Departure Mfg. Co.

BRISTOL, CONN.

R-C-H "Twenty-Five"

MODEL SS

5-Passenger Touring Car—110-inch Wheelbase

$950 F.O.B. DETROIT

Equipped with HANNA SELF-STARTER, 32x3 1-2 tires, dual ignition, demountable and quick detachable rims, gas tank, extra rim, top, windshield, 5 lamps, horn, tools and tire repair kit, LONG STROKE MOTOR, 3 SPEEDS, ENCLOSED VALVES, MAGNETO.

OVER 11,000 ACTUAL ORDERS IN FOUR MONTHS—Think of it!

THERE'S a record that beats by thousands the sales of any other car in the history of the automobile industry, during the same period of its existence.

It tells better than anything we could say what a wonderful car-value the R-C-H really is. For these 11,000 orders didn't come from people who bought without looking to see what they were getting—you can bank on that. The cars were ordered after the people had compared the R-C-H with every other car at anywhere near its price—after they'd found that you can pay a thousand dollars more, but you can't get a better car.

And that's just what we want you to prove for yourself. The farmer today is, perhaps, the best-informed man on automobile values in the country. He studies the announcements more carefully—and he usually knows ten times as much about mechanical details as the city buyer.

So, if you'll just compare the R-C-H construction, equipment and special features with any other car you have in mind up to $2,000, we'll be satisfied. For we're willing to take your judgment.

We also manufacture the R-C-H "Twenty-Five" English-body roadster, Model SS with same specifications and equipment as the model SS touring car (except that the roadster wheelbase is 86 inches) is priced at $800. Equipped for 4 passengers, $850. Touring Roadster, extra large gasoline and oil capacity, $900. Write for booklet; sent FREE.

For certain sections, where we have not yet gotten in touch with the right dealer, we are reserving a few hundred cars. Dealers are urged to write us promptly—if the territory is open and you're the right man a good proposition waits you.

Standard Models

The standard models of the R-C-H are completely equipped with top, side-curtains, windshield, lamps, generator, horn, tools and kit, but do not have the self-starter or other special equipment mentioned above. They are priced as follows, F. O. B. Detroit:

5-Passenger Touring Car	$ 850
Touring Roadster	800
Roadster	700
(Equipped for 4 Passengers)	750
Colonial Coupe	1050

GENERAL R-C-H SPECIFICATIONS—Motor—4 cylinders, cast en bloc, 3¼ inch bore, 5 inch stroke, two-bearing crank shaft. Timing gears and valves enclosed. Three-point suspension. Drive—**Left side.** Irreversible worm gear. 16 inch wheel. Control—**Center lever** operated through H plate, integral with universal joint housing just below. Springs—Front, semi-elliptic; rear, full elliptic and mounted on swivel seats. Frame—Pressed steel channel. Axles—Front, I-beam, drop-forged; rear, semi-floating type. Body—English type, extra wide front seats. Full equipment quoted above.

TENTH ANNUAL BOSTON AUTOMOBILE SHOW.

Industry's Largest and Best Exhibition in the Centre of the World's Greatest Motor Vehicle and Accessory Market—Pleasure Cars and Industrial Transports to Be Displayed Separately Amid Artistic Surroundings.

CAREFUL study of automobile history in the United States leads to the conclusion that Boston and New England have played a part as important therein as has this section in the history of the country itself. There is little question that spasmodic attempts were made to invent a horseless carriage in various parts of the country, long before Kenneth A. Skinner of Boston imported the first De Dion tricycle, with which he made the memorable run from Boston to New York in 1897. But there is no doubt that the real stimulus to American motor vehicle building dates from the arrival of that machine and the opening of the first automobile salesrooms by Mr. Skinner at 122 Massachusetts avenue, Boston.

New England people may be regarded as conservative, but it is certain that long before the practicability of the automobile had been demonstrated to the satisfaction of others, this section had become the greatest motor vehicle market in the world. This is no idle boast. For years the registration figures in these six states showed conclusively that more machines in proportion to the number of inhabitants were owned and operated here than in any other portion of the world. It is only within the past two years that other sections of this country have begun to present figures worthy of comparison therewith. It still retains its position, despite the fact that some of these other sections show a large percentage of increase in those two years.

Chester I. Campbell, Manager Boston Automobile Show.

It will not be denied that the automobile show has done its full share in exploiting the motor car, and it cannot be forgotten that the first venture of this nature was held in conjunction with the Mechanics' Fair in Boston in the fall of 1898. Automobile shows have been held in that city practically every year since that time; and four had passed into history before other cities began to realize their importance.

In the beginning, motor vehicles were displayed in connection with bicycles and later with motor boats. The first exhibition, under what may be regarded as the present management of the Boston show, was in March, 1903. The Boston Automobile Dealers' Association was not organized until the following year, but the management of the 1903 display was in the hands of Chester I. Campbell, who has acted in the same capacity at every show since that time.

In 1907, the importance of automobiles had so far overshadowed the motor boats, that it was neces-

Digitized by Google

sary to utilize a second building. Naturally, the two classes of exhibits were separated the following year, and since that time there has been increasing demand for space. Last year it was again necessary to house some of the exhibitors in a second structure, and another separation is noted this year, in the holding of a special exhibit of commercial vehicles during a second week.

So located that it becomes the logical commercial centre of New England, Boston is the logical place in which to hold an important display. Every portion of these six states is within easy riding distance of Mechanics' Building, in which the shows are held. With the exceptional interest in motor vehicles, manifested by their adoption and use, it does not appear unreasonable that the annual Boston show should become the largest in the country, from the standpoint of attendance, number of exhibits and amount of business transacted.

Coming as it does at the close of the really big show season and at the very opening of the active motoring season, it has long been regarded by the manufacturers and others in the industry as the biggest and best of them all. This is true despite the fact that the local dealers arrange the details and supply the exhibits, and the display is in no sense regarded by the manufacturers as national in character. It is only necessary to cite figures to bear out the assertion that this is correctly regarded as the largest in point of number of exhibits.

First, it must be remembered that the Boston display has been held all under one roof, with the exception of the two years mentioned. No other city in the country is able to supply a building large enough to house so many exhibitors. Chicago employs two structures, and New York always has had two shows, each under separate and distinct management, in order to accommodate those who desired to make display.

Officials of the Boston Automobile Dealers' Association.

At the Madison Square Garden show in New York City this year there were 60 makes of pleasure cars represented, and this was the largest display ever held in that city. There were 37 makes on display at the Grand Central Palace during the 1912 show. At Chicago there were 98 different companies represented in the Coliseum and First Regiment Armory. The accompanying list of exhibitors, furnished by the Boston show management, indicates there will be at least 93 makes of pleasure cars on view in the Mechanics' Building during the week of March 2-9. It must be remembered in this connection, that there always are a few late comers who must be provided for at the last moment, and it is not unreasonable to presume that before the doors open the evening of March 2 the record of Chicago, with its two buildings, may be equalled if not exceeded in Boston's one.

Reference has been made to the separate display, for motor trucks this year. This section of the Boston show will be held during the week of March 13-20. It is still some time before the opening date, but it will prove of interest to compare the number of exhibitors listed to appear with those who were represented at New York and Chicago.

At Madison Square Garden there were 37 makes; at Grand Central Palace 33; and at Chicago, in the Coliseum and First Regiment Armory 82. Already there are 65 names on the list, and it must be remembered that not only is this Boston's first commercial vehicle show, but the display is to be housed in one structure. Last year was the first in which New York and Chicago decided to hold separate industrial transport exhibits, and there were only 35 different makes in the former city, and 57 in the western metropolis.

In most instances, vehicles and accessories are displayed at the Boston show by local dealers. Only a few manufacturers, who have not yet arranged for New England representatives, are able to secure space.

Digitized by Google

Last year's Boston show found 83 makes of pleasure vehicles and 41 of commercial cars on display. This means an increase of more than 50 per cent. in truck exhibitors alone.

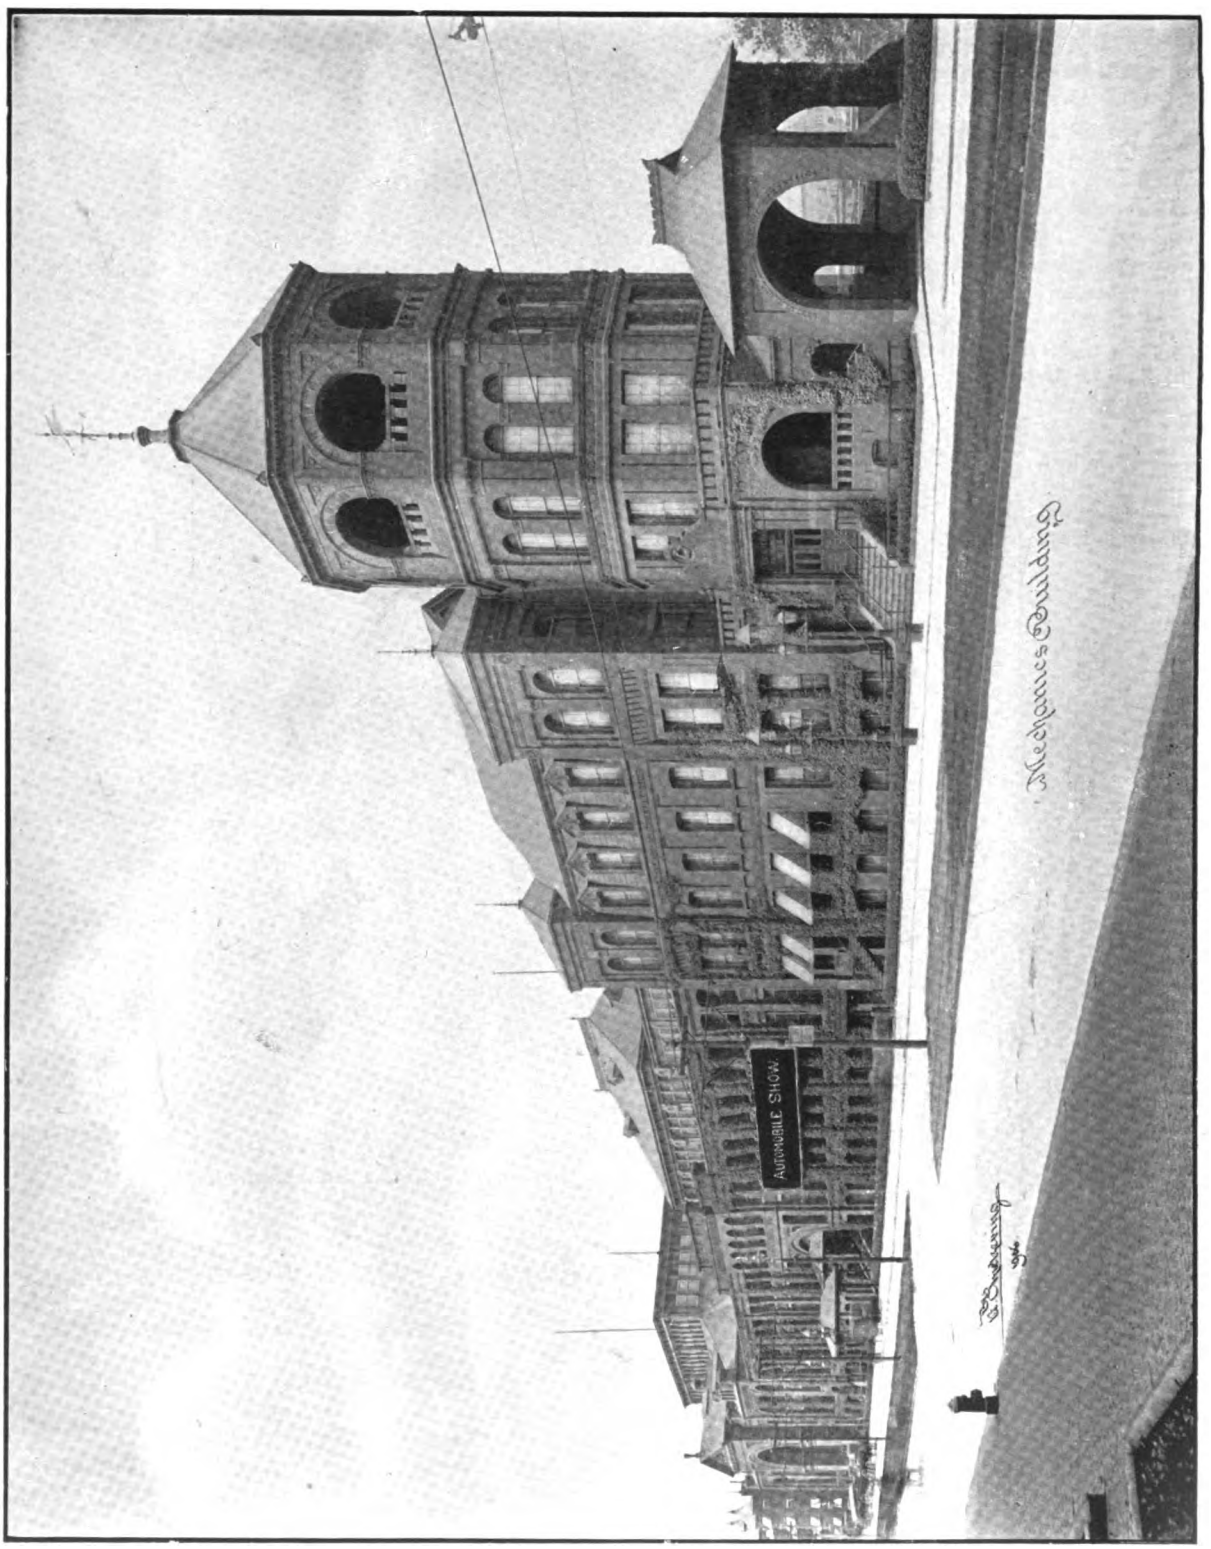
Considering the matter of accessories: The Boston show fails to impress with numbers, since many local agents present lines produced by numerous manufacturers. The list includes over 200 separate stands for accessories as against 184 for Chicago, where the manufacturers displayed direct. Were it possible to segregate the different makers represented, the list would reach a figure much in excess of double its present proportions.

It follows that many pleasure and commercial cars will be seen for the first time in the East at the Boston show. The same thing applies to the accessory exhibits. At least one new motor will be displayed, the product of woman's inventive genius. Miss Margaret E. Knight of South Framingham, Mass., presents this feature, and while nothing has been made public concerning it, it is expected to create as much interest in the industry as that other Knight motor which first made its appearance at a Chicago show a few years ago and has proved so successful in America and Europe.

Officials of the Boston Commercial Motor Vehicle Association.

In still another respect the Boston show always has been distinctive, reference being made to the decorations. Manager Campbell has been particularly fortunate in associating with himself artists of refined ability, who have been able to so transform the interior of the Mechanics' Building, that the decorative scheme has harmonized with the beauty of the cars and accessories on display. At times, this transformation has been with a view to creating a springlike floral bower, and at others to bring about fascinating architectural creations.

This year, Mr. Campbell paid a visit to Europe during the progress of some of the more notable shows in England and on the Continent, and the result will be reflected in the decorations for the forthcoming exhibition. The same setting will serve for both sections, and the arrangement has been with this idea in view.



The Garrison street entrance will be treated in a light tracery in steel, with three illuminated domes in colors. Foliated bands, extending from these to the sides of the building, will form a most spectacular arch leading to the main entrance.

Exhibition Hall will typify an old English garden fete. Real box hedges, imported for the purpose and specially prepared by a process which preserves them, will serve to divide the various exhibition spaces. The beauty of the dark green of these hedges will be intensified by thousands of rose vines climbing from between these and running up along old English beams and plastic work, which will conceal completely every one of the many posts and girders for which this hall is noted.

Nearly 15,000 square feet of scenic work will be necessary to to give the beam effect alone. The main aisle will present a strikingly beautiful avenue of rose trees, illuminnated with festoons of colored lamps across the ceiling. The side wall treatment will consist of the hedge, beyond which a distant scene will be rendered in perspective. Arches of box hedge and springlike foliage will surround the open light well space, and even the floor covering will be in perfect harmony, as to the coloring.

Grand Hall, which lends itself much more easily to treatment from an artistic standpoint, will present an entirely new transformation. Under a canopy composed of a painted sky, which will contain over 25,000 square feet, the exhibits will be placed in a scene founded upon the Spanish mission style. Every piece of composition here will be found in complete accord with the main principle of the design.

Digitized by Google

Quaint structures erected along the balcony fronts, with illuminated bells in their towers, will serve to bring out the effect sought. Around the entire hall, escutcheons and groupings of illuminated foliage will serve as decorative features. All columns are to be covered to harmonize with the Spanish mission treatment, while probably one of the most unique features will be the sign posts with their tile caps and buttresses, and the central dividing lines, all designed to correspond with the balcony scheme. Sunbursts of electric lights will be suspended over the main floor, illuminating the entire interior.

The basement will be treated in white panels with brilliant red background, every post being enclosed and all connected with triangular arches of white bars and foliage. Strands of varied colored lights will be used to the best advantage. All balconies will be covered in with gilded panels, azure blue and white ceilings and side walls, draperies, artistic signs, and every feature necessary to complete the entire design.

The pleasure vehicle section will be under the auspices of the Boston Automobile Dealers' Association, of which J. H. MacAlman, agent for Columbia and Stearns cars, is president; J. S. Hathaway, manager of the White Company's Boston branch, is vice president, and F. A. Hinchcliffe, manager of the local branch of the Winton Motor Carriage Company, is treasurer. In addition to the officers, the directors are: E. A. Gilmore of the Whitten-Gilmore Company, agent for Chalmers cars; C. E. Fay, local manager for the Ford Motor Company; F. E. Wing, of the F. E. Wing Motor Car Company, agent for Marmon cars; C. F. Whitney, of the Whitney-Barney Company, agent for the Selden; A. P. Underhill, of the Underhill Company, Knox agent, and J. W. Maguire, of the J. W. Maguire Company, Pierce-Arrow representative.

The commercial car section is under the auspices of the Boston Commercial Motor Vehicle Association, of which C. F. Whitney is president; Alvan T. Fuller, Packard agent, is vice president, and E. Day Baker, manager of the General Vehicle Company's Boston branch, is treasurer. The directors, in addition to the officers, are: J. H. MacAlman, J. S. Hathaway, J. W. Maguire, A. P. Underhill, A. B. Henley and L. B. Butler.

Chester I. Campbell, who acts as general manager of both sections, is secretary of both associations. In addition to managing successfully all of the Boston automobile shows since 1903, Mr. Campbell has been in charge of all the motor boat and aerial craft displays held in that city. He is recognized as the dean of all automobile show managers in the country and is consulted frequently by those who desire to learn the best methods to pursue in securing success.

CLASSIFIED EXHIBITORS AT BOSTON AUTOMOBILE SHOW.

GASOLINE PLEASURE CARS.
(First Week.)

Space	Make	Exhibitor
20	Abbott-Detroit	W. M. Jenkins & Co., 228 Columbus avenue, Boston.
33	Alco	American Locomotive Company, 591 Boylston street, Boston.
140AA	American	Essex Automobile Company, 887 Boylston street, Boston.
38	Apperson	W. L. Russell & Co., 11-12 Park square, Boston.
28	Atlas-Knight	Atlas Motor Car Company, Springfield, Mass.
32	Auburn	Rawles-Cobb Company, 74 Pearl street, Boston.
34	Bergdoll	White, Ware & Leatherbee, 574 Commonwealth avenue, Boston.
133	Brush	United Motor Boston Company, 100 Massachusetts avenue, Boston.
136-140	Buick	Buick Motor Company, Motor Mart, Boston.
2	Cadillac	Cadillac Automobile Company of Boston, 372 Boylston street, Boston.
316-317	Cartercar	Cartercar Company, Pontiac, Mich.
205-206	Case	J. I. Case Threshing Machine Company, 1860 Broadway, New York City.
107-109	Chalmers	Whitton-Gilmore Company, 907 Boylston street, Boston.
35	Cole	G. E. & H. J. Habich Company, 117 Massachusetts avenue, Boston.
15, 19	Columbia-Knight	J. H. MacAlman, 96 Massachusetts avenue, Boston.
151-152	Cunningham	Chauncey Thomas & Co., 101 Chestnut street, Boston.
332-335	Cutting	Clarke-Carter Automobile Company, Jackson, Mich.
315	DeTamble	Lunt-Moss Company, 43 South Market street, Boston.
223-224	Elmore	Clyde H. Smith Auto Company, Skowhegan, Me.
26	E-M-F	E-M-F Boston Company, 889 Boylston street, Boston.
148	Empire	Empire Motor Car Agency, 94 Massachusetts avenue, Boston.
312-313	Everitt	J. S. Harrington & Co., 589 Boylston street, Boston.
113-114	Fiat	Fiat Automobile Company, 839 Boylston street, Boston.
226	Firestone-Columbus	Columbus Buggy Company, 889 Boylston street, Boston.
27	Flanders	E-M-F Boston Company, 889 Boylston street, Boston.
117-118, 331	Ford	Ford Motor Company, 147 Columbus avenue, Boston.
127-128	Franklin	Franklin Automobile Company, 671 Boylston street, Boston.
326	Great Western	Great Western Automobile Company, Peru, Ind.
211	Havers	Havers Motor Car Company, Port Huron, Mich.
38	Haynes	W. L. Russell & Co., 11-12 Park square, Boston.
24-25	Hudson	Henley-Kimball Company, 893 Boylston street, Boston.
229, 234	Hupmobile	H. J. Koehler Sporting Goods Company, 1074 Boylston street, Boston.
150**	Imperial	Imperial Automobile Company, Jackson, Mich.
135, 141	Inter-State	Inter-State Automobile Company, 153 Massachusetts avenue, Boston.
104, 311	Jackson	Jackson Motor Car Company, 821 Boylston street, Boston.
220	King	Charles A. Malley, 208 Warren street, Boston.
146-147	KisselKar	KisselKar New England Branch, Motor Mart, Boston.
8, 12	Knox	Underhill Company, 885 Boylston street, Boston.
29	K-R-I-T	W. M. Jenkins & Co., 288 Columbus avenue, Boston.
134	Lenox	Lenox Motor Car Company, 3368 Washington street, Boston.
218-219	Lexington	Lexington Company of New England, Inc., 1020 Boylston street, Boston.
110-111	Locomobile	Locomobile Company of America, 700 Commonwealth avenue, Boston.
36-37	Lozier	Lozier Motor Company, 646 Beacon street, Boston.
121-122	Marmon	F. E. Wing Motor Car Company, Motor Mart, Boston.
22-23	Marquette	Marquette Com-

pany, 733 Boylston street, Boston.

102-103 Matheson — Roy A. Faye Company, 664 Commonwealth avenue, Boston.

123-124 Maxwell—United Motor Boston Company, 100 Massachusetts avenue, Boston.

17 Mercer—Fred S. Smith, 38 Columbus avenue, Boston.

100-101 Metallurgique — Alfred Cutler Morse & Co., Motor Mart, Boston.

154, 314 Metz — Hollander Motor Company, 169 Huntington avenue, Boston.

254-256 Mitchell—Lawrence & Stanley, 555 Columbus avenue, Boston.

318, 322 Moon — Andrews-Dykeman Company, 18 Columbus avenue, Boston.

327-328 National—W. H. Stevens, 642 Beacon street, Boston.

338, 347 Oakland—Massachusetts Motor Company, 591 Boylston street, Boston.

214-217 Ohio—Ohio Motor Car Company, Cincinnati, O.

221-222 Oldsmobile — Oldsmobile Company of Massachusetts, 94 Massachusetts avenue, Boston.

330 OttoMobile — OttoMobile Company, Philadelphia.

129-130 Overland — Connell & McKone Company, 555 Boylston street, Boston.

1 Packard—Alvan T. Fuller, 1089 Commonwealth avenue, Boston.

209-210 Paige-Detroit — Paige-Detroit Motor Car Company, Detroit.

14, 18 Peerless—Peerless Motor Car Company of New England, 660 Beacon street, Boston.

237 Penn—Penn Motor Car Company of New England, 224 Columbus avenue, Boston.

16, 20, 200-208 Pierce-Arrow—J. W. Maguire Company, 745 Boylston street, Boston.

13, 153 Pope-Hartford—Dodge Motor Vehicle Company, Lansdowne street, Cambridge, Mass.

112 Premier—Premier Motor Car Company of New England, 1008 Boylston street, Boston.

105-106 Rambler—Thomas B. Jeffery Company of New England, 93 Massachusetts avenue, Boston.

240-241 R, C. H.—R. C. H. Corporation, 563 Boylston street, Boston.

250-251 Regal—Regal Motor Car Company, Detroit.

100-101 Renault—Alfred Cutler Morse & Co., Motor Mart, Boston.

119-120 Reo—Linscott Motor Company, 163 Columbus avenue, Boston.

133 Sampson—United Motor Boston Company, 100 Massachusetts avenue, Boston.

125-126 Selden — Whitney-Barney Company, 823 Boylston street, Boston.

142-144 Speedwell — Curtis-Hawkins Company, 162 Columbus avenue, Boston.

19 Stearns-Knight—J. H. MacAlman, 96 Massachusetts avenue, Boston.

5, 9 Stevens-Duryea—J. W. Bowman & Co., 911 Boylston street, Boston.

115-116 Stoddard-Dayton-Knight — Stoddard-Dayton Sales Company, 94 Massachuetts avenue, Boston.

149 Stutz—Empire Motor Car Agency, 94 Massachusetts avenue, Boston.

131-132 Thomas—Thomas Motor Car Company of Boston, 915 Boylston street, Boston.

145 Velie—Velie Boston Branch, 92 Massachusetts avenue, Boston.

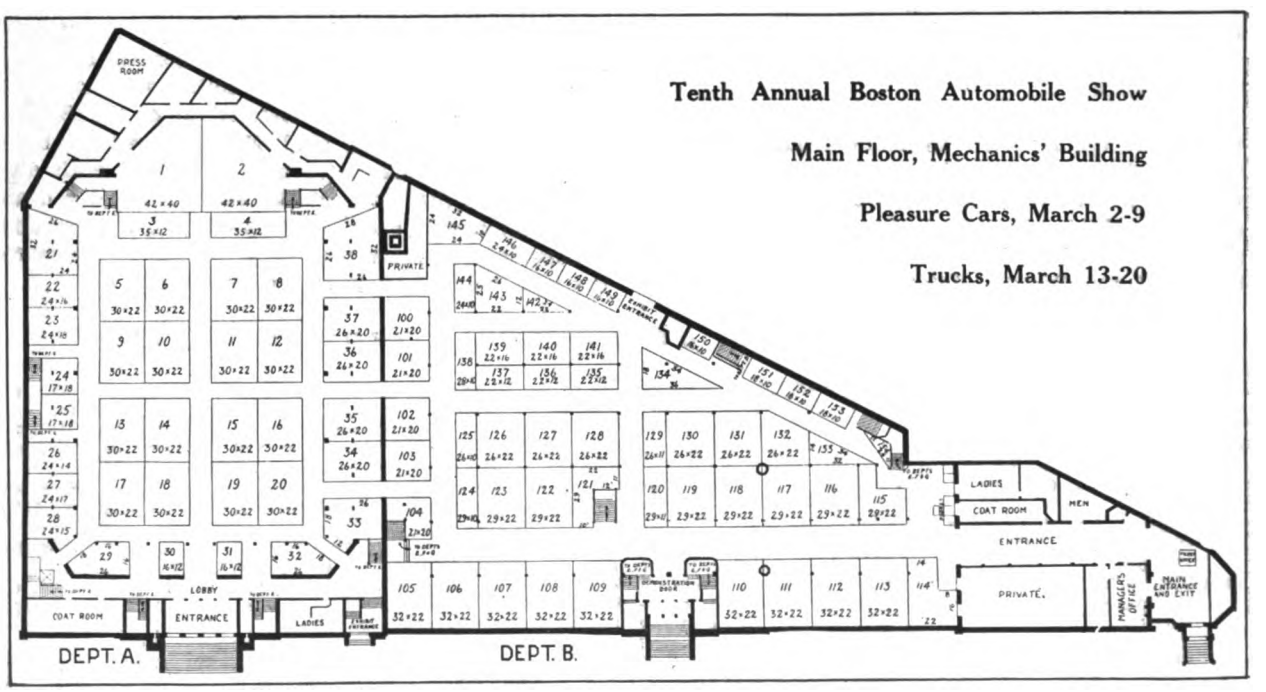
248, 253 Warren—Malley Motor Vehicle Company, 903 Boylston street, Boston.

227-228 Westcott — Westcott Motor Car Company, Richmond, Ind.

7, 11, 230-233 White—White Company, 320 Newbury street, Boston.

6, 10 Winton—Winton Motor Carriage Company, 574 Commonwealth avenue, Boston.

ELECTRIC PLEASURE CARS.
(First Week.)



324 Babcock — Babcock Electric Carriage Company, 643 Washington street, Boston.

3 Bailey—S. R. Bailey & Co., Amesbury, Mass.

2AA Baker—A. F. Neal, Motor Mart, Boston.

30-31 Detroit—Boston Electric Garage Company, 321 Columbus avenue, Boston.

245—Ohio—Ohio Electric Car Company, Toledo, O.

231-232 Rauch & Lang—D. C. Tiffany Company, 136 Chestnut street, Boston.

STEAM PLEASURE CARS.
(First Week.)

21 Stanley—Stanley Motor Carriage Company, Newton, Mass.

GASOLINE COMMERCIAL CARS.
(Second Week.)

110-111 Alco—American Locomotive Company, 591 Boylston street, Boston.

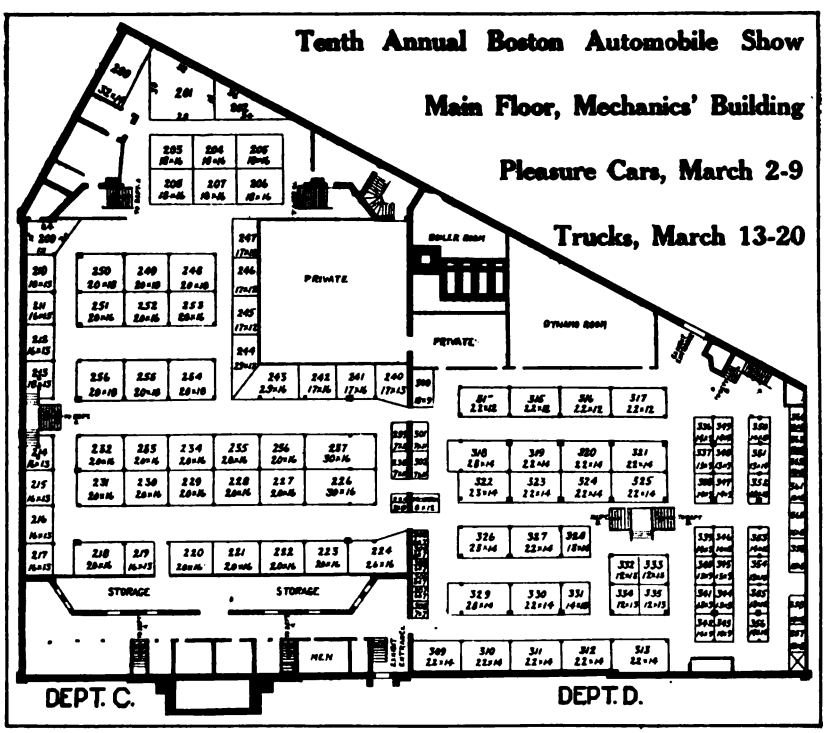
132-133 Atterbury—Atterbury Motor Truck Company, Buffalo, N. Y.

34-37 Autocar — Autocar Company, 642 Beacon street, Boston.

38 Buick—Buick Motor Company, Motor Mart, Boston.

148 Cameron — Standard Motor Truck Company, 9 Harcourt street, Boston.

Digitized by Google



339, 346 Chase—Chase Motor Truck Company, Syracuse, N. Y.
141 Clark—Edward S. Clark, 242 Freeport street, Dorchester, Mass.
222-224 Commer—Dodge Motor Vehicle Company, Lansdowne street, Cambridge, Mass.
149 Commerce — Curtis - Hawkins Company, 162 Columbus avenue, Boston.
17 Dayton—Whitten-Gilmore Company, 907 Boylston street, Boston.
102-103 Decatur—Decatur Motor Car Company, 20 Green street, Cambridge, Mass.
134, 150 De Dion—Boston Motor Company, 1002 Boylston street, Boston.
13 Federal — Whitten - Gilmore Company, 907 Boylston street, Boston.
124 Ford—Ford Motor Company, 147 Columbus avenue, Boston.
26-27 Garford — Garford Company, Elyria, O.
105-109 G. M. C.—General Motors Truck Co., 944 Massachusetts avenue, Boston, and Butler Motor Truck Company, 1022 Commonwealth avenue, Boston.
226-227 Grabowsky—Lewis S. McCreary, 183 Pleasant street, Boston.
15 Gramm—Whitney-Barney Company, 823 Boylston street, Boston.
114 International — International Harvester Company of America, 43 Somerville avenue, Somerville, Mass.
100-101 Kelly—Eastern Motor Truck Company, Shoe & Leather building, Cambridge, Mass.
129-130 KisselKar—KisselKar New England Branch, Motor Mart, Boston.
8, 12 Knox—Underhill Company, 885 Boylston street, Boston.
151-152 Koehler—L. E. Schlotterback Manufacturing Company, East Orange, N. J.
135 Lauth-Juergens — Lauth-Juergens Motor Car Company, Lima, O.
15 Lippard - Stewart — Whitney-Barney Company, 823 Boylston street, Boston.
5 Locomobile—Locomobile Company of America, 700 Commonwealth avenue, Boston.
19 Lozier—Lozier Motor Company, 646 Beacon street, Boston.
228-235 Mack—Mack Motor Truck Company, 201 Pleasant street, Boston.
329-330 Mais—R. L. & H. H. Smith, 1008 Commonwealth avenue, Boston.
147 McIntyre — Standard Motor Truck Company, 9 Harcourt street, Boston.
32 Mercury—Mercury Manufacturing Company, Chicago, Ill.
21 Morgan—Morgan Motor Truck Company, Worcester, Mass.
24-25, 28-29 Motor Wagon—Boston Motor Wagon Company, Motor Mart, Boston.
1-2 Packard—Alvan T. Fuller, 1089 Commonwealth avenue, Boston.
14, 18 Peerless—Peerless Motor Car Company of New England, 660 Beacon street, Boston.
30 P. H. P.—P. H. P. Motor Truck Company, Westfield, Mass.
312-313 Philadelphia — Philadelphia Truck Company, Philadelphia.
16, 20 Pierce-Arrow — Pierce-Arrow Motor Car Company, Buffalo, N. Y.
318-320 Pope-Hartford—Dodge Motor Vehicle Company, Lansdowne street, Cambridge, Mass.
31 Poss — Poss Motor Company, Detroit.
118-120 Reo—Linscott Motor Company, 163 Columbus avenue, Boston.
332-335 Sandusky — Sandusky Auto Parts & Motor Truck Company, Sandusky, O.
22 Sanford—Sanford-Herbert Company, Syracuse, N. Y.
115-117 Sampson — United Motor Boston Company, 100 Massachusetts avenue, Boston.

ELECTRIC COMMERCIAL CARS.
(Second Week.)

137-139 Baker—Frank N. Phelps, 17 Harvard street, Boston.
121 Couple-Gear—W. E. Eldridge, 178 Devonshire street, Boston.
136 Detroit—Anderson Electric Car Company, Detroit.
122-123 General Vehicle — General Vehicle Company, 84 State street, Boston.
105-109 G. M. C.—General Motors Truck Company, 944 Massachusetts avenue, Boston.
127 Lansden — Lansden Company, Newark, N. J.
126 Walker—Walker Vehicle Company, 131 State street, Boston.

STEAM COMMERCIAL CARS.
(Second Week.)

23 Stanley — Stanley Motor Carriage Company, Newton, Mass.

254-256 Saurer—Mack Motor Truck Company, 201 Pleasant street, Boston.
142-144 Speedwell — Curtis-Hawkins Company, 162 Columbus avenue, Boston.
6 Stearns—J. H. MacAlman, 96 Massachusetts avenue, Boston.
237 Sternberg—Hanson Bros., 95 Commercial street, Boston.
112 Teel-Woodworth — Teel Manufacturing Company, Main street, Medford, Mass.
113 Universal — Universal Motor Truck Company, Detroit.
145-146 Velie—Velie Boston Branch, 92 Massachusetts avenue, Boston.
326-327 Victor—Victor Motor Car Company, 75 Haverhill street, Boston.
4, 7, 11 White—White Company, 320 Newbury street, Boston.

IGNITION EQUIPMENT.

614* American Storage Battery Company, Albro street, Cambridge, Mass., batteries.
514* Apple Electric Company, Dayton, O., batteries.
616-617* Bi-Motor Equipment Company, 177 Portland street, Boston, Salom batteries.
242* G. C. Blickensderfer Company, Stamford, Conn., spark plugs.
408-409* Burn - Boston Battery & Manufacturing Company, 9 Doane street, Boston, batteries.
414* Champion Ignition Company, Flint, Mich., magnetos, plugs.
504* Connecticut Telephone & Electric Company, Meriden, Conn., Connecticut magnetos, etc.
619* Smalley Daniels, Motor Mart,

Boston, Kingston magnetos, etc.

415* **Detroit Electric Appliance Company,** Detroit, batteries.

500* **Edison Storage Battery Company,** 895 Boylston street, Boston, batteries.

546-547 **Electric Storage Battery Company,** Philadelphia, batteries.

620* **Walter J. Forbes,** 243 Columbus avenue, Boston, magnetos, plugs, etc.

531* **Heinze Electric Company,** Lowell, Mass., Heinze magnetos.

...* **Holt & Beebee,** 40 Sudbury street, Boston, electric supplies.

618 **Holtzer-Cabot Electric Company,** Brookline, Mass., magnetos, etc.

...* **C. S. Knowles,** 7 Arch street, Boston, spark plugs.

417* **W. H. Leland & Co.,** Worcester, Mass., coils, etc.

553* **Mac-Kae Manufacturing Company,** 185 Armory street, Jamaica Plain, Boston, Mac-Kae spark plugs.

508 **Marburg Bros., Inc.,** New York City, Mea magnetos.

441-442* **Chas. E. Miller,** 202-204 Columbus avenue, Boston, magnetos, plugs, etc.

438 **A. R. Mosler & Co.,** New York City, spark plugs.

336* **Narragansett Chemical Company,** Providence, R. I., batteries.

540* **National Carbon Company,** Cleveland, O., batteries.

509* **National Coil Company,** Lansing, Mich., National magnetos, etc.

421* **Pittsfield Spark Coil Company,** Dalton, Mass., Pittsfield magnetos, etc.

543 **Remy Electric Company,** Anderson, Ind., Remy magnetos, etc.

601* **T. F. Russell & Co.,** 176 Federal street, Boston, magnetos, etc.

548-549 **C. F. Splitdorf, Inc.,** Motor Mart, Boston, Splitdorf magnetos, etc.

521 **U. S. Light & Heating Company,** New York City, batteries.

560* **Vesta Accumulator Company,** Chicago, batteries.

TIRES, RIMS, ETC.

519-520 **Ajax-Grieb Rubber Company,** 15 Park square, Boston, Ajax tires.

516* **Allen Auto Specialty Company,** New York City, cases, pressure gauges, etc.

355 **Atlas Chain Company,** Brooklyn N. Y., chains.

513* **Auburn Auto Pump Company,** 537 Tremont street, Boston, pumps, compressors.

561* **Batavia Rubber Company,** Batavia, N. Y., Batavia tires.

429A* **Booth Demountable Rim Company,** Detroit, Booth rims.

610* **Boston Auto Gauge Company,** 8 Waltham street, Boston, gauges.

609* **Boston Tire & Rubber Company,** 182 Friend street, Boston, tires.

449* **F. Shirley Boyd,** 903 Boylston street, Boston, Dorian rims.

625* **Century Tire Company,** 817 Boylston street, Boston, tires.

350 **Clayton Air Compressor Works,** 200 Devonshire street, Boston, compressors.

619* **Smalley Daniels,** Motor Mart, Boston, Detroit rims.

433 **Diamond Rubber Company,** 867 Boylston street, Boston, Diamond tires.

562* **Dorian Remountable Rim Company,** New York City, Dorian rims.

431 **Empire Tire Company,** 119 Summer street, Boston, Empire tires.

410* **Endurance Tire & Rubber Company,** New York City, Endurance tubes.

550-551 **Federal Rubber Manufacturing Company,** Milwaukee, Wis., Federal tires.

506, 527 **Firestone Tire & Rubber Company,** 145 Columbus avenue, Boston, Firestone tires and rims.

538 **Fisk Rubber Company,** 811 Boylston street, Boston, Fisk tires and rims.

606* **Jas. L. Gibney & Bro.,** Philadelphia, Gibney tires, etc.

541-542 **B. F. Goodrich Company,** 581 Boylston street, Boston, Goodrich tires.

544-545 **Goodyear Tire & Rubber Company,** 669 Boylston street, Boston, Goodyear tires, etc.

446* **Hopewell Bros.,** 29 Chapel street, Newton, Mass., cases.

526-527 **Kelly-Springfield Tire Company,** 683 Boylston street, Boston, Kelly-Springfield tires.

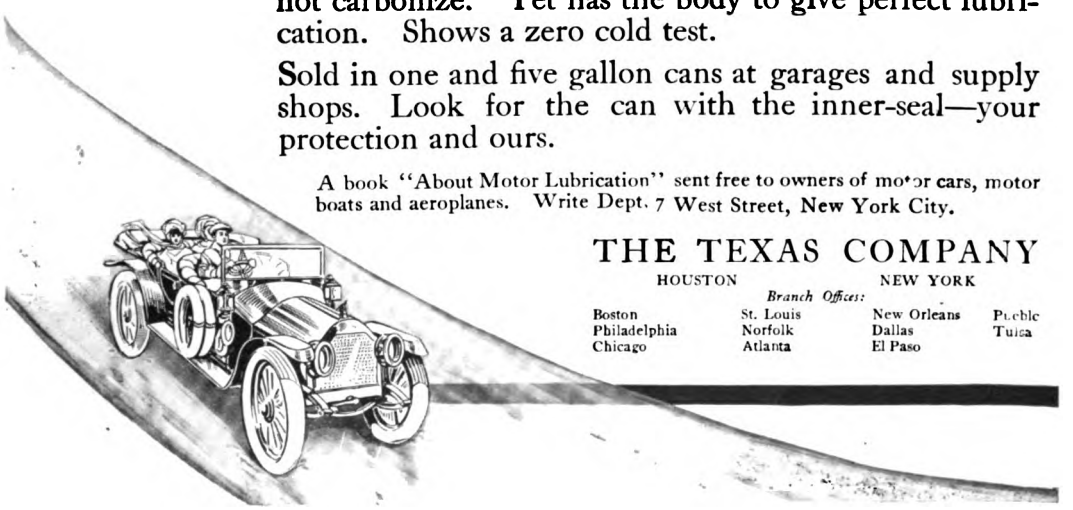
The Road to Motor Pleasure



WITH a good car under you, good fellows beside you, and a hard, clean stretch ahead, you're on the road to motor pleasure if your engine is fed with Texaco.

There is no real pleasure unless your motor drives, and drives, with only a sweet, soft purr. There must be no misses, no hitches, no stops.

So use Texaco Motor Oil. It gives life and strength to your motor. It is free from carbon impurities. Will not carbonize. Yet has the body to give perfect lubrication. Shows a zero cold test.

Sold in one and five gallon cans at garages and supply shops. Look for the can with the inner-seal—your protection and ours.

A book "About Motor Lubrication" sent free to owners of motor cars, motor boats and aeroplanes. Write Dept. 7 West Street, New York City.

COMMAND the EASTERN MARKET

Boston's Service Wagon Show for DISPLAY

MOTOR TRUCK for PUBLICITY

The OWNER or PROSPECTIVE BUYER Will Visit the Boston Show of SERVICE WAGONS, March 13-20, Inclusive.

This Exhibition Will Inaugurate the Greatest Season in the Richest and Most Productive Market of the World.

Millions Will Be Spent for Vehicles, Equipment, Supplies and Accessories.

The Demand for Trucks and Wagons Exists---Your Business Depends Upon the Buyers Knowing of Your Lines.

MOTOR TRUCK, to Issue March 5, Deals With This Mammoth Show and its Features.

You Can Obtain the Best of Publicity in the National Authority on Haulage, for a Single Expenditure and Without Duplication of Circulation. You Need But One Print to Reach a Vast Number of Buyers.

This Edition Will Have Thousands of Extra Distribution at the Show. It Will Be an Encyclopedia of Motor Wagon Information, Invaluable to the Man Who Is Studying Haulage as a Business Problem.

A Wire or Letter Will Reserve Space. Make Reservation and Rush Your Copy.

Last form will be closed March 5.

Electric Lighting of Motor Cars

Outlining Various Systems Employed and Methods of Operation.

By C. P. Shattuck

Part II—Lamp Designs and Wiring.

IRRESPECTIVE of the source of electricity utilized for lighting the motor car, whether it be derived from the storage battery or mechanical generator, the lamp equipment should receive careful consideration. The most important member of the group is the headlight, inasmuch as railroad crossings, bridges, dangerous turns and the unstable conditions of country roads, demand lights of the highest efficiency to make night driving safe.

The units not only should project a powerful almost parallel beam sufficiently far ahead to permit reasonably fast driving, but also a quickly diverging beam to illuminate the sides of the highway near enough to the front of the car for safety in passing other vehicles. The divergent beam should provide ample light for a distance of about 100 feet, and other users of the highway in meeting this light should not experience any dazzle except when they are a long way in front of, or directly in the path of the automobile; and as they emerge out of the parallel into the diverging beam there should be light enough for them to see clearly the sides of the road almost up to the car itself. All these conditions are fulfilled with the properly designed electric headlight which provides a greater lateral range, throwing as it does, a steadier, brighter and more far reaching light than any other form utilized in connection with the motor car.

Photometric tests recently conducted by the engineering department of the National Electric Lamp Association showed that two 16 candlepower tungsten lamps focused properly in eight-inch silvered parabolic reflectors threw twice as much light on a 10-foot circle 50 feet ahead as did two .75-inch acetylene burners in ordinary gas headlights. Further experiments were conducted with acetylene burners rated at .625 cubic foot an hour and these gave an average maximum horizontal candlepower of 29.8. The electric lights were of the parabolic type, the actual diameter of the reflectors being 8.25 inches and the bulbs used were "Mazda" 21.4 candlepower consuming 21 watts. Both types of lamps were mounted 30 inches between centres and readings were taken from them across the plane of the axis of the beams and at intervals of one foot. Determinations in foot-candles were made and the candlepower computed.

"Although the acetylene burner is rated at not

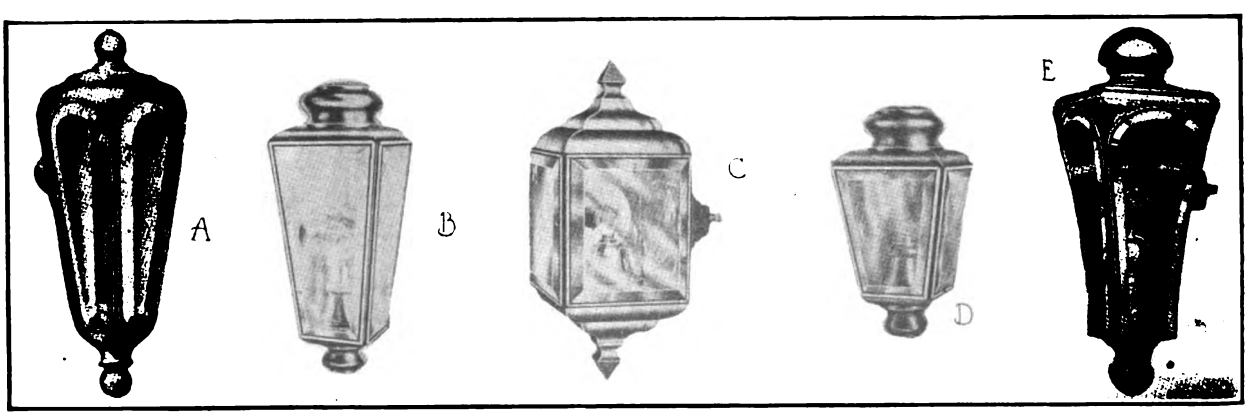

Fig. 9—Types of Pillar Lamps Adapted to the Limousine: A, B and C, Vesta; D, Solar; E, Gray & Davis.

Digitized by Google

less than double the candlepower of the electric lamp, the illumination curves show that the apparent candlepower of the latter is nearly 10 times that of the acetylene," states the report, "and that the curves of the electric give a much closer distribution and do not project light where it is not necessary. With the electric about 75 per cent. of the total light is turned to useful account while only 24 per cent. of that of the gas flame strikes the reflector, and about 61 per cent. illuminates only the black interior of the lamp." This difference is due to the construction of the parabolic reflector, as previously explained.

Focal Adjustment.

Another advantage of the electric is the ease with which the position of the bulb relative to that of the reflector may be adjusted by means of various devices, which may be termed sliding focuses. The majority of headlights are thus equipped and may be changed readily, without disturbing the lamp, so as to throw a nearly parallel beam several hundred feet ahead, or if desired, may be adjusted to give a broader distribution. This is an important factor as correct focal adjustment is very necessary for the proper operation of electric headlights equipped with parabolic reflectors.

Considering reflector design, relations between the focal length and the various dimensions of a parabola should be taken into account. One of short focal length is deeper for a given diameter than one of greater length, and it is claimed that the reflector of a shorter focal length is the more efficient inasmuch as a larger proportion of the light is redirected in a useful direction. In general practise the focal length is between .875 and 1.25 inches. Shorter than the former is prohibited because of certain mechanical requirements in the bulbs utilized.

Assuming that the maximum is 1.25 inches and the bulb is set in the centre, the geometrical focus of the paraboloid: Under these conditions, the reflecting rays are parallel and a far reaching beam is obtained. When the location of the bulb is to the rear of this point, and at its maximum, the beams diverge, providing more light at the sides. If moved to the extreme forward point of the focal length, the rays will diverge but cross. Generally speaking, it may be said that a one-inch focal length reflector is considered most satisfactory for the motor car headlight.

Adjusting Devices.

Considerable ingenuity is displayed by the manufacturer in fitting the adjusting devices, these being arranged in various ways. Some lamps are designed to prevent tampering with the adjustments or stealing the bulbs, and a novel arrangement is the device fitted to the Gray & Davis product. A small knurled nut attached to a lever, which in turn is connected with focusing mechanism, is located at the top of the reflector inside the door. By simply turning the nut the bulb may be moved backward or forward easily. The door locking device consists of a substantial screw fitted over the bar of the door fastener, to remove which the use of a screw driver is required.

The Vesta lamp is equipped with a small button located at the back of the member and the focus is regulated by turning the device. Various methods are employed for changing the focus and adjustable attachments are not confined alone to the lamps de-

signed for electricity but to those of the convertible type as well.

It is essential that the parabolas should be free from lines or corrugations and in this respect the manufacturers have perfected designs by different processes. Some are made with dies while others employ a combination of alloys, and obtain a parabola and great brilliancy by polishing. The reflectors when silvered, are given heavy coats of plating and when finally completed have the brilliancy of a mirror. They are made proof against dust and moisture by accurately fitting doors, and rattle is eliminated by utilizing an interlining of felt.

Lamp Designs.

In the construction of electric lamps for the motor car the makers have attained a high degree of efficiency and many beautiful and artistic designs are noted, particularly in the equipment for the limousine or closed cars, the interiors of which preclude the use of oil or gas lamps. A wide variety of interior dome lights is produced, including flush members and those fitted with holophane shades. Even more attractive are the side lamps of the pillar type which are manufactured in different styles and sizes, and in which the richness of the design is accentuated by the use of heavy plate glass, dark finish, etc.

The fore door type of automobile body is responsible for the development of the flash side lamp, a design which makes for compactness and eliminates to a very great extent, danger of injury to these members. These are manufactured for both metal and wood dashes, are attached easily, and fulfill all requirements of the law as well as making for more simple lines in body design. A combination ventilator and flush type of lamp is noted in the Cowles, which is produced with the ventilating door for exterior or interior service.

Side and Other Lamps.

Regarding side lamps, there are a large number of different designs and sizes to meet all requirements. These are manufactured in bullet, torpedo, acorn, barrel and square types and some are equipped with an adjustable device. The bullet form will appeal to those of simple tastes while richer and more attractive designs are provided in the Colonial, Alpha and square members.

Next to the headlight in importance is the tail or rear member and in the construction of these the manufacturer has paid particular attention to developing a device that is durable and efficient, some in-

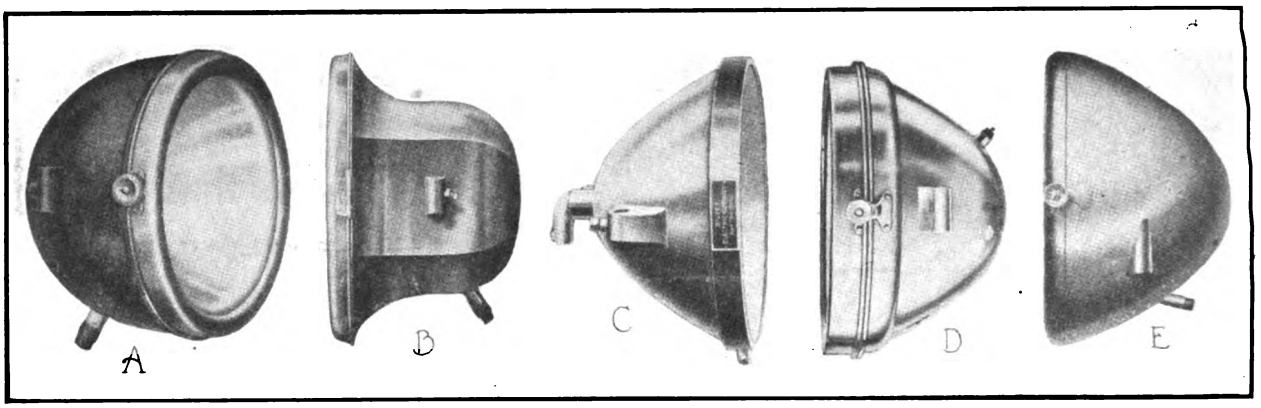

Fig. 13—Other Forms of Headlights: A, Solar Acorn; B, Solar Colonial; C, Silvey, Turned from Casting; D, K-W; E, Solar Bullet.

cluding an arrangement for attaching the license plate. The use of electricity is not confined alone to head, side and tail members, as incandescents are employed for lighting the dial of the speedometer, oil gauge or interior of the touring car.

Selecting the Equipment.

In selecting the equipment to be utilized in connection with the straight storage battery system the design of the car and the service required of the light should be considered. It is obvious that a large touring car or roadster will need larger and more powerful headlights than a small runabout because of the higher power and speed of the former, although some owners of small machines utilize large lamps.

For city driving an equipment consisting of two side and one tail light may be sufficient, the usual acetylene headlights being retained for use in traversing unlighted roads. Some may prefer electricity for the headlights alone, relying upon the oil for the side and rear lamps. Others may desire an entire electric equipment consisting of a group of five lamps or additional circuits being employed for the speedometer or trouble lamp and for operating the signal device.

Converting Oil Lamps.

Dealing first with converting the oil and gas members into electrical units, an arrangement which provides for the use of either system, it may be said that they are inexpensive. Several concerns which make a specialty of electric lighting devices for the motor car, offer complete outfits, these ranging in price from about $6 upward, the equipment depending upon the number of lights, etc. The lower priced apparatus consists of converters for the side and tail lamps or headlights alone, and the prices are graduated, as well as the equipment. One large electrical concern offers an outfit for $10, this consisting of two six-inch headlight converters, a two-gang flush tumbler switch, two cable connectors, two 15 candlepower bayonet base "Mazda" lamps, 10 brass cleats, 20 brass screws and 20 feet of suitable wire. A number of various combinations are obtainable and complete instructions for installation accompany these.

Although many will desire to purchase a complete equipment it is interesting to note that a large number of owners prefer to select and install the components of a lighting system, and there is a growing tendency in this direction, especially among motorists who make it a practise to overhaul their own car. Many are desirous of utilizing electric lighting, although not familiar with its application, and for the

Digitized by Google

benefit of these the suggestions herein are made.

Assume that the oil lamps of the car are to be converted into electrical units. This would require three fittings and these may be complete including a connector which allows the removal of the lamps without cutting the wires. Although there are several forms of these members the use of the bayonet lock joint is recommended as the contacts are solid and will not jar loose. Irrespective of which type is utilized the connections should be positive and admit of the passage of the necessary current without causing a material drop in the voltage. In addition to possessing these essentials the connector should be such as not to be affected by moisture and oil.

Besides serving to connect the wires from the battery to those of the lamp socket, certain types of these may be utilized for connecting the leads of the trouble or inspection lamp by simply disconnecting, or breaking the coupling and inserting the attachment plug. At Fig. 15 is depicted several types of connectors, that at F being of the bayonet type and fitted with an attachment plug which when removed permits of the insertion of the trouble lamp member. At H is shown a cable connector devised to withstand all the severe conditions peculiar to motor car lighting service. Each half of the device is covered with a protective brass sleeve, one end of which fits snugly over the cable. The two halves are held together by means of a standard Ediswan bayonet joint.

Where the leads from the battery pass through the dash or body of the car flangeless connectors may be employed and these are utilized when the lamp device is not equipped with a connector. In addition the leads of the trouble lamp may be fitted with a plug for insertion in the dash member. These are made both for metal and wood dashes or bodies and at B is shown one of the former type, this being attached by boring a hole, inserting and fastening with screws. That at C is a metal dash device and is secured by means of a locking nut. Another form is outlined at G and is attached by screws. That depicted at D is of the wood type, designed for use in connection with the side lamps. It will be noted that the connector is of the double type and provided with two attachment plugs. The connector proper is inserted and fastened to the dash just above the frame while one plug leads to the lamp socket and the other to the battery. This is a simple form and attached easily.

Wires.

Upon well constructed wiring depends the success or failure of the system as a thorough insulation of all lighting apparatus is most essential on account of the fact that the majority of the ignition systems have one side of the circuit grounded to the metal of the chassis, and should an accidental ground occur through the lighting system, both the ignition and lighting would become affected. Thus it is obvious that circuits should be separate, although exceptions are noted, for instance with the Ford automobile in which ignition system it is possible to use one side of the ignition circuit in the lighting apparatus. This system, and others, will be outlined in logical sequence.

Referring again to the three-lamp equipment in which a six-volt battery is to be employed: As this has a relatively low voltage there is a minimum line drop in the circuit, that is, electrical pressure, and in considering this factor the size of wire is important.

Digitized by Google

All wires should be of the copper strand type and sufficiently flexible to permit of manipulation in the installation. The coverings of the metal strands should be water and oil proof and constructed to withstand the hard usages encountered in motor car service. As previously outlined, the protection from abrasion or wear is important both in the insulation itself and in fitting.

Regarding the sizes, No. 14 B. & S. gauge is suitable for ordinary work, but where greater current carrying capacity is required, No. 12 or 10 is recommended. The overall diameter dimensions of these wires are: No. 14, .25 inch; No. 12, .28125; No. 10, .375. Twin conductor cables are favored and these are not expensive. Fig. 15 H depicts the No. 10 wire with outer insulation removed, also that from the copper strands.

At J is shown the brass armored cable, which has desirable features, inasmuch as its construction elimi-

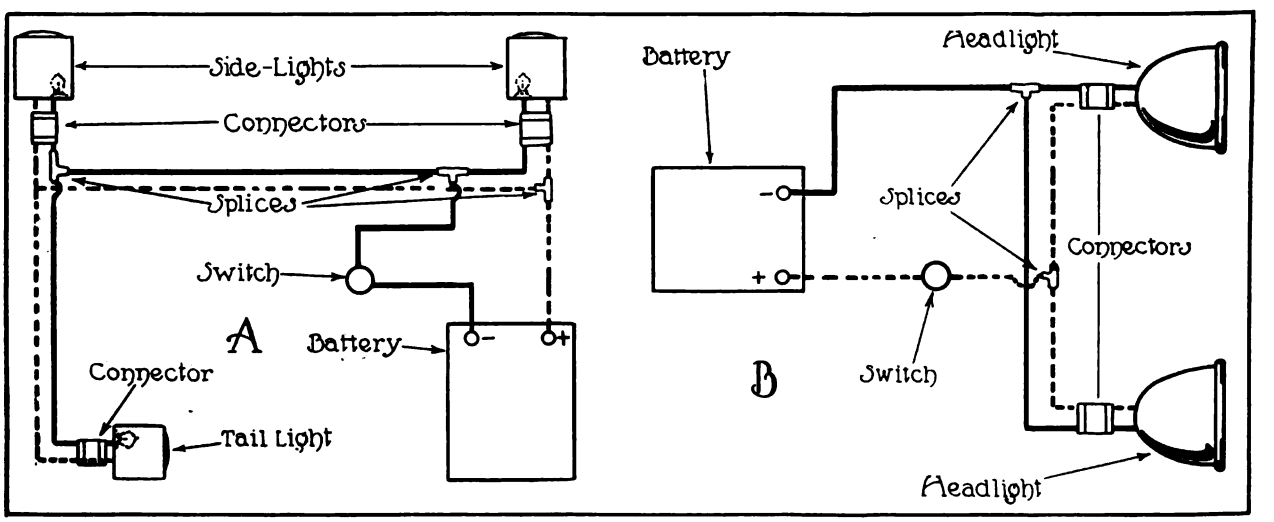

Fig. 16—Wiring Diagrams for Straight Battery System: A, Plan for Two Side and Tail Lights; B, Method of Installing Headlights.

nates danger of short circuits, although its cost is approximately two cents a foot more than the ordinary twin conductor cable. A feature of the former is that it may be employed where the wiring plan calls for exposed leads and its appearance does not detract from that of the car. Regarding switches for a three-lamp system, an ordinary lever member may be employed or one of the push button type. There is a large variety of designs and they are inexpensive and easily fitted.

Battery Location.

In selecting the location for the battery, which should be of the lighting type, it preferably is mounted on the running board, where the jarring and jolting is the least. The use of a steel box is recommended as it is stronger and presents a neater appearance than one constructed of wood. The interior should be lined with a paraffin or chemically treated wood to prevent the leads or terminals touching the metal of the container. The box should be deep enough to prevent the cover coming in contact with the battery and the latter should be secured firmly in the container. Where a large battery is employed and it is desired to keep the running board free from accessories, the current container may be suspended by straps on the frame as outlined in the previous installment.

Wiring Diagrams.

In a three-lamp system, such as two side and a tail, the following material will be required: Three convertors, three double connectors, switch, wire and cleats. The amount of wire will depend upon the car and may be ascertained by measuring. If the leads are to be extended through the dash the flangeless connectors, such as previously described, may be utilized. At Fig. 16 A is presented a wiring plan which is drawn with two leads, positive and negative, but in the installation twin cable should be employed although single leads may be utilized. This installation is effected easily, requiring as it does but two splices and when these are made they should be covered with electrical tape.

When the gas headlights are to be converted into electrical units the wiring is simplified and the equipment will require but two connectors, one of which may be of the double type to permit the use of a trouble lamp. The method of wiring is shown at B.

For Group of Five Lights.

A wiring plan which may be utilized for a group of five lights, these consisting of two head, two side and a tail member is presented at Fig. 17. This is applicable to both the convertor and straight lamp systems and when a selective type of switch is fitted provides for the use of three groups of lights as follows: Side and tail, head and tail, and all lamps. The advantage of an arrangement of this kind is obvious as it permits the cutting out of the side lights when driving on country roads and the elimination of these

Digitized by Google

members prevents reflections from the varnished surfaces of the car into the operator's eyes.

Although the wiring may appear complicated to the novice, it is installed easily by a little study of the diagram. The switch is marked, letters denoting the openings through which the single leads pass, and the ends of the wires are attached to the screw plates directly opposite the apertures. In the accompanying drawing these leads and their location are indicated by "battery," "side," "tail" and "head."

In selecting the connectors for this equipment the design of the car will have to be considered. If it be a roadster and the bullet or torpedo type of lamps is to be fitted, three double connectors may be employed, these being used with the headlights and tail member. Flangeless connectors may be inserted in the dash or the brass armored cable carried outside and ordinary connectors utilized. As with the other wiring plans it is advisable to provide for use of a trouble lamp, and by fitting double connectors the inspection light may be attached at five different points. Another advantage will be that a shorter cord can be fitted to the trouble member.

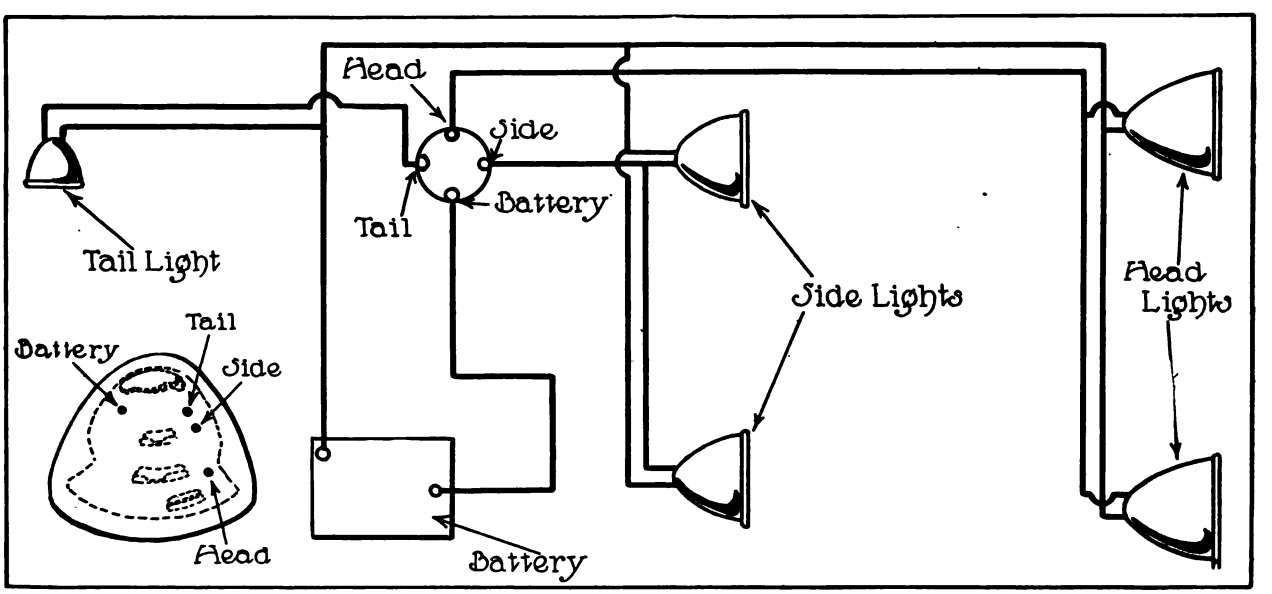

Fig. 17—Depicting Wiring Plan for Group of Five Lights Controlled by Selective Type of Switch.

Wiring a Large Car.

A method of wiring a large car for a group of five lights, also two extra leads one of which may be utilized for an electric horn and the other for the speedometer or a light for the tonneau, is depicted at Fig. 18. In this drawing the rear view switch has been made large purposely to bring out its features, including the terminals to which the leads are fastened.

This system is a very simple one to install inasmuch as there are no splices to be made, and in connecting a lead the ends of a twin cable are stripped, exposing the copper wires which are secured to the proper terminals. For example, in wiring to the tail light, one end of the double cable is stripped and one wire attached to the right hand tail light terminal of the switch and the remaining wire fastened to the left terminal. The wire is then led to the connectors of tail light. The other lights are similarly connected.

In fitting the lead for the electric horn or signalling device one of the circuits is broken to introduce a push button and this may be located on the steering wheel or column as desired. A type of floor switch which is operated by pressure of the foot is depicted at Fig. 15 E, and is installed easily in the floorboards. If the use of a speedometer light be not desired, the circuit may be employed for a trouble lamp by fitting a flangeless connector in the dash or body of the car or at any convenient point. The extra lead may then be employed for a cigar lighter in the tonneau or for a lamp. The switch is of the flush type, fitted with a handle, which may be removed when the car is left unattended. It provides for utilizing the different groups of lamps and its simplicity as well as its multiple arrangement will appeal to motorists not familiar with the installation of electric lighting equipment.

Rear Light Signals.

Those who experimented with the early types of incandescent lamps for lighting the tail member did not find these satisfactory as they burned out, and it is said that it was difficult to note whether the lamp was lighted, without leaving the seat. This objection might hold equally true with the oil member, for the latter has been known to jar or blow out. With the improved lamps and lighting apparatus, however, there is no reason why a lamp lighted by electricity should not give as efficient service as an oil device. With the high grade tail light, the white lens of which projects a powerful beam, the operator should be able to satisfy himself as to the rear signal by merely turning his head and noting the rays on the road.

There are several methods of incorporating devices

Digitized by Google

for signalling the driver when the tail lamp is extinguished and one concern manufactures an appliance which lights a bulb on the dash or sounds the electric horn when the circuit is broken to the rear member. The tail and speedometer light may be wired in series, that is, if the voltage be six, two three-volt lamps are fitted and when one burns out the circuit will be broken and the operator warned accordingly. Some object to a continual light on or near the dash but if a suitable shade be fitted there should be little if any reflection.

(To Be Continued.)

GRANT TO SELL APPERSON CARS.

Harry F. Grant, twice a Vanderbilt cup winner, is vice president of the Harry Grant Company of Boston, a recently organized concern which has opened salesrooms at 1008 Boylston street, for the sale of Apperson cars, made by the Apperson Bros. Automobile Company, Kokomo, Ind. The other officers are: President, W. R. White, and treasurer, Hugh Miller. In addition to the Apperson line, the concern will handle the Rayfield carburetor, made by the Findeisen & Kropf Manufacturing Company, Chicago, in New England, with the exception of Rhode Island.

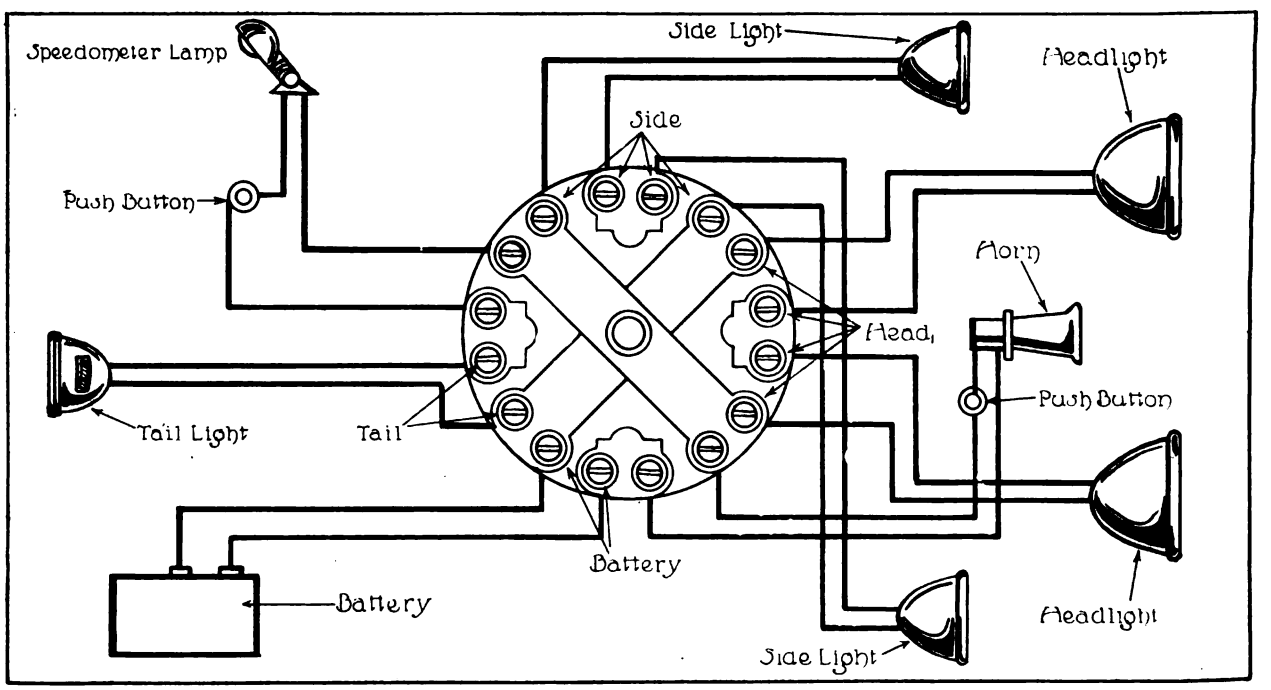

Fig. 18—Outlining Method of Wiring Providing for Group of Five Lamps Controlled by One Switch, Also Two Extra Circuits Which May Be Utilized for Trouble Lamp, Speedometer, Top or Horn.

U. & H. MAGNETO BARGAINS.

The third annual bargain sale of U. & H. master magnetos, made in Germany, is now being conducted at 250 West 54th street, New York City, by the J. S. Bretz Company, sole importer of this product. For those who are unfamiliar with this annual sale, it is proper to state that the business of the Bretz concern is largely with manufacturers of motor cars, who purchase in large quantities for the season's use and who are therefore unable to utilize these bargains, because they represent almost wholly new types, salesroom and salesmen's samples in small lots as shown by the inventory of Jan. 1. All are first class instruments, of the true high-tension type, and are as fully guaranteed as any U. & H. magneto.

MEA HELPS CREATE RECORD.

During a sanctioned race against time at Portland, Ore., Feb. 25, the Oregon Wolf, a nine-cylinder hydroplane, created a new world's record over a five-mile course for all distances up to 30 miles. The new mark for the 30 miles is 42:14.4, against 44:33.2, made by the Dixie IV at St. Louis in 1911. The Oregon Wolf is equipped with a Mea magneto, made in Germany, and represented in this country by Marburg Bros., Inc., New York City.

SWETLAND ELECTED CHAIRMAN.

At a meeting of the board of directors of Wyckoff, Church & Partridge, Inc., New York City, held recently, H. M. Swetland, formerly head of the Class Journal Company, was elected chairman. He is well known to the automobile industry, having been identified with it from its infancy.

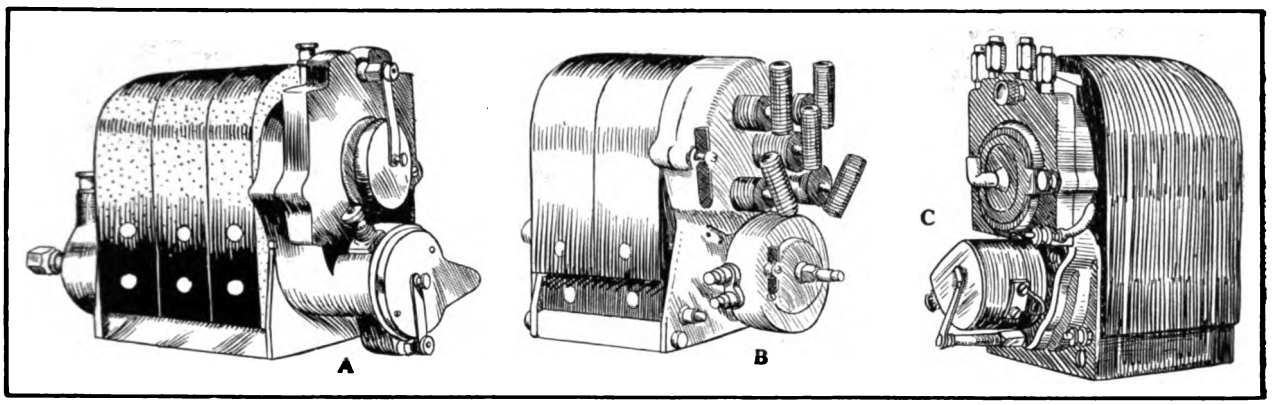
Magneto Types for 1912

AS THE efficiency of the internal combustion motor depends first of all upon engine proportions, second upon effective carburetion, third upon precise ignition and fourth upon lubrication, these essentials receive equal consideration from the designer. The engineer is responsible for results and he must create the motor and its system for lubrication. He may design the carburetor, but he does not attempt to construct the ignition system he employs. The instruments and apparatus are developed and perfected by the electrical expert who has specialized automobile equipment because of the seemingly almost unlimited commercial possibilities of the field. The demands made upon the manufacturers of ignition systems are based on thousands of experiences and tests, and to produce what will give the greatest power and economy in the motor is the ideal sought by every electrical engineer engaged in manufacturing.

In theory to obtain the best result the ignition system ought to be designed with reference to the requirements for each engine, but a common practise is by experiment with a standard instrument, establishing operating conditions that may be expected to obtain in any motor. With these facts known the installation is made and the engine tested and adjusted with reference to ignition, carburetion and lubrication. It is not possible to obtain from any two engines precisely the same power under adjustments that are exactly the same, although the variance may be extremely small, but there are many reasons why the full capacity of the motor may not be realized in operation. The three essentials to efficient power production must be synchronized and to accomplish this it is desirable that each should serve equally well from minimum to maximum.



The ideal ignition system should be simple, without complications; be so constructed that it will endure under the most exacting service; should have construction permitting fine adjustment, and yet after being adapted to the motor require no adjusting other than to compensate for wear. It should be absolutely dependable as to continuance of service and it ought to have such protection that it cannot be affected by accumulation of water, lubricant, grease, dust or any form of abrasive. Naturally the mechanical generator is preferred to the chemical generator, for the storage battery and the chemical generator both have limitation which preclude their use save under conditions not usually met with. Some forms of mechanical generators can be used as a reserve in connection with storage batteries, however.

In considering the qualities of magnetos offered in the market or furnished as equipment with motor cars it should be understood that the exact conditions for which an instrument was designed may not be approached in the use made of it. Some have been constructed for more limited service than others, although it is generally assumed that any magneto for

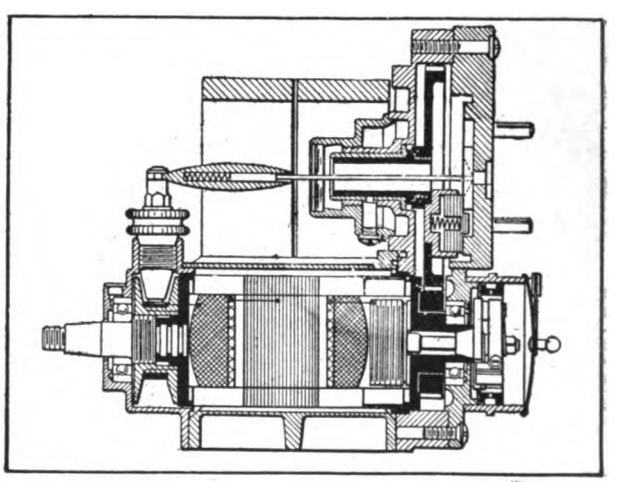
A, Eisemann High-Tension Magneto; B, Bosch Model ZR4 Waterproof Instrument; C, K-W High-Tension Device.

Digitized by Google

A, U. & H. Master High-Tension Instrument; B, Kingston Magneto; C, Remy High-Tension Device.

a four-cylinder motor, for instance, may be utilized with some degree of success on any other motor with four cylinders. As a matter of fact, the rapidly increasing number of types of magnetos is a result of manufacturing experiments which have established that there are very widely differing needs which cannot be met generally and which can only be satisfied by machines constructed with reference to special requirements.

Many Refinements Made.

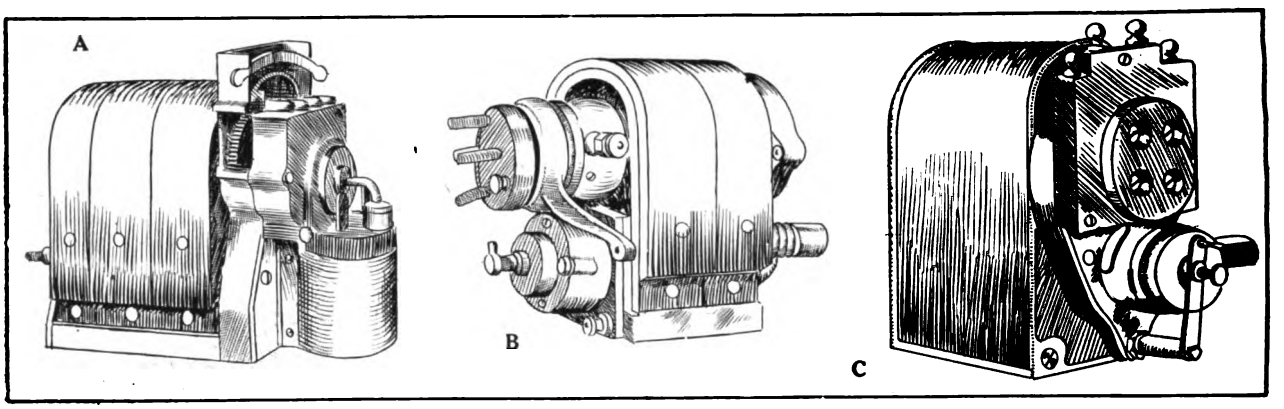


In consideration of magneto development as evidenced by the latest productions it is natural enough to contrast them with similar instruments, yet with the majority of the recent types it is evident that these are generally intended for special purposes rather than for broader use. This does not always apply, however, and some of the machines are designed for adaptation to an increased number of types of motors. Each magneto engineer has worked out some particular purpose in changes made in his production, and while a change may have been comparatively trifling so far as description is concerned the result may have been of material importance in the general efficiency of the instrument.

The magneto, as is undoubtedly well known, will increase the size and consequent heat or firing value of the spark generated as its number of revolutions are increased, and this degree of progression continues to the maximum speed of the motor, so that when the engine is doing its hardest work it is being served with the greatest ignition energy. With the dry cell chemical generator or the storage battery as a source of ignition current there is the same value of spark no matter what the engine speed until the electrical force is so diminished that the spark is ineffective.

This statement explains why it is that when an engine is cranked it will start on a battery spark with perhaps a quarter-turn of the crank, when if a magneto were used a sufficient turning speed must be attained for the magneto to energize itself. In small engines it is possible to turn them rapidly, but with larger machines it is quite beyond the strength of the average man to turn them sufficiently fast to secure ignition. Starting an engine under some conditions means labor decidedly strenuous, and to eliminate this work the self-starting devices have been developed. With comparatively few cars, however, has starting equipment been included for the market price, and not as yet have the magneto manufacturers taken into consideration the influence that starters will eventually have.

Possible Effects of Self-Starters.

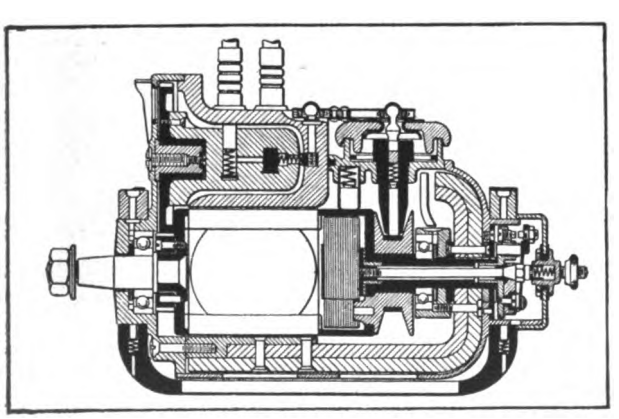


There is no doubt whatever that with the engine started by mechanical means there will be less need of very slow magneto speed unless it is intended to provide for starting independently of the starter. While it is not probable that there will be a disposition to change the designs or constructions of the magnetos so there will be imperative need of automatic starters because of the desire for slow engine work in traffic, it is possible that such devices will later on have more or less influence on the instruments produced. It can be said that practically all magnetos have thus far been designed without regard to automatically starting, yet with a purpose

Section Plan of the Simms Magneto.

that with them engines might be started more easily than with preceding types. Many makers have sought to improve their instruments by increasing the genera-

Digitized by Google



Three Representative Types of Magnetos: A, Duplex; B, National; C, Connecticut.

tion of current at very slow turning speed.

This would seemingly increase the current production throughout the operation of the motor, although this claim is not made for the magnetos by any of the engineers. It is a fact that there is a limit to capacity in any form of generator under specific conditions and this is realized with the magneto, but it would appear that with the effectiveness of the instrument improved at very slow turning speeds this would be continued as the speed of the magneto is increased.

How Magneto Types Differ.

That the references to different magnetos may be understood it may be pointed out that there are numerous forms in general use. These are first of all classed as armature and inductor, and these differ in that the armature form has a single or double winding revolving between the poles of the magnets, while the inductor type has a rotating member that is revolved between stationary windings. The armature construction is the more complicated and the inductor is the simpler of the two. Either may be high or low-tension. The usual form of automobile engine is equipped with jump spark ignition in that the current is made to jump or arc an air gap between the electrodes of the

Sectional Plan of the Mea Instrument.

spark plug, these being often referred to as the sparking points. Such current as is used in a jump spark system has primarily creation at low-tension in the core and first winding of an armature and is intensified to high-tension in the secondary winding.

Taking the armature form of magneto the armature that has but the core and first winding is known as the primary armature type and the current generated is carried to and transformed to high-tension in a separate coil that is generally installed on the dash for convenient examination and adjustment, and for protection against oil and grease accumulations from the engine. The second form of armature magneto has the core and first and second windings in the armature and the current is distributed direct to the engine. The primary armature type is low-tension and the compound form is high-tension.

High and Low-Tension Forms.

The inductor form has been partly described, but this has the rotating member installed between the magnet poles and it may have but a core and single winding and, consequently, primary coil incorporated in its construction. This is then used with the transformer coil, as is the primary armature type. If the windings of the coil are both primary and secondary then the current is used direct and the magneto is high-tension.

To differentiate between the low-tension and high-tension magnetos it may be well to emphasize that the low-tension has precisely the same function as has the dry cell or storage battery in that it is merely a source of current, the energy being generated as the engine is operated. The high-tension magneto generates the current and sends it out to the spark plugs without further intensifying.

Of the two types, armature and inductor magnetos, the inductor forms are much the simpler in construction. To illustrate, there are no revolving wires, no sliding or wipe contacts, no brushes, no collector rings, and these forms are seemingly less susceptible to wear than those with numerous moving parts. The high-tension forms eliminate the necessity of the vibrator coil and timer used with the low-tension, a distributor taking the place of the timer.

Possible Ignition Systems.

The ignition systems differ decidedly in many ways and methods. They may be classified something as

A, Hers High-Tension Magneto; B, Pittsfield High-Tension Instrument; C, Briggs Magneto.

follows: The use of the dry cell battery with the transformer coil, the storage battery and the transformer coil, the dry cell and the storage battery in combination, the low-tension magneto and the dry cell battery, the low-tension magneto and the storage battery, the high-tension magneto, the high-tension magneto and the storage battery, the high-tension magneto and the dry cell battery, the high-tension magneto and the low-tension magneto (seldom used and named as a possibility), two high-tension magnetos.

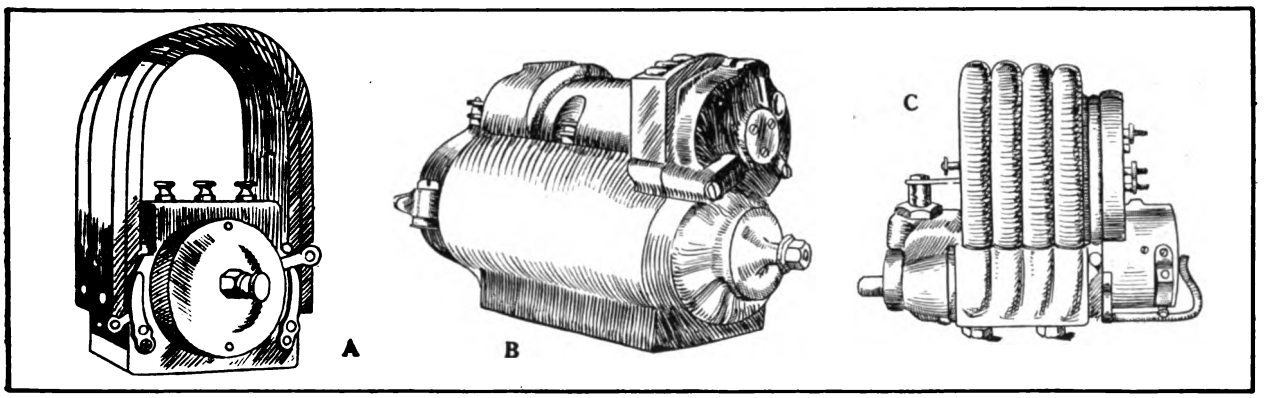
With the single or combination battery systems, and with the low-tension magneto and battery there is but a single system of wiring and one set of spark plugs. A switch is used to break the circuit. The battery or batteries are connected with the transformer coil and from the coil there is but single wiring to the spark plugs and the ground. With the low-tension magneto and the battery the general custom is to use the same coil and the one distributor, this being a matter of economy, but it is evident that any defect will cause failure of the system from either source of current. Using the single high-tension system the magneto may not generate an efficient spark

Sectional Plan of the Splitdorf Magneto.

at a very low speed and with a large engine considerable strength and skill is necessary to secure a spark that will start it. This has been the principal reason why these instruments have been used in connection with a battery, but usually provision is made for the use of a battery as a reserve.

The use of the phrase dual, which means two of the same kind, has been often erroneously applied to the combination of high or low-tension magneto and battery, when the word double would properly define it; also to a combination in which two sets of spark plugs might generate either one or two sparks simultaneously in a cylinder, either from a magneto or battery. The true dual system is by two magnetos to two separate sets of spark plugs, each being entirely apart from each other, although possible of connection should there be failure of either magneto or wiring system. Such installations, however, are generally combined with a battery for starting. This system is usually termed two-independent.

Some Results from Refinements.



Where two spark plugs are used and each fired from the one magneto at the same time, a system developed by the Bosch Magneto Company, New York City, that has given a decided increase of power because of the more rapid and complete combustion of the charge, the term "two-point" ignition has been coined. This form has not been utilized to a great extent as yet, but its obvious advantages have directed attention especially to it and it has been developed very rapidly.

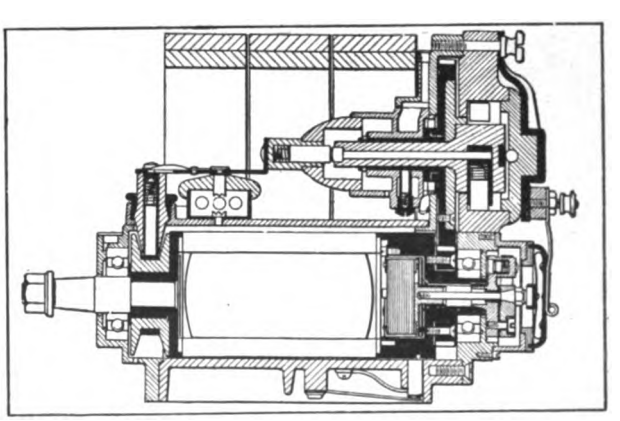
Summarizing the developments obtaining generally with the latest types of magnetos it may be pointed out that these include the production of a spark at a more uniform intensity at the slower speeds of the instrument, this making for greater ease in starting and for better power in low engine speed. Another improvement has been the utilization of means for automatically advancing and retarding the spark and the use of a governor. The installation of separate transformer coils near the spark plugs to reduce the transmission of high-tension currents, has been adopted by some makers, while all have sought to secure greater durability, more efficient current production, and more accessible construction.

Eisemann Automatically Times.

In considering the different machines it may be

Digitized by Google

A, No-Lag Magneto; B, Mea Imported Instrument; C, Heinze High-Tension Device.

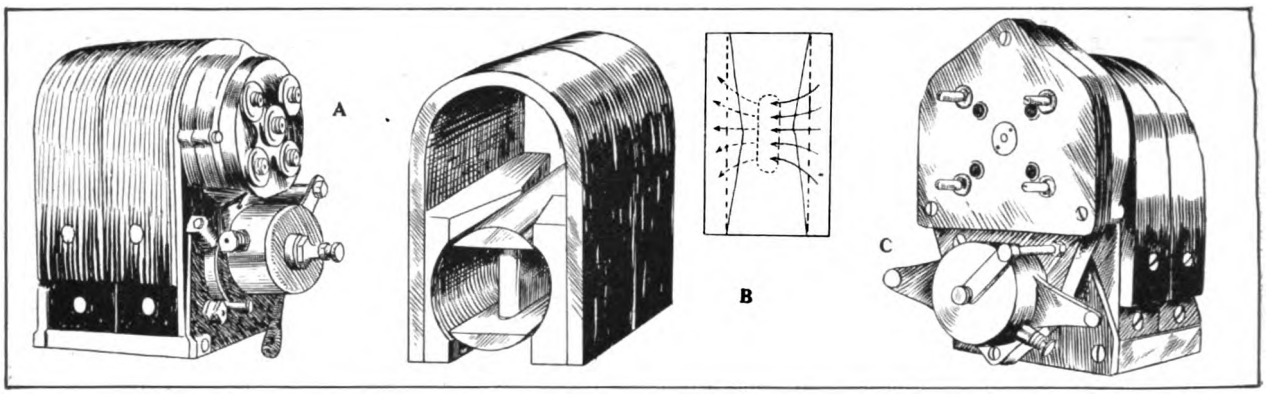


well to refer briefly to some of the improvements rather than to describe each individually. With the Eisemann line, Eisemann Magneto Company, New York City, is the automatically timed instrument, an innovation in America. On an extension of the armature shaft is rigidly mounted a rectangular cage in which is a block into which is fitted and secured by a thread a helical-cut driving shaft. Governor balls are attached to the block by linkage, and as the block will move in a square-cut double thread as the shaft is revolved the governor balls are thrown outward by centrifugal force and the block is rotated, carrying with it the cage and the armature shaft to which the cage is attached. This advance of the armature and the armature shaft carries with it the advance of the contact breaker at the end of the armature shaft. Another Eisemann improvement is a new form of pole piece, these being pointed in the centre so that the lines of force of the magnets are compelled to pass through the pole pieces at these points. This increases the strength of the magnetic field and concentrates it at the centre of the armature, producing a higher voltage and greater efficiency at slower engine speeds. The breaker box has been improved by the installation of large steel pins in lugs at the sides of the box, these taking the place of the usual cams. The contact breaker disc is secured by the use of a safety spring. A small oil wick affords lubrication for the fibre contact lever pieces, drawing oil from the bearings and oiling each piece at each revolution.

The Remy RD Model.

The RD Remy inductor magneto, Remy Electric Company, Anderson, Ind., is constructed with two steel inductor wings revolving within a stationary winding. The magneto has a single winding of coarse magnet wire incorporated in the pole pieces of the magnets, and at either side of this winding are the laminated steel wings. The stationary winding is direct-connected through the magneto circuit breaker with the primary of the non-vibrating transformer coil. The breaker cam is attached to the inductor shaft and the generation of the spark is with reference to the position of the breaker box on this shaft. The contact screw of the breaker box is held by a lock spring and by lifting this spring and turning the screw the adjustment is made. An oil wick lubricates the cam in the breaker box. The distributor shaft is reduced in length and the gear is placed at the free end. The distributor is of bakelite, a new heat-resisting insulating material.

Herz Automatic Control.

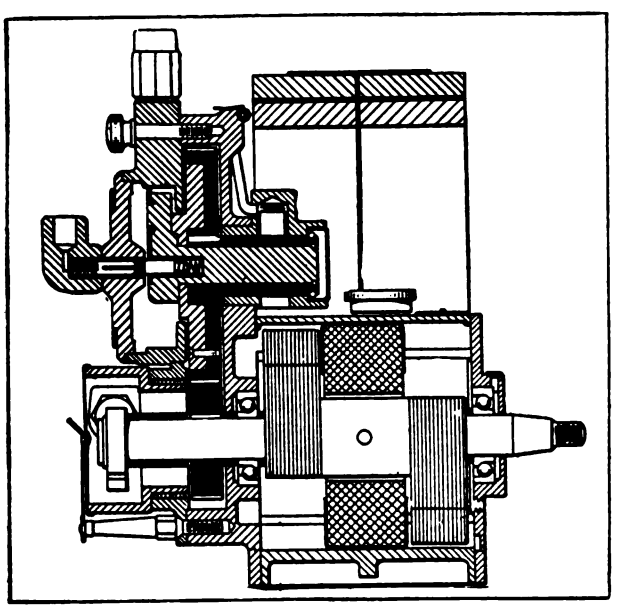


In the latest Herz magneto, produced by Herz & Co., New York City, the magnets are discs of Syrian magnet steel, .5 inch in thickness, faced true and bolted together. The end cases, containing the annular ball bearings for the armature, are aluminum and are attached to the magnets by steel bolts. The condenser is incorporated with the primary and secondary windings of the armature and revolves with it. The secondary winding is connected with the primary and the condenser forms a shunt for both. In front of the condenser on the armature shaft is located the breaker box, which has a hardened steel segment beyond the casing which contacts with a fibre roller and is raised at each revolution of the armature. The segment raises and engages with a spring on the end of which one of the platinum points

Sectional Plan of Bosch Model D4 High-Tension Device.

is mounted, breaking the contact with the other platinum point, which is stationary at the end of an adjusting screw.

Digitized by Google



A, Splitdorf Low-Tension Instrument; B, Eisemann Pole Piece Construction; C, Simms Magneto.

The Herz automatic timing device consists of two juxtaposed coupling flanges in each of which are six grooves curving radially from the centre, these grooves reversing when faced. Into each groove a steel ball is set which serves as a coupling and governor weight. As the positions of the balls are changed with the slightest variation of the engine speed the timing is automatically controlled. By varying the curves of the grooves any desired adjustment may be obtained, and it is claimed that with this device the motor may be started with the spark fully retarded. At slow speeds change of adjustment has been shown with a difference of 20 revolutions a minute.

Features of Mea Models.

The Mea magneto, imported by Marburg Bros., Inc., New York City, is distinctive in that it has a bell shaped magnet so formed and mounted that its axis coincides with that of the armature. The entire

Sectional Plan of Remy High-Tension Instrument.

magnet is moved about the axis and by so advancing or retarding the field the spark produced has the same heat and value. The magnets and the breaker are moved together, which maintains the perfect relation of the armature and field at the sparking moment. The dual Mea magneto is a new foreign importation in which the battery breaker is mounted on the distributor shaft so that the battery breaker will not lessen the accessibility of the magneto breaker. The model A4 Mea magneto is made with a stationary shell in which the magnet is installed. This instrument is completely housed for protection and this housing may be lifted by the removal of two screws.

Bosch Line Has Five Types.

The Bosch line, Bosch Magneto Company, New York City, for 1912 consists of five models, the DU type being for motors of six cylinders and generating as large a spark at full retard as when fully advanced. It is fitted with ball bearings throughout and is entirely self-contained. Type DR produces a double spark for motors to eight cylinders through two plugs for each cylinder, but while each pair is in series the failure of one plug or connecting cable will not prevent the spark in its mate in the series. The armature is on ball bearings. Type DU6 resembles the DU and is for engines of approximately 4.5-inch bore and stroke. When used as a dual installation it has two separate contact breakers but the distributor, spark plugs and the secondary leads are used in common. Type D independent magneto is for large motors. It has ball bearings for the armature and it is self-contained. Type DA2 is used principally for motorcycle ignition. Type DU4, model 11, is built with the interrupter housing permanently set so that the cams operate the circuit breaker at the maximum inductance point, thus making it have a fixed spark, reducing the number of components and simplifying the construction, making for long endurance. That a magneto may be used for starting the engine without a battery the Bosch company has constructed a special poleshoe in which comb-like teeth extend outward from the usual edge to a point about the centre of the space between the magnets. When the rear edge of the armature core is passing under the teeth the ignition spark is produced, and when moving the spark is at fixed speed; at full advance a spark is produced when the edge of the armature

core passes the base of the teeth, and when fully retarded the spark is generated when the rear edge of the armature core leaves the ends of the teeth.

Qualities of Splitdorf Models.

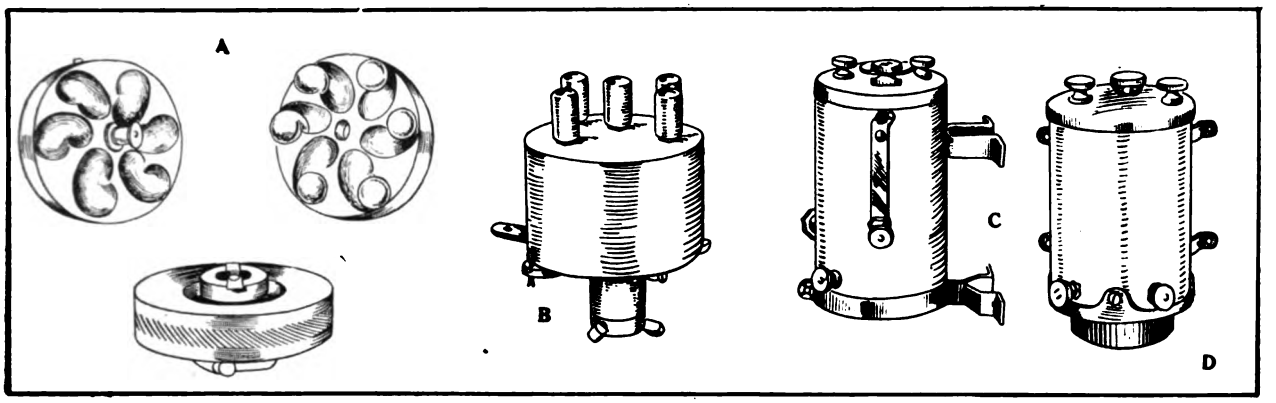
A quality of the model T Splitdorf magneto, made by C. F. Splitdorf, New York City, is that the engine may be started without regard to the battery. The vertical distributor is used with this instrument and the circuit breaker has platinum contacts, a revolving cam making and breaking the circuits. Both poles of the circuit are brought to the transformer and the battery is not grounded. The model O type differs with model T in that the distributor block is smaller, but in other respects the construction is the same. A new high-tension instrument for foreign markets is soon to be produced, as well as a "booster" high-tension machine for American use. In all of

Sectional Plan of K-W High-Tension Magneto.

the models the insulation has been much improved and the magnetos are better protected from all deteriorating influences.

But One Simms Instrument.

The SU model Simms magneto, Simms Magneto Company, New York City, is the only one yet produced and it is designed to obtain ignition at slow engine speeds through the shape of the pole pieces. The edges of the pole pieces are so formed that there are three points extending beyond usual line of the edge, these establishing two separate points for induction in the same direction for each half revolution of the armature. The point furthest extended generates for the slow speeds and the others for the fast movement of the engine. For four and six-cylinder engines a dual ignition system may be established by the substitution of some of the parts. The dual system may be adapted for use with self-starting motors, as by turning the switch a vibrating spark may be obtained at one of the plugs through a wide range. The switch is combined with a small vibrator and coil, the current from the battery being sent through the switch, vibrator and primary winding of the magneto and back to the battery, producing high-tension through the secondary winding of the magneto.



K-W Magnetos Refined.

The K-W magnetos, made by the K-W Ignition Company, Cleveland, O., are with windings concentric with the rotor shaft and between the halves of the rotor, with two wings on either side and at right angles so that there is induction at each quarter-revolution of the rotor. These instruments are in three sizes for high-tension and there are several types of low-tension machines for ignition and lighting purposes. With the high-tension magnetos the current is sent through the circuit breaker from the primary winding and when interrupted in the circuit breaker the current is greatly intensified in the secondary winding and is sent through the centre of the high-tension distributor brush and thence to the motor.

One New Pittsfield Machine.

Model F is the new Pittsfield magneto, produced by the Pittsfield Spark Coil Company, Dalton, Mass., this being constructed with a fixed ignition device

Digitized by Google

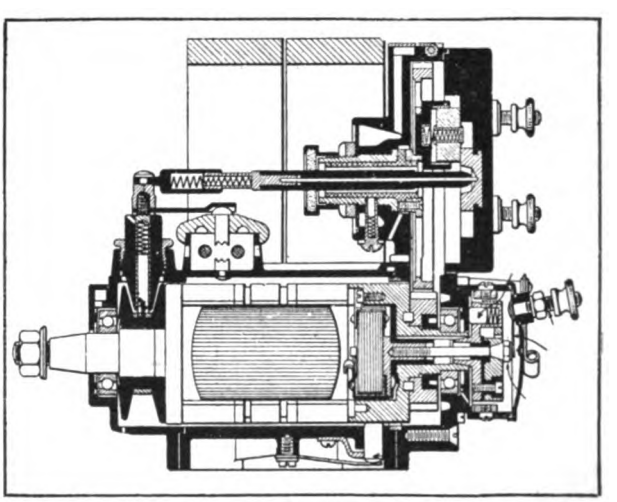
A, Hers Automatic Coupling; B, Rhoades Distributor and Timer; C, Briggs & Stratton Plug Transformer; D, Briggs & Stratton Master Vibrator.

with single magnets and a jump spark distributor. All of the six types are high-tension and of the inductor form. There are no windings on the inductor shaft or armature, but the windings are externally mounted at the rear of the magneto. The rotor is operated in an oscillating sleeve that permits the spark to be advanced or retarded without affecting the induction or the spark productiveness of the instrument. Type N-B has two sets of double magnets and a wipe-spark distributor. Type NA is well adapted for two-cycle engines as it produces four sparks a revolution. Dual ignition is possible with type NBD, which differs with type N-B in that it has provision for the attachment of a battery wire at the primary.

Two Changes in Kingston Line.

The four models of primary and compound Kingston magnetos are alphabetically designated. A is high-tension and B, C and D low-tension. This line is made by the Kokomo Electric Company, Indianapolis, Ind. Type A is designed with the circuit breaker at the free end of the distributor at the driving end of the inductor shaft. B type has both circuit breaker and distributor at the same end of the shaft. C type has no distributor, and D type is larger and heavier than C. The last two are used for engines that are fired at 180 degrees and with transformer coils. There has been no change in design, but the types have been refined.

Two Distinct Connecticut Types.



The Connecticut magnetos, made by the Connecticut Telephone & Electric Company, Meriden, Conn., are two distinct types, the single or independent being designed for use as the sole source of ignition with a single set of spark plugs, or with any battery system using two sets of plugs, each being independent and controlled by the Connecticut combination magneto and battery switch. The dual type combines two systems in one and uses but one set of plugs. The magneto is the primary armature type with the transformer coil included as a part of the instrument in a metal tube above the armature. The primary wiring runs to the switch and all secondary wires connect directly with the spark plugs. The claim is made for these instruments that they have all the desirable qualities of the high and low-tension magnetos with none of the faults of either.

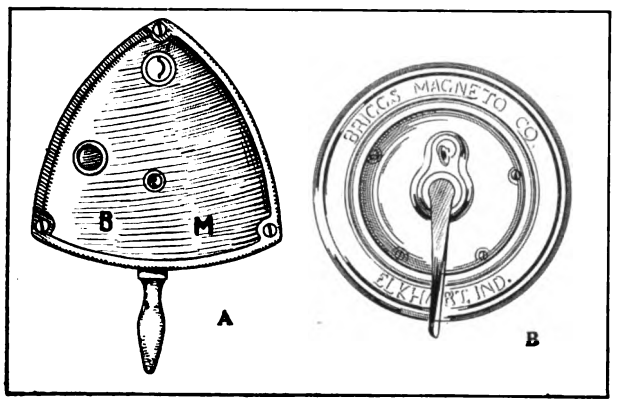
New Heinze High-Tension Model.

The latest Heinze magneto, made by the Heinze Electric Company, Lowell, Mass., is a compound armature type and it has the construction characteristic of the Heinze low-tension magnetos in that the magnets are of round horseshoe form. The ends of these magnets are ground and fitted into reamed tapering holes in the pole pieces, which design is claimed to insure against loss of the magnetic force. With this instrument both ends of the primary wiring are attached to the terminals of the circuit breaker box, instead of one end being grounded, wire leads connecting the switch and the breaker box.

Dual Ignition National Magneto.

The feature of a dual ignition system created by the National Coil Company, Lansing, Mich., in which a new National magneto is the source of current, is that the magneto is of the primary armature type

Sectional Plan of Bosch Model ZR4 Magneto.



and with it a low-tension timer is used. The switch is a new production that includes a vibrator of the master type. In connection with this magneto a separate

Digitized by Google

transformer coil is mounted on the motor near each spark plug. When this system is employed batteries are utilized for starting purposes.

No-Lag Design Unchanged.

There has been no change in the original con-

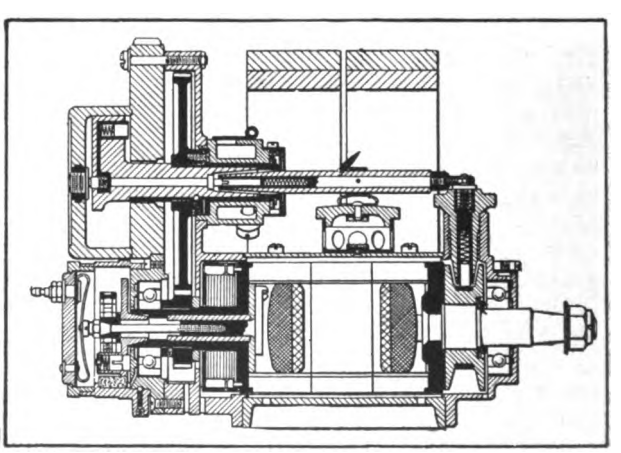
Two Types of Kick Switches: A, Remy; B, Briggs.

struction of the No-Lag magneto, produced by the American Circular Crown Company, Aldene, N. J., which is of the primary armature type. On the front end of the armature shaft is the double circuit breaker and over the armature is the condenser. At each revolution two alternating waves of current are generated in the armature and when one wave is interrupted by one set of contact points at one side of the circuit breaker and the second wave is interrupted by the other set of contact points, the current is transformed by two separate induction coils, the two functioning as might the ordinary coil. It is claimed there is increased efficiency in that the spark is made in the cylinder at the same time the break is made at the contact points of the circuit breaker. There is claimed to be less wear on the breaker arm springs because of the lessened tension and there is elimination of the destructive effect on the platinum points by the condenser being placed near the circuit breaker. Two spark plugs are used connected in series, one firing at the beginning of the compression stroke and the other in another cylinder at the end of the exhaust stroke, which is claimed to clean the spark in the latter cylinder and intensify the spark in the former.

Briggs Has Two New Models.

The new types of Briggs magnetos are models BC and D. These are made by the Briggs Manufacturing Company, Elkhart, Ind., and are of primary armature form and a dash transformer coil is used. The magnets and the rear end of the machines are enclosed in a water and dust tight metal case. The new instruments do not differ materially in general construction with the previous productions, but in the C model, for instance, is an oil tank under the arch of the magnets which will contain six ounces of oil. Lubricant sufficient for 15,000 miles travel is fed automatically to the bearings. The speed of model BC is controlled by a centrifugal governor, and with model D a specially designed timer will, it is claimed, allow a range of 90 degrees of spark movement and yet maintain uniform efficiency.

Two Forms of Duplex Magnetos.



The Duplex magneto is in two forms, one a primary armature type in which a small transformer coil is installed above the distributor. The maker is the Duplex Electric Company, Fond-du-Lac, Wis. The distributor is of a double construction with one series of wires leading to the magnetic make and break terminal of the spark plugs and another series leading to the jump spark terminals of the same plugs. The other magneto is purely high-tension and resembles the type first described in that it has a transformer coil to intensify the battery current. In these magnetos the platinum points of the circuit breaker are placed at the top of the box, which is located between the magnets and the distributor plates for better protection and ease for examination or adjustment.

Michigan Model Is Low-Tension.

The Michigan magneto, made by the Michigan Magneto Company, Detroit, is a primary armature design. The armature is of the laminated form with shaft mounted in F & S ball bearings. The magnets are of tungsten steel. The circuit breaker is carried on the forward end of the armature shaft and from this the primary current is sent to transformer coil and thence to the distributor. The coil is fitted with a kick switch and starting push button. The instrument is well enclosed as a protection against the influences of water, mud, and other accumulations.

High-Tension U. & H. Master Magneto.

The U. & H. master magneto, imported by the J. S. Bretz Company, New York City, is a compound armature instrument and is suited for a single ignition system. It is well constructed and has ball bearings for the armature shaft. At the end of the armature

Sectional Plan of Eisemann Automatic Advance High-Tension Magneto.

is mounted the interrupter by which the normally closed primary current is broken. The distributor is carried in the magneto assembly and by this the current is supplied to the motor. The magneto is well protected against water, mud, oil and grease by a case.

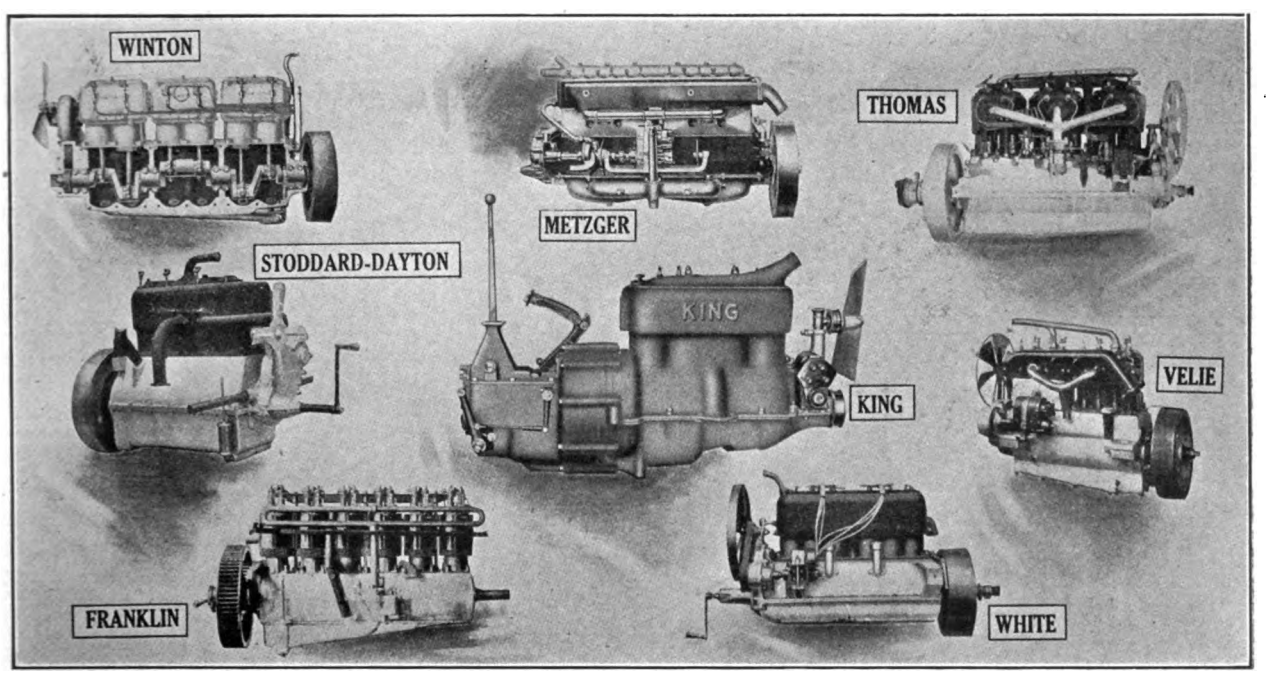
WITH all who are motorists or motoring enthusiasts there is no question that interest in any vehicle is centred in its power plant. The engine supplies the energy to drive the machine and it is imperative that it be constructed to principles established by knowledge of operation under varying conditions. It is not to be assumed that all engines are alike because they have been designed with reference to certain principles. It is true that when reduced to certain classifications by form of valve, for instance, there are but few types. Yet when classified by other characteristics the forms may be exceedingly numerous. As motors are more generally rated by horsepower, or by cylinder capacity, it will be understood that the different categories may include those which might be differently rated. As there are no recognized rules and the differentiation is largely governed by the judgment of the individual it will be seen that classes as recognized by the one will not always be comformable to the satisfaction of others.

With motorists generally the motors have been differentiated by the number of cylinders, and it has become customary to speak and write of them, and oftentimes to establish their value, according to cylinder number, when as a matter of fact it might be possible to demonstrate by practical tests that the engine with one cylinder might be in every way more efficient and have more desirable qualities than one with four cylinders. This is not meant to imply that the approval of the owners of cars is to be questioned but it is intended to prove that cylinder number has been accepted as a fair estimate of motor value and the consideration of other elements equally potent has been neglected.



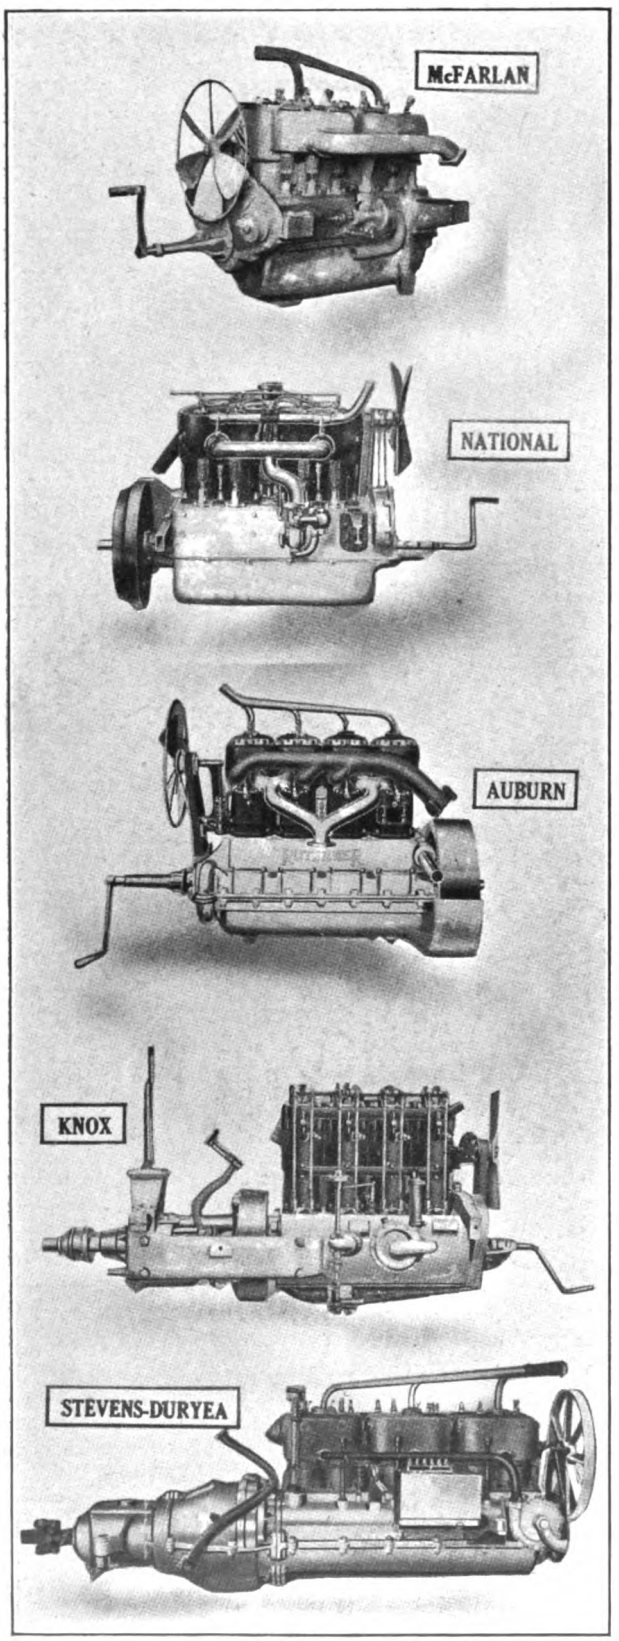
Regarding classification in anything like a fair light it will be seen that the classes might very properly be made with regard to construction. By this is meant the forms of cylinders, the locations of the valves, the types of pistons, the character of bearings, the number of main bearings, the manner of cooling,

Digitized by Google

the systems for ignition, the method of carburetion, and so on through innumerable detail. As a matter of fact it would appear that much the clearer classification would be by stroke-cycle, and then by piston capacity, sub-dividing the second according to engine cylinder number.

It is seemingly a very fine distinction to classify a motor by its valve construction alone when as a matter of fact it might be included with much more reason in another class. It might be equally justifiable to establish classes by number of main bearings, or by the system for lubrication, when as a matter of fact the real factor is horsepower developed. But, from the viewpoint of the purchaser, the detail is not of such importance, as results, always assuming that it is worked out mechanically, and results being equal the choice would be for that which was the most economical in operation. Carrying this still further then would come economy in upkeep and maintenance.

Regarding "Trend of Design."



There has been constant discussion relative to "trend of design," a decidedly misleading phrase applied to variance in detail, which seemingly means, or is intended to mean, a certain manner of development, when it really applies to description of differing methods of obtaining a definite result. If the subject as considered were properly applied, as to valve design, to cylinder design, to shaft design, etc., and the differing types specifically considered, the true meaning of the word "trend" might be realized.

No one today is disposed to question the efficiency of the internal combustion motor. But there are possibilities that have seemingly been little realized. In the first five years of active motor vehicle manufacturing practically every form of motor now in use had been created. Since that time there has been development resulting from careful engineering observation and experience. This search for data has been very carefully conducted by the different individuals, firms and organizations identified with the motor vehicle industries. What was first general experimentation based largely on theory was succeeded by more systematized endeavor along lines that seemed to promise results, and naturally this work led those engaged in it in channels often parallel or as often widely diverging.

European practise and experimental work was not so indiscriminate as in this country and for that reason certain types were accepted as standards, which the makers sought to perfect by experiment, not being willing to undertake development until a principle was established beyond possibility of question. This policy directed attention specifically to several forms which justified very general approval, and these were systematically perfected.

It was conclusively established to European engineers, at least, that motor efficiency depended upon proportions rather than upon anything else, and the motor vehicle engineers have directed their work toward creating assemblies that will have the greatest power and the smallest operating cost as compared with the recognized standards. One fact proven was that with any given engine the stroke was quite as important a factor in power development as the bore, and speed was also equally potent. French automobile engineers have for several years worked on these elements of design with surprising results, and while it cannot be said that exact ratios of each to the other have been determined it is fully established that the real trend of motor vehicle design has been to lengthen

Digitized by Google

the stroke and not the bore of engines.

Long Or Short Stroke.

The experience with the steam engine was first applied to, or regarded as paralleling, the internal combustion engine in that it was theorized that the short stroke was associated with speed and the long stroke with power. That is to say, that motors with short stroke could be driven more rapidly than those with long stroke and that power was proportionate to engine speed. But, as there were limitations to the speed, which was specified as number of feet of piston travel a minute, it will be understood that the stroke was directly regarded as a factor. It was not considered, however, at the same definite value as the bore.

Considering engine design it will be seen that primarily cylinder bore is the basis for estimating power. The first accepted rating by dimensions was an approximation devised by the technical committee of the Automobile Club of Great Britain and Ireland, afterwards the Royal Automobile Club, in which the bore of the cylinder was squared and this result multiplied by the number of cylinders, and in turn divided by 2.5, a constant regarded as reasonably definite. Under this formula the capacity of an engine was taken at 1000 feet of piston travel a minute. This formula was adopted by the Association of Licensed Automobile Manufacturers and later by the Society of Automobile Engineers.

In connection with ratings obtained in this manner it has often been stated of an engine that while having an estimated capacity by formula it had developed a power considerably in excess of it by brake test. It is probable that such statements are made of the majority of motors, and it is equally reasonable to believe that similar braking tests have been made. But with regard to the determination by actual trial it is apparent that these are not to a standard and the conditions may differ broadly. This being so the brake test is not universally adopted as a means of engine rating. If it were possible to standardize power production by actual uniform trials definite value could be established with a basis of engine speed.

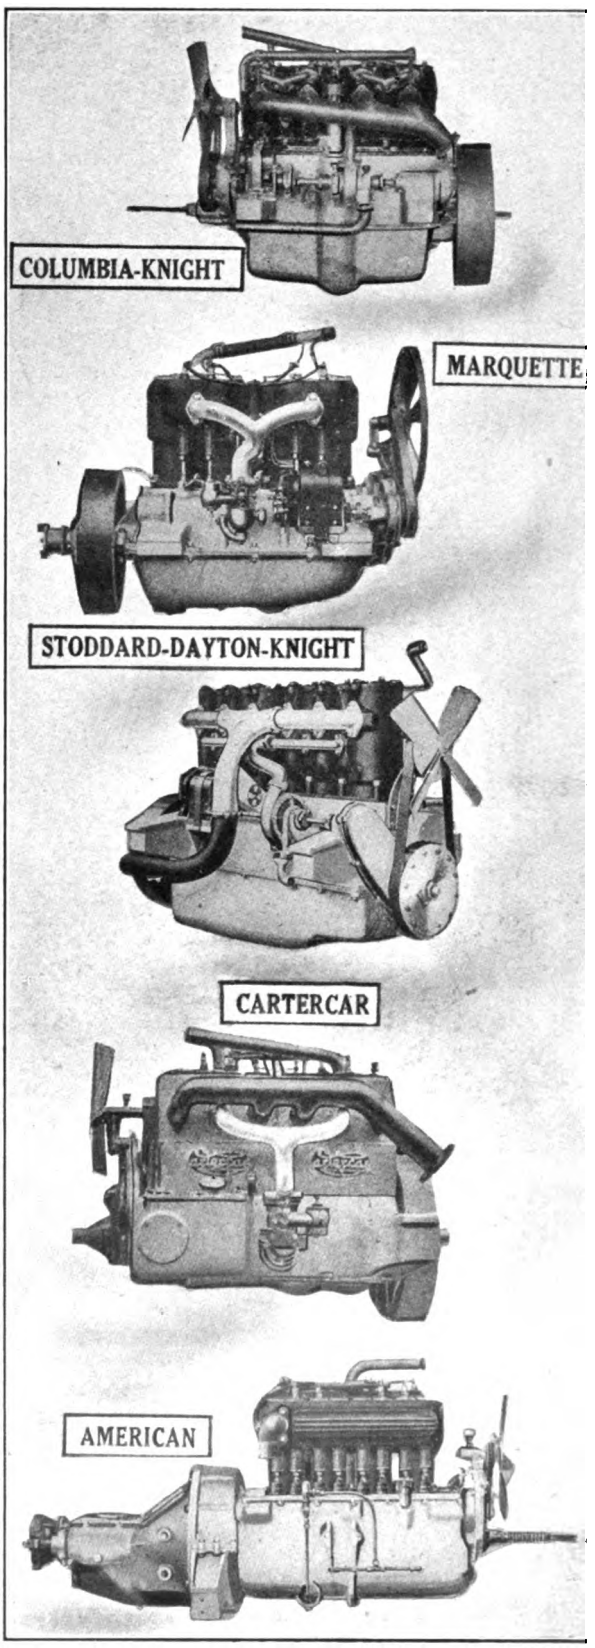
Relation of Stroke to Bore.

In connection with this subject it may be well to note the most interesting experiments have been made by French designers and engineers who have given more attention to the stroke of the engine. Probably the best known of the engines that have been produced commercially is the Sizaire-Naudin, which has the longest stroke of any as compared with cylinder bore. Cars with this engine with 100 millimeter bore and 260 millimeter stroke have been constructed for racing purposes and one was driven on the Brooklands track in England at an average speed of more than 72 miles an hour for six successive hours. This engine, of one cylinder, under the basis of bore, would rate at approximately six horsepower, but the actual power developed has been rated at 38. The engine speed, however, had been increased to 3000 feet of piston travel a minute.

Digitized by Google

This is but one of the numerous demonstrations of the value of engine stroke and while it cannot be said that it is possible to establish the exact value of the different ratios, because these ratios would probably differ with each separate motor, and much depends upon carburetion, ignition, quality of fuel, lubrication, temperature and the relation of each to the other, there is no question whatever of the stroke being quite as much of an element in power production as bore.

Now as this subject is considered, the attitude of the American motor car manufacturer is decidedly interesting. Many automobile engineers will say that it is not desirable to have extremely high speed motors. It is well enough known that fast engines are destructive of themselves and the other elements of the car. This being so the desire has been to obtain increased power without increased engine speed, which has been possible by lengthening the stroke. While it would appear that there is no inclination to go to extremes as regards the stroke ratio to bore, it may be pointed out that the material change that would be necessary in manufacturing equipment, should there be a wide variance from previous models, is a restraining influence of decided weight.



There should be no assumption that the facts as stated are arguments that the ratio of bore to stroke should be extreme. The statements are made to establish that there is recognition of stroke having value, and that this value is not definitely known.

American Motors Analyzed.

Perhaps one of the best illustrations of the increase of stroke is contained in an analysis of the dimensions of the engines of 301 different pleasure cars, these all being the latest products of leading American makes. The percentages given are substantially correct and can be regarded as dependable.

Of these motors but 5.33 per cent. have a bore in excess of the stroke, and 8.66 have the bore and stroke equal, so that 86 per cent. have a stroke which exceeds the bore. This is taking the cars without reference to price or horsepower, but with consideration of the two factors referred to.

On the basis of these figures it is probably assumed that there is a very general adoption of the long stroke, and so it would appear without further consideration, but taking the next group with the ratios ranging from 1.01 to 1.25 it is found that this contains 70.33 per cent. of the 301 motors, which may be illustrated by a cylinder five by four inches. Surely this is not a long stroke in the acceptance of the term by the foreign engineers, and yet it is found that of these 301 engines 84 per cent. of them have a stroke not more than 25 per cent. in excess of the bore. Taking as the next group those having a stroke of 1.26 to 1.50 in excess of the bore it is found that it is 14.66 per cent. of the total, and in the succeeding group, with the ratios 1.75 to one, there is but one per cent. In but one engine is the

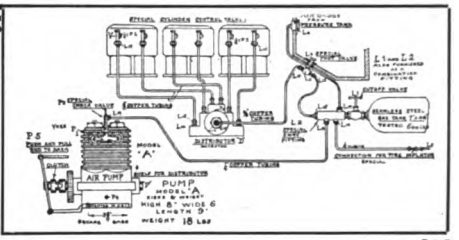
4.00	7.00	1.75
4.00	7.20	1.80
4.00	7.40	1.85

stroke more than 1.75 to one. This tabulation is decidedly interesting in that it shows that the general tendency is not to greatly increase the stroke with relation to the bore when compared with some of the engines that are standardized in Europe, and where the stroke has been lengthened with the express purpose of increasing the power of the motor. Considering these figures reference may be made to the table above.

For a better understanding of these values, which have been expressed by proportions or ratios, the other table may be referred to, and it is reasonably accurate. Taking a cylinder four by four inches as the basis the stroke to bore relations are found as stated therein.

The figures stated have been merely for the purpose of illustration and taking any group of cars it will be seen, for instance, that where the ratio of bore to stroke is one to 1.06-1.10, inclusive, the expression in inches is four to 4.20 as a minimum and 4.40 as a maximum. As the cylinder dimensions range from .015625 to .5 inch, and the ratios are expressed decimally in multiples of five the exact number of cylinder sizes is not well demonstrated.



Stroke in Excess of Bore.

There is no good reason why there should be adherence to standard dimensions by any designer. As a rule a motor is constructed to develop a sufficient power, and the horsepower as stated is usually accepted as an average rather than maximum or minimum. Engines built for specific work often exceed requirements, but it is not even reasonable to make comparisons by cylinder dimensions because so much is dependent upon other conditions.

Referring to tabulations of engine ratios, it will

The JANNEY-STEINMETZ
Motor Starter and Tire Inflator

The advent of the Motor Starter has made Automobiling more popular than ever before and eliminates the danger and trouble encountered when one operates a car depending upon the old crank method of starting.

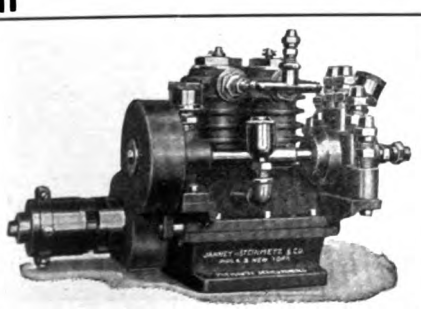
Many motor starters are now on the market and most of them are flat failures as far as real starting and efficiency are concerned.

COILED SPRING AND RATCHET STARTERS are expensive, unsightly and undependable—they won't pump tires.

ACETYLENE GAS METHODS of starting are not always certain and are expensive and the gas tank is quickly emptied. Acetylene is a dangerous explosive.

THE ELECTRIC STARTING DEVICES are heavy, complicated, delicate and expensive. It requires the constant attention of an electrical expert to maintain its efficiency and besides won't pump tires.

The only proper way is compressed air; clean, pure fresh air. The Janney-Steinmetz way.

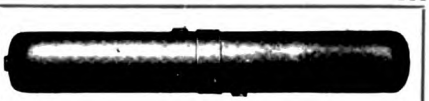


PUSH THE BUTTON ON THE FOOT BOARD AND THE ENGINE STARTS EVERY TIME

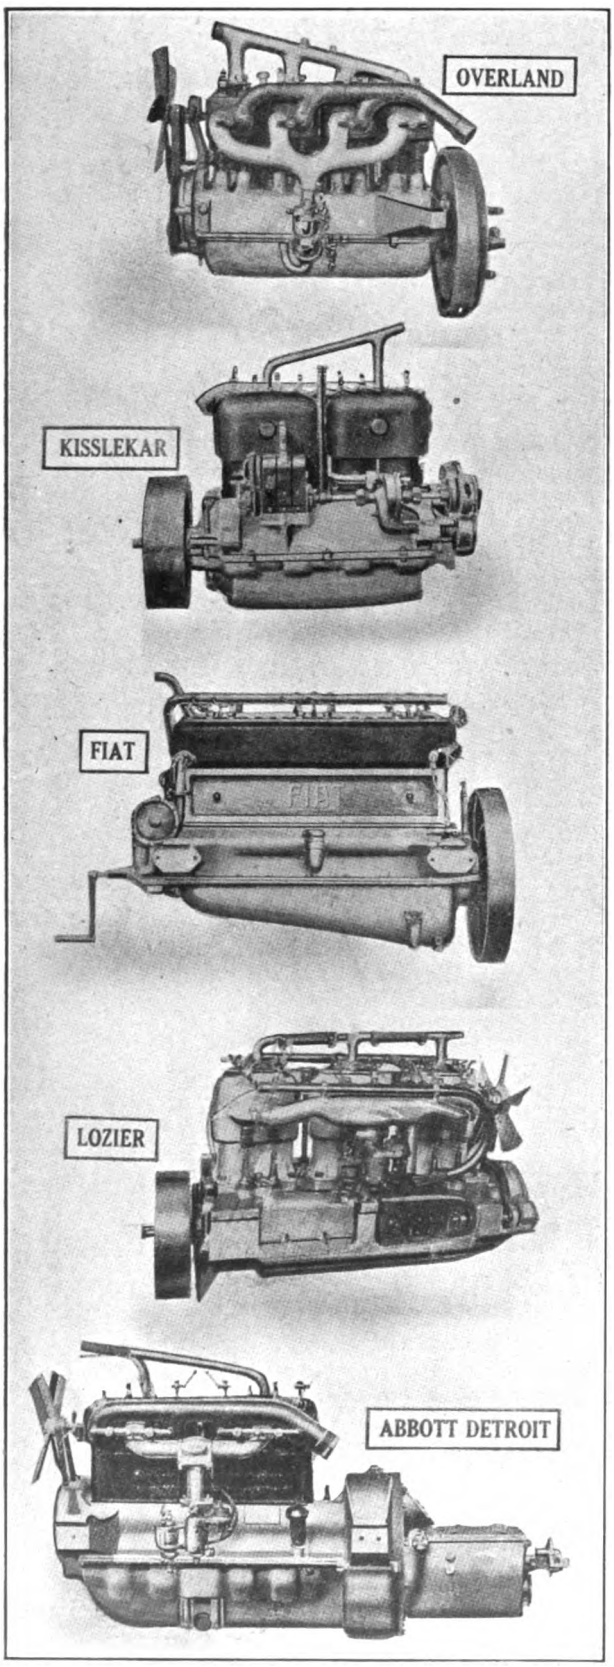
It consists of a Double Cylinder Air Pump Motor Starter and Tire Inflator, weighing about 20 pounds; small and compact, but 8 inches high and 6 inches wide, Pump Distributor; Seamless Steel Air Tank tested to 600 pounds pressure; Air and Throttle Valves, one for every cylinder; Pressure gauge and all necessary fittings for air line.

The Distributor automatically directs the compressed air from cylinder to cylinder in the order of firing and admits it only on the power stroke. Starts the motor quickly and easily.

A tire inflating attachment from the tank quickly fills your tires and eliminates all labor from tire inflating.



Every prospective or present car owner should install this starter and tire pump on their car. Manufacturers will supply it on demand. Write us for full detailed description and price.



New catalogue ready. Seamless Steel Gasoline and Tested Air Pressure Tanks. All sizes in STOCK.

be seen that 70.33 per cent. have a stroke between an equivalent to four to five, and that those equivalent to a bore in excess of the stroke, and those with a ratio exceeding four to five, are approximately the same.

The longest stroke ratio engine built is the Only, which is one to 1.85. This vehicle was originally designed to have a single-cylinder motor of the type developed in the Sizaire-Naudin cars, but when the four-cylinder form was decided on the long stroke was retained. This is without question the extreme of American machines, having bore of 4.25 and stroke of 7.87. Next in ratio extreme is the Hupmobile with bore of 3.25 and stroke of 5.50, the Austin with bore of 4.50 and stroke of seven, and the R. C. H. with bore and stroke of 3.25 to five, these ratios being 1.69, 1.65 and 1.54, respectively. The Moline and the Oldsmobile are in the 1.50 class with bore and stroke of four and six inches each, and the Bergdoll is 1.49 with bore and stroke of four by 5.935. The Mitchell is rated at 1.43 with bore of 3.75 and stroke of 5.50, the Dispatch at 1.43 with bore and stroke of 3.50 by five, and in the 1.40 group may be found the Pierce-Arrow and Peerless, with bore and stroke of five by seven inches, the Halladay and the Rayfield, which have 3.75 by 5.25 and 3.562 by five, respectively.

Ranging between this ratio and 1.25 are the Courier, Austin, Peerless, Fiat, White, Roader, King, White, Havers, Penn, Peerless, Simplex, Spoerer, Marion, S. G. V., Kline-Kar, Stearns-Knight, Thomas, Suburban, Alpena, Ames, Arbenz, Auburn, Babcock, Clark, Colby, Davis, Great Eagle, Henry, Imperial, Lambert, Lenox, Lexington, Shelby, Spaulding and Pierce-Arrow. All other makes of machines have motors where the ratio is not in excess of one to 1.25, and there are 211 machines included in this group. Where the bore exceeds the stroke or equals it the remaining 42 machines are grouped.

Term Is Misleading.

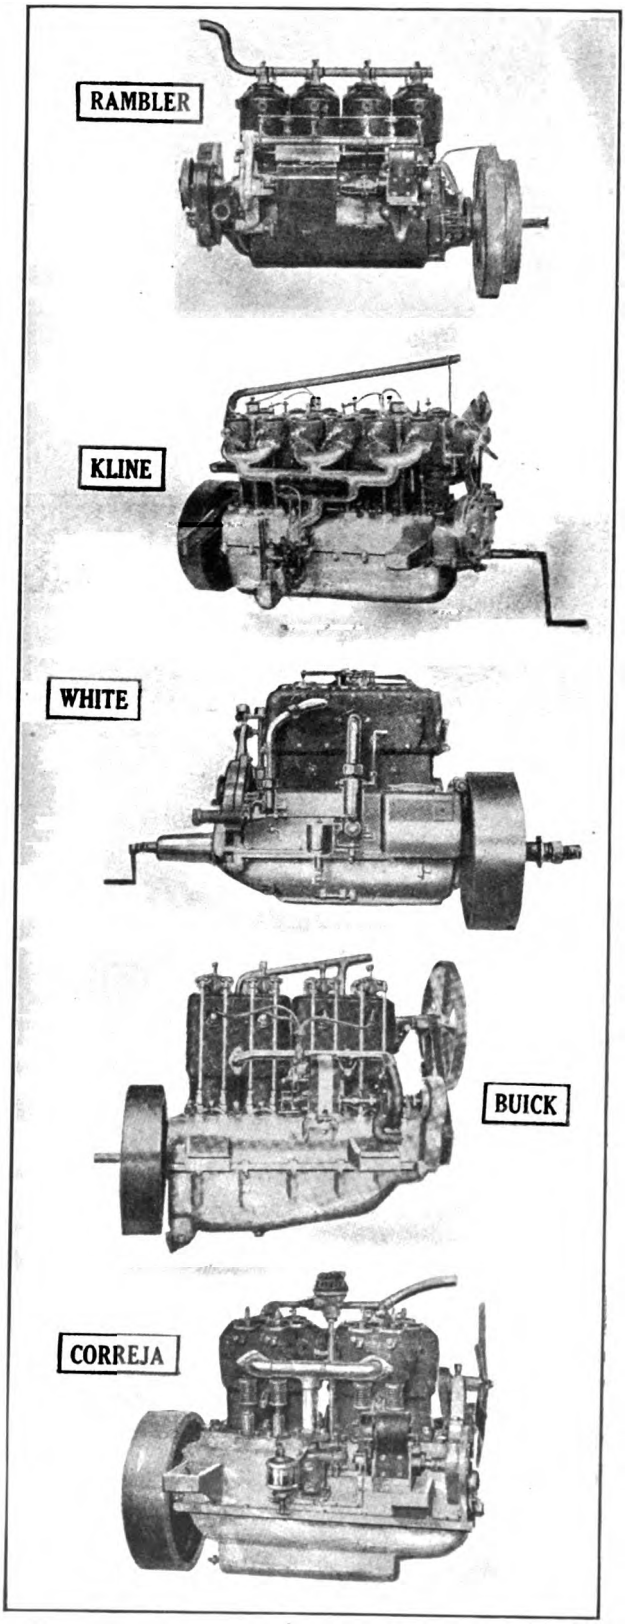
Now it is very evident that the phrase "long stroke" is decidedly misleading unless it is intended to be applied exactly as the above figures indicate that it should be—to specify that the stroke exceeds the bore of the engine cylinder, but not necessarily largely in excess.

It might be pointed out, however, that every engine that may be classed as a new production has a stroke longer than its bore, and while among these are the extreme types named above, it is not reasonable to assume that all of these motors are extreme. Perhaps the better illustration is by showing that 253 of 301 different engines have a stroke that might be regarded as equivalent to .75 to 1.25 as compared with the bore. This is a sufficient indication that American motor manufacturers have not been swept away by "long stroke" design, although there is seemingly a desire by many writers to convey this impression. It will also be understood that there are

Digitized by Google

but six engines, or two per cent. of the total, that have a stroke 50 per cent. greater than the bore.

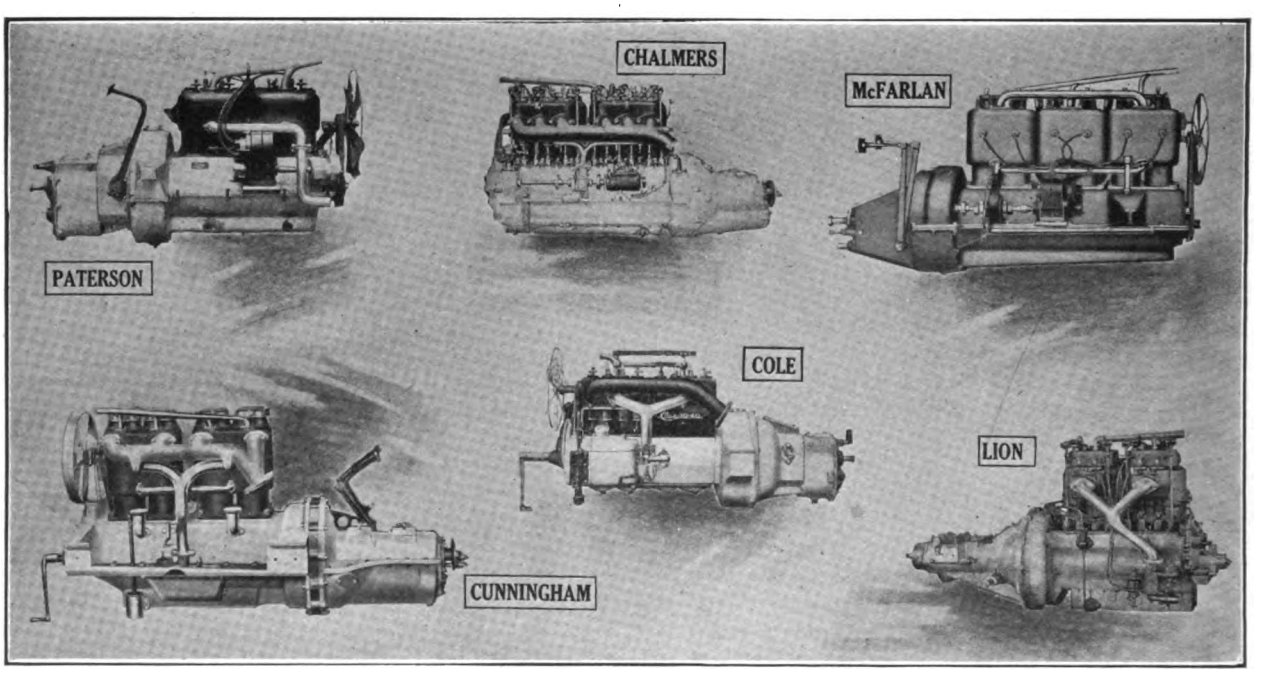
It is to be noted, however, that while there has been previously increase of power by increasing the bore of the cylinder there is a disposition to obtain this by lengthening the stroke, and for that reason there is not an indication of greater horsepower in the engine bore. Regarding this it may be instanced that the Only engine, with bore and stroke ratio of one to 1.85 has a horsepower rating of 28.9 by the S. A. E. standard.



The Austin is rated at 48.6 horsepower for six-cylinder motor, and the Oldsmobile and Moline are allowed 25.6 by the S. A. E. standard. The Moline is held to have 35 horsepower, and there is no question of the validity of the claim.

But it is evident that aside from dimensions many other elements enter into the matter of engine capacity, and of course these cannot be given the same comparison as can be a constant. There is a condition of progression, however, that is not given consideration, and that is the greater efficiency of the motors that are rated according to cylinder bore. The lengthening of the stroke in many cases, and the improved carburetion, ignition and lubrication, has resulted in considerable increase of power that is not in any manner manifested save in actual trials of useful work delivered at the traction wheels. There is admirable judgment in a conservative engine rating and while no one will take issue with the claim made for a machine the rejection of a standard because it is insufficient must be inferred when a different rating is claimed than would be indicated by the standard. Were there but one or two to assume this attitude the question might be regarded as debatable, but when there is every evidence and demonstration that power has actually increased and bore dimensions have not, and these claims are set up by the designers and the manufacturers, it is apparent what has been regarded as a basis or standard cannot be accepted even as an approximation.

Considering Design Details.



Turning from the subject of engine design to design details it will be noted that there has been a disposition by many engineers to protect the mechanism from every influence that would cause rapid deterioration. Though there may be assumption that many of the motors have been constructed with extreme care to minimize wear, it has been the universal experience that fullest lubrication is absolutely necessary, and this has led to differing methods of housing the moving parts wherever this may be done. Another purpose has been to minimize manufacturing cost, both with reference to materials and workmanship, without sacrificing any quality.

One of the most interesting mechanical subjects for study is the manner in which designers have secured certain results. Considering design details then,

Digitized by Google

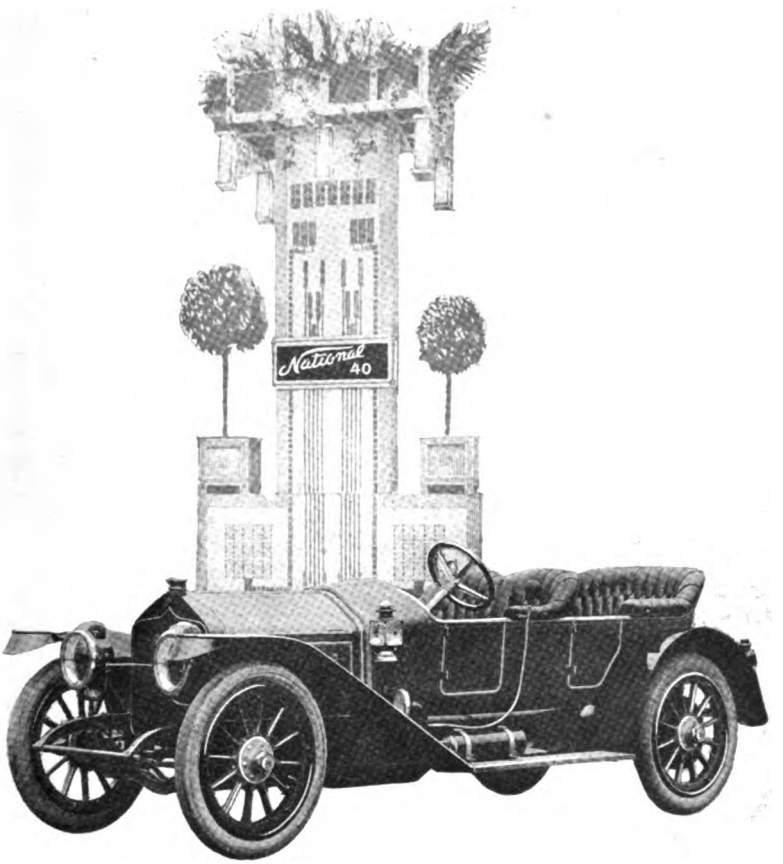
there is a disposition to enclose the valve stems and the valve lift or pushrods because of the excessive wear from abrasive substances accumulating on them and being retained by the oil. When heated the oil has fluidity that precludes any possibility of wholly retaining it in the wearing surfaces, were they not in any way exposed, and this condition has resulted in encasing the lift rods, valve stems and springs in light metal housings, in extending webs from the sides of the cylinder units below the valve pockets to form chambers to be covered with plates, and in covering these moving elements with metal casings. As all of these are quickly removable the valve stems and rods are nearly as accessible as when open. With constructions where the lift rods and valves operate in bushings it is evident that wear is not so destructive as in those in which the guides are not bushed and restoration may be accomplished as often as necessary.

Motor Design Classified.

The designs of automobile power plants are indeed numerous but they may be divided into classes where the motor, clutch, transmission and differential are each separate, where the motor and clutch are combined and the other two assemblies separate, where the engine and clutch and the transmission and differential are two groups, and where the engine, clutch and transmission are a unit and the differential separate.

In considering the forms of housings attention may be directed to the types that are characteristic of some of the models of the Abbott-Detroit, American Scout, Chalmers, Cole, Cunningham, Havers, Herreshoff, Jackson, King, K-R-I-T, Lion, McFarlan, Oakland and Paterson, in which the motor, clutch and transmission are housed, and with the Packard six-cylinder with the clutch and flywheel completely enclosed. The Knox six-cylinder assembly has the motor, flywheel and clutch in a single assembly, but the flywheel and clutch are exposed. The power plant of the Moline is similarly constructed and suspended. The same construction that has been adopted for the Chalmers four-cylinder has been followed in the six-cylinder car.

The purpose sought by the designers has been to eliminate so far as is possible the stresses upon the motor, clutch and transmission when installed separately and connected by universal joints in the shafting. It has been found that with the two or three groups as a unit that there was less possibility of strains from distortion of the chassis and it has been with a view to relieving the shafts from excessive friction, to minimize the leverage pressure upon the bearings, and to prevent the binding of the gears through temporary twisting of the chassis frame that the machinery of the car has been installed in a single housing.



It is not the purpose of this article to analyze the methods adopted by the engineers, but rather to point out that there is unquestionably a well founded belief that it is best to obtain every advantage in motor designing, which in these instances means protection from wear and all of the qualities summarized above. Each designer has worked out the details differently. Not all of those who have adopted the unit assembly have protected the valve mechanism, but of these there is a sufficient number to justify the conclusion that this class will be largely increased in the year

to come. Where the motors are of the valve-in-the-head type it is impossible to house all of the valve operating mechanism, a condition that holds true of the side and head valve forms.

En Bloc Construction.

The success obtaining with the motors with en bloc cylinder castings has caused designers to give careful attention to development of this construction. While the production of cylinder blocks, both with and without heads, incorporating water jackets, were the limitations of the first designs of the block forms, the manifolds for fuel and exhaust and for water inlet and outlet have been included until with some of the motors there is but little evidence of the operating mechanism. In this manner protection has been obtained in the casting itself. These motors are splendid examples of iron casting throughout, the proportions being exact so that there is absolute uniformity of heated and cooled surfaces and no untoward effect from extremes of temperature. There is no question whatever there there is a degree of rigidity obtaining in the en bloc assembly that is not always possible with the single or twin unit construction, and the objections that were once raised against this form have been practically nullified by the excellent results. The en bloc castings have been adopted for the Everitt and White six-cylinder engines and the American Fiat motor is of this design, while the four-cylinder form has become so common that it has ceased to be a subject for comment. Naturally in the three motors mentioned there has been much interest because of the increased complications, but apparently these have been worked out with quite as much success as were the four-cylinder types.

If there has been a more general use of the block form of engine by some of the engineers it may be said that with practically every one greater attention has been given to lubrication. The need of positive lubricity under all conditions of use has impelled perfections that have been intended to insure greater equality of oil distribution to every moving part, and the mechanical feed has been recognized as being certain of results with a large proportion of the builders. No other phase of constructional detail has received more careful study and while it may be said there are ideals that have by no means been attained there is no question whatever that decided progress has been made.

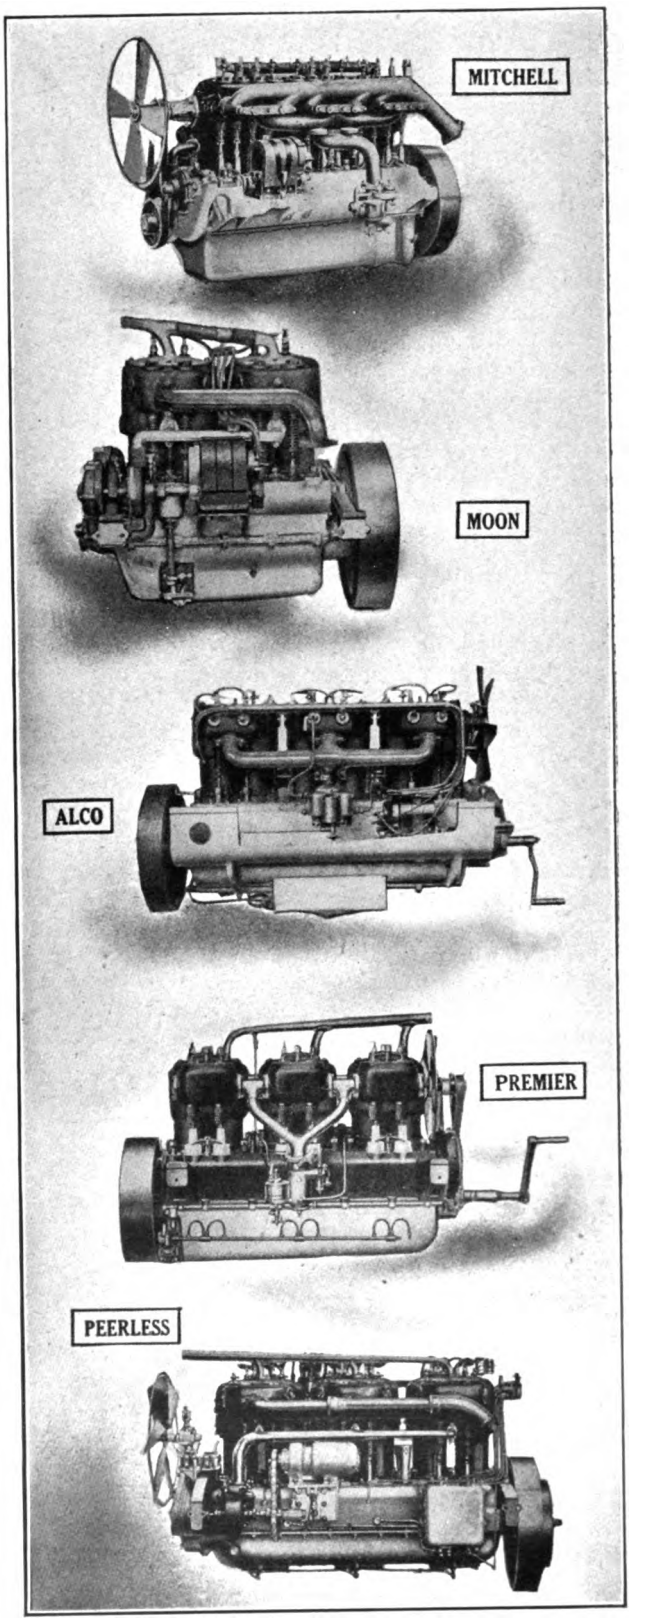
Water-Cooling Systems.

So far as the water-cooling systems are concerned there has been a tendency to increase so far as possible the areas cooled by the circulating liquid and to surround the exhaust valves and often the fuel intake with the jackets for the purpose of protecting the valves against extreme heat as well as to enhance the volatilization of the fuel during the colder seasons. The manifolds for fuel and water have been formed with the purpose of eliminating the resistance of

Digitized by Google

sharp turns and to make positive flow under all conditions of operation. The exhaust manifolds have been often increased in size to lessen the back pressure and to insure better silencing, two essentials for effective operation.

Improvement of Ignition.



The ignition systems have been improved in many ways. The dual system, in which two sparks are produced simultaneously in each cylinder, and often with one set of spark plugs installed over the exhaust valves, has been adopted by a larger number, it being regarded that this insures more rapid and complete combustion of the gas and with these results greater power and more thorough scavenging of the cylinders. Others have perfected the double systems, in which magneto and battery is used, or the single system of wiring and the double source of current, such as the battery and magneto using the same distributor. There are innumerable variations from these for the purpose of economizing in construction, to obtain a specific result, to afford protection, etc., and with practically all an endeavor has been made to shield the wiring from contact or saturation with water or lubricant. Not only this the magnetos are often housed completely though well protected from dust and fluids.

Few Radical Changes.

As a whole the motors themselves are not radically different. One may go through the entire list and with each point out some instance where detail has been improved. There are the Alco motors, to illustrate, where the maker emphasizes that there has been practically no changes. There is the Packard six-cylinder, for example, which embodies the motor and clutch enclosed in a single casing. The White six-cylinder, the Fiat six, the Knox, the Chalmers, the Everitt and the Stevens-Duryea sixes, are all constructions presenting in combination a very large number of the qualities regarded as ideal.

Going through the list it is possible to select types of construction, each representative, and distinct and apart from others, wherein have been combined good qualities. It is not reasonable nor practical to expect in the small and low priced engines the design, material or workmanship that is characteristic of the more expensive, but if there is any reason for surprise in comparison of the types generally it is the combinations of desirable qualities to be found in the least expensive machines.

But it is not alone with the makers of cars that progression has been manifested. As a matter of fact some of the builders of standard engines have brought out new models that are admirable from every point of view. With some of these, the well known Rutenber and Continental engines especially, the recent productions have qualities that establish them at parity with the products of the best motor vehicle builders. These motors are utilized by many of the car manufacturers because of their efficiency and economy of operation.

MOTORING NEWS OF NATIONAL IMPORT.

First Combined Show of Kansas City Dealers—Canadian Exhibitions of Importance to Industry in the Dominion and the United States—Many So-Called Minor Displays in All Sections of the Country.

It is well known that the automobile dealers in Kansas City, Mo., have been unable to hold a combined display until this year, but the recent organization of the Kansas City Motor Car Dealers' Association was reflected in the first exhibition of this character in the Convention Hall, Feb. 12-17. Four hundred models, representing some 80 makers were on display, the total value of the exhibit being estimated at approximately $1,000,000.

Special attention was paid to the showing of commercial vehicles, these being segregated in the Arcade. The decoration scheme was very similar for both sections. Wallace J. Ferry, secretary of the show committee, had this matter in charge, and completely transformed the interior of the buildings by a liberal use of bunting, palms, potted plants and electric lights.

Included among those who displayed pleasure cars were the following: E. P. Moriarty & Co., Packard; Buick Motor Company, Buick; Studebaker Bros. Manufacturing Company, E-M-F, Flanders; J. I. Case Threshing Machine Company, Case; Greenlease Motor Car Company, Cadillac; Oldsmobile Company of Missouri, Oldsmobile; Day-Embry Automobile Company, Pierce-Arrow; Rambler Automobile Company, Rambler; Mitchell Motor Car Company, Mitchell; Hall Bros. & Reeves, Premier, Dorris; Witwer Motor Car Company, Marion, Garford, Flanders electric, Ohio electric; Fletcher Cowherd, Jr., Peerless; Bond Motor Company, K-R-I-T, Everitt, Franklin; D. A. Kendall Motor Car Company, Halladay; Kaw Valley Auto Company, Abbott-Detroit; McGee-Huckell Motor Car Company, Stoddard-Dayton-Knight; KisselKar Company, KisselKar; Columbus Buggy Company, Firestone-Columbus, Oakland; Cartercar Company, Cartercar; United Motor Kansas City Company, Columbia-Knight, Maxwell; Cole Motor Car Company, Cole; C. L. Taylor Motor Car Company, Reo; Stafford Motor Car Company, Stafford; Ford Motor Company, Ford; Hart Motor Company, Inter-State; Albertson Boyd Motor Company, Hudson, Marmon; McFarlan Six Sales Company, McFarlan, Alco; Velie Motor Company, Velie; Chalmers Motor Company of Missouri, Chalmers; Winton Motor Car Company, Winton; A. J. Davies Motor Company, Knox; Jackson Motor Company, Jackson; White Motors Company, White; E. R. Hunnewell Motor Car Company, Lozier; Stevens-Duryea Motor Company, Stevens-Duryea; Overland Company, Overland; Hupp Corporation, R. C. H., Hupp-Yeats electric; Clark Motor Company, Baker electric; Dodge-Robinson Motor Company, Woods electric; Anderson Electric Car Company, Detroit electric; Bruening Bros. Automobile Company, Apperson, Waverley electric; Snedeker & Chestnut, Cino; Kansas City Auburn Automobile Company, Auburn; Hupmobile Sales Company, Hupmobile; Brush Runabout Company, Brush; Karshner Motor Car Company, Speedwell, Warren.

Commercial vehicles were displayed as follows: United Motor Kansas City Company, Sampson; Day-Embry Motor Car Company, Pierce-Arrow; General Motors Truck Company, G. M. C.; E. P. Moriarty & Co., Packard; Buick Motor Car Company, Buick; International Motor Company, Mack, Sauer; Avery Company, Avery; Monitor Commercial Car Company, Monitor; W. R. Soher, Kelly; Ford Motor Company, Ford; C. L. Taylor Motor Car Company, Reo; Anderson Electric Car Company, Detroit electric; Electric Truck Company of Kansas City, Walker electric; Hall Bros. & Reeves, Dorris; Mitchell Motor Company, Mitchell; White Motors Company, White; Velie Motor Company, Velie; KisselKar Company, KisselKar.

DAYTON CLUB'S EXHIBITION IN MEMORIAL HALL.

Although it was the first show held under the auspices of the Dayton Automobile Club, that in Memorial Hall, Dayton, O., Feb. 12-17, was the fourth in which local dealers have taken part. The event was under the direction of a committee composed of Walter L. Kuhn, Walter S. Kidder and E. A. Deeds, with Elmer L. Redelle as general manager. The decorative scheme was simple and attractive, and from a business standpoint, the show was a decided success in every way.

Among those who made display of cars were: Baker & Weaver, Cutting; Heathman-Solliday Motor Company, Abbott-Detroit, Paige-Detroit; Dayton Automobile Company, Cole, Winton; Ohio Automobile Company, Republic; Cadillac Motor Company, Cadillac; Standard Motor Car Company, Marmon, Hudson; Peckham Motor Company, Buick; H. H. Barton, Oldsmobile; Hosler-Overland Sales Company, Overland; Dayton & Troy Automobile Company, Ford; G. W. Shroyer & Co., Pierce-Arrow, Mitchell, R. C. H., Colonial electric, Columbus electric; Dayton Electric Car Company, Dayton electric; Stoddard-Dayton Sales Company, Stoddard-Dayton-Knight, Stearns-Knight; Miami Valley Auto Company, Reo; George L. Baker,

Speedwell; Marion Automobile Company, Marion; H. P. Michael Sales Company, Hupmobile; H. H. Barton, Oakland; Dodds Motor Car Company, Chalmers; Lindsey American Sales Company, American.

Accessories were shown as follows: L-C-R Storage Battery Company, storage batteries and lamps; C. E. Bowman, tires; Economical Auto Tire & Repair Company, Firestone tires; Patterson Tool & Supply Company, tools; Dayton Auto Equipment Company, Dayton airless tires; Goodyear Tire & Rubber Company, Goodyear tires; Diamond Rubber Company, Diamond tires; Dayton Engineering Laboratories Co., Delco lighting and starting systems; Myers Automobile Top Company, tops; Silvey Electric Company, batteries and lamps; Apple Electric Company, Aplco lighting and starting systems.

ORIENTAL SETTING FOR CLEVELAND'S TENTH DISPLAY.

An Oriental setting in red and onyx completely covered the ceiling and side walls of the Central Armory at the opening of the 10th annual show of the Cleveland Automobile Club, Cleveland, O., Feb. 17. The event was held for one week, under the direction of the following committee: Fred C. Wood, Fred H. Caley, H. M. Barger and C. M. Brockway.

Magnificent paintings, hung across the ends of the building and along either side, the motif being that of an automobile speedway. Potted plants and palms marked the various exhibition spaces, and the lighting effects were such as to set off the whole in a most pleasing manner. Those who made display were unanimous in the statement that it was the best show for business that Cleveland ever has known. The estimated value of the exhibits was close to $1,000,000, and a representative showing of motor trucks was a feature.

Splendid Showing Made by Recently Combined Dealers in Convention Hall, Kansas City, Mo.

Pleasure cars were shown by: New York Simplex Distributors, Simplex; States Cleveland Motor Company, Brush, Stoddard-Dayton-Knight, Courier; Ford Motor Company, Ford; Thos. B. Jeffery Company, Rambler; Anderson Electric Company, Detroit electric; American Motor Sales Company, American; F. B. Stearns Company, Stearns-Knight; White Company, Alco; V. R. Hall Automobile Company, Broc electric; Koepke Motor Sales Company, Cutting; Brooks-Norton Motor Sales Company, Ohio electric; Chisholm-Phillips Auto Company, Stevens-Duryea, Hudson; Western Reserve Motor Car Company, Garford, Marion; Reo Sales Company, Reo; Franklin Automobile Company, Franklin; Jackson Motor Car Company, Jackson; J. M. Rauch Motor Sales Company, K-R-I-T; Auto Sales Company, Overland; A. R. Davis Motor Company, E-M-F, Flanders; Richardson-Neighbors Motor Company, Hupmobile; Peerless Motor Car Company, Peerless; Lucas & Christenson, Mitchell; E. Holmes, Alpena; R. C. H. Corporation, R. C. H.; J. I. Case Company, Case; Baker Motor Vehicle Company, Baker electric; Parrish Motor Car Company, Packard; V. R. Hall Automobile Company, Cartercar; Rauch & Lang Carriage Company, Rauch & Lang electric; Weaver-Sealand Motor Car Company, Pierce-Arrow, Everitt; Olds-Oakland Company, Oldsmobile, Oakland; Euclid Automobile Company, Firestone-Columbus; Barger Automobile Company, Cadillac; Lozier Motor Company, Lozier; E. B. Finch, Chalmers; J. H. Greenwald, Abbott-Detroit, Marmon; United Motor Cleveland Company, Columbia-Knight, Maxwell; Buick Motor Car Company, Buick; Winton Motor Car Company, Winton; Pullman Motor Car Company, Pullman, Knox; Ohio Motor Car Company, Ohio gasoline; Henderson Motor Sales Company, Cole; Goss Supply Company, Marathon; Cleveland Mercer Sales Company, Mercer.

Commercial vehicles were represented by: States

THIRD WESTERN MICHIGAN SHOW AT GRAND RAPIDS.

Within an hour after the opening of the third annual western Michigan show in the Furniture Exposition Building, Grand Rapids, Mich., Feb. 12-17, "sold" tags began to make their appearance in the cars displayed. The event was under the auspices of the Grand Rapids Herald, but all the local dealers co-operated in making it a decided success. The interior decorations were in keeping with the importance of the display and the 54 makes of cars were disposed to the best advantage. In every way it was one of the largest shows in the state, not excepting those held by the dealers at Detroit, the very heart of the industry.

Pleasure cars were shown as follows: Adams & Hart, Franklin, Rauch & Lang electric; Allen & Dorthy, National; American Motor Sales Company, American; Austin Automobile Company, Austin; Becker Auto Company, Ford; Buick Auto Sales Company, Buick; Central Auto Company, Cadillac; G. P. Dowling, Oakland, Ohio electric; S. A. Dwight, Everitt; W. S. Farrant, Chalmers, Columbus electric; Fox & Wood, Abbott-Detroit; Grand Rapids Auto Company, E-M-F, Flanders, Westcott, Havers; Guarantee Auto Sales Company, Stearns; Hupmobile Sales Company, Hupmobile; Mitchell Motor Car Company, Mitchell; Moran Auto Sales Company, Columbia-Knight, Maxwell, Velie; Oswald Motor Car & Supply Company, KisselKar, Detroit electric, Baker electric; Overland Motor Car Company, Overland, Garford, Marmon, Standard electric; Palmer Sales Company, Peerless; Peck-Haynes Company, Packard; Rambler Auto Sales Company, Rambler; Riekse Auto Company, Cutting; Stratton-Woodcock Auto Company, White, Hudson, Paige-Detroit, Broc electric; Townsend & Thwing, Lion; W. D. Vandecar, Reo, Stoddard-Dayton-Knight; Robert A. Wiley Auto Company, Winton, R. C. H., Crow-Elkhart, Hupp-Yeats electric; I. H. Gingrich, McIntyre.

Commercial vehicles were displayed by: Adams & Hart, Chase; Becker Auto Company, Ford; Buick Auto Sales Company, Buick; W. S. Farrant, Studebaker electric; I. H. Gingrich, McIntyre; International Harvester Company, International; Mercury Garage, Mercury; Oswald Motor Car & Supply Company, KisselKar, Federal; Palmer Sales Company, Peerless; Peck-Haynes Company, Packard; Stratton-Woodcock Auto Company, White; W. D. Vandecar, Reo; Grand Rapids Automobile Company, Decatur; Moran Auto Sales Company, Van-L.

Accessories were displayed by: John Bodbyl, L. W. D'Lye, Paul Eifert, Folgers, Grand Rapids Auto Supply Company, Grand Rapids Electric Company, Heth Bros., Inner Shoe Tire Company, W. B. Jarvis Company, Kent County Good Roads Commission, Lewis Electric Company, Michigan Tire Company, Joseph Poisson, Richmond Sales Company, Star Clothing Company, William E. Starr, Verroys & Veltman, Wayne Oil Tank & Pump Company, O. A. Williams, Grand Rapids Muskegon Power Company, J. W. Russell.

ST. PAUL DEALERS REBUILD AUDITORIUM INTERIOR.

The interior of the Auditorium at St. Paul, Minn., proved far too small to accommodate the members of the St. Paul Motor Car Dealers' Association at its annual show, Feb. 12-17. The event was under the management of W. R. Wilmot, assisted by Harry W. Wiley, and these men decided upon the novel experiment of building a temporary platform over a greater portion of the main floor.

The front was made to represent a viaduct, the piers dividing the exhibition spaces underneath. A mosaic effect was obtained, and the whole was illuminated by numerous clusters of electric lights, so that the view was unobstructed in every part of the building. Several of the cars on display were the same as were seen at New York and Chicago, and much business was transacted throughout the week.

Among those who exhibited pleasure cars were: Central Auto Company, Marmon, Reo; Pence Automobile Company, Stevens-Duryea, Buick; KisselKar Company, KisselKar; Smith & Heberle, Chalmers; P. J. Downes Company, Rambler; Barclay Auto Company, Paige-Detroit; Foster-Lawrence Motor Car Company,

The following were represented in the accessory division: Metal Shelter Company, portable garages; Electric Manufacturing Company, full line; Brictson Manufacturing Company, Brictson treads; Northwestern Motor Supply Co., supplies; Goodyear Tire & Rubber Company, Goodyear tires; St. Paul Tire & Repair Company, G & J tires; Bartles Oil Company, oils and greases; S. F. Bowser & Co., Bowser gasoline storage systems.

IMPORTANT SHOWING OF DEALERS IN PORTLAND, MAINE.

Although the annual display of the dealers in Portland, Me., in the Auditorium in that city, Feb. 12-17, was the seventh held by them, there will be little disposition to question the assertion that this was the most important event the industry has known in Maine. Within the past two years, the automobile has been making rapid strides in this commonwealth, and the state officials have begun to realize the value of encouraging its exploitation. A decidedly effective good roads campaign has been waged, with the result that motor cars are now being used most generally both for pleasure and business.

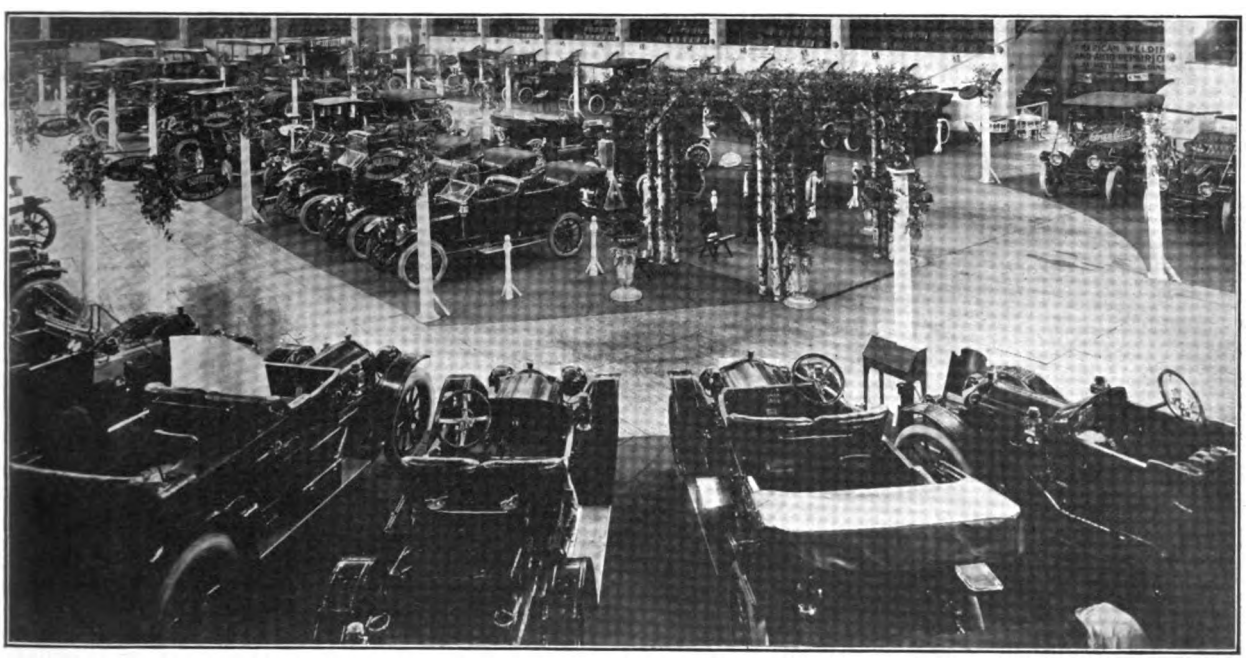
The event was under the management of F. M. Prescott, and every effort was made to produce an attractive display. The ceiling was covered with blue and white bunting, while hundreds of electric lights were utilized in the illumination scheme. The crowds throughout the week evidenced the interest that is being taken in motor subjects and numerous sales were recorded soon after the show opened.

Among the exhibitors of cars were the following: Frank A. Sullivan, White; W. E. Hackett, Stearns-Knight; Auto Sales & Supply Company, E-M-F, Flanders, Kelly truck; J. H. McDonald, Overland; Harold M. Blanchard, Stoddard-Dayton-Knight; Darling Automobile Company, Maxwell; Spear Automobile Company, Ford; W. B. Thombs, Buick; Forest City Automobile Company, Jackson; Thomas B. Jeffery Company of New England, Rambler; Harmon Automobile Company, Hudson, Franklin, Thomas, Reo; Motor Truck & Auto Company, American; Stoughton-Folkins Company, Oakland; F. A. Nickerson Company, Pierce-Arrow, National; Fred D. Morse, R. C. H.; Gilson Auto Company, Mitchell; C. A. Blanchard, Selden; Eastern Sales Company, Haynes; J. S. Harrington & Co., Everitt; Morrill & Higgins Motor Company, Marquette, G. M. C. trucks; Maine Motor Carriage Company, Peerless, Pope-Hartford, Paige-Detroit, Chalmers, Stevens-Duryea; Mank-Stuart Motor Car Company, Cadillac; Alvan T. Fuller, Packard; Geo. E. Morrison Auto Company, Brush Elmore; Portland Company, Knox, Cole; Inter-State Automobile Company, Inter-State; Clyde H. Smith Auto Company, Nyberg; Bath Garage Company, Cutting; Patterson Garage, Pratt-Elkhart, K-R-I-T, Metz; Alco Motor Agency, Alco; Amos J. Shorey Company, Velie; Empire Motor Car Company, Stutz.

Accessories were displayed as follows: Standard Oil Company, Polarine oils; Valvoline Oil Company, Valvoline oils; C. A. Scott Company, windshields, motors, etc.; Wayne Oil Tank & Pump Company, Wayne storage systems; Pyrene Company of New England, fire extinguishers; James Bailey Company, full line; Underhay Oil Company, Underhay oils; Auto Sales & Supply Company, full line; L. W. Cleveland Company, full line; Gulf Refining Company, lubricants.

SEPARATE COMMERCIAL VEHICLE SHOW IN CINCINNATI.

Two weeks were set aside by the dealers in Cincinnati, O., for the exhibition of 1912 models, the first, Feb. 19-24, being devoted to pleasure cars. Motor trucks will be displayed during the week of Feb. 26-March 2. In the first instance, at least, the showing was much more complete than ever before, and the same thing is expected to be true of the industrial vehicle display.



The event was held in Music Hall, under the auspices of the Cincinnati Automobile Dealers' Association, and the decorative scheme was decidedly in keeping with the importance of the show. While numerous displays are being held this year in Ohio, the Cincinnati show had sufficient drawing power to include many of the surrounding towns, and the number of sales recorded was in excess of anticipations.

Pleasure cars were shown by the following: Ford Motor Company, Ford; Cadillac Motor Sales Company, Cadillac; Stevens-Costello Company, Dayton electric, Stutz, Moon; Citizens Motor Car Company, Packard; Franklin Automobile Company, Franklin; Model Garage, Nyberg; Imperial Motor Car Company,

THE ANNUAL SHOW IN NEWARK PLEASES CROWDS.

Perhaps no automobile exhibition ever held in Newark, N. J., was awaited with more interest than the fifth annual display of the New Jersey Automobile Show Association in First Regiment Armory, Feb. 17-24. This interest was maintained throughout the week, and the attendance not only was much larger than at previous displays, but the amount of business transacted was correspondingly large.

Digitized by Google

The decorative scheme comprised a painted blue sky over the entire main hall, the exhibition spaces being divided by white trellis work. A false flooring, covered with green burlap, raised the cars about four inches above the aisles, thereby making each machine seen to the best adavantage.

Pleasure cars were shown by the following: Van Deman & Wainright, Abbott-Detroit; F. L. C. Martin Automobile Company, Alco, Mitchell, R. C. H.; J. J. Meyer, Auburn; Baker Motor Vehicle Company, Baker electric; Chace & Bradley, Borland electric; Buick Motor Company, Buick; Detroit-Cadillac Motor Car Company, Cadillac; Paddock-Zusi Motor Car Company, Chalmers; A. Commercial cars were shown as follows: A. G. Spaulding & Bro., Chase; Commercial Motor Truck Construction Company, Commercial; Commercial Maintenance & Motor Company, Grabowsky; H. J. Koehler Sporting Goods Company, Koehler; Crescent Automobile Company, Mack, Saurer; Packard Motor Car Company of New York, Packard; Peerless Motor Car Company of New York, Peerless; Ellis Motor Car Company, Pierce-Arrow; R. M. Owen & Co., Reo; E-M-F & Flanders Newark Sales Company, Studebaker electric.

TWO SEPARATE DISPLAYS FOR BALTIMORE DEALERS.

In common with a number of other cities, the dealers in Baltimore, Md., have found that the interest in motor trucks is sufficient to warrant the holding of a separate show, although this will take but three days, Feb. 26-28. Pleasure cars were displayed in the Fifth Regiment Armory, during the week of Feb. 19-24, under the auspices of the Automobile Club of Maryland.

The decorative scheme was even more distinctive than last year. The vaulted ceiling of the armory interior was covered by an immense dome, from the centre of which was hung a fantastic chandelier, resembling a pin cushion as much as anything, containing numerous stick pins, etc., outlined in electric lights. Five hundred tungsten bulbs were utilized to bring about this effect. From the edge of this huge inverted bowl, 20,000 yards of bunting were draped to all corners of the main hall. In addition the four corners of the room were marked by 18-foot torcheres, each capable of reflecting 3000 candlepower.

Those who displayed pleasure cars were: Motor Car Company, Overland, Stevens-Duryea; Foss-Hughes Company, Pierce-Arrow; Norwood Bros., Elmore; Rice Bros., S. G. V., Rauch & Lang electric; Ford Auto Company, Ford; F. W. Sandruck, American, Moline; Mt. Vernon Motor Company, KisselKar; Lozier Sales Company, Lozier; H. H. Babcock Company, Babcock electric; G. A. Pope, Jr., Simplex; Walter Scott, Marmon, Crawford; Callahan Bros. Company, De Tamble; Neely & Ensor, Alco, Kline-Kar; Franklin Automobile Company, Franklin; L. M. Vordenberge Motor Company, Maxwell; White Automobile Company, White, Abbott-Detroit; Carl Spoerer Sons Company, Spoerer; D. C. Walker Auto Company, Cole, Stearns-Knight, E-M-F, Flanders; Mar-Del Mobile Company, Packard; C. R. Misner, Oldsmobile; Winton Motor Carriage Company, Winton; J. S. Ditch Company, Detroit electric; Model Automobile Company, Pullman; Lambert Automobile Company, Hudson, National; Stoddard-Dayton Automobile Company, Stoddard-Dayton-Knight; George R. Snodeal, Guy Vaughn; Zell Motor Car Company, Peerless, Chalmers; Auto Outing Company, Buick; Cooper-Sinclair Company, Moon; F. C. Lathrobe, Fiat; Callahan, Atkinson & Co., Locomobile; Oakland Motor Company, Oakland, Thomas; Standard Motor Company, Cadillac; Everitt Auto Company of Maryland, Everitt; Schall-Crouch Auto Company, Paige-Detroit; Shaffer Manufacturing Company, R. C. H.

Commercial vehicles will be shown during the second week as follows: Foss-Hughes Company, Pierce-Arrow; International Harvester Company, International; George R. Snodeal, Commer; White Automobile Company, White; Oakland Motor Company, Federal; Standard Motor Company, Cadillac; Neely & Ensor, Alco; Everitt Auto Company of Maryland; Board; Norwood Bros, Seitz, Elmore; Kelly Motor Truck Company, Kelly; Chase Motor Truck Company, Chase; Consolidated Gas Electric Light & Power Company, Electric Company wagons; Zell Motor Car Com-

ONTARIO MOTOR LEAGUE'S EXHIBITION IN TORONTO.

Second only in importance to the recent Montreal show was the annual display of the Ontario Motor League at Toronto, Ont., Feb. 17-24. Both were national in character, and there even may be some question as to which really was of the more importance to the industry. E. M. Wilcox, until recently the active secretary and now honorary secretary of the league, was the manager at each.

Perhaps there was a larger percentage of Canadian-made machines at the Toronto exhibit, and some of the names do not appear at all familiar in the States. Among those which attracted decided attention was the Russell-Knight, made by the Russell Motor Car Company. This is the only concern in Canada to possess a license from Charles Y. Knight, the inventor of this type of motor.

The decorative scheme centred around an immense Union Jack flag, hundreds of yards of white and blue bunting being utilized in its making. All the emblems thereon were outlined in electric lights. In addition, the beautiful King Edward crown, which saw duty at the Montreal show, was another feature of this portion of the display.

The following makes of pleasure cars were represented: Alco, American, Brockville Atlas, Cadillac, Galt, Century electric, Clinton, Cole, E-M-F, Flanders, Everitt, Fiat, Ford, Gibson electric, Hupmobile, Hupp-Yeats electric, Imperial, Jackson, KisselKar, K-R-I-T, Lion, Lozier, McLaughlin, Maxwell, Mitchell, Moon, Oakland, Oldsmobile, Overland, Packard, Peck electric, Petrolea, Pierce-Arrow, Pope-Hartford, Rambler, Rauch & Lang electric, R. C. H., Reo, Russell-Knight, Schacht, Stoddard-Dayton-Knight, Tudhope, Waverley electric, White, Winton.

Commercial vehicles were represented by the following makes: Brantford, Clinton, Commer, Foden steam, Ford, G. J. C., Gramm, Green electric, International, Kelly, KisselKar, Pierce-Arrow, Reo, Saurer, Victor, White.

Motorcycles were shown as follows: Excelsior, Indian, Pierce, R-S, Russell-Hulett, Tangent.

Among the accessories shown were: Bosch magnetos, Bowser storage systems, Crofton storage batteries, Diamond tires, Dunlop tires, Fisk tires, Goodrich tires, Goodyear tires, Havoline oils, Independent tires, McCord radiators, Mea magnetos, Old Sol lamps, Queen City oils, Springfield tires, Stepney wheels, Tallman windshields, Triple Tread tires, Wayne storage systems, Willard storage batteries, Woodworth treads.

SEVENTH ANNUAL DISPLAY IN OMAHA'S AUDITORIUM.

The seventh annual show of the Omaha Automobile Show Association was held in the Auditorium, Omaha, Neb., during the week of Feb. 19-24. Not only was the number of cars on display much larger than ever before, but the interest in the 1912 models was decidedly more intense, judging from the attendance throughout the week. Omaha being the commercial centre of a large district, it was but natural to expect that the display would attract people from a large area, and this was as true this year as ever. The success of the event indicates that this will prove a decidedly important year for the industry in this section, having in mind the number of possible sales.

Among those who made display were: J. J. Deright Co., Stoddard-Dayton-Knight, Waverley electric, Locomobile; Nebraska Buick Automobile Company, Marquette, Buick; Electric Garage Company, Packard, Rauch & Lang electric, Flanders electric, Baker electric; E. R. Wilson Automobile Company, Lexington; Studebaker Corporation, E-M-F, Flanders, Studebaker electric; Moline Automobile Company, Moline; Apperson Automobile Company, Apperson; Rogers Sales Company, Elmore; Cadillac Company of Omaha, Cadillac; Huffman Automobile Company, Hupmobile, Abbott-Detroit, Hupp-Yeats electric; R. R. Kimball, Stevens-Duryea; Guy L. Smith, Peerless, Hudson, Franklin; T. G. Northwell Company, Detroiter; Marion Auto Company, Marmon, Marion, Ohio electric; United Motor Omaha Company, Columbia-Knight, Maxwell; R. A. Duff, Matheson; Inter-State Automobile Company, Inter-State; Rambler Motor Company, Rambler; J. I. Case Threshing Machine Company, Case; International Harvester Company of America, International; John Deere Plow Company, Velie; Freeland Auto Company, Midland; Van Brunt Automobile Company, Overland, Pope-Hartford; Wallace Automobile Company, Stearns-Knight; Nebraska Regal Sales Company, Regal; Mitchell Motor Company, Mitchell; Andrew Murphy & Son, Kelly truck; Johnson-Danforth Company, Avery truck; Lininger Implement Co., McIntyre; Bradley, Merriman & Smith, Imperial; R. B. Held, Lion; H. E. Frederickson Auto Company, Chalmers.

MEMPHIS CITIZENS INSPECT THE LATEST MODELS.

With over $500,000 worth of cars on display the second annual show of the Memphis Automobile Dealers' Association in the Auditorium, Memphis, Tenn., Feb. 12-17, was one of the most important ever held in the South. A liberal use of bunting transformed the interior of the building, while palms and potted plants were utilized to good effect in making the various exhibits. Over 100 Nernst lights and thousands of incandescent bulbs were employed in the lighting scheme.

Memphis has a total of over 2000 cars in daily use, although Tennessee often is considered as a poor state in which to sell automobiles. The Glidden tourists of 1910 found some sections of the commonwealth with almost impassable roads, but this condition does not apply in the vicinity of Memphis. The association in charge of this show expended nearly $10,000 in staging the display, and the business of the week was sufficient to indicate it was money well spent. The event was under the direction of the following committee: Jerome P. Parker, Aubrey Clapp, W. R. McDonald and Sid. Black, with G. W. Buchanan as general manager. The display was most complete in every way.

Among those who exhibited cars were: Jerome P. Parker-Harris Company, Stoddard-Dayton-Knight, K-R-I-T; Ford Motor Company, Ford; Southern Motor Company, Maxwell; Memphis Auto Company, Packard; Memphis Motor Car Company, Hudson; Evander Williams & Co., Oldsmobile; Vernon Rogers, Jr., R. H. C.; Chickasaw Motor Company, Columbia; W. R. McDonald & Co., E-M-F, Flanders; W. S. Bruce & Co., Abbott-Detroit; McDonald Auto Company, Mitchell; Blomberg Auto Company, Lozier, Bergdoll; E. E. Loving Auto Company, Cole; Baker Electric Company, Baker electric.

How the Various Models Were Disposed in the Auditorium for the Inspection of Memphis People.

SUCCESS MARKS FALL RIVER DEALERS' FIRST SHOW.

Although an automobile show was held in the Casino at Fall River, Mass., last year, that which took place Feb. 12-17 was the first under the auspices of the recently organized Fall River Automobile Dealers' Association. The management was under the direction of William E. Higgins. Although the building is small, it was surprising how many cars could be displayed therein to good advantage.

In transforming the interior, the ceiling was entirely obscured by wide strips of white and lavender. From this were suspended potted palms, while chrysanthemums and other flowers were intermingled with the greenery and gave the touch of color which emphasized the delicate background. The exhibitor's

Digitized by Google

spaces were separated by a low railing of green and white tapestry, and strings of mountain laurel.

The list of exhibitors included the following: J. Edward Newton, Stevens-Duryea, Knox, Chalmers, Haynes; Robert W. Powers, Peerless, Pope-Hartford, American, Hudson; Richard W. Tierney, Ford, White, Locomobile; David M. Connell, Overland, Franklin; Albert A. Mills, Chase truck, Briggs-Detroiter; John B. Quinn, Maxwell, Brush; Henry Golden, R. C. H.; Wilfred Cote, Everitt, E-M-F, Flanders; Joseph Fountaine, Buick, Jackson; John Williams, Warren; Byron W. Cottle, Crawford; George N. Durfee, insurance; John B. Quinn, Harley-Davidson motorcycles; Wayne Oil Tank & Pump Company, Wayne storage systems; A. E. Rich & Son, cylinder boring; John Lyons, spark gaps; Standard Wrench & Tool Company, tools; Union Drop Forge Company, sundries; Congdon & Carpenter Company, general accessories; Auto Parts Company, Ford specialties; Jean B. Gaudreau, Indian motorcycles; Borden & Remington, accessories; Valvoline Oil Company, Valvoline lubricants; Waite Auto Supply Company, general accessories.

PITTSBURG ENJOYS ITS BIGGEST AND BEST SHOW.

Although some of the dealers in Pittsburg, Penn., held their display in that city earlier in the month, it appears to be established that the really big event of the year in that city was that conducted by the Pittsburg Automobile Show Association in the Exposition building, Feb. 19-24, under the management of Thomas I. Cochran. In the face of which was believed to be almost certain failure, Mr. Cochran, who was the directing head of the first automobile display ever held in Pittsburg, was able to rally a large number of the dealers to his assistance, and succeeded in presenting the most elaborate and artistic display the city has known.

Thomas I. Cochran, Manager Pittsburg Exposition Show.

In the matter of decorations, the prevailing colors were red, white and gold. Three immense circles, or wheels, 12 feet in diameter, were suspended from the ceiling by electric cables, and the rims and spokes were studded with thousands of electric light bulbs, presenting a decidedly pleasing effect. The side walls were covered with handsome paintings, 23 feet long, presenting scenes from foreign shores and gardens. Another feature was the presentation of moving pictures of some of the more important events in the industry during the past year.

The following displayed pleasure cars: Aaron Deroy Motor Car Company, E-M-F, Flanders; Abbott-Detroit Sales Agency of Pittsburg, Abbott-Detroit; Alco-Pittsburg Sales Company, Alco, Haynes; B. F. Benson, Moon; Buhl-Regal Motor Car Company, Regal; Cole Motor Car Company of Pittsburg, Cole; Columbus Buggy Company, Firestone-Columbus; Correja-Agency, Correja; Craig-Center Auto Company, Republic; East Liberty Auto Company, Paige-Detroit; Federal Motor Car Company, Oldsmobile, Ohio; Forbes Motor Car Company, Inter-State, Stutz, Warren; Great Western Auto Company, Great Western; Halladay Sales Agency, Halladay; Havers Motor Car Company, Havers; Kline-Kar Motor Company, Kline-Kar; Manchester Garage Company, Staver; Paul Marford, Marathon; L. G. Martin, Rambler; Metz Pittsburg Sales Company, Metz; Michigan Auto Company, Michigan; Miller Auto Company, Crawford; A. H. McKellip, National; OttoMobile Company, OttoMobile; Penn Auto Company, Alpena; Pullman Motor Car Company of Pittsburg, Pullman; R. C. H. Auto Company, R. C. H.; Richardson-Neighbors Motor Company, Hupmobile; Selden Pittsburg Company, Selden; State Auto Company, De Tamble, Dorris; Thomas Motor Sales Company, Thomas; E. J. Thompson Company, Fiat; Union Motor Car Company, Penn; Universal Motor Car Company, Lion; Velie Motor Vehicle Company, Velie; West Penn Auto Company, Detroit electric; Williams-Hasley Motor Car Company, Jackson, Mitchell, Clark.

Truck exhibitors included the following: Alco-Pittsburg Sales Company, Alco; Aspinwall Auto & Garage Company, Atterbury; Bessemer Motor Truck Company, Bessemer; Eclipse Motor Truck Company, Eclipse; Federal Motor Car Company, Mais; Harwood-Barley Manufacturing Company, Indiana; Lange Motor Truck Company, Lange, Chase, Dayton; Mack Bros. Motor Car Company, Mack, Saurer; Packers Motor Truck Company, Packers; Pittsburg Automobile Company, Commer; Pittsburg Machine Tool Company, Curtiss; Schacht Motor Car Company of Pittsburg, Schacht; Speedwell Motor Car Company, Speedwell; Union Motor Car Company, Penn; Velie Motor Vehicle Company, Velie; West Penn Auto Company, Kelly.

Accessories were shown by: American Roller Bearing Company, Diamond Metal Garage Company, Doubleday-Hill Electric Company, Duquesne Auto Parts Company, Hoover & Hurst, Jackson Motor Supply Company, John G. Higbee Glass Company, Jos. Woddwell Company, Miles Spring Wheel Company, Motorcycle Exchange, O'Neil Tire Protector Sales Company, Penn Auto Specialty Company, Perfection Auto Lighting Company, Pittsburg Auto Equipment

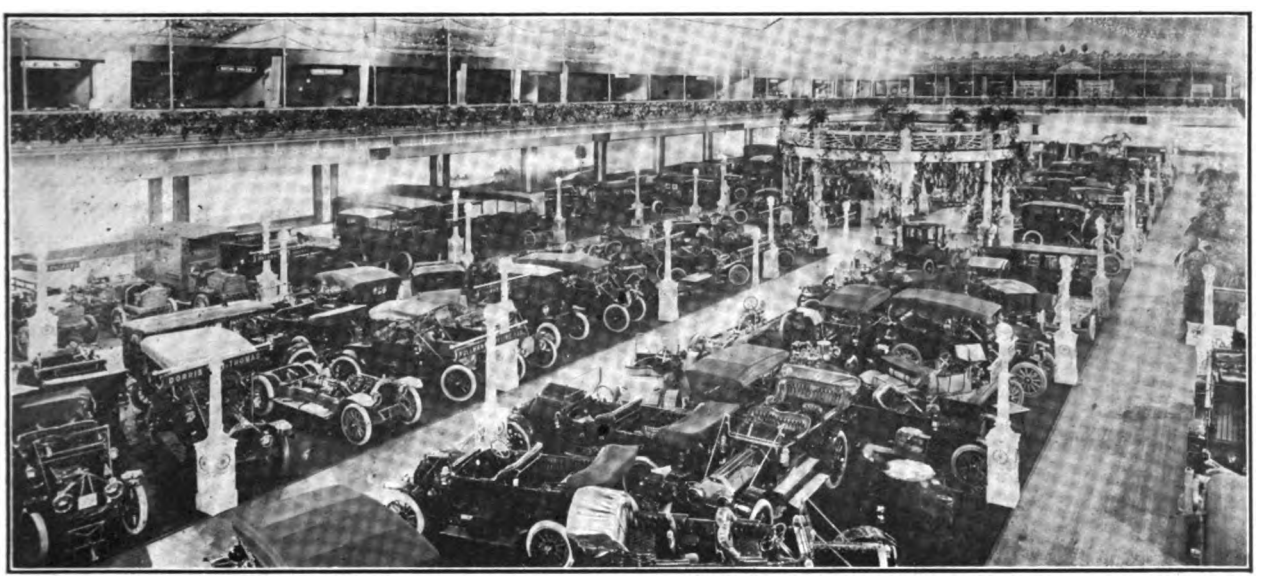
Company, Pittsburg Auto Lamp Repair Company, R. D. Nuttall Company, S. & S. Shock Absorber Company, Brictson Manufacturing Company, Union Auto Specialties Company, Walker Shcck Absorber Company, Wayne Oil Tank & Pump Company, Williams & Co., Winterton Manufacturing Company.



RIVAL DISPLAYS ENGAGE AGENTS IN MINNEAPOLIS.

Two rival displays running at the same time caused something of a stir in automobile circles in Minneapolis, Minn. One was under the auspices of the Minneapolis Automobile Show Association and the management of W. R. Wilmot, in Armory, Feb. 17-24, while the other was in charge of the Minneapolis Dealers' Association in the Auditorium, Feb. 19-22. An admission fee was charged at the former, but the dealers' association presented complimentary tickets for its exhibition.

Both shows were well patronized, and it is suggested that the rivalry will help rather than discourage business. Both shows were neatly decorated and the cars were well displayed. The Auditorium exhibition was marked by the appearance of a number of motorcycles, and trucks were conspicuous at both displays, there being 74 different makes of cars at the Armory and 33 at the Auditorium.

Those displayed at the Armory were: Velie, Ford, Chalmers, Thomas, Paige-Detroit, Case, Speedwell, Bergdoll, Mitchell, Flanders electric, Buick, Stevens-Duryea, Stearns-Knight, Maxwell, Columbia-Knight, Sampson truck, National, Wilcox truck, Detroit electric, Rauch & Lang electric, Lozier, Marion, E-M-F, Flanders, Studebaker electric, Inter-State, Cadillac, Packard, Rambler, Gramm truck, Ohio electric, Reo, Marmon, American, R. C. H., Hupp-Yeats electric, Courier, Waverley electric, Brush, Haynes, Locomobile, Fiat, Lexington, Regal, Westcott, Hupmobile, Pierce-Arrow, Peerless, Columbus electric, Firestone-Columbus, Kelly truck, Winton, Twin City tractor, Motor Wagon truck, Gopher truck, Big Four tractor, Avery truck, Chase truck, Pioneer tractor, Federal truck, Overland delivery wagon, Metz, Cameron, Grabowsky truck.

The makes represented by the dealers' association at the Auditorium were: Everitt, K-R-I-T, Corbin, Amplex, Anhut, Crow-Elkhart, Veerac truck, Babcock electric, Woods electric, Baker electric, Union, Cole, Paterson, Oakland, Premier, Stoddard-Dayton-Knight, Halladay, Elmore, Warren, Abbott-Detroit, Apperson, Colby, Hudson, Jackson, Fuller, Michigan, Nyberg, White, Penn, Midland, Briggs-Detroiter, as well as the following motorcycles: Harley-Davidson, Merkel, Minneapolis, Excelsior, R-S, Wagner, Indian, Yale, Thor.

General View of Main Floor and Balcony Exhibits in the Exposition Building at Pittsburg.

SECOND WESTERN CANADIAN EXHIBIT AT WINNIPEG.

The first automobile show in Winnipeg, Manitoba, last year, was such a splendid success that the industry in Canada and the States has been reaping the benefits ever since. With the increased activity in favor of good roads, it is more than probable that western Canada will present an even more favorable market for automobiles during the coming season.

The second show was held under the auspices of the Winnipeg Motor Show Association in the Palace Garage building, Feb. 12-17. The decorative scheme was modelled after a monster hanging garden. The various exhibition spaces were marked by tall white

Digitized by Google

pillars, on top of which were mounted ornamental vases containing potted plants and flowers. Green and white ropes connected the pillars, along the aisles, giving an unobstructed view of the cars and motorcycles on display.

The list of exhibitors was not large, but when it is remembered that very few makes were being represented in this section a year ago, progress made is more evident. Among the cars displayed were: R. C. H. Motor Sales Company, R. C. H., Alpena; Jackson Motor Company, Jackson; Fort Rouge Garage, Hudson, Paige-Detroit; Boyce Carriage Company, Ltd., KisselKar, Brush; Th. Oddson & Co., Rambler; George Duis, Michigan; Walker Motor Company, Maxwell, Columbia-Knight, Paterson; Lion's Garage, White; Canadian Motors, Ltd., Galt.

The exhibit of motorcycles was most complete, including the following: Consolidated Cycle & Motor Company, Indian, Excelsior; Dominion Cycle Company, Merkel, Yale, Flanders; North End Cycle Company, Thor; Winnipeg Cycle & Motor Company, Harley-Davidson, Wagner.

BINGHAMTON AUTOMOBILE CLUB'S THIRD ANNUAL DISPLAY.

For the third time the Binghamton Automobile Club held an annual show in the local armory, Binghamton, N. Y., Feb. 20-24. Besides being a display of the models for the coming season, these annual events take on a society aspect not generally expected. The main drill hall is utilized for the exhibition of motor cars and accessories, while a second portion of the building is employed for dancing and other social events.

The decorative scheme this year was entirely new. A liberal use of vines and colored electric lights transformed the exhibition hall into an open air garden, the sky effect being produced in blue bunting. Palms and potted plants aided in making the dancing room attractive. The attendance was in excess of previous years, and the social feature did not appear to detract from the business side of the venture.

Among the exhibitors may be mentioned: New York Sales Company, Hudson, Cole, Rambler, Paige-Detroit; Lowell, Hammond & Worden, Winton, Stearns-Knight, Marmon, E-M-F, Flanders, Pullman; Binghamton Ford Sales Company, Ford; S. H. Lewis & Co., Maxwell, Columbia-Knight, Franklin, Waverley electric; J. M. Davidge, Pierce-Arrow; R. W. Whipple, Packard; Abbott-Detroit Sales Agency, Abbott-Detroit; Palmer-Singer Agency, Palmer-Singer; Binghamton Cadillac Company, Cadillac; June Automobile Company, Brush, Chalmers, Mitchell; Lewis & Niblett, Reo; S. B. Judd Company, Overland; Purdy & Mix, Hupmobile, Fiat; Broome County Motor Car Company, American; H. W. Brown, Buick, Pope-Hartford, Thomas.

SPLENDID ATTENDANCE MARKS YOUNGSTOWN'S SHOW.

That there is decided interest in the 1912 models in the vicinity of Youngstown, O., was made evident during the opening night of the second annual show of the Youngstown dealers in the Auditorium in that city, Feb. 12-17. Liberal use of electric lights and "Old Glory" served to transform the interior of the building for the event. In every respect it was a successful display, and the crowds came as well to purchase as to examine the various makes on display.

Among the exhibitors of cars were: City Auto Garage, National, Jackson, K-R-I-T, Firestone-Columbus; F. M. Mayberry, Cartercar; J. Ralph Seidner, Warren; Buick Sales Company, Buick; Eddy & Henderson, Overland, R. C. H., Maxwell; Drury-Wells Motor Car Company, Marathon; Viaduct Garage, Everitt; Motormart, Packard, Hudson, Rauch & Lang electric; Elton Auto & Repair Company, Cadillac; Cutting Sales Company, Cutting; Youngstown Auto & Repair Company, Reo, Oakland, Oldsmobile; Youngstown Carriage Company, E-M-F, Flanders, Baker electric, Peerless; Ralph P. White, Cole; Standard Auto Sales Company, Chalmers; F. R. Smith, Rambler, Ford; Leonard & Haynes, Grabowsky truck; Park Auto Sales Company, Michigan; J. C. McClaren, Elmore; McNutt Auto Company, Motor Wagon truck; E. J. Thomas, Kline-Kar.

CONNECTICUT'S BIGGEST EVENT IN HARTFORD ARSENAL.

The importance of Hartford, Conn., as an automobile producing centre is sufficient reason why it should be selected as the location for a state display of motor vehicles and accessories. The Hartford Automobile Dealers' Association has been holding shows in that city for some year, but it always has been handicapped for lack of room. This year permission was granted for the use of the new state arsenal, and the desire of the association to carry out its plan for a state-wide display was gratified, Feb. 19-24.

The management of the event was under the direction of F. W. Dart, E. G. Biddle and W. L. Ledger. These three men solicited the co-operation of the city officials to the extent of securing a special appropriation, and the business men aided in making the week one long to be remembered. All the principal streets were decorated with bunting and flags, and many of the local manufacturers and others made special display of their wares in the store windows.

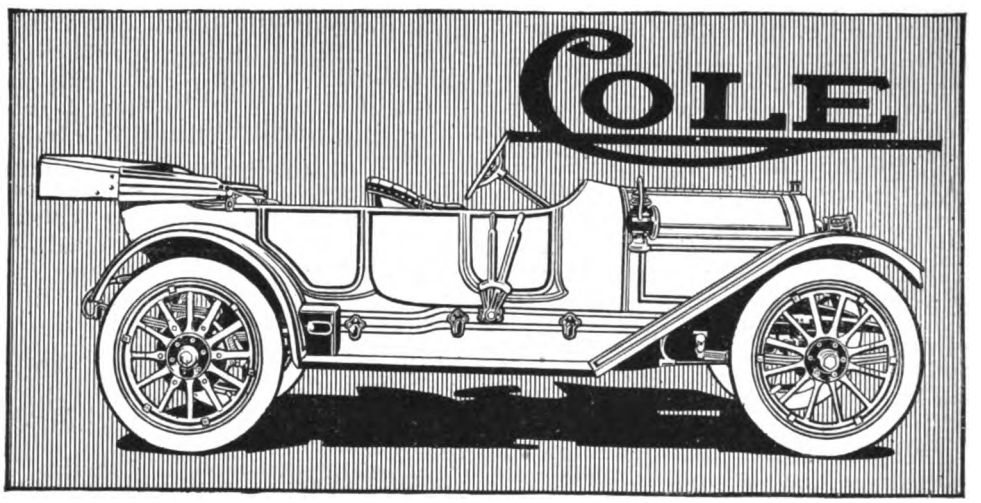
The interior of the arsenal was transformed into an Italian pergola with lattice work surrounding the four walls, while clusters of grapes, each grape enclosing a tiny electric bulb, were trailed over these frames. A canopy of silk, blue for the dome and white for the side walls, entirely covered the display, and the sky effect was further accentuated by the use

Digitized by Google

of electric lights as stars. Heavy bronze shields, on which were embossed a Roman chariot vying with the modern automobile, marked the various spaces.

Pleasure car exhibitors were: Electric Auto Station, Flanders electric, Baker electric; Alpena Motor Car Company, Alpena; F. L. Caulkins, Buick; F. W. Williams, Metz; F. H. Strong, Schacht; Firestone Motor Car Company, Firestone-Columbus; W. W. Wetherell, Stoddard-Dayton-Knight; Columbia Motor Car Company, Columbia-Knight; Winton Motor Car Company, Winton; R. D. & C. O. Britton, Maxwell; Palace Auto Station Company, E-M-F, Flanders, Thomas, Waverley electric, Oldsmobile; J. T. Curtis Company, Sibley Curtis; Dunbar Motor Car Company, Elmore; Knox Automobile Company, Knox; Packard Motor Car Company, Packard; R. M. Spencer, KisselKar; Kilby & Barrett, Matheson, Jackson; Brown, Thomson Company, Stevens-Duryea, Lozier, Cadillac; Capitol City Auto Company, Mitchell; Russell Taber, Reo; J. A. Palquist, Pratt-Elkhart; Andrew Cassky, De Tamble; Fiske Garage, Marion; J. J. & F. Ahern, Abbott-Detroit; New England Garage, Cutting; Miner Garage Company, Pierce-Arrow; Pope Manufacturing Company, Pope-Hartford; Elmer Auto Company, Ford; Carl H. Page Associates, Chalmers; S. A. Foster & Co., Regal, Rambler; Eldree Clark, Paige-Detroit; Fred Reed, National; E. H. Harris, Overland; George L. Kaiser, Empire; George D. Knox, Peerless, Hudson; Corbin Motor Vehicle Corporation, Corbin; Skinner Bros., Stearns-Knight; A. H. Eddy, Cartercar; Buick Garage Company, Buick, Alco, Hupp-Yeats electric; M. T. Bill, Havers; A. D. Scoville, Stanley steam; Fred E. Purinton, Marathon.

Commercial vehicles were represented by: Knox Automobile Company, Knox; S. A. Foster & Co., White; S. A. Miner, Pierce-Arrow; New Haven Truck & Auto Works, Moeller; Hartford Electric Light Company, General Vehicle electric; Packard Motor Car Company, Packard; Pope Manufacturing Company, Pope-Hartford; Buick Garage Company, Buick, Alco; Atterbury Truck Company, Atterbury; E. H. Harris, Overland; Russell Taber, Reo; Elmer Auto Company, Ford; R. D. & C. O. Britton, Federal.



Accessories were displayed as follows: Maxfield Bros., garage equipment; Dahl Punctureless Tire Company, tires; Frisbie Motor Company, engines; Windsor Locks Auto Company, garage equipment; Hartford Auto Parts Company, full line; Todd Rubber Company, tires; Bi-Motor Company, sundries; R. D. & C. O. Britton, general line; Auto Tire Company, tires; Richardson Tire Company, sundries; E. R. Clark, pumps; O. D. Cornell, gas lighting system; Baldwin-Stewart Electric Company, electric supplies; Spencer Turbine Cleaner Company, vacuum cleaners; Universal Auto Repair Company, sundries; Connecticut Oil Company, lubricants; Wayne Oil Tank & Pump Company, Wayne storage systems; Hart Gas Igniter Company, lighting equipment; G. W. Fuller, leather goods; Chas. E. Miller, general line; Post & Lester Company, full line; Alling Rubber Company, tires; G. F. Thomas, vacuum cleaners; Welding Company, autogenous welding; Lathrop Company, sundries; Connecticut Steel & Wire Company, sundries; Finch & Hayes, motorcycles; Smith Worthington Company, leather goods; Aetna Insurance Company, insurance; Blue Ribbon Garage, sundries.

COLE

The Cole Toy Tonneau—Four Passengers.

At the Boston Show

If you attend the Boston Show don't fail to see the Cole models at the exhibit of our Boston Representatives, G. E. & H. J. Habich Company.

The Cole is a perfect combination of stylish beauty and mechanical perfection. An examination of its specifications, size, power and construction will convince you that it is a matchless value at its price---$1885.00.

And back of the Cole is years of satisfactory service to thousands of Cole users.

At every show the Cole exhibit is the center of interest. We feel sure that at the Boston Show it will repeat the triumphant successes it has enjoyed at the New York, Chicago, Philadelphia, Detroit, Buffalo and other shows.

We repeat, if you attend the Boston Show, see the Cole Cars. Our Boston representatives will take great pleasure in explaining and demonstrating the Cole either at their Show rooms or at the Show.

COLE

The Cole Touring Car

122-Inch Comfort

The Cole has a 122-inch wheelbase---every inch for comfort. Long wheelbase makes for ease of riding---the same as big wheels do. It smooths out the road "humps."

The Cole 122-inch wheelbase also provides for a large, roomy body. There is plenty of leg room and the seats are big and thickly upholstered. The size and roominess of the Cole lend distinction and elegance to its appearance.

But the Cole is not only big in size. It is big in value. Consider what is offered for $1885.

Self-Starter---the most reliable in the market. Dynamo Electric Lighting---the Ward Leonard System---service guaranteed. Long Stroke Motor (4 1-2 by 5 1-4). Unit Power Plant---enclosed valves; clean, silent. Bosch Dual Ignition. Timken axles front and rear (full floating rear)---demountable rims---36-inch wheels.

All Cole models will be on exhibition at the Boston Show at the exhibit of G. E. & H. J. Habich Company.

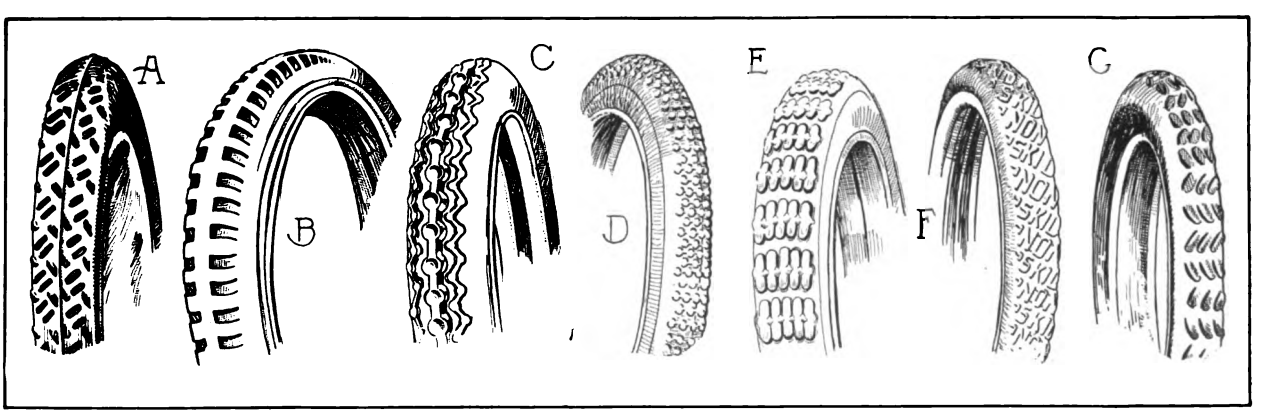
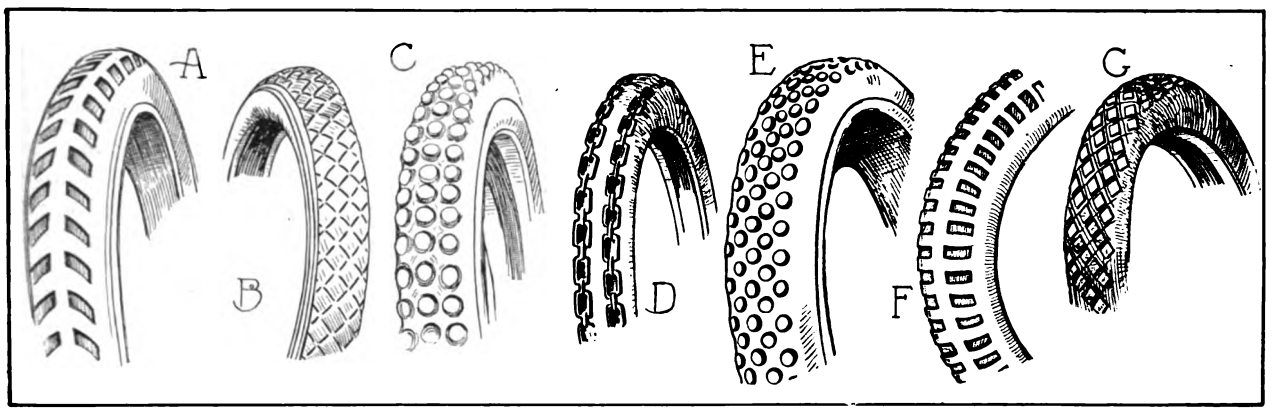
APPARENTLY manufacturers of tires have reached a point where little may be expected in the nature of radical departure from accepted practise in the construction of the tire itself. Continued improvement undoubtedly will result in different methods, with a view to producing a shoe that will withstand better the stresses and strains imposed upon it in service. However, these must be regarded as details of manufacturing, such as the selection of materials and their incorporation in the proper proportions, not easily discernible by the average motorist.



Car owners are beginning to realize that they have an important share in the responsibility for satisfactory tire service. The producers have been waging an educational campaign in the matter of overloading and improper inflation, until the users have begun to take the proper precautions in this respect. In addition car manufacturers are acting in conjunction with the producers of tires in specifying sizes that will have an ample margin of safety. This does not mean necessarily larger wheel diameters, but it is noticeable that several makers are presenting tires of wider section.

Rubber compounds and textile fabrics are the principal materials employed in the manufacture of tires, and as neither of these is especially strong in itself, extreme care is needed in building to insure adequate strength. For this reason every factory has different methods of construction and the compounds, number of layers of fabric, and its strength vary in nearly every instance. Each maker believes that his proportions are best adapted to the requirements of the motorist.

Development of Non-Skid Tread.



Perhaps the most notable feature of the tire situation at present lies in the development of the non-skid tread. The advantages claimed for all types are much the same. The first requisite is that they shall prevent side slipping, and some companies go so far as to guarantee this. Even when the protuberances have worn away from the contact surface of the tread, there still remains on each side a shoulder, which has a tendency to keep the car on the road. An additional feature is that when the anti-skidding portion has been worn away entirely, there still remains a tire practically as good as a new plain tread shoe.

While few manufacturers make a guarantee as to the mileage that may be obtained from non-skids, it has been pretty thoroughly demonstrated that it takes about 1500 miles to show any appreciable difference in the tread itself. As it is admitted that the tire is then capable of rendering the same service as a plain tread type, it would seem perfectly fair to assume that a tire equipped with protuberances will add at least 1500 miles to the guaranteed mileage of the regular shoe. The result is an indicated economy

New Ideas in Non-Skid Treads: A, Shawmut; B, Seamless; C, Goodrich; D, Kelly-Springfield; E, Diamond; F, Firestone; G, Morgan & Wright.

Another Group of Anti-Skids: A, Prowodnick; B, Ajax; C, Federal; D, United States; E, Michelin; F, Batavia; G, Goodyear.

in the use of tires with anti-skid treads.

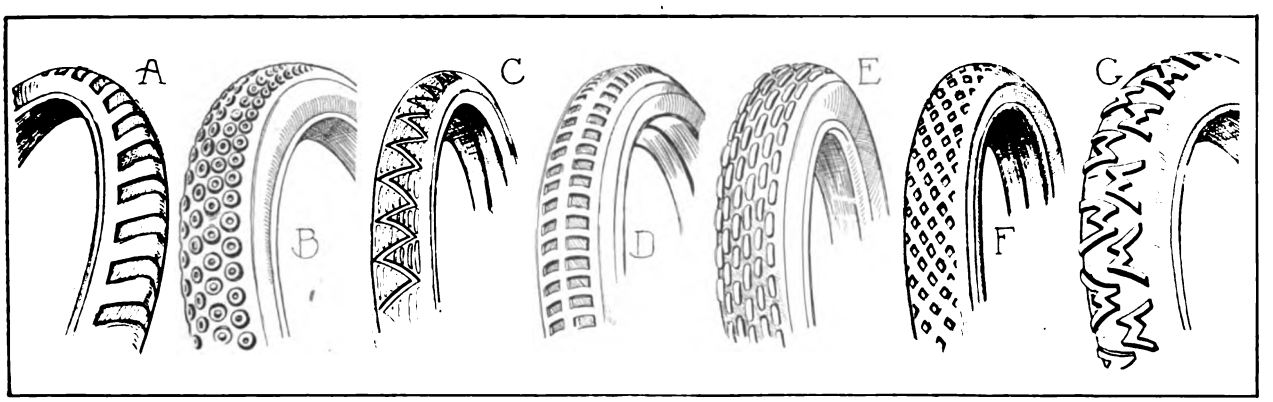
Since it has been explained that each manufacturer believes his method the best and that the difference lies mainly in the use of the compounds or the proportions employed, it will be necessary only to note the various means of bringing out the anti-skidding feature. Reference may be had to the accompanying drawings, presenting a large number of the newer non-skid designs.

Some Distinctive Designs.

The Shawmut Tire Company, Boston, Mass., has a continuous line along the centre of the tread, with small protuberances branching off on either side at stated intervals. In addition similar protuberances are disposed in regular order over the remainder of the tread.

Arrow head indentations stud the surface of the Seamless tread, made by the Seamless Rubber Company, New Haven, Conn., and much the same formation is noted in the Prowodnick, made by the Russian Tire Company, New York City; the Stein lap lock, made by the Stein Double Cushion Tire Company, Akron, O.; the Hardman, made by the Hardman Tire & Rubber Company, New York City; the Security, made by the Batavia Rubber Company, Batavia, N. Y.; and others, although, of course, they differ more or less in the manner in which they are arranged.

In the Goodrich Master tread, the B. F. Goodrich Company, Akron, O., has brought out a new design. It consists of large, round studs running in a straight line along the centre of the tread, while smaller circular studs are placed along the sides of the tire.

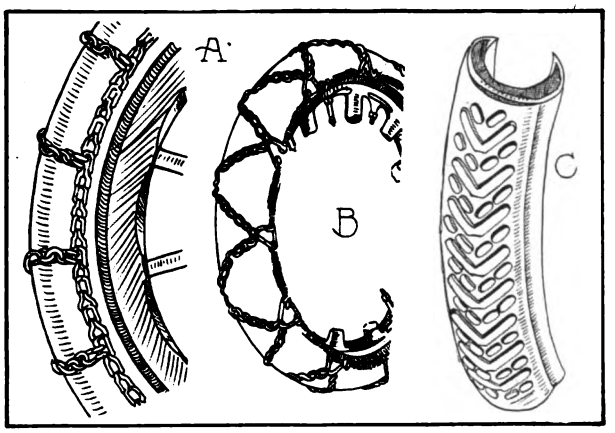


The Kelly-Springfield, made by the Consolidated Rubber Tire Company, Akron, O., is more in the nature of the standard Bailey tread, which is one of the oldest types made in America under license from the original inventor.

The Diamond Rubber Company, Akron, O., presents its new Safety tread, in which rows of studs are run in series circumferentially about the tire.

The Firestone Tire & Rubber Company, Akron, O., utilizes the word "Non-Skid," arranged diagonally over the surface of the Firestone tire, the resulting angles and curves supplying the anti-skid element.

The Morgan & Wright Nobby tread is continued by the United States Rubber Company, New York City, which has taken over the original concern, the three rows of knobs being molded upon the surface of the tread in zig-zag style.



The Ajax-Grieb Rubber Company, Trenton, N. J., has a checkered tread on its Ajax non-skid, the diamond shaped apertures being disposed entirely over

Additional Non-Skid Designs: A, Hardman; B, Pennsylvania; C, Lee; D, Stein; E, Republic; F, Swinehart; G, Miller.

Digitized by Google

the surface of the tire. Much the same arrangement is provided in the Goodyear, made by the Goodyear Tire & Rubber Company, Akron, O., although the

Tire Protectors: A, Weed Chain; B, Auto Appliance Chain; C, Standard Tire Protector.

diamond shaped studs are a triffe smaller.

The Federal Rubber Manufacturing Company, Milwaukee, Wis., has brought out a Rugged tread, which resembles the Bailey very closely. There are three rows of studs, those in the centre being shorter than those on the side.

The United States Rubber Company, New York City, has placed in the market a new tire bearing its name, on which the anti-skid feature is produced by protuberances shaped like the links of a chain.

The Michelin steel studded tread is continued by the Michelin Tire Company, Milltown, N. J. This form has been copied widely by American makers.

The Pennsylvania Vacuum Cup tread is still made by the Pennsylvania Rubber Company, Jeannette, Penn. The surface is covered by rows of round studs, and in the top of each stud is a small cup, giving the tire its characteristic name and appearance.

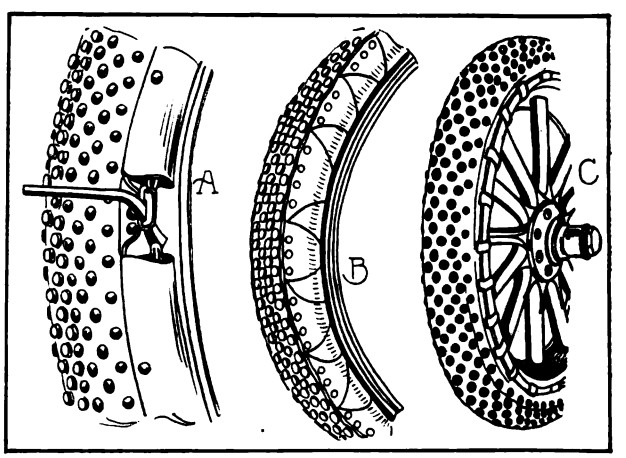
The Lee Tire & Rubber Company, Conshohocken, Penn., presents the Lee, in which a zig-zag line works back and forth over the entire surface of the tread, and different sizes of knobs are disposed between the points of the zig-zag line.

The Republic Rubber Company, Youngstown, O., continues its Staggard tread, in which six rows of studs run circumferentially about the tire, the studs of one row being arranged to overlap the spaces between those of its neighboring row.

The Swinehart Tire & Rubber Company, Akron, O., has a checkered tread, which differs from others of a similar nature, in that the squares are cellular instead of being raised.

Protuberances composed of the letter "M" form the anti-skid features in the Miller tire, made by the Miller Rubber Company, Akron, O.

This is by no means a full list of the non-skid treads presented, but will serve to illustrate the wide diversity of design. It is stated that about 40 per cent. of the total output of the American tire factories may be designated as anti-skids. Their cost is from 18 to 20 per cent. higher than the plain treads. Some factories are making more of the former than of the latter, while one or two report that the production of non-skids runs as high as 60 per cent. of their total product. It would appear that the future is to see a much larger proportion of these.



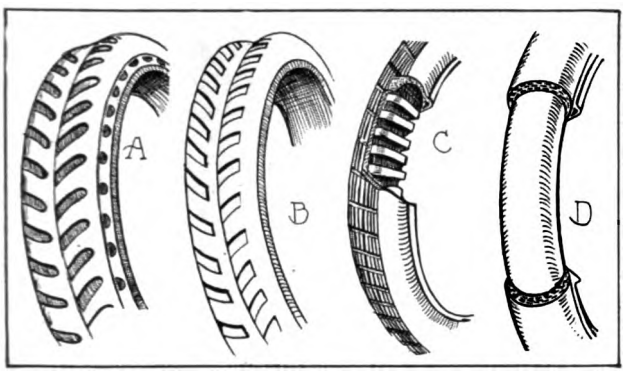
Auxiliary Anti-Skid Devices.

Closely allied to the non-skid tires are the appliances for converting the plain tread types into anti-skid. This is accomplished either by fitting extra treads or by applying tire chains. A few examples of each will be presented.

The Woodworth tread, made by the Leather Tire Goods Company, Niagara Falls, N. Y., is composed of leather in which steel studs are imbedded. This is held in place on the tire by coil springs along the side which are designed to take up all slack and prevent any looseness. The Universal Tire Protector Company's Universal tread is similar in appearance, though the method of anchorage is different. The same thing applies in a measure to the tire protector of the Twentieth-Century Tire Protector Company, Midlothian, Tex.

The Standard tire protector of the Standard Tire Protector Company, Akron, O., virtually is a removable tread, and is made both in the plain and non-skid types. Several layers of sea island cotton and a compound of para rubber are combined in its manufacture, and it is much the same as an additional tread for the regular pneumatic tire.

One of the best known tire chains is the Weed, made by the Weed Chain Tire Grip Company, New York City. This consists of a strand running along each side of the tire, and connected at short intervals by cross chains. In the Auto-Appliance chain, made by the Modern Auto Appliance Company, Chat-



Special Treads: A, Woodworth and Special Tool for Applying; B, Twentieth Century; C, Universal.

ham, N. Y., the cross chains run diagonally about the tire, being held in place at the sides by helical coil springs.

Digitized by Google

Quick Detachable Features.

The no-rim-cut feature, which was brought out originally by the Goodyear Tire & Rubber Company,

Special Tires: A, Motz Cushion Electric; B, Firestone Electric; C, Dayton Airless; D, Double-Fabric Interlock Inner Tube.

Akron, O., appears to have gained new converts. In some instances it may be termed a straight edge tire and in others a quick detachable, but whatever the name, the principle is that of providing for attaching to the rim without the clincher ring, so that there is no possible danger of cutting the base of the tire should it be run with less air than recommended.

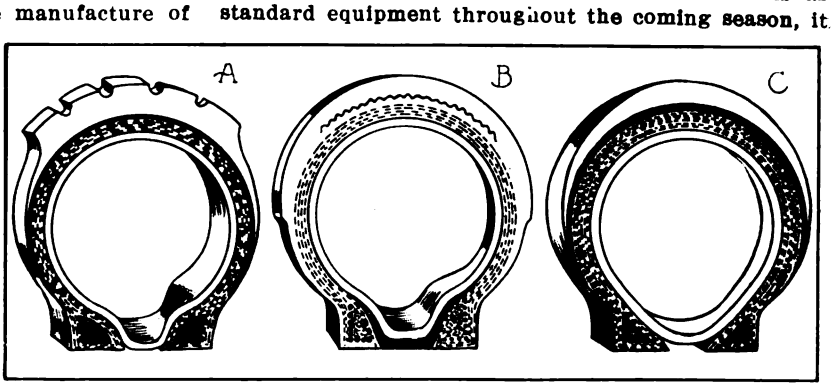
The Empire Tire Company, Trenton, N. J., is among the concerns which have brought out one of these straight edge, quick detachable shoes. It will be noted from the accompanying illustration that the Empire differs in shape from the Goodyear, although the base fits the rim at right angles, permitting of heavier construction at this point.

The Shawmut Tire Company, Boston, Mass., also has a new tire of somewhat similar design, only this is called a straight edge, or quick detachable U. It is manufactured with wires imbedded in the bead so that the rim fits perfectly when inflated. It differs from the other Shawmut tires only in the type of rim it is made to fit.

Some few firms specialize in the manufacture of tires for electric cars, and among the best known of these may be mentioned the Motz Tire & Rubber Company, Akron, O. This is a cushion tire, made of solid rubber to fit all standard rims on electrics, and is a trifle less in width than is a pneumatic of the same diameter. The inequalities of the road surface are taken up by a series of molded cuts in the sides. The tread is elastic and of a high quality rubber to withstand wear and provide constant and uniform traction.

The Firestone Tire & Rubber Company, Akron, O., also makes a cushion tire for electrics, in which a double or dual tread is employed, with internal cavities at frequent intervals in the base and directly under the tread, so that the full cushioning effect may be gained. This is made either with plain tread or anti-skid as desired.

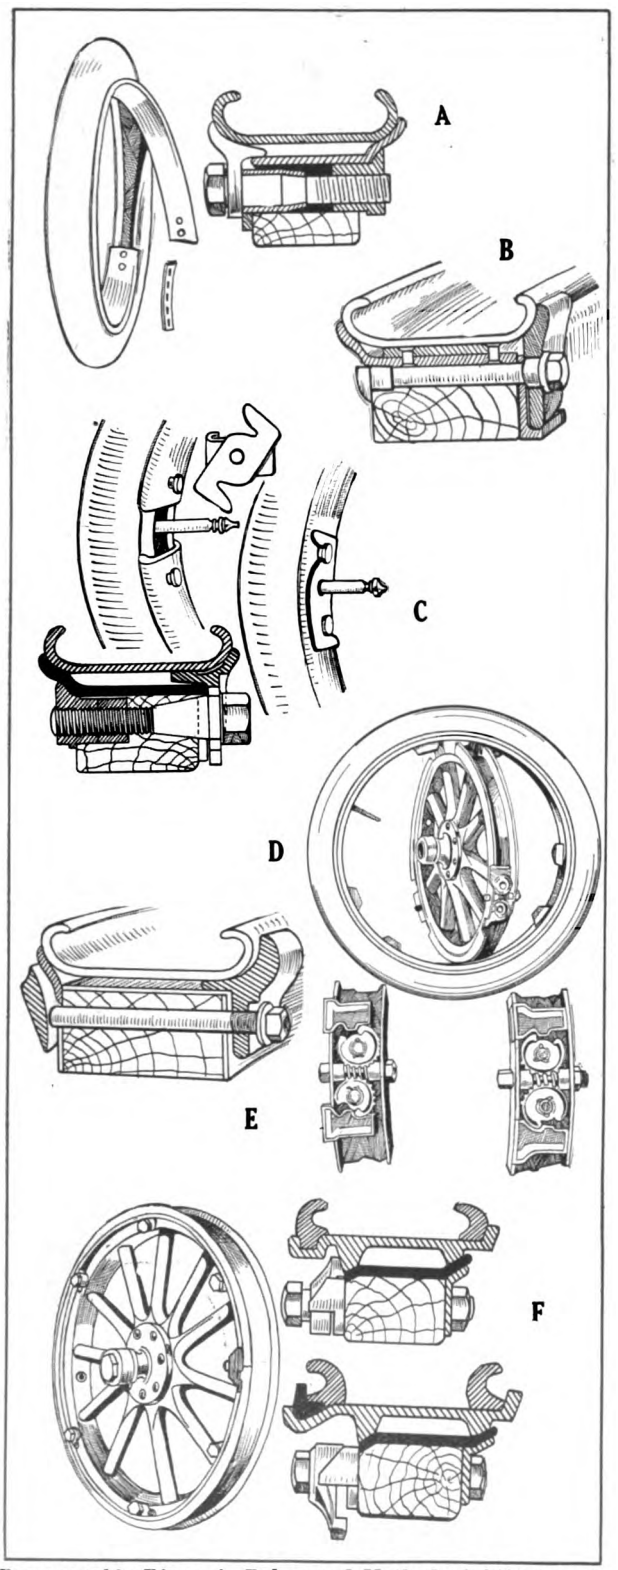
Tires for Electric Cars.



There are some half dozen concerns which continue the production of pneumatics for this class of service, including the United States Tire Company, New York City, with one of the Morgan & Wright lines; Diamond Rubber Company, Akron, O., with the Silvertown Cord tire; the Goodyear Tire & Rubber Company, Akron, with the Long Distance, and the B. F. Goodrich Company, with the Palmer Webb. None of these has undergone important changes.

A tire that is designed for use for either gasoline or electric cars is the Dayton Airless, made by the Dayton Rubber Manufacturing Company, Dayton, O. The carcass and tread are like the ordinary pneumatic casing, but the space usually occupied by the inner tube is taken up with a series of solid rubber piers, separated by air chambers, the former supporting the tread and filling out the side walls.

The stands at the tire exhibits during the present show season display a variety of new things in blowout patches, inner sleeves, tire preservatives, etc., but space does not permit of taking these up in detail. Among the novelties in connection with inner tubes, is the interlock inner tire of the Double Fabric Tire Company, Auburn, Ind. This is made in one piece with no seams or joints, and by a new process in which the bead or tire portion is drawn in at the same time the tread is pushed out, sufficient adjustability being provided to insure a perfect fit. By means of double lapping endless flaps, it is possible for the thickened side portion of each flap to draw past the thinner centre of the bead and form an interlocking bead, which makes the tire self-sustaining and obviates any possibility of the inner tube being cut by the edges of the inner fabric.



Demountable Rims.

Inasmuch as car manufacturers have displayed a tendency toward the fitting of demountable rims as standard equipment throughout the coming season, it is evident that motorists will be interested more than ever in this section of the subject. Speaking generally, there has been a notable attempt upon the part

New Types of Quick Detachable Tires: A, Goodyear No-Rim-Cut; B, Empire Straight Edge; C, Shawmut Straight Side.

Digitized by Google

Demountable Rims: A, Baker and Method of Attachment; B, Cross Section of Empire; C, Detroit Cross Section and Locking Device; D, Booth and Two Views of Locking Arrangement; E, Cross Section of Michelin; F, Standard Universal and Cross Sections of Nos. 1 and 2.

of rim producers to simplify design and reduce the number of parts. In this respect, at least, there has been decided improvement.

Demountable rims may possess the quick detachable feature or not, although this usually is combined, and when that is the case, the rim may be constructed so as to permit the operation of the detachable feature without demounting, or it may be so arranged that it is necessary to take it from the wheel before the tire can be removed. An attempt has been made to divide all demountable rims into four general classes, as follows: Bolted, split rim, expanding ring, and wedge. However, the practise is such that two or more of these features may be found in the same construction.

The Baker, made by the Universal Rim Company, Chicago, combines the bolted, split rim and wedge features. The wedge clamp is attached in such manner that it immediately swings out of the way when the nut holding the bolt in place is loosened. This is accomplished by the use of a bolt on which a collar is pressed. This holds the wedge against the bolt head, but only so far as to permit of its being turned by the brace wrench when the bolt is loosened. The rim is split only for the purpose of quick detachment of the tire, and is held in place by a stud plate carrying four dowel pins, which pass through holes in the rim and into depressions in the felloe.

Rims for Wire Wheels.

The Booth Demountable Rim Company, Detroit, is bringing out a new type of Booth rim for use on wire wheels. This is exactly like that for wooden wheels, with the exception that the rim is drilled for the insertion of wire spokes. This may be described as of the true expanding ring type. The expanding and locking device is placed in the felloe band and three or more are employed on a rim. Two toothed wheels mesh with a worm gear, which is turned by a socket wrench. The teeth on each wheel are cut away about one-quarter of the circumference, forming two shoulders for each, which engage on lugs on the rim so that when the rim is pushed into place on the felloe, turning the worm rotates the wheels so that they engage these lugs and bind the rim in place. The rim is split for detaching the tire, and the locking device consists of a taper pin, which draws the edges of the rim into contact and into alignment vertically.

The Detroit, the product of the Detroit Demountable Rim Company, Detroit, also is of the bolted type, although the rim is split for tire detachment. The chief feature of the design is the construction of the lug or wedge clamp, which is provided with a projection designed to pass under and hold the rim. It is slotted so that when the bolt is loosened the lug will drop and release the rim. A special tool is furnished for drawing the split portion together, and the additional plate in the lock fills the gap when in use.

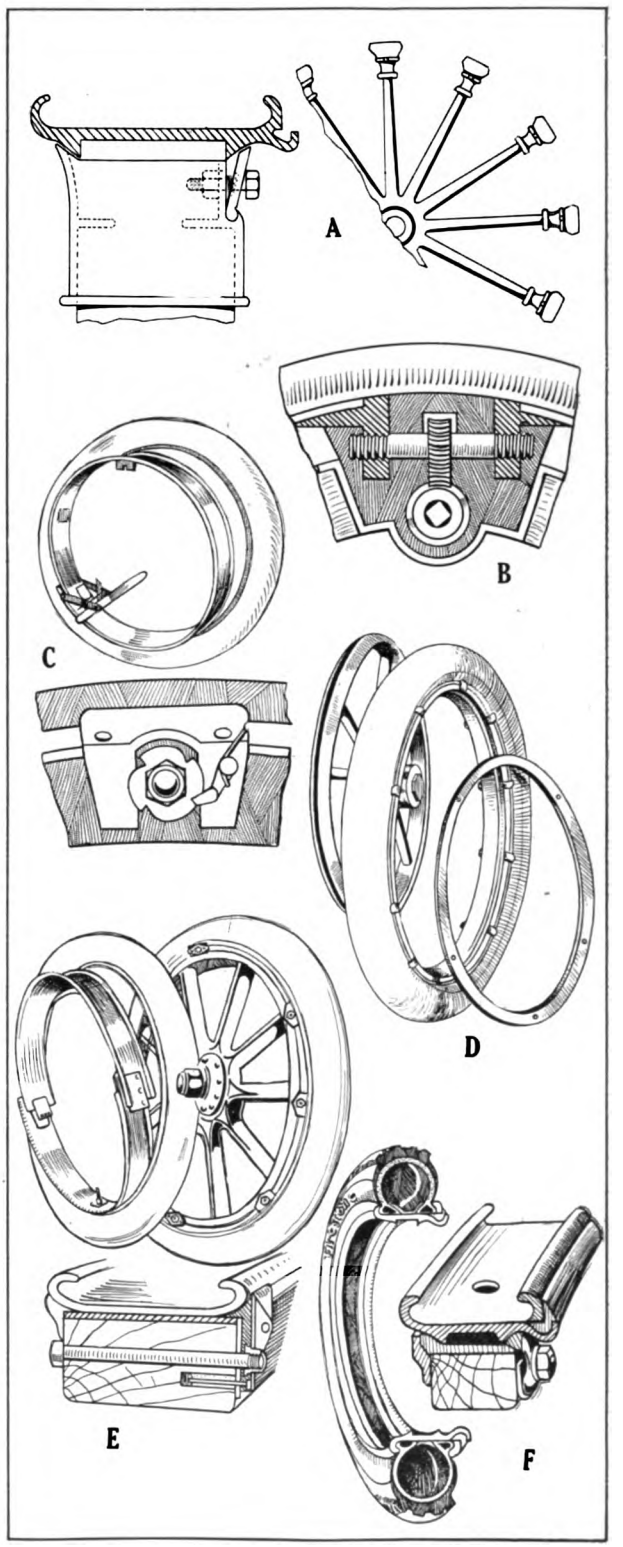
The Dorian is made by the Dorian Remountable Rim Company, New York City. This is of the bolted

Digitized by Google

type, but the detachable feature is permitted by expansion. A wedge clamp and nut are attached permanently to the felloe. The nut passes partly through the clamp and carries a collar, over which a cap is fitted, this being riveted to the clamp and allowing the nut to be turned by a socket wrench, although it is kept from moving away from the clamp. A pin fastened to the lower part of the clamp passes through a plate screwed to the felloe and prevents the clamp and nut from falling to the ground. The split rim is connected by a double jointed hinge, consisting of six rods, pin jointed at either end. A special tool is provided for insertion in the slots, by which the tire is brought away from the rim.

Special Type for Light Cars.

A new Dorian rim has been brought out this year for use on light vehicles. It is of the expanding type, and instead of the hinge is provided with a lock, consisting of a tongue with a downwardly extending end which fits into a corresponding recess in the other portion of the rim. Still another special tool is provided for working this.



The Empire demountable rim of the Empire Tire Company, Trenton, N. J., is also of the type in which the loosening of a nut on the through bolt permits the wedging lug to be turned out of the way. The nut is provided with a collar upon which rides the wedge clamp, and L shaped pieces are riveted to the felloe band, on which the lugs rest when in place. The new feature is the zig-zag split in the rim for the detaching process, this being locked by a plate screwed on the inner side and held in place by four dowel pins.

The Firestone, made by the Firestone Tire & Rubber Company, Akron, O., is of the through bolt type, in which by loosening a nut a lug is permitted to slip downward from its seat on a plate, releasing a wedge ring and allowing the rim to be slipped off. The clincher side ring has been simplified by the substitution of one pin for two in the locking device. The dual demountable rim for solid or pneumatic tires, brought out last year, has been improved, so as to permit of sliding both tires off at the outside instead of one each way.

The Fisk, designed by the Fisk Tire Company, Chicopee Falls, Mass., for use with its special type of bolted-on tires, offers little change from last year The felloe is bevelled off at an angle of about 45 degrees through half its width. On this fits a band of the same shape and carrying a shoulder on the side opposite to the bevel. This is held in place by bolts passing through the felloe band and through a continuous wedge ring, which has a similar shoulder. This ring is forced up the bevelled side and the shoulders grasp a U shaped channel ring to which the tire is fastened. The Fisk dual demountable also is retained practically without change.

Eliminates Wheel Felloe.

The Gibson is produced by the Newmastic Tire Company, New York City. This is decidedly new and

Demountable Rims: A, Method of Attaching Gibson to Wheel Spokes, Eliminating Felloe; B, Cross Section of Howard Locking Device; C, Lambert and Its Locking Arrangement; D, Fisk Bolted-On Tire and Rim; E, Dorian and Cross Section; F, Two Views of Firestone.

Digitized by Google

novel, particularly as both felloe and felloe band are eliminated. On the end of each spoke there is a steel clamp which engages the rim. The outside clip of this has a recess in which a spiral spring is wound around a studbolt. This bolt passes through another clip, the upper end of which serves to clamp the rim into place. When the bolt is loosened the pressure of the spring forces the clip outward and releases the rim. This is designed primarily to be used in connection with tires employing the Newmastic tire filler made by this concern.

The Howard, made by the Howard Demountable Rim Company, Trenton, N. J., is of the expanding ring type. Its action depends upon the spreading of the segments of the ring placed between the rim and the felloe. The rim itself is not split, but in demounting the ends of the ring are brought together so as to present a smaller circumference and permit the rim to be slipped off. Only one bolt is employed, and a lug on the inside of one portion of the ring is brought to and catches in a slot in the other portion for the purpose of locking.

The Lambert is the product of the American Rim Company, New York City. This is of the wedge type, a number of these being welded permanently to the wheel. On the side of the rim are an equal number of plates. At opposite points on the rim two slotted tongue shaped pieces fit into the felloe. These latter are termed dismounting wedges, while those on the rim are known as adjusting wedges. These act in conjunction with those on the felloe band in supporting the rim in place. In mounting, the cap nut is turned by means of a socket wrench so as to engage the thread of a bolt secured to the felloe. This draws the rim on so that the wedges on the felloe band and rim slide over each other and gradually lock in place. On this nut is a ratchet wheel which engages with a pawl under pressure from a spring, thereby locking the nut automatically.

Another Wire Wheel Type.

This concern also has brought out a demountable rim for wire wheels, which presents a slight modification of the above. The single bolt of the locking mechanism is welded to the steel rim in place of running it through the felloe. In all other respects it is the same,

The Michelin, made by the Michelin Tire Company, Milltown, N. J., offers practically no change over the design which has seen satisfactory service in racing and ordinary work for the past five years. The clamping members have a wedge shaped projection which fits between the felloe and the rim carrying the tire. This latter is provided with a series of keys on its underside which fit suitable recesses in the felloe band and prevent the rim slipping back and forth on the wheel.

The Standard Universal is the product both of the Standard Welding Company and the United Rim Company, the former of Cleveland, O., and the latter of Akron, O. This is made in three styles, known respectively as Nos. 1, 2 and 3. No. 3 is the older, in which the nuts and wedges must be removed entirely before demounting is permitted.

In the Standard Universal No. 1, there are six locking clamps, each secured by a bolt passing through the felloe. A nut and washer on the inner edge of the felloe band engage the latter to give it support. A collar on the outer extension of the bolt on the opposite side serves the double purpose of holding the front washer against the face of the felloe and of supporting a seat for the bushing end of the clamp nut. The front washer, which fits over a square shank on the bolt has an outwardly extending lug which acts as a stop and prevents the clamp from being overturned in either direction. The top of the washer is cut off square to receive a square shoulder on the clamp and a bushing nut is threaded to the clamp on the outside and the bolt on the inside.

In locking the rim to the wheel, the mere turning effort of the socket wrench carries the clamp upward to position, and in unlocking, two turns of the wrench will loosen it sufficiently to allow the clamp to be turned on the collar to a position out of the way of the rim. In tightening, the squared portions of the clamp and washer overlap and the clamp nut jams on the bolt collar. Bolts, clamps, nuts and washers remain on the rim at all times and there never is any danger of their becoming lost. The universal feature is provided by reversing the rings so that the rim may be made to take either clincher or straight sided tires.

The Standard Universal No. 2 is identical with No. 1, with the exception of the rim base and locking device. The rim consists of a continuous wedge ring, the inner side of which presses on a flat band on the felloe, which has a similarly shaped extension to fit it. This band is bevelled at its outer edge, and upon it rests the bottom of a U shaped channel rim. The edge of the clamp extends above the felloe, and when tightened, wedges the rim against the inner edge of the band.

Accompanying drawings set forth the important features of these various rims, and in connection with the brief descriptions outlined should make the method of operation clear.

IDEAL PUMP'S EXHIBITION SPACE.

Owing to a rearrangement of some of the exhibition spaces to provide for late entrants for the Boston automobile show, the Ideal Oil Pump & Tank Company, 146 Summer street, Boston, maker of Ideal storage systems, has consented to accommodate the show management by accepting another location than that first assigned. Ideal pumps and tanks will be seen therefore at space 300, department D, instead of at the space mentioned in the company's advertisement on page 27 of this issue.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

Digitized by Google

WHILE decided progress has been made in perfecting a carburetor which will maintain the proper proportions of gasoline and air at constantly varying speeds of the internal combustion motor, the problem of perfect carburetion has not wholly been solved. That there is a wide variety of ideas concerning this important component of the motor car is manifest by the large number of different designs. This apparent lack of uniformity is due in a measure to the introduction of modifications in motor design, such as variance in the bore-stroke ratio, and a lower grade of commercial gasoline.

The original carburetor, of the surface type, was fairly successful insofar as mixing the gasoline and air was concerned, but the regulating devices required constant changing, these alterations being made in accordance with the engine speed. It was a simple vaporizer, inasmuch as air was drawn through the fuel, or over surfaces wet with it, by suction.

With the introduction of the spraying carburetor, in which the gasoline was reduced to a fine spray or mist before it was mixed with air, the supersensitive feature of the surface device was eliminated as well as the staleness of fuel. Another marked improvement was that it permitted the use of a separate fuel container and one of liberal size. Furthermore, its construction allowed proper proportions of the air and fuel through their respective passage areas because of the same approximate pressure acting simultaneously upon both fluids. Slight errors in proportion also were less noticeable in their effect upon the engine.

Although the early forms of the spraying type obviated the sensitive feature of the surface carburetor, the former at extreme high engine speeds developed too rich a mixture, but this trouble was remedied by the introduction of the automatic carburetor, in which the suction of the engine piston is a factor in operating a spring returned valve. The varying of this pressure, due to the different speeds of the piston, creates a disturbance in the flow of the fluids through their respective passages, and it may be stated that the flow of gasoline will become proportionately greater than that of air with increases in either the frequency or the intensity of the pressure changes, the former causing the greater trouble; that is, if the air and fuel passages be unchanged. This may be explained by the statement that the inertia of gasoline is several times that of air.

The usual method is to regulate these pressure changes by an automatic valve which opens when a certain point is exceeded, and acts indirectly upon the fuel passage, reducing to a certain extent an over supply of gasoline, as it is important that the liquid be completely vaporized, that the ingredients of the mixture be proportioned properly.

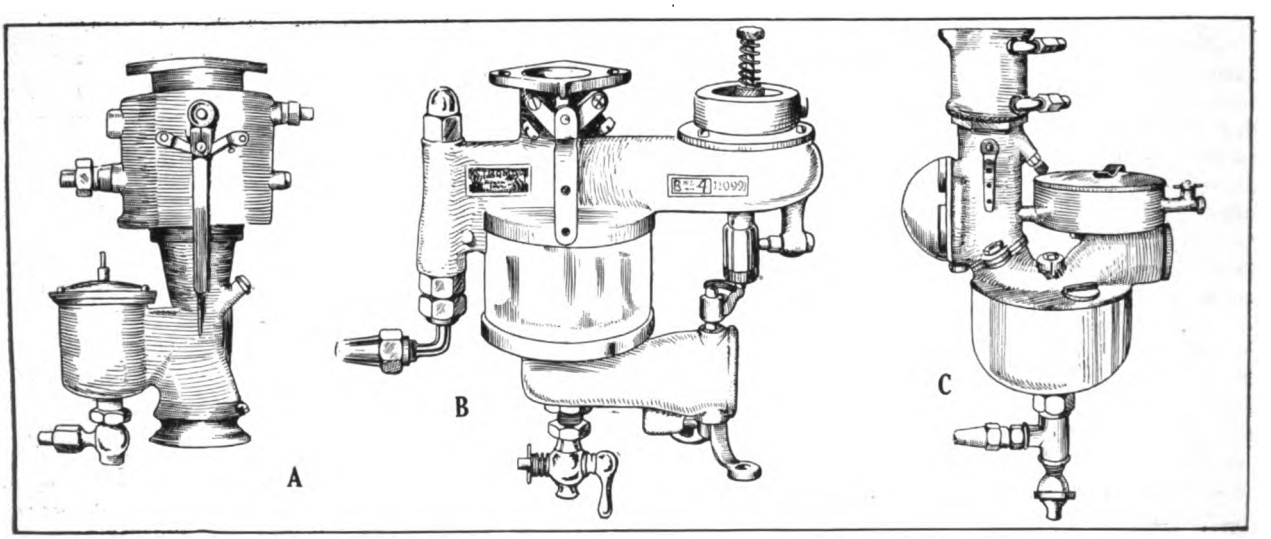
Basic Principle Involved.

In considering the vaporization of fuel the basic principle involved is the transfer of enough heat to convert it from a liquid to a vapor. This may be brought about by the transfer of sufficient heat to the fuel, maintaining the air temperature at a certain value, or by keeping the walls of the mixing chamber at a relatively high temperature.

Regarding this vaporization and proper proportions of the ingredients, the manufacturers of modern carburetors have incorporated features which make for easy starting; accessibility of adjustments, either on the device itself or by dash control, and independent adjustments for low, intermediate and high speeds. Refinements of these features are noticeable in the design of the carburetor during the past year, as well as improvement in the material used.

The low grade commercial gasoline is responsible perhaps for the increase in number of hot air devices whereby heated atmosphere is led into the mixing chamber—a distinct aid in starting. Some makers of the water jacketed carburetor have adopted the hot air method which usually consists of heat taken from the exhaust members. It may be stated, however, that this is not entirely new, it having been in vogue several years ago.

No Radical Changes Noted.



Considering the 1912 carburetor it may be said that no radical changes are to be noted. During the past year a number of makers have moved the adjusting means from the bottom and sides to the top, and

Digitized by Google

these with the separate controls for the different speeds, appeal to the motorist who makes his own adjustments. Dash control has many followers this season and while this is not in the nature of a necessity, it is a refinement, inasmuch as it facilitates starting as well as aids in securing a proper proportion of air and fuel without the operator leaving the seat. The use of better material is noted, extruded metal replacing the casting, and all-steel needle valves instead of steel tipped brass members are finding favor.

The types of carburetors may be divided into three classes, namely: Concentric, offset float and the non-float. The first two utilize either a cork or metallic float, the latter made generally of spun brass, while the non-float relies upon a ball check to regulate the flow of fuel from the tank.

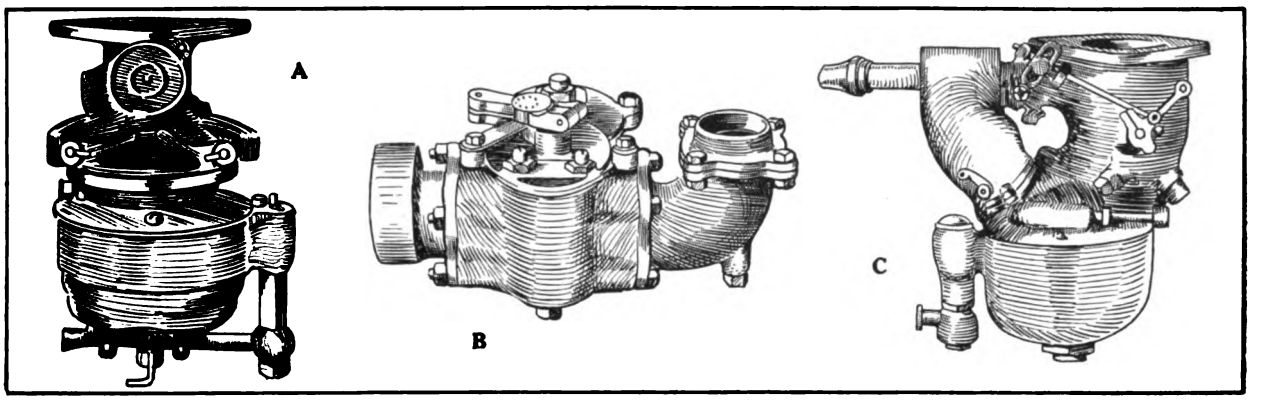
Some makers believe in other means than the suction of the motor to control the flow of gasoline to the float chamber and utilize a cam or some other device to raise automatically the needle valve, while others adopt the multiple jet. With the latter system two or more are used, this depending upon the speed of the motor.

Carburetors: G. & A., in Which Auxiliary Air is Regulated by Balls; B, Stromberg, Featuring a Starting Device; C, Excelsior, Having a Ball Governed Venturi Tube, Clock Spring Controlled Air Valve and Graduated Setting Attachment.

G. & A.

An ingenious system comprising 12 balls of different sizes governs the auxiliary air supply of the G. & A. carburetor, made by the G. & A. Carburetor Company, New York City. The number and sizes of the spheres lifted are governed by the speed of the motor and the suction of the piston. The float chamber is set to one side of a well formed Venturi tube in the throat of which is located the outlet of the fuel discharge nozzle. This tube forms the main air intake to the motor, and the air passing through it picks up the fuel. A new feature is a valve for starting, this cutting off the air supply.

Stromberg.



The use of the heavy glass float chamber, one of the unique features of the Stromberg carburetor, made by the Stromberg Motor Devices Company, Chicago, is retained this year. It is made in three types, A, B and C, A being the original to which many refinements have been added. Both A and B employ the single spray nozzle, but a double jet is utilized with C, which is designed for six-cylinder motors. Separate adjustments are provided for low and high speeds. The changes in these carburetors include the addition of a dust proof cap over the float chamber, the removal of the gasoline level regulating device from its position over the float chamber, and the fitting of a hot air horn and starting device. The latter consists of a valve in the horn which is closed by means of a lever operated cam.

Excelsior.

The Excelsior carburetor, manufactured by the Excelsior Needle Company, Torrington, Conn., presents interesting features inasmuch as a ball governed Venturi tube is fitted and the air valve is controlled by a clock spring; these with the device for adjustment contributing to the success of the vaporizer. The spray nozzle is located in the Venturi tube passage and the amount of opening is regulated by a needle valve. The outlet of tne Venturi is restricted by the ball and at low speed the area around the member is very small, obstructing partially the flow of air, lessening the suction on the spray nozzle and consequently diminishing the amount of fuel drawn into the mixture. As the speed of the motor increases, the ball is lifted proportionately. The auxiliary air valve is controlled by a finely tempered clock spring, housed in a dust proof case, proportions the air accurately and is adjustable.

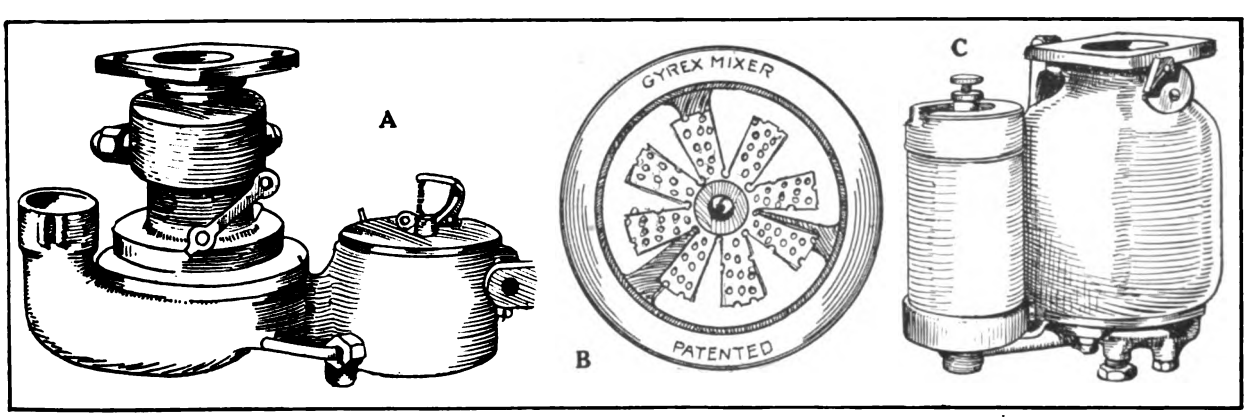
A feature which will appeal to motorists is that

Digitized by Google

Carburetors: A, C. R. G., Incorporating Three Fuel Jets and Jet Passages; B, White & Poppe, English Vaporizer of Many Refinements; C, Marvel, with Initial Air Port at the Bottom.

the fuel adjustment is obtained by exact figures. The knurled head of the adjusting device is calibrated and numbered and the carburetor is set according to a table of figures compiled by the company. The arrangement is such that six different positions are obtainable. Another feature is a visible fuel level; that is, by removing an inspection cap the height of the float may be noted readily without removing the carburetor. The float is of brass, concentric with the spray nozzle and maintains a level constantly. A lever is provided for closing the air valve, facilitating starting in cold weather. The Excelsior is made in the water jacketed form or without.

White & Poppe.



The White & Poppe, an English carburetor for which the Sarco Engineering Company, New York City, is the American representative, presents two notable changes in the 1912 design. The slight whistling noise which is noticeable when the throttle of carburetors is partially open, has been entirely eliminated by the fitting of two corrugated plates which deflect the stream of air. The second improvement is the introduction of what is known as an acceleration lever, consisting of means whereby the admission of air to the mixture can be adjusted to a very great nicety. The extra air is taken through the spindle of the throttle sleeve, the cam valve controlling the air being attached to the throttle lever, and revolving with it. In addition to these adjustments, the original one of altering the relation of the air port to the inlet port by a lever on the cover of the throttle chamber is still retained. The White & Poppe is of the float feed type and fitted with a hot air attachment which is heated by the exhaust.

C. R. G.

Three fuel jets, the passages of which are of the Venturi form, are the feature of the C. R. G. carburetor, made by the C. R. G. Manufacturing Company, Saugus, Mass. The three tubes are nested together and surrounding them is the float chamber. All three tubes open into an upper chamber attached to which is an outlet passage fitted with a butterfly throttle valve. A cam turns with the throttle spindle, and permits the progressive communication of the Venturi passages with the chamber containing the throttle.

Marvel.

The new model Marvel carburetor, made by the Marvel Carburetor Company, Indianapolis, Ind., takes initial air through a port at the bottom of the float bowl, and the atmosphere drawn in acts upon the fuel discharged from the spraying nozzle which is adjustable. The main mixing chamber is of U form and a

Carburetors: A, Mayer with an Offset Float Chamber; B, Gyrex, a Device for Facilitating Mixture; C, Newcomb, in Which Is Incorporated a Novel Proportioning Device.

Digitized by Google

butterfly valve is incorporated to deflect the air entering the main port down around the nozzle. The valve is controlled by a special double spring which permits the admission of additional air when the motor is operating at speeds and under load.

Holley.

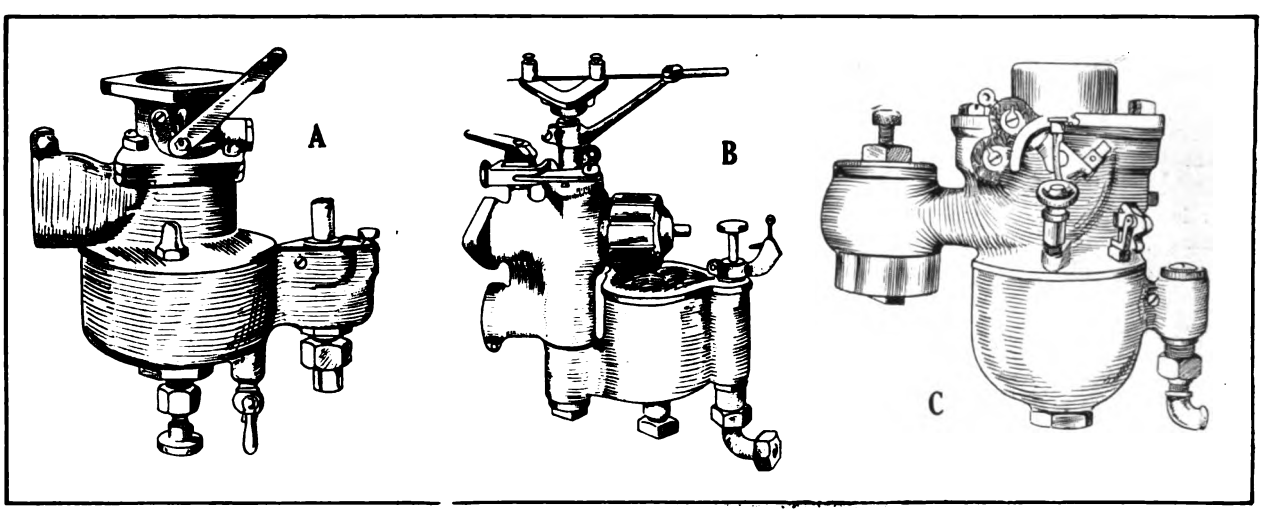
The Holley carburetor, the product of Holley Bros. Company, Detroit, utilizes a double jet. The main member is within the Venturi passage and uses a needle valve with hand adjustable features. The second jet is in the seat of the auxiliary air valve and when the latter is lifted by the suction of the engine, due to high speeds, additional fuel is drawn in.

Mayer.

Compact in design and simple in construction is the Mayer carburetor, made by the Mayer Carburetor Company, Buffalo, N. Y. The gas lever is controlled by means of the usual cork float. A single air intake pipe is fitted with a horn for the attachment of a hot air tube, the warm air being led into the carburetor at the bottom and passing around the spraying nozzle. The float chamber is offset from the mixing member, and the latter contains an air valve so arranged with reference to the position of the nozzle outlet that as the suction of the engine increases the action upon the nozzle becomes proportionately less than upon the air passing the valve.

Newcomb.

The Holtzer-Cabot Electric Company, Brookline, Mass., maker of the Newcomb carburetor, presents novel features, inasmuch as proper proportions of the ingredients are obtained by measuring. Surrounding the nozzle is a form of valve which seats over an opening concentric with the nozzle through which the entire air utilized is caused to enter. The valve arrangement is practically a cylinder having a closed top and bottom, and enclosing the nozzle within it. The top wall carries a rectangular needle of tapered section, which lifts the valve and controls the fuel. Means for adjustment are provided by an annular ring.



The Gyrex.

The Gyrex, made by the Royal Equipment Company, Bridgeport, Conn., is too well known to need very much in the way of description. It consists of a small bronze helical wheel which is placed in the intake manifold and the blades of the wheel are perforated with a large number of small holes. The gas in passing through the intake pipe imparts motion to the wheel, thus cutting and breaking up any of the globules of gasoline which are very apt to be present. In addition to perfecting the mixture it effects an economy of fuel. This is not a carburetor, but a device to assist in proper carburetion.

Rayfield.

Economy in fuel, reliability in varying temperatures and an increase of power are the features emphasized by the Findeisen & Kropf Manufacturing Company, Chicago, maker of the Rayfield carburetor. It is produced in two types, D and F; is compact in design, and proper proportioning is obtained by automatic means. The high and low speeds operate independently of each other—a desirable feature. The nozzle through which the fuel is discharged is of novel construction, the outlet area being controlled by a movable sleeve by means of which the amount of fuel may be regulated according to the demand. The spray nozzle is actuated by an adjustable cam on the end of the throttle spindle.

In addition to this control, one of the air passages is fitted with a butterfly connected with the throttle so that they move in a fixed relation with each other. The automatic air valve is provided with a spring latch adjustment. The regulating means are all near the top of the carburetor, and a dash adjustment for air is a 1912 feature. The float chamber is easily

Carburetors: A, Holley, Utilizing a Single Air Opening; B, Rayfield, a Compact Design in Which Proportioning Is Obtained by Automatic Means; C, Schebler, Equipped with a Cam-Actuated Needle Valve.

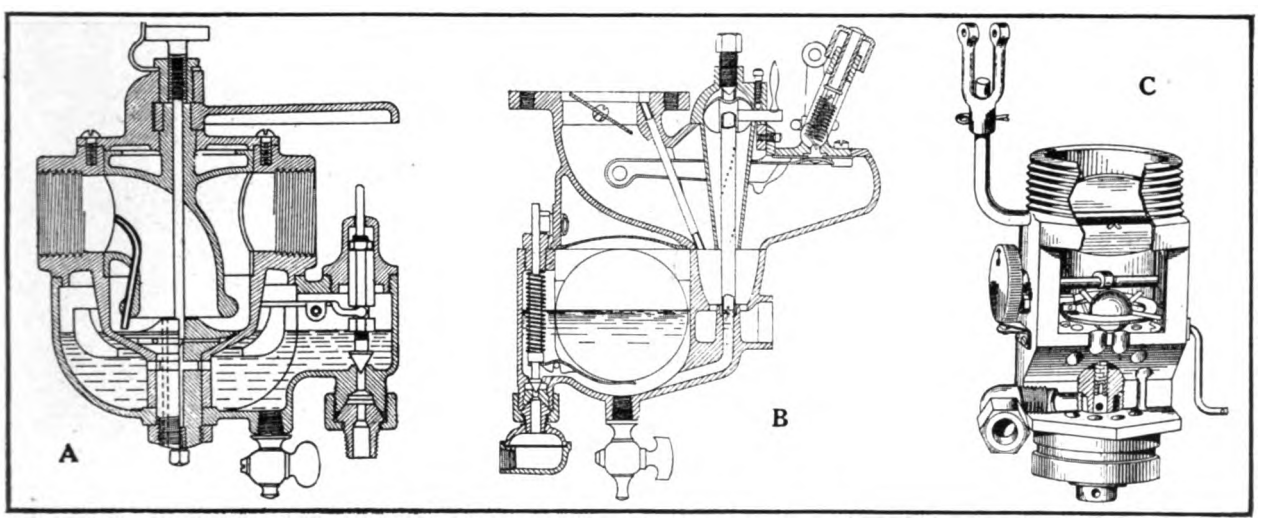
Digitized by Google

accessible by removing the screws which retain the dust proof cap. Model D is water jacketed.

Shain.

Utilizing a ball to regulate the gasoline supply instead of a float, the Shain ball spray carburetor is unique. The device, which is made by Charles D. Shain, New York City, automatically shuts off the supply of fuel by the ball seating. It is lifted by the suction of the piston and the quantity of air is regulated at all speeds, accordingly. The ball sprayer revolves, due to the action of the fluid beneath it, throwing up a fine spray, which the air passing through 10 ports vaporizes.

Schebler.



A feature of the Schebler carburetor, manufactured by Wheeler & Schebler, Indianapolis, Ind., is that the needle is raised at the same time as the opening of the throttle, this being brought about by a rocker or bell crank lever carrying a roller which bears against the throttle arm. When the throttle is opened the needle valve is lifted from its seat, augmenting the amount of gasoline. Several types are manufactured, that known as L having several new features, including an interchangeable air valve, standard needle valve and a device for facilitating starting. The intermediate and high speed dials are numbered, making adjustment easy. The low speed is set by means of a knurled nut which is securely held by a boss.

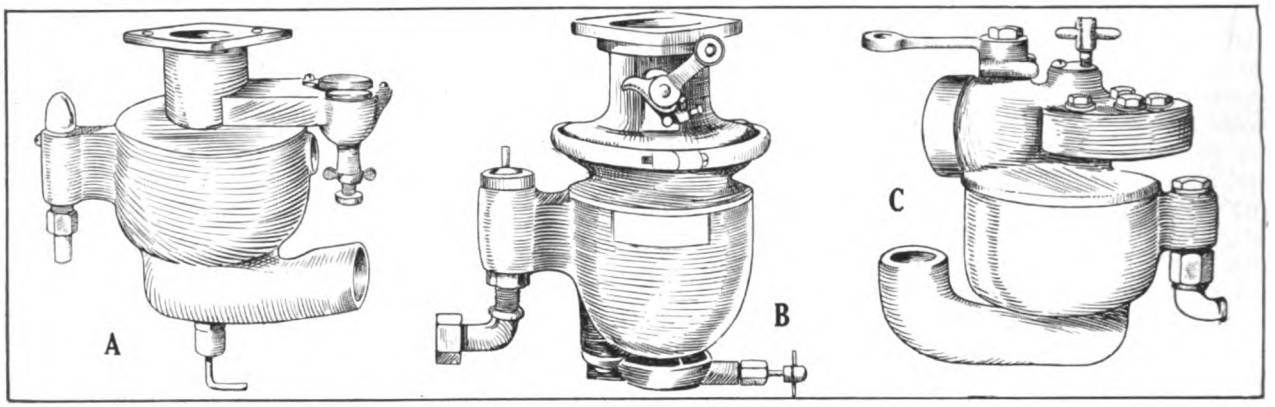
Krice.

A feature of the Krice carburetor, made by the Krice Carburetor Company, Detroit, is the annular spraying principle utilized in mixing the liquid fuel with the air. The gasoline enters the mixing chamber from the float through horizontal ducts and a vertical duct whose opening is regulated in size by a needle valve and annular crevice. The latter is exceedingly small so that the emerging fuel spreads out in a film and creeps up the walls of the mixing chamber instead of being sprayed. The air sweeps down over the walls and basin of the chamber absorbing the liquid and converting it into vapor.

Carter.

The Carter carburetor, manufactured by the Carter Carburetor Company, St. Louis., Mo., employs a ball float and is of the multiple jet type. When a partial vacuum is created by action of the piston, air is drawn into the main opening and up through a circular opening around the lower end of the jet tube. Fuel is drawn through the lowest or primary jet and strikes the surrounding wall of the seat of the jet tube imparting a whirling motion. Upon opening the throttle additional air enters through an auxiliary air port and funnel. The fuel rises in the jet tubes and sprays out through the upper members. The number of jets engaged varies with the speed of the motor. An air dash control is fitted and the 1912 improvement is an improved type of air valve.

Carburetors: A, Krice, with Annular Spraying Device; B, Carter, Utilizing a Ball Float and Multiple Jets; C, Shain, with Float Replaced by a Ball.



Bowers.

In the Bowers carburetor, produced by the Gilbert Manufacturing Company, New Haven, Conn., the initial air enters through a fixed opening in the bottom, and passes through a Venturi constriction in the throat of which is located the spraying nozzle, which is adjustable. Surrounding the outlet of the Venturi tube is a flat circular chamber divided horizontally into two parts by a partition wall into which the end of the tube fits. The lower part of the flat chamber is open to the atmosphere through several openings and others also are provided in the partition. Over these latter are arranged flat valves of spring brass, fastened at one end.

Columbus.

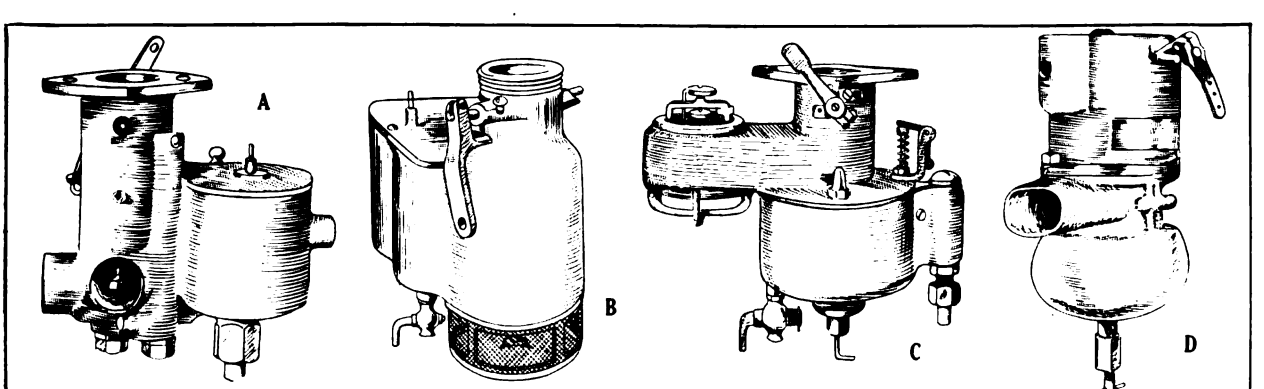
Triple air supply is the feature of the Columbus carburetor, made by the Columbus Carburetor Company, Columbus, O. One of the air passages is at

Digitized by Google

Carburetors: A, Columbus, Featuring Three Air Passages; B, Bowers, with Partitioned Mixing Chamber; C, Kingston, Employing Concentric Arrangement of Float and Mixing Chamber.

the centre of the bottom of the device and the atmosphere passes through a constricted passage in which is located an adjustable fuel nozzle. The second supply is by means of balls seated over openings in a flat chamber while the third source is a horizontal branch of the main mixing chamber and contains a small valve, this being utilized only at high engine speeds.

Kingston.



The Kingston carburetor, made by Byrne, Kingston & Co., Kokomo, Ind., employs a concentric arrangement of the float and mixing chambers. The former is of cork and governs the supply of fuel by means of a lever pivoted in the body of the instrument, controlling the needle valve in the fuel intake pipe. The initial air port surrounds the centrally located fuel nozzle, and is of constricted Venturi form. The auxiliary supply of air is governed by five balls located in the upper part of the carburetor. The adjusting devices placed on the top of the device offer the principal refinement in this design.

Krause.

A unique air valve is one of the features of the Krause carburetor, made by R. F. Krause, Cleveland, O. Around the bottom of the mixing chamber is a large gauze covered opening through which all the air used enters. The mixing chamber is located at one side of the float chamber, and standing vertically in its centre is the fuel nozzle. Surrounding the latter and concentric with it is a nest of five valves. These, with the exception of the topmost and inner one, all have the same outer diameter and are guided by vertical ribs in the main mixing chamber body. They are all gravity controlled, and have progressively decreasing inner openings, which the suction of the piston opens.

Zenith.

Of French origin is the Zenith, handled in this country by the Zenith Carburetor Company, Detroit. It utilizes a single Venturi shaped air passage in the throat of which is located a compound nozzle, comprising a central fuel jet of ordinary form and a concentric tube which forms a second nozzle of annular form surrounding the first. Both communicate directly with the fuel chamber, the flow being controlled by a calibrated hole in a plug. Ordinarily both nozzles supply fuel to the air passing their outlets, but as the maximum demand is approached the discharge from the annular member automatically diminishes in correct proportions because of the nature and positions of its supply passages.

Carburetors: A, Zenith, a French Design Now Made in This Country; B, Krause, Possessing Unique Air Valve; C, D. B., with Conoidal Tube Around Fuel Nozzle; D, Stewart, with but One Moving Part Besides Float.

Digitized by Google

D. B.

In the D. B. carburetor, manufactured by the Detroit Motor Casting Company, Detroit, the float chamber is arranged concentric with that of the mixing member, a conoidal strangling tube surrounding the nozzle and serving to give a high air velocity past it. The nozzle is adjusted from the bottom of the vaporizer, and the passage in which it is located is in line with the outlet passage in which is incorporated the butterfly throttle. The supplementary air valve is arranged with a vertical spindle at the outer end of a horizontally extending passage.

Stewart.

The Stewart Precision carburetor, brought out last year by the Alfred C. Stewart Machine Works, Los Angeles, Cal., remains unchanged for 1912 except that a hot air device is added for those who prefer this method of heating. There is but one moving part, aside from the float and throttle valve, and that is controlled by gravity. The float chamber is at the extreme bottom of the carburetor and concentric with it, and arranged somewhat above it is the guide for the air valve. The latter controls the entire amount of air used. The upper portion of the valve body is conical and seats upon the carburetor body. Formed with it are air passages leading past the nozzle in such manner that a portion of the air becomes carbureted. Suction of the piston lifts the valve.

KAISER'S SIGNAL ON VELIE.

A replica of the official automobile horn used by Kaiser Wilhelm of Germany has been presented to Harold D. Bornstein of the Velie Boston branch, and will be displayed by that company at the Boston show. This horn will be used on the official car of Prince Adelbert, the third son of the Kaiser, upon his forthcoming visit to Boston. It plays a distinct tune and is permitted to be used in the city of Berlin only on motor cars owned or driven by members of the royal family.

JERICHO HORNS IN COURT.

The experiences of two members of the Automobile Legal Assocation, which recently were haled into court for alleged violation of the Massachusetts law respecting the use of automobile horns which make a harsh, unreasonable or objectionable sound, will prove of interest to other motorists. Both owners utilized Jericho horns, made by the Randall-Faichney Company, Boston.

The cases were placed in the care of William A. Thibodeau, counsel for the association, who explained to the court the mechanical construction and operation of the Jericho, with the result that the court was convinced that its operation did not violate the statute. Both defendants were discharged.

A similar ruling was secured recently in the Roxbury district court, and it is now regarded by Mr. Thibodeau as definitely settled that the use of Jericho horns is not in violation of the Massachusetts law.

UNITED STATES MOTOR AFFAIRS.

According to a report of President Benjamin Briscoe of the United States Motor Company to the stockholders of that concern, the directors have decided to pass the dividend payable in February. It is explained that this action is taken in order that the working capital of the company may be devoted to taking care of the largely increased business.

The report states that during the first five months of the fiscal year the number of cars sold was 6512, as compared with 4483 for the corresponding period of the previous year. This is an increase of 45 per cent. The company also has contracts with 1503 dealers as against 1403 last year. The number of cars contracted for is more than 25 per cent. in excess of the number contracted for at the same time last year. In addition the accounts payable for merchandise are almost $1,500,000 less than it was six months ago. President Briscoe sees every reason to believe that the affairs of the company are in much better condition than ever before and that the action of the directors is wise under the circumstances.

HEATH'S AUTO AND TIRE SHOP.

Somewhat in the nature of an innovation is the auto and tire shop, recently opened at 2000 Massachusetts avenue, Cambridge, Mass., by S. Clark Heath. While automobile repair work occupies the attention of experienced repairmen, who make a specialty of producing work of the highest order, unusual attention is paid to the matter of tire replacement. In this field, casings or tubes are called for and delivered without extra charge, and the same degree of attention is paid to this part of the business as to the other. Included in the new equipment are a steam vulcanizing plant and other modern applicances for work on tires.

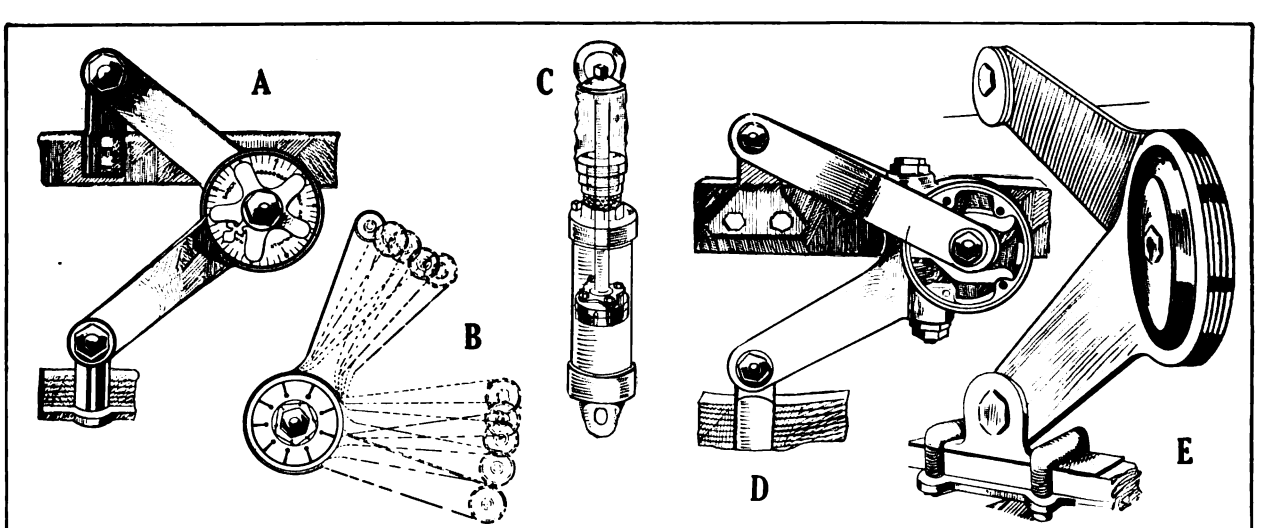
A SPLITDORF MAGNETO A MINUTE.

A magneto a minute is the record at the laboratory of C. F. Splitdorf, New York City, where special factories are devoted to the production of the functioning parts of the well known Splitdorf instrument. In one building hundreds of expert workmen are engaged solely in the manufacture and assembly of the finely micrometered ball bearings which enter into the making of the device of precision and ignition. Out of over 800 men employed, there are only nine to be found in the repair department, and when it is considered that the concern produces a magneto a minute, it is all the more remarkable that but three of the nine are engaged in repairing magnetos.

Digitized by Google

WHILE many cars are sold with what is known as complete equipment, others are marketed without many of the devices and attachments regarded as necessary for the convenience and comfort of the owner. With use of an automobile it is natural that there be realization of needs by which the service value may be enhanced, and to meet the demand thus created many industries have been developed. It is customary to group as accessories hundreds of differing products, varying in quality and appearance, each of which may be utilized by the motorists. Because of the multiplicity of the productions it has been desirable to group them for the greater convenience in description and for the benefit of those who consult a reference, this affording opportunity for comparison.

SHOCK ABSORBERS.



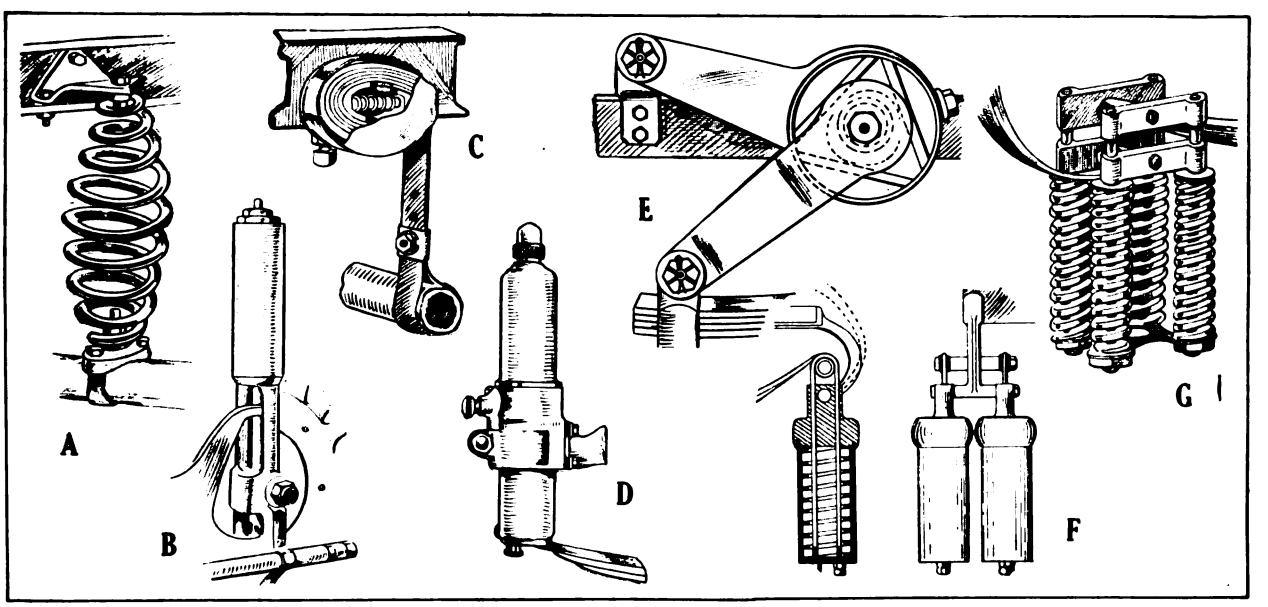
Among the advantages claimed for the use of shock absorbing devices, are those of comfort, safety and economy. There can be little question as to the additional comfort to be obtained from riding in a car equipped with some supplemental means of taking up jars and stresses resulting from the uneven road surface. In addition it is held that the elimination of vibration not only protects the occupants of the machine, but its mechanism as well. This factor enters into the economical view of the proposition, and it is further asserted that the use of shock absorbers diminishes tire bills. Many well known designs are offered, in some of which little change has been found necessary, and several new devices are marketed this year for the first time.

Peerless.

The Peerless shock absorber, made by the J. H. Sager Company, Rochester, N. Y., consists of two arms attached to the chassis frame and the axle, one arm terminating in a case in which are two levers retained by coiled springs, between which a double cam on the other arm is fitted. Two inches free action is permitted before the cam compresses the coiled springs by compression or recoil. The case is grease packed and all wearing parts protected. It is adjustable throughout.

Mondex.

The Mondex is sold by the Aristos Company, New York City. The principle of this absorber is two



Shock Absorbers: A, Truffault-Hartford; B, Westen; C, Flentje; D, Peerless; E, Mondex.

Digitized by Google

lever arms attached to the chassis frame and the axle, the ends being shaped to enclose alternate discs of metal and rubber. The discs are made to have faces with a series of inclines and the movement of the arms compresses the rubber between the discs, resisting any action of the spring proportionate to the force of the shock. The variance of resistance is established by the degree of the inclination of the faces.

Flentje.

Produced by Ernst Flentje, Cambridge, Mass., the Flentje is a hydraulic device in which a piston is actuated in an oil-filled cylinder by vehicle spring compression and recoil. The ports in the piston will permit easy movement and will restrain gradually and without shock, excess motion upward or downward. The piston is attached to the chassis frame and the cylinder to the axle. Ample protection is given to the working parts. The latest design has

Shock Absorbers: A, Sager; B, S & S; C, Gabriel; D, Westinghouse; E, Connecticut; F, J-M; G, Velvet.

several improvements to further perfect the action.

S & S.

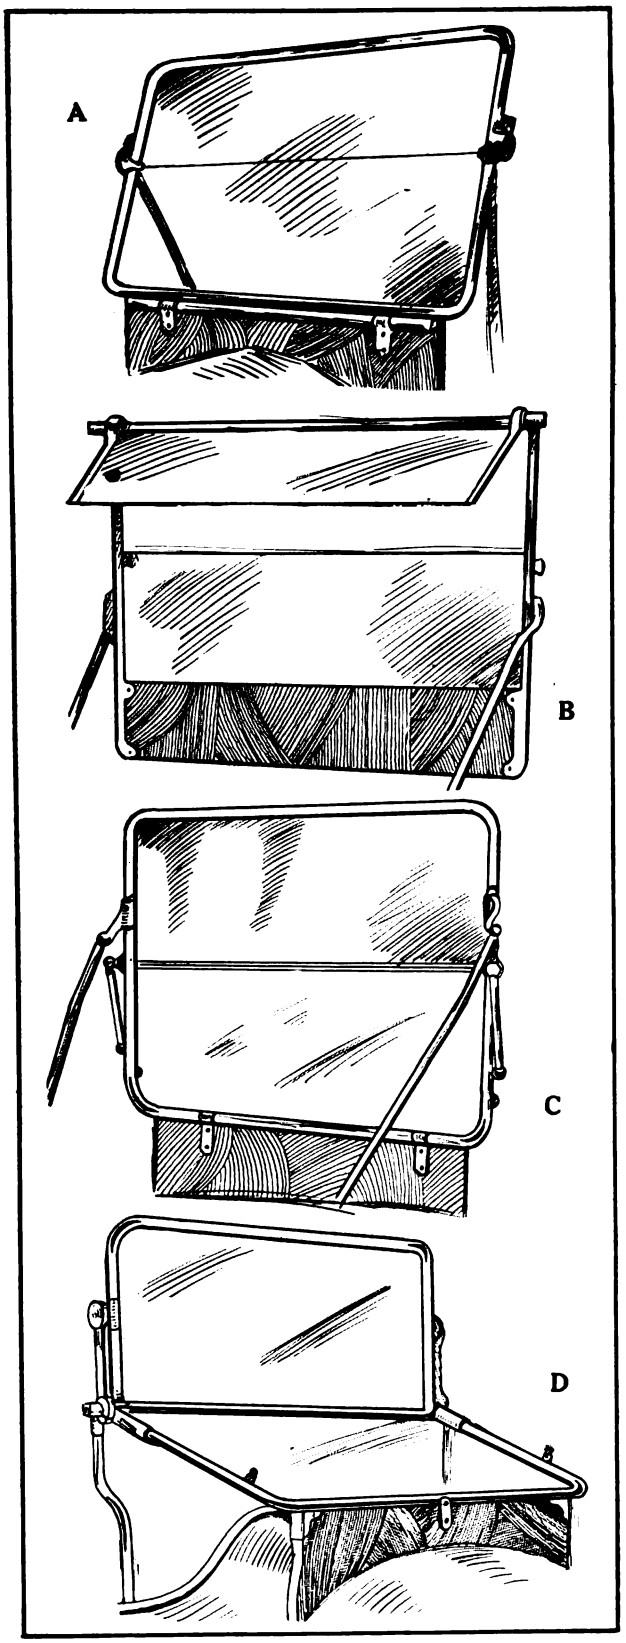
The S & S, made by the S & S Shock Absorber Company, Washington, D. C., is attached to the front wheels only. It includes wheel spindles and steering pivots, the pivots being installed in the axle yokes, extending above the yokes. A right angle yoked extension of the spindles has a vertical movement on the shaft or upper end of the pivot, road shocks causing compression of a helical spring carried in a cage above the end of the axle yoke. The resistance is to all vertical movement of the vehicle body.

J-M.

Made by the J-M Shock Absorber Company, Philadelphia, Penn. The J-M shock absorbing attachment consists of two coiled springs enclosed in barrels fitted for installation to the rear or forward ends of the springs. The expansion of the coiled springs holds the vehicle springs normally and when subjected to road shock the compression of the coil springs in the barrels nullifies the jolt and jar. The absorber has special fittings for attachment. The design has been much used abroad.

Gabriel.

In the Gabriel, made by the Gabriel Horn Manufacturing Company, Cleveland, O., the friction of a belt wound about a device that is expanded by a spring is the method of checking the recoil of the vehicle, the circular case carrying the belt being attached to the chassis frame and the other end of the belt to the axle. As the spring is compressed the belt is automatically wound and recoil is restrained by the friction of the belt and the resistance of the coiled spring to compression.



Connecticut.

The Connecticut, made by the Connecticut Shock Absorber Company, Meriden, Conn., consists of a central case in which are three straight springs set in triangular form. Within the triangle is a three-faced cam attached to a shaft. The arm carrying the case is attached to the chassis frame and the other arm carrying the cam is fitted to the spring clip. A limit is given to movement of the vehicle springs and compression or recoil in excess is resisted by the springs within the case surrounding the cam.

Westen.

Produced by the Westen Manufacturing Company, Newark, N. J., the Westen shock absorber is a device in which two discs at the ends of arms enclose frictional areas and are pivoted with means for adjusting the degree of frictional contact. The arms are attached to the chassis frame and the axle. The adjustment is made so that the resistence to movement becomes greater as the motion of the vehicle

Digitized by Google

Windshields: A, Cox; B, Bean; C, Ackerman; D, Troy.

body is increased. The absorbers are made in three sizes.

Truffault-Hartford.

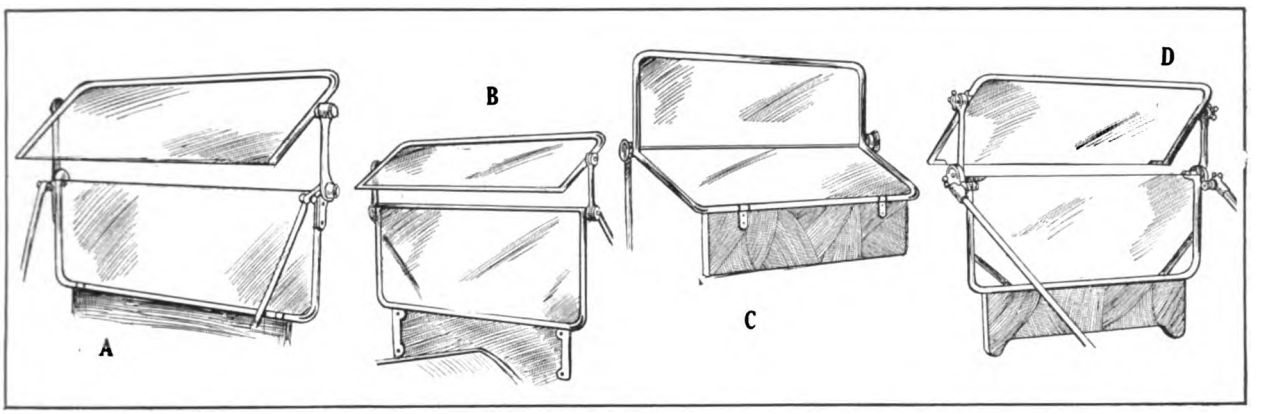
The well known Truffault-Hartford shock absorber, made by the Hartford Suspension Company, Jersey City, N. J., is with a double arm with a circular recess containing frictional discs and a single arm fitted between the recesses, the assembly being retained by a bolt and adjusting nut. The absorber may be adjusted to compensate for any excessive spring action. It is so enclosed as to be fully protected against all influence of moisture or abrasives. The device is made in four sizes to meet all requirements of light, medium and heavy vehicles.

Sager.

The J. H. Sager Company, Rochester, N. Y., also makes the Sager shock absorbing springs, which are of different strengths and are wound in oval shape instead of round, this form being believed to have better resistance to the road shocks. The springs are fitted by hangers to the chassis frame and clamp to the axle. As the springs are normally set they resist compression or recoil of the vehicle springs proportionate to the degree of movement. They are made in differing sizes and this form has been used for seven years with uniform success.

Velvet.

The Velvet springs, made by the J. W. Blackledge Manufacturing Company, Chicago, consist of a group of four helical springs mounted on four rods fixed in a base, at the top of which are two fittings, the upper attached to the lower spring half and the lower to the upper spring half. The lower fitting moves vertically on the rods with the compression or recoil of the vehicle spring, compensating the excess movement. These are made in five sizes for varying weights of cars, and for different forms of springs.



Westinghouse.

Made by the United States Rapid-Fire Gun & Power Company, Derby, Conn. This is a metal cylinder attached to the chassis frame that telescopes into a slightly larger cylinder attached to the end of the vehicle spring. By increasing or decreasing the internal area with oil in the base the air pressure is varied and the movement of the vehicle controlled. The mechanism is ingeniously developed to insure operation and to permit fine adjustment. It is regarded as being productive of excellent results during long experiments.

WINDSHIELDS.

The windshield is absolutely indispensable to the motor pleasure car driver. It is as desirable protection from the dust of summer as it is from the freezing blasts of winter air. In event of snow or rain it is equally as serviceable. Each year the experience has brought the creation of what makes for even greater comfort or convenience, and in the different

Digitized by Google

Windshields: A, Polson; B, Boreas; C, Gemco; D, Sprague.

makes of windshields now offered in the market one has a wide range of design, quality and value.

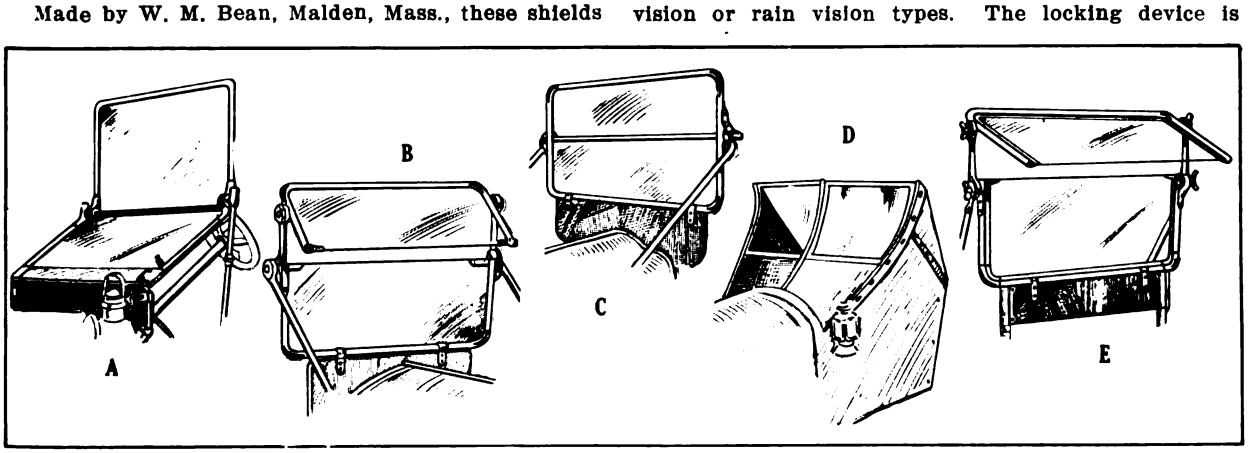
Eagle.

In the product of the Eagle Company, Newark, N. J., three styles, Eagle, Standard Friction and X-L are included, the first in clear vision and rain vision types, and either in straight or zig-zag; the second in clear and rain vision designs, and the third in standard forms. These are of high class construction. The Eagle hinge is of the multiple disc type and the Standard is hinged with a combination of friction, and ratchet and pawl. The frames are of heavy brass and are strongly reinforced. As designed these shields may be installed to secure practically any effect.

Troy.

There are 10 models of Troy windshields, made by the Troy Carriage Sunshade Company, Troy, O., four of which are new this season. These are either clear or rain vision types and may be adjusted to any dash. The shields may be adjusted to six positions, even to the single form created for torpedo bodies. The frames are constructed of heavy brass tube and the locking devices are packed with hard grease, and are noiseless and dust proof. The double-arm joint is a patented device.

Bean.



Made by W. M. Bean, Malden, Mass., these shields are designed to eliminate the danger of broken glass, the sashes being of non-breakable pyralin, .0625 inch thick and as clear as glass. They are framed in brass and aluminum, the latter type weighing but 15 pounds. They are made either curved or straight and the upper section telescopes into the lower, so the height is adjustable. With the straight form the upper section is held in any position by a friction device. The curved type is designed especially for the torpedo dash vehicle.

Auto.

Produced by the Auto Wind Shield Company, Cambridge, Mass., the curved form of the Auto windshield, which is of fabric leather and celluloid panels, is such that the driver looks over the shield and not through it, while the air currents are deflected above his head. It has nothing to break and it may be removed or replaced in five minutes. It has detachable side curtains and a roll front for summer use. It is strongly constructed and is water proof.

Polson.

The Polson windshield is made by the Polson Manufacturing Company, Buffalo, N. Y., in four styles and to order only. The construction is exceedingly durable, the frames being strong and the glass .25 inch in thickness. All styles are made in the clear vision or rain vision types. The locking device is

Windshields: A, Banker; B, Kinwood; C, Vanguard; D, Auto; E, Eagle.

Digitized by Google

automatic. The shields may be furnished with base brackets to afford ventilation to the forward body of the car. The shields are furnished in brass, nickel or black enamel.

Vanguard.

Clear vision and self-ventilating, rain vision, zig-zag, torpedo and straight types are produced for the Vanguard line, by the Vanguard Manufacturing Company, Chicago. The self-ventilating design is new, this being adjustable on brackets at the top of the skirt board. The Vanguard ball lock hinge is employed for all of the folding shields and the side arm hinge is used for the rain vision types.

Sprague.

The Sprague Umbrella Company, Norwalk, O., makes four types, and of these one is a clear vision construction. They are designed for varying installa-

Storage Batteries: Edison, Adapted for Both Ignition and Lighting.

tions and have heavy brass tube frames reinforced with wood where necessary. The roller bearing lock is used for three types, this being of steel rollers and manganese bronze discs, insuring long wear. The latest type has an air cushion lock that is positive and especially effective.

Banker.

Made by the Banker Windshield Company, Pittsburg, Penn., Banker windshields are of the clear vision type and it is claimed that each shield is made to order for the car for which it is intended. The line now includes a straight rain vision shield for touring cars and zig-zag rain vision shield for roadsters. The shield hinges are ball ratchet construction. The tubular frames are fitted with rubber packing strips and the filler boards are made with ventilators.

Ackerman.

Innumerable positions can be obtained by the Ackerman design, made by Joseph N. Smith & Co., Detroit, which includes a divided shield with a lower rigid frame. The upper section is mounted with stay rod connections about three inches in length midway of the frame and from these arms ball and socket joint connection is made with side supporting members that slide up or down in guides on the lower frame.

Boreas.

Smalley Daniels, Boston, is factory sales agent for the Boreas windshields, made by the Page Woven Wire Fence Company, Adrian, Mich. These are in five types—zig-zag, clear vision, rain vision, ratchet torpedo and folding torpedo. The working members are steel stampings covered with drawn brass. Section joints are constructed with a pair of gears, one mounted in each section, which are automatically locked in any position by coiled springs. The hinge is said to be very enduring and noiseless.

Gemco.

The Garage Equipment Manufacturing Company, Milwaukee, Wis., produces five types in the Milwaukee adjustable, Gemco automatic, clear vision, rain vision and torpedo. The friction hinges of the Milwaukee are leather between discs. The brace rods telescope so that the lower section may be set at any angle to the dash. The Gemco is similar, save that the lower section is not adjustable. The shield may be mounted on brackets at the base to permit of ventilation of the body.

Cox.

The six styles made by the Cox Brass Manufacturing Company, Albany, N. Y., include the clear vision type. With practically all the shields the upper section is mounted on side arms which permit adjustment in many positions. The upper section is fitted on hinges which are retained by hinges of the spring plunger and ball design and the shields are locked automatically wherever set.

Kinwood.

Made by the Kinsey Manufacturing Company, Toledo, O., one of the features of the Kinwood line is the simplicity and substantial construction, the appearance being decidedly neat and pleasing. The sections are united by an automatic hinge that is enclosed in a plain brass cap. Among the designs are the clear and rain vision types, and the straight and zig-zag models.

IGNITION AND LIGHTING BATTERIES.

Considerable improvement has been made in ignition and lighting batteries during the past year, makers having incorporated features which make for efficient and reliable service as well as more constant voltage and longer life. Among the refinements may be mentioned lighter batteries with larger current capacity, devices for the prevention of corrosion, and

Digitized by Google

methods of supporting the cells in the container. The growing demand for electric lighting has been responsible for a large number of high grade lighting storage batteries, these being made to meet the requirements of the purchaser.

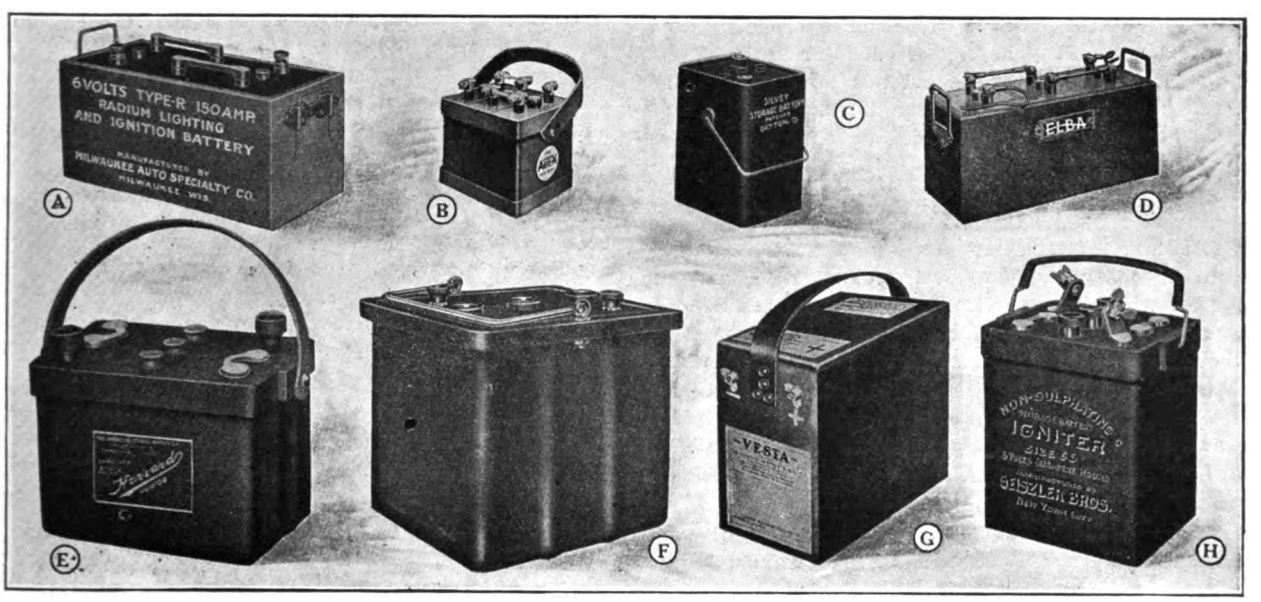
Geiszler.

The Geiszler Bros. Storage Battery Company, New York City, makes several types of both ignition and lighting batteries in which the non-sulphating features are emphasized. These batteries are sturdily constructed, compact in size and of long life. The company makes a specialty of lighting batteries of different ampere-hour capacities and this type is suitable for ignition work as well. They are based upon the six-volt capacity although members of different voltages may be secured.

Edison.

A feature claimed for Edison storage batteries, the product of the Edison Storage Battery Company, Orange, N. J., is that they can stand indefinitely in a charged or discharged condition without injury. The construction is such that they may be charged at a high rate in considerably less time than some types. Corrosion is eliminated as acid is not employed, and the components of the battery are rugged. The lighting type is guaranteed to give its full rated capacity at the end of five years' service.

Salom.



The mechanical method of applying the spongy and peroxide of lead to the plates is a feature of the Salom battery, manufactured by the Niagara Lead & Battery Company, Niagara Falls, N. Y., which concern produces batteries of several types and capacities. Besides saving in cost of maintenance and yielding rated capacity, swelling and shrinking of the plates are eliminated as well as short circuits by disintegration. Besides ignition and lighting batteries the company makes vehicle types.

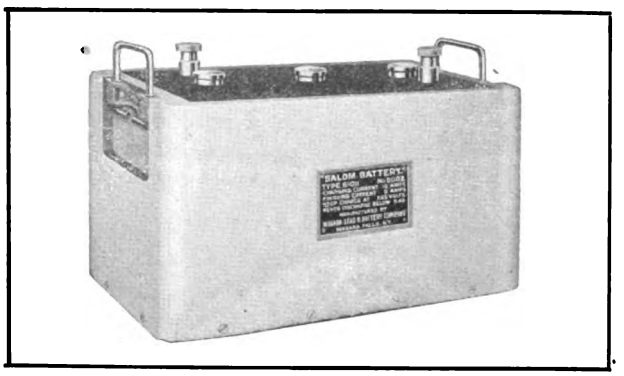
Elba.

Utilizing the individual cell unit which permits the member to be inspected without disturbing the other cells, is a feature in the construction of the Elba storage batteries, which are suitable for ignition and lighting purposes. These vary in ampere-hour capacities, and are provided with non-corroding terminals. The Willard Storage Battery Company, Cleveland, O., maker, manufactures different types of battery boxes including a special member for attaching to the frame.

Vesta.

Vesta ignition and lighting batteries, produced by the Vesta Accumulator Company, Chicago, are specially made to stand the constant jarring and jolting of the motor car, and a feature of the members is the method of sealing to prevent the acid from creeping. The company produces various types, these ranging from two to eight volts, and with ampere-hour capacities from six to 160. The smaller types are adaptable for portable work. A special charging rheostat is also manufactured.

Storage Batteries: A, Radium; B and D, Elba; C, Silvey; E, Harvard; F, Witherbee; G, Vesta; H, Geissler.



Witherbee.

A capacity in direct proportion to the combined area of the plates in each cell is the feature emphasized by the Witherbee Igniter Company, Springfield, Mass., maker of the Witherbee batteries, which are produced in different sizes and capacities to meet the requirements of the purchaser. The smaller ignition members utilize five plates in each cell while large batteries are fitted with cells having seven plates. Both ignition and lighting containers are produced.

Digitized by Google

Silvey.

Interchangeable units, hard rubber jars with high ribs in the bottom for carrying the parts and providing ample space below the plates, are features of the Silvey batteries produced by the Silvey Electric Company, Dayton, O. The top of each jar is fitted with a projecting flange which extends above the sealed cover plates, and each of the latter has a central vent set in a recess so that if any of the electrolyte escapes it is returned to the cell. The connectors are acid proof.

Storage Batteries: Salom, Manufactured in Sizes to Meet Requirements of Purchaser.

Radium.

Radium batteries are produced by the Milwaukee Auto Specialty Company, Milwaukee, Wis., and the staggered design of plates is utilized, making for long life and providing for expansion and contraction. The number of cells varies from five to 15, and the ampere-hour capacities from 70 to 200. Hard rubber jars are employed, these being contained in a case of hard wood, which is treated chemically to withstand acid. Handles of the sliding type are fitted.

Harvard.

Harvard batteries, which are made for all kinds of electrical service, are simple in construction and rugged in design. A feature of this product of the American Storage Battery Company, Boston, is the non-spraying and non-leakable vent tubes, which enable the use of the batteries in boats, etc. The company makes a specialty of lighting batteries, these being made in 80, 100, 120 and 150 ampere-hour capacities. Hard rubber jars are employed and these are sturdily constructed.

DRY CELLS.

The dry cell type of battery finds favor with many motorists owing to their compact form and cleanliness. Not only are they inexpensive but they provide a source of electrical energy that is reliable. They make an excellent equipment for starting purposes where the automobile is fitted with a magneto, and are employed to operate signalling devices. Considerable service may be obtained by wiring in multiple series, thereby increasing their amperage.

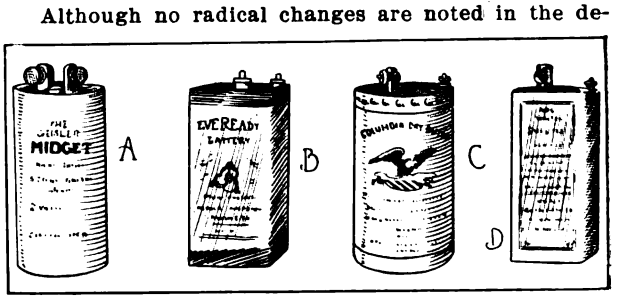
Waite.

A hot, snappy spark, maximum mileage and consistent service are the emphasized features of the Waite dry cell, the product of the Waite Auto Supply Company, Providence, R. I. The cells are of standard design but their durable qualities are obtained by the compounds utilized in the electrolyte. The voltage of each member is 1.5 and the ampere capacity 30. They are made in square carton form, the cell being protected by a cardboard casing, an arrangement making for longer life.

Eveready.

Eveready batteries are manufactured by the American Ever Ready Company, New York City, and are produced in four different types with the same voltage, 1.6. The ampere capacity ranges from 17-20 to 30-35. They are made in cylindrical form, also in square carton, and it is claimed that the cells may remain idle for some time without depreciating. In addition to the Eveready, the company has brought out a new type known as the Aerco.

Columbia.



The National Carbon Company, Cleveland, O., maker of the well known Columbia dry cells, manufactures these in two forms of which the No. 6 is standard for ignition purposes. The company also markets a cell known as the Columbia igniter, this being designed for heavy service and with higher amperage capacity. These are made in different sizes

Geiszler.

A battery which is of the storage type inasmuch as it is constructed with a semi-dry electrolyte, entirely eliminating the spilling of acid, is produced by the Geiszler Bros. Storage Battery Company, New York City. It is known as the Geiszler Midget non-sulphating battery and is of the same size as standard dry cells. It is claimed that this type will outlast three of the usual form on each recharge. They are of two volts, have 30 ampere-hour capacity, and are designed for reserve ignition, motorcycle and other light work.

HEAD LAMPS.

Although no radical changes are noted in the design of the 1912 head acetylene lamp, many refinements have been made to conform with the new body designs of the motor car. Particular attention has

Dry Cells: A, Geiszler; B, Eveready; C, Columbia; D, Waite.

Digitized by Google

been paid by the maker to lighting efficiency, and simplicity of design is a feature. Fewer parts and accessibility make for easy cleaning and adjustment, while better material provides for durability. Practically all makers bring out designs with a black finish, metallic lacquer-like lustre or black enamel finish. Some are combination, permitting the use of electricity, and a complete description of these will be found elsewhere in this issue.

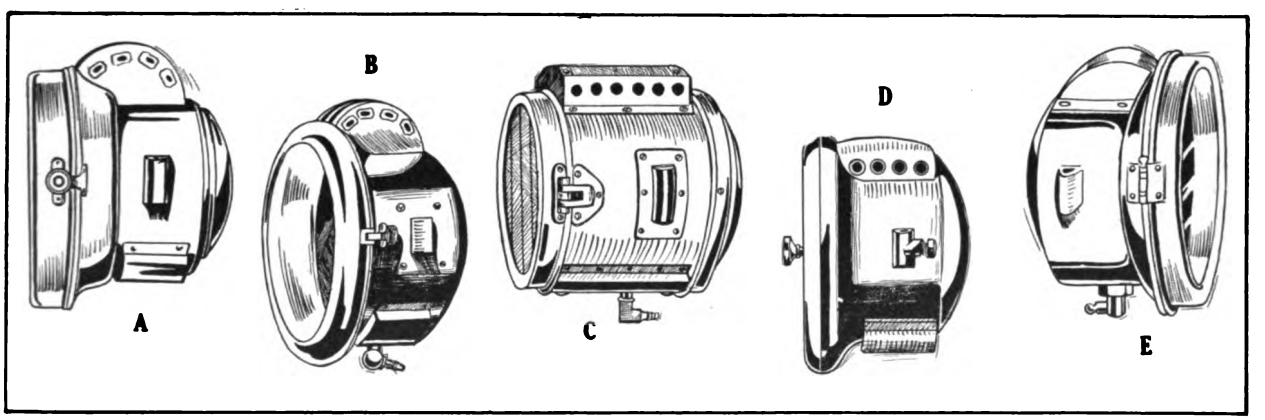
Rushmore.

A high efficiency lens mirror is a feature of the Rushmore lamps, produced by the Rushmore Dynamo Works, Plainfield, N. J. No changes have been made during the past season, the product of this company having been such as not to warrant any departure from the accepted design. The head lamps are made in plain and flare fronts and in a variety of sizes. The company makes a specialty of dash searchlights.

Gray & Davis.

The 1912 designs of lamps manufactured by Gray & Davis, Amesbury, Mass., embody the latest ideas of lamp making, and few parts, high efficiency and absence of rattle are features emphasized. The close-coupled lamps provide a steady light, are easy to clean and the black enamel and brass finish add to their attractiveness. A feature that will appeal to motorists is that the set screw for securing the lamp to bracket is placed inside, so as not to catch in clothing when cranking the motor.

Solar.



The Badger Brass Manufacturing Company, Kenosha, Wis., maker of the Solar lamps, presents a new form in a flat and high hood, the design making for simplicity. The body and flare are of a single piece of heavy brass with front aluminum reflector attached to the door, providing two fields of light. They are made in two sizes of the low hood type. The Solar lead glass lens mirror is fitted, which is claimed to provide a short focus and make for high efficiency in lighting.

Old Sol.

Old Sol lamps are made in a variety of forms, including those for motor car, motorcycle and carriage use by the Hawthorne Manufacturing Company, Bridgeport, Conn. The 1912 head lamp is of the close-coupled type, very compact and of it is claimed high efficiency in lighting. Mangin mirror lenses are fitted, and arrangement is made for focussing if desired. The motorcycle light is attached to the generator and fastened to the handle bars of the mount.

ELECTRIC TAIL AND SIGNAL LIGHTS.

An increasing number of electric tail lights and signalling devices lighted by electricity have been brought out during the past year and a wide variety of design is noted. Many consist of the tail member while others incorporate an arrangement for attaching the number plate and illuminating its surface. Several combination devices are being introduced, these consisting of different colored lenses which are employed for signalling a vehicle in the rear that the machine is about to turn or stop. These are operated by a switch on the dash convenient to the driver.

Acetylene Headlights: A and B, Gray & Davis; C, Rushmore; D, Solar; E, Old Sol.

Gray & Davis.

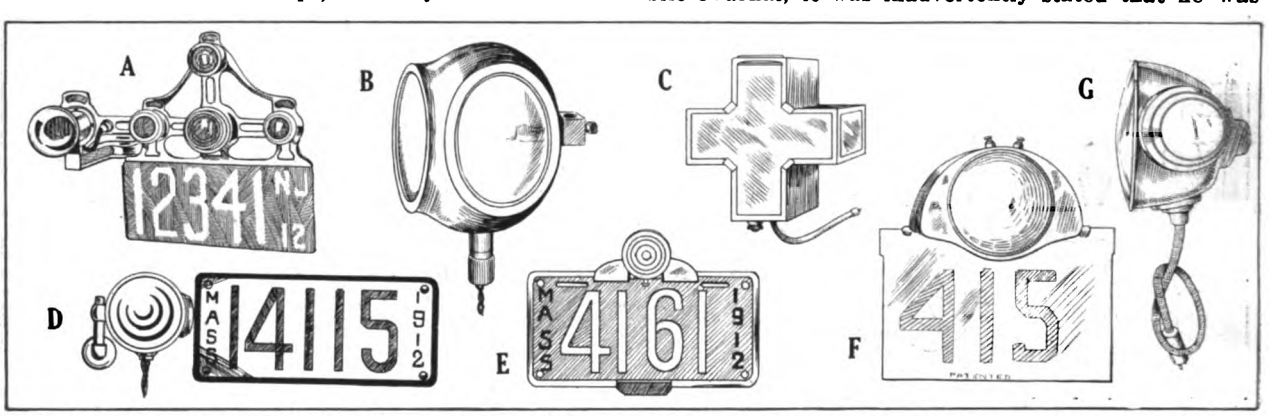
The Gray & Davis tail light, made by Gray & Davis, Amesbury, Mass., is very neat and compact and is fitted with a red lens 3.5 inches in diameter. A silver reflector inside the lamp, magnifies the light and throws it out of an oblong square opening upon the number plate. The white beam is clearly defined, so that the operator by merely glancing around may ascertain if the lamp is lighted. It is air and dust tight, and made with round, tapered or flat holder.

Couch & Seeley.

The Couch & Seeley device, manufactured by the Couch & Seeley Company, Boston, is a combination tail lamp and number plate holder. It is attached easily to the usual lamp bracket, and the number plate is fitted to an adjustable clamp, operated by a screw. The lamp box is attached to the clamp member and is removable. The usual red lens is provided, and also a white light for illuminating the number plate, any size of which may be utilized.

Digitized by Google

Neverout.



The Neverout, produced by the Rose Manufacturing Company, Philadelphia, is a combination of tail light, license bracket and signalling device. The latter is operated by a special switch fitted with three buttons. The lights are four in number. A red disc shows constantly while a white illuminates the license tag. The latter and another are utilized for signalling as is a green disc. An electric horn is incorporated which sounds whenever any of the signal lights are flashed.

Guide.

A neat and compact electric tail light has been brought out by the Guide Motor Lamp Manufacturing Company, Cleveland, O., it being of the torpedo type and fitted with a clear lens for lighting the license number and semaphore red lens for the tail light signal. It is attached in the usual manner to the bracket, and is designed to operate a two candlepower six-volt lamp.

Electric Star.

Electric Star tail lamps, made by the Milwaukee Bronze Casting Company, Milwaukee, Wis., are manufactured from a one-piece aluminum casting five inches in diameter, this making for sturdy construction. The exterior of the light is finished in black with polished nickel plated rims around the lenses. The bullet shape provides a liberal sized white and red lens and is cleaned easily. They are made in two forms, one for attachment by set screw and the other for fastening to body.

Electric Rear Lights and Signalling Devices: A, Neverout; B, Electric Star; C, Fowler; D, Gray & Davis; E, Couch & Seeley; F, Holt & Beebee; G, Guide.

Holt & Beebee.

An electric tail light which also serves to illuminate the license tag is made in two forms by Holt & Beebee, Boston. It is attached to and above the number plate, and its position brings the light a little forward of the license tag. The white light is thrown upon the plate. When desired it may be attached to the body of the car. It is made in brass, black or white nickel. The light is said to meet with all of the requirements of the authorities.

Fowler.

The Fowler Lamp & Manufacturing Company, Chicago, is marketing a novel form of tail lamp, it being in the form of a maltese cross and designed especially for use by physicians. The usual red lens forms the cross, providing a noticeable signal. A white light is thrown upon the number plate through a white lens fitted to one of the projections of the design. It is attached to the regular tail lamp bracket.

(To Be Continued.)

Ed. Note—Space does not permit of describing in detail all of the prominent accessories made or sold in this country, and the subject will be continued along the same lines in a succeeding issue.

WILLIS NOW WITH NATIONAL.

P. P. Willis of Indianapolis, Ind., formerly advertising manager of the Mais Motor Truck Company of that city, is at present associated with the National Motor Vehicle Company, maker of National cars, in the same capacity. In a recent issue of The Automobile Journal, it was inadvertently stated that he was still engaged in exploiting the Mais truck. However, he has been with the National company for the past three or four months.

BRUNNER COMPANY IN NEW PLANT.

The Brunner Manufacturing Company, Utica, N. Y., has moved into its new plant, which is equipped with the latest improved machinery specially adapted for the production of small air compressors, in capacities of from one to 15 cubic feet a minute. The Brunner line is most complete and up-to-date, and while the compressors are small they are very heavily constructed and will withstand severe usage. D. G. Caywood, until recently vice president and sales manager of the Gleason-Peters Company of New York City, has been appointed sales manager of the Brunner concern, and will locate his headquarters in New York.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3⅛ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28 00	30.00	45.00	Only made in
	3⅛-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

BOSTON'S TENTH ANNUAL SHOW.

Located in the heart of the greatest motor vehicle and accessory market in the world, and within easy riding distance of an immense district deeply interested in the modern methods of commercial transportation, Boston offers an exceptional opportunity for those who desire to do business. Coming as it does at the very beginning of the active motoring season, the Boston show always has been the biggest, best and most largely attended display in the country. More sales are closed here annually than at all the other exhibitions combined. This explains its importance to the industry, an importance fully appreciated by the manufacturers, albeit they have never cared to dignify it by the name of National.

The results at New York and Chicago indicate that this is a year of refinement in pleasure car construction, and the distinctive beauty of the machines displayed in those cities will be combined in the forthcoming show at Boston. It is the one exhibition of the country in which all makers are represented under one roof, where the fullest opportunity is given to make comparison of the merits of the various models. Those who are interested in selecting a new machine cannot afford to overlook this feature.

Ever since the automobiles were separated from the motor boats, there has been a growing demand for space. Each year there has been a long waiting list, months in advance of the opening date. The time has arrived when it has been deemed advisable to provide distinct shows for pleasure and commercial lines, and what has been said with respect to the pleasure vehicle exhibit applies even more fully to the industrial transports.

In the matter of accessories, supplies, parts and fittings, the Boston show always has excelled, principally because of the fact that these are represented by agents, who often carry more than one line, each of which is shown by a display arranged by the manufacturer. Although it is certain that some pleasure and commercial cars will be seen at this exhibition for the first time, the new things will by no means be confined to the finished vehicles.

The Boston show reflects the importance of the district it serves. While other sections of the country have become interested in the automobile within the past two years, New England still remains the great motor vehicle and accessory market it was during the early days of the industry. There is every reason to believe that the 10th annual display in Mechanics' Building will be the same big business producer as all of its predecessors.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

PREPARING FOR SPRING.

Every thoughtful motorist will agree that the car should undergo a systematic and thorough overhauling, at least once a year. Most owners decide to have this done just previous to the opennig of the active driving season in the spring. In these days, when it is no longer considered necessary to lay up the automobile at the approach of the first cold weather, it is somewhat difficult to determine upon this step in plenty of time.

It may be pointed out that repair shops are less busy during the winter months, and the possibility of obtaining good work is thereby en-

Digitized by Google

hanced. Many repairmen complain that motorists wait until the last minute before deciding to have work done, and continually demand the car again before the necessary overhaul and adjustment is properly completed.

The motorist who desires to start the driving season with a car which presents the best appearance will decide to have the work done early, and give the repairman sufficient time. In case it is necessary to give the chassis and body a new coat of paint, it will be found that a much better piece of work will result if the workmen have plenty of opportunity to let the different coats dry before applying the next. This is a subject which may be considered with profit by the owner.

Universal lighting means the safe use of public ways at night. It need not inflict unreasonable restrictions on anyone. Why not follow Massachusetts' example?

RADICAL AUTOMOBILE LEGISLATION.

It has been pointed out in these columns that motoring offers abundant opportunity for the legislator who feels he must evolve some form of radical legislation. Heretofore it has more often taken the nature of increasing the fees or limiting the speed, but a new note has crept in this year. Massachusetts, which has borne an enviable reputation for conservatism, even in the matter of automobile laws, presents a long list of amendments, some of which must be classed as decidedly radical.

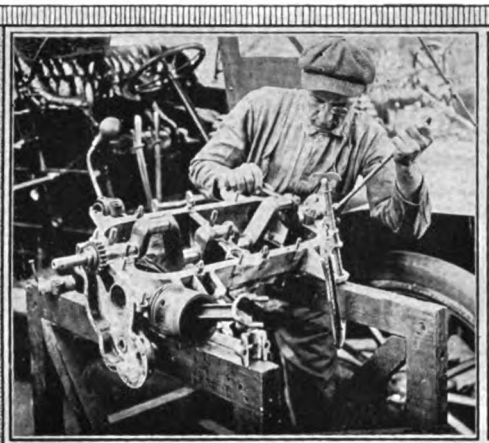
Limiting the size and shape of an automobile top, unless it be of a certain color, ought not to take a great deal of time from the proper consideration of more important matters. Restricting the weight of vehicles using the highways has a direct personal interest not only to those in the industry but to all citizens who are studying modern methods of transportation and their bearing upon the economic side of life. Recent developments indicate that this law will not be passed without considerable revision.

One other important piece of proposed legislation is that requiring owners of motor vehicles to file a bond of $5000 when making application for license. The evident purpose of this bill is to provide some means of reimbursing those who may be injured through the improper operation of the automobile. In reality it would have the effect of increasing the cost of motoring and perhaps of decreasing the number of cars operated.

An analysis of the accidents in which motorists are to blame reveals the fact that in nearly every instance the owner, who usually is the operator, is abundantly well able to satisfy any claim upon him. The man of moderate means drives carefully, both because he has the price of his automobile at stake and because he is not given to the excesses which make operators careless. As has been suggested before, a better way to guard against such accidents is to refuse licenses to men who ought not to have them, and it should be easy enough to determine a man's qualifications in this regard before the application is acted upon.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

THE AMERICAN MONOPLANE.



American aeroplane constructors appear to have given rather more attention to the development of the biplane, and such monoplanes as have been brought out really have been little more than copies of the successful Bleriot design. Reference is had especially to those machines which have demonstrated their practicability in satisfactory flight.

There is considerable difference of opinion among those who have given much study to the new science with reference to the relative merits of the two types. The Wright brothers always have maintained that there was no evidence that the monoplane was faster than the biplane, and after all this is the most pronounced claim of its adherents. French constructors appear to differ with the Wrights, since many of the so-called pioneers have been neglecting their biplanes for the production of monoplanes within the past year.

The success of the monoplane in the recent French military trials seems to have had its effect upon United States army and navy officials. As a result, at least one American manufacturer practically has been commissioned by the government to work out a monoplane design with the help of army and navy experts. Students of aviation will await its appearance with much interest, particularly with reference to the effect foreign practise may have upon the completed machine.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

HEATING THE AUTOMOBILE.

In these days of refinement in automobile construction, the operator, as well as the owner, desires comfort, and the modern machine is equipped with numerous devices which appeal to the progressive motorist. The more general use of the car in winter has resulted in an attempt to provide some method of heating its interior, and several appliances are marketed for this purpose. The majority of these are intended primarily for keeping the occupants of the tonneau or limousine warm, although some of them may also be employed by the driver.

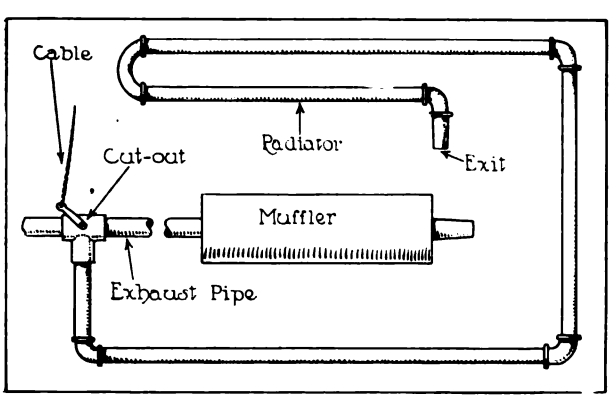

Fig. 1—Suggestion for Utilising the Cut-Out to Convey Heat to a Pipe Radiator.

Many modern cars of the fore door type are equipped with openings in the floorboards or dash through which the heated air from the motor may pass, but unless arranged properly more or less cold atmosphere finds its way through the openings in the radiator and thence to the other apertures. Where the power plant is protected fully by a pan, the heat of the engine may be utilized successfully by fitting a shield back of the radiator to deflect the air currents downward so that they will pass under the power plant and out at the opening in the rear.

Some devices provide for the use of hot water, the fluid being taken from the circulation system, but the average motorist hesitates to install this method owing to tapping the manifold and the trouble involved in securing tight connections. A suggestion for utilizing the heat from the exhaust of the motor is outlined at Fig. 1. It consists of attaching a pipe to the cut-out device and continuing the tube to the part of the vehicle to be heated.

It will be noted that the upper section of the pipe is constructed in the form of a radiator. The size of the piping employed will depend upon the cut-out, this varying according to the design of the motor. Standard piping is practical and this is attached to the lower section of the cut-out; that is, the opening through which the exhaust gases pass. The latter is threaded to take a section of the pipe, and if necessary a fit may be obtained by employing a reducing member.

An elbow is next attached to the part leading from the cut-out and another section of tubing continued to a point under the front seat or tonneau, thence upward through the flooring to radiator. The latter may be placed in the tonneau near the seat partition, where it will occupy but little room, or may be located in front for the benefit of the operator, or one may be used in each place.

Where the pipes pass through the floor, it will be well to employ a plate which may be fastened to the floor by screws. This arrangement will keep the radiator from moving. The free end may be held securely by a strap of metal.

In connecting the sections of the piping it is an excellent plan to cover the threads with a liberal coating of graphite and oil as the combination will assist in making a gas tight joint, as well as preventing the connections from rusting when the heater is removed in the spring. A smart appearance may be given the radiator by painting with aluminum paint.

While more back pressure will be exerted upon the engine by the use of this device, it should not be noticeable in operating the car. The heat may be

Digitized by Google

controlled to a certain extent by attaching a cable to the cut-out lever and holding the latter more or less open. While the radiator may become too warm to hold the hand upon it for any length of time, it will not be hot enough to do any damage to the clothing, and will be appreciated in extreme cold weather.

ACETYLENE PRIMING DEVICE.

Acetylene is a highly explosive hydrocarbon when mixed with air, and the mixture when exploded produces a greater force than gasoline similarly employed. The proper proportions are about one part of acetylene to 10 of air, although with larger quantities of the former, it is said that it is ignited even more easily than a gasoline mixture under the same conditions.

Unfortunately, acetylene gas cannot be stored in an ordinary can and the cylinders primed as with gasoline. If this were possible it would facilitate the starting of a motor in extreme cold weather when the vaporization of a liquid fuel is retarded by low temperatures.

A method of employing acetylene for starting and one that does not require any other fitting than a petcock for priming, is depicted at Fig. 2. A feature of the arrangement is that the ordinary acetylene generator may be used without disturbing its operating mechanism.

Assume that the motor refuses to respond to the usual cranking, having been exposed to the cold for a considerable period, and that priming with acetylene gas is desired. A rubber tube is attached to the generator and led to a petcock installed in the intake manifold as illustrated in the drawing at A.

The generator is turned on and when acetylene is produced it will flow through the tubing to the petcock and thence into the intake pipe. By cranking the motor a certain amount of air will be drawn through the carburetor, and mixing with the acetylene flowing into the intake pipe, will be drawn into the cylinders and exploded by the usual methods. The acetylene may be fed until the engine becomes warm and its flow may be regulated by the petcock, which is closed when not in use.

At B is suggested a method of priming the cylinders through the priming cup. The latter is opened, the tube connected and the gas allowed to pass into the combustion chamber. Each cylinder is similarly treated, and with the switch turned on and spark lever retarded, the motor should start. If not, a turn of the starting crank will usually bring about the desired result. A gas tank might be employed but care should be taken in turning on the acetylene because of the pressure at the container.

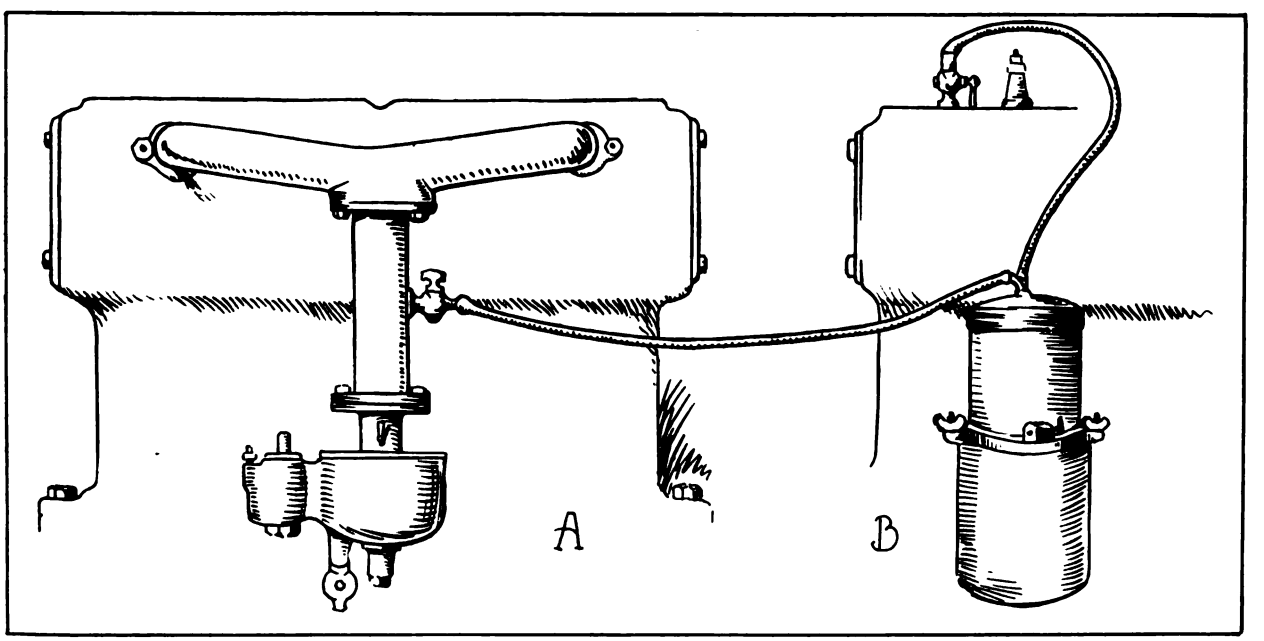

Fig. 2—Depicting the Use of a Generator to Facilitate Starting Cold Motor: A, Introducing Gas to Intake Manifold; B, Priming the Cylinder with Acetylene.

OIL CAN HOLDER.

The majority of operators do not drive on a cold day without carrying in the car a small oiling can filled with gasoline for priming purposes. Usually the container is stowed away in the tool box or in some convenient place in the body. It frequently happens that the can is overturned and its contents spilled unless it be fitted with some form of cap, which should be gas tight so that the fluid will not escape.

An excellent location for the priming member is inside the hood, where the fuel will be kept more or

Digitized by Google

less warm. Some cars are equipped with holders for both oil and priming vessels, but where the machine is not thus fitted, they may be installed easily and without expense.

Usually an old lamp may be picked out from the scrap heap and the lower part, the fuel container, will make an excellent holder. The member may be heated to separate the lower section from the main body and the former fitted with a bracket, made from a piece of stout brass and riveted to the tray. Holes are next drilled in the strip for attachment to the dashboard. To strengthen the angle bracket the brass strip may be soldered. A feature of such a device is that when employed for an oil can, should the latter leak, the lubricant will be caught in the tray and not drip, as is the case with some holders.

COMPLETING THE TOOL OUTFIT.

Although the manufacturer is liberal in the matter of tool equipment with the new car, it is rare in these days that a motorist is able to keep the outfit intact. Tools are mislaid, broken, and frequently loaned and not returned. With the annual overhauling season approaching, when the use of the tools will be needed, it is a good plan to look over the kit and note if new ones are required.

During the winter months many large and even small hardware stores hold special sales and excellent tools may be purchased at considerably less than their usual price. The second hand stores and pawn shops offer similar opportunities, where tools in good condition may be bought for a low figure. By picking up a wrench here and there, for instance, a good outfit may be accumulated at very little expense.

SOLDERING RADIATORS.

Some drivers effect their own repairs to a leaky radiator and the success of the work depends largely upon the skill of the operator. Usually the amateur believes in quantity when applying solder, and the result is an unsightly cooler. The following suggestion is made by a tinsmith who has had considerable experience in stopping radiator leaks: Clean the parts thoroughly, scraping the metal until a bright surface is obtained. Next cut a small piece of fairly heavy sheet brass to fit snugly in the opening to be stopped, and utilize a blowpipe with the solder and acid, taking care not to burn the metal. When soldering, the radiator should be laid perfectly flat.

CARE OF BALL CONES AND RACES.

Where the wheels of the car are fitted with ball bearings of the cup and cone type, unless these and the balls be hardened nearly alike, considerable wear is likely to take place, especially if the machine has been operated for any great length of time without the members having been given attention. It is a good plan to jack up the wheels and test for lost motion and when it is necessary to take up so much that the wheel will not revolve freely before the play is eradicated, the bearing should be disassembled and examined for wear. If the cone or cup shows recesses a new one should be installed.

TIRE PUMP HINT.

Constant use of the tire pump results in wear and in time slight leaks will develop in the air coupling. It is particularly annoying to discover that the action of the device is faulty when attempting to inflate a tire after a puncture and when one is some distance from a garage where a good pump may be secured.

A simple kink and one that will prove of value when the coupling leaks, is to utilize a handkerchief as follows: Take one corner of the handkerchief and make a single wrap between the coupling and valve stem. Then make a number of turns toward the rubber tubing, making each wrap as snug as possible.

VALVE SPRINGS CAUSE MISSING.

Intermittent missing of the motor may be caused by faulty ignition, but it also may be due to the valve springs. A peculiar skipping of a model T Ford bothered the operator for some time and even the repairman failed to entirely eliminate the trouble. An expert finally solved the problem by removing the valve springs and stretching, when the motor ran perfectly.

A PISTON RING KINK.

In overhauling the motor the piston rings should be examined carefully and thoroughly cleaned before replacing. The carbon should be scraped from the recesses in the piston as well as from the rings themselves. In replacing the members it may be noted that they do not expand enough to perform their proper function. New ones should be fitted, but when this is not desired the old members may be improved by fitting a thin strip of tin or brass in the recess of the piston. This will expand the ring slightly.

AFFILIATED AUTOMOBILE ENGINEERS.

As a result of a recent amendment to the constitution of the Society of Automobile Engineers, an affiliated grade of membership has been created, to which firms or corporations engaged in the manufacture of automobiles, parts and accessories are eligible. Concerns thus represented have the right, subject to the approval of the council, to designate personal delegates to the number of six. It is felt that the grade will fill a distinct need, in that concerns who desire the benefit of the proceedings of the society, may do so whether or not their employees may be eligible for full membership.

Back Pressure of Muffler.

(1339)—What is the percentage of horsepower lost, due to back pressure in the muffler? I have been informed that it runs as high as 37 per cent. with high efficiency mufflers. Will you kindly enlighten me on this point? RALPH M. PEARSON.

Chicago, Feb. 10.

According to the chief engineer of a leading pleasure car maker, the back pressure caused by the muffler is about 1.5 per cent. of the maximum output of the motor; that is, if the car be fitted with a standard type of silencer.

There are a number of conditions which must be taken into consideration, such as the motor, design of exhaust manifold, size of piping leading to the muffler, shape of the former, and the muffler itself. If the latter be new it is obvious that less back pressure will be exerted than if it be full of soot. The writer does not know of any general rule which would apply, owing to the different designs of motors, mufflers, etc. It is stated, however, that by utilizing a cut-out the efficiency of the motor is increased about five per cent., and that racing cars lead the exhaust pipes almost directly from the cylinders. The percentage of back pressure might range from almost zero to a point whereby the operation of the engine would be seriously affected.

Cylinders Miss Explosions.

(1340)—I have a model ——— two-cylinder ——— car and experienced trouble upon the arrival of cold weather. It misses explosions on the rear cylinder when I use a little gas and if I give it more the rear explodes but the front cylinder misses. There are no leaks in the intake pipes, both cylinders have good compression and the valves are tight. When I use a medium amount of gas the missing jumps from one cylinder to another. In warm weather both cylinders operate perfectly.

PETER MICHAELSON.

Tilden, Neb., Feb. 11.

The fact that the motor operates successfully in warm weather and gives trouble in the winter would indicate carburetion difficulty. Vaporizers of the type with which your car probably is equipped might be responsible for the missing, because the motor is being given too rich a mixture at low speeds and too thin at high, or vice versa. The intake pipes should be tested carefully for auxiliary air, but as these are stated to be correct the trouble is more likely to be with the carburetor. If adjustment fails to bring the desired results the vaporizer should be examined to note if in working order. Sometimes a pipe led from the air intake of the device to the cylinder or exhaust pipe for the purpose of taking warm air will facilitate carburetion under such circumstances.

Lost Power and Hot Motor.

(1341)—I have a 40 horsepower ——— car, which until recently has been giving perfect satisfaction. Have always been able to reach 60 miles an hour on the third speed and climb hills easily. The motor was thoroughly overhauled a short time ago and ran nicely for a while, but upon taking it out of the repair shop where some small repairs were made, the engine acted dead. The carburetor was adjusted but conditions were not improved. I was advised to put on a new carburetor and bought a leading make, but with the new one the motor was just as dead and the exhaust manifold became red hot. I can run the spark both on the battery and magneto up to the top of the wheel without getting a knock. Formerly this advance would cause the motor to knock badly on the level and at speed. The battery and magneto are independent of each other. I bought another carburetor but conditions are not improved. Was informed by a fellow motorist that the ignition timing was out, but cannot see how this can be, as the motor was overhauled a short time ago and the car has been run but little since. Can you advise me as to the cause of trouble? S. K. WHITNEY.

Jacksonville, Fla., Feb. 11.

The friend was correct, as the motor has every indication of not being timed properly with respect to the ignition. The fact that the car heats badly and has no power, either when operated by the battery and coil system or the magneto, shows that the spark is taking place too late in the cylinder. This may be tested easily with the battery system, by throwing the switch to battery and with the spark lever fully retarded listen for a buzz of the coil. If the coil does not buzz, gradually advance the spark lever until the noise is noted. It probably will be possible to move the lever nearly to its limit before the buzz is heard, denoting that the spark takes place too late. The buzz of the coil should be heard with the lever almost fully retarded.

A better way is to check the lead of the piston. Bring cylinder No. 1 up on the compression stroke, then insert a rod through the priming cock, and turn the starting crank slowly with the switch off until the rod moves upward and stops. This indicates the top of the compression stroke or dead centre. Remove rod and throw the switch to battery. The coil should buzz, and if it does not with a slight advance of the spark lever, the timer or distributor should be moved backward until a contact is made; that is, begins to be made, which will be denoted by the sound of the vibrator.

If upon testing out the machine the motor operates efficiently with the battery, and upon switching to the magneto, does not develop its power, the magneto is not timed properly. If not familiar with this operation it is performed best by an expert, However, if the generator be shaft driven with an Oldham coupling, the driving gears will have to be remeshed; that is, set a tooth or more ahead as needed. Usually the

Digitized by Google

gears are marked at the factory, and an examination will probably show that the repairman in assembling was careless in replacing these members.

Rebuilding the Car.

(1342)—I have a model ——— four-cylinder ——— machine, the motor of which is in excellent condition, having plenty of power. The rear system has always given me trouble as the cones and races were out, although I have had special members made. Am considering rebuilding the car into a roadster, fitting a new rear construction and replacing the planetary transmission with a sliding gear. Those with whom I have talked the matter over do not agree as to the feasibility of the plan. Some say I will not get good results and that the expense will be too great. Can you give me any approximate estimate as to the cost and whether or not it is advisable to rebuild? WILLIAM DOOLITTLE.

New Haven, Conn., Feb. 15.

Reconstructing a car sometimes is very costly and the expense is not always warranted, this depending largely upon the general condition of the machine and how it is to be redesigned. Then again, unless a price can be secured for the entire work and parts, by the firm estimating the job, it usually happens that many incidentals will increase greatly the supposed cost. A good rear system and transmission, aside from the work of installation, would mean an outlay of several hundred dollars, and it is reasonable to presume that special fittings would have to be made and that the machine work would be considerable. The better way would be to sell the automobile and use the proceeds towards buying a new one, or trade the old car in part payment for a new machine. A new rear system can be obtained from the maker for about $100 and as these are fitted with roller bearings the former trouble will be eliminated.

KISSELKAR'S NEW ENGLAND BRANCH.

Work will begin shortly on the erection of a handsome new building on Commonwealth avenue in Boston, which will be occupied by the New England branch of the Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure and commercial cars. Manager Pruden anticipates that it will be one of the finest equipped service stations in the country.

The building will have a frontage of 74 feet on Commonwealth avenue and a depth of 200 feet. The salesroom will be on the first floor, extending back 70 feet from the street. The office force will be located on a balcony across the front of the building. The service shop will be on the second floor, while the garage will be in the rear of the salesroom.

BAY STATE CLUB'S COMMITTEES.

President E. A. Gilmore of the Bay State Automobile Association, Boston, has appointed the following committees for the ensuing year: Show, Russell Green, F. W. Nichols, R. A. Dobyns, M. E. Lebon, A. P. Teele; revision of bylaws, A. P. Teele, A. P. Underhill, R. R. Ross; runs and tours, W. H. Stevens, Chase Langmaid, W. H. Williams, M. E. Lebon, R. A. Dobyns; contests and races, H. H. Knepper, E. L. Vail, F. Shirley Boyd; house, Chase Langmaid, A. H. McIntyre, H. H. Knepper; entertainment and annual dinner, A. B. Henley, F. P. O'Brien, Fred F. Swett, N. H. Halliday, R. R. Ross.

LEGISLATION IN NEW YORK.

According to information from Albany, N. Y., a number of amendments to the existing automobile laws will be introduced during the present session. Among the more important changes suggested are the following: Lights on all vehicles from one hour after sunset to one hour before sunrise; prohibiting the use of muffler cut-outs in cities and incorporated villages; Connecticut provision for non-resident tourists; uniformity in local ordinances; filing daily records of owners registered and chauffeurs licensed with the police authorities in all cities requesting such action; pro-rata reduction in fees for all applications for licenses filed after Feb. 1 in each year, and provision for transferring the automobile bureau from the office of the secretary of state to the department of highways.

GLIDDEN TROPHY IS SECOND BEST.

Additional information concerning the national automobile tour of 1912, indicates that the Glidden trophy is not to be dropped altogether, although the new A. A. A. cup is to become the chief award. The older cup is to be retained as a team prize, while the new one will be offered for the best individual score. Charles J. Glidden, donor of the trophy bearing his name, has the following to say about the matter:

"I have no personal feeling over the action of the American Automobile Association in voting to discontinue the Glidden tours. The Glidden trophy has seen service for eight years, and has done the good work for which it was intended. I wish the association the utmost success in the new programme and shall do all I can to assist. In accordance with that purpose I sent Chairman Batchelder the following telegram:

" 'Please accept my personal entry for the 1912 tour to compete for the new trophy. Will drive my own car.' "

COVENTRY CHAINS IN AMERICA.

Announcement is made by the Sarco Engineering Company, 116 Broad street, New York City, that the exclusive selling agency for Coventry chains, made by the Coventry Chain Company, Ltd., in England, hitherto carried on at this address by S. Hoffnung & Co., Ltd., has been transferred to it, dating from Feb. 1. The Hoffnung company has given up its New York offices, and the management of this line will continue to remain in charge of Herbert F. L. Funke. In addition to Coventry chains, the Sarco company also is the sole American representative for White & Poppe carburetors and Fastnut lock washers.

UNITED STATES TIRES ARE GOOD TIRES

The amount of service a tire gives is directly proportionate to the amount of strength built into it.

There can be no argument about that. The same is true of the engine, the carburetor, or the magneto.

And to select the strongest tire on the market is no longer a difficult task. It is merely a matter of selecting the maker who has the most thoro knowledge and the best facilities for putting strength into his tires.

Suppose the four leading shoe manufacturers of the country should unite to produce one line of shoes.

Suppose one maker had worked out and controlled a series of machines that were an improvement over those used by other makers—another had devised a method of construction that was a distinct advance over all his competitors. The other two makers likewise possessed manufacturing secrets that had for years back distinguished their particular brands.

Would not the product of the combined knowledge and facilities of these four makers, to your mind, be a shoe of better quality and design than if made with the limited experience and facilities of any single maker?

There is only one answer possible.

Precisely this same condition exists today in the automobile tire industry.

UNITED STATES TIRE COMPANY

New York

Digitized by Google

You can actually buy tires that combine the strength of four

—four makes which for years were leaders in the industry—Continental, G. & J., Hartford and Morgan & Wright.

You can buy tires that are made by four corps of tire making experts from these four famous factories, working together—tires into which have been put all the good points which served to make these four brands famous.

Every business man in the country who has anything to do with the manufacturing of goods, if he will consider a moment, will readily understand why tires made under these extra favorable conditions must necessarily possess strength and endurance which other brands cannot hope to equal.

Yet you can buy United States Tires for the same price you are asked to pay for other kinds.

Dealers, you cannot deny the fact that tires made as United States Tires are made are not only the easiest and most profitable tires to sell now but are the tires which are bound to be increasingly

IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

FOR LOADING LUMBER QUICKLY.

It is accepted as truth that a motor truck best demonstrates its economy when it is on the road, and in many lines of work it is something of a problem to prevent long waits at one or both ends of the line. This applies particularly in the lumber business, and many attempts have been made to solve the problem of quick loading and unloading. In fact, almost as much effort has been expended along this line as in the handling of coal or other materials which must be dumped.

An accompanying illustration presents the arrangement employed by the Curtis & Pope Lumber Company of Boston, which concern maintains a fleet of White trucks, made by the White Company, Cleveland, O. The device was produced by W. A. Havens, one of the members of the firm, and has been in constant use for a period covering more than a year.

As will be noted, one of the old horse drawn wagons is utilized for loading the lumber, which is packed on a false bottom. The workmen in the yard may be employed thus while the truck is delivering the previous order. Upon the return of the motor vehicle, the horse wagon is manipulated into position beside it, until the runways register properly, when it is the work of but a moment to shift the false bottom with its load from one wagon to the other.

KENTUCKY ELECTRIC DELIVERY WAGON.

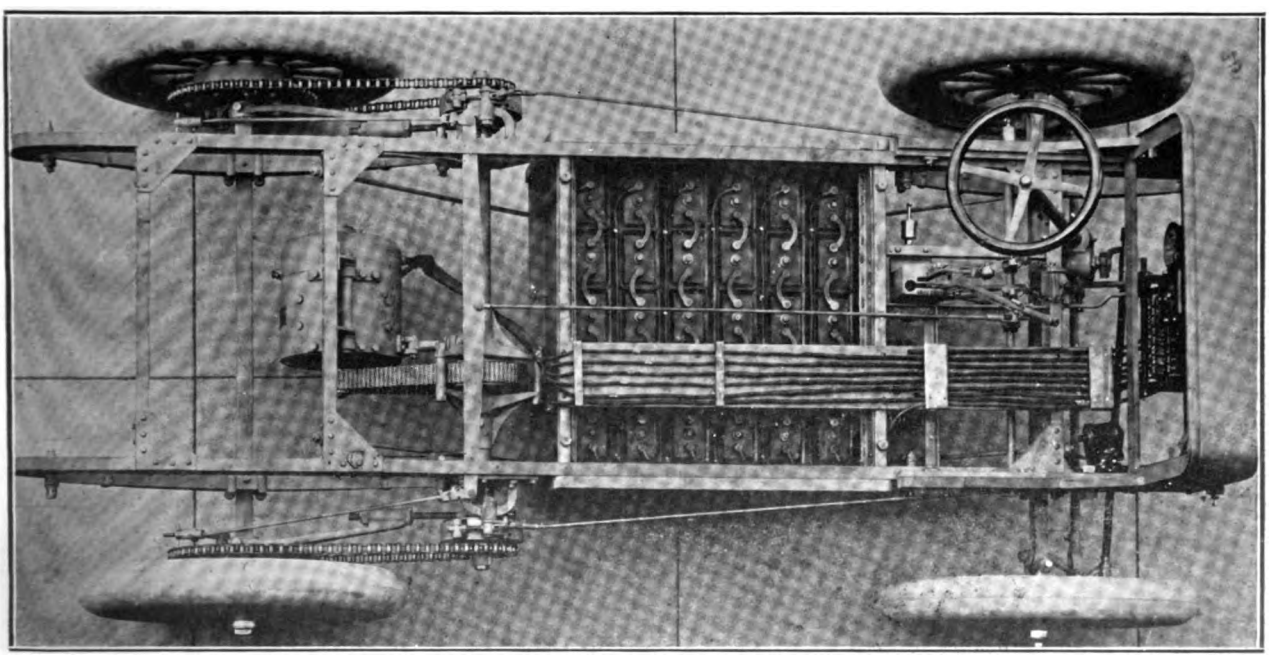
In view of the continued demand for electric vehicles in light delivery work, unusual interest attaches to the new models brought out in this field. Herewith is presented an illustration of the light delivery chassis recently placed in the market by the Kentucky Wagon Manufacturing Company, successor to the Electric Vehicle Company of Louisville, Ky. It may be stated that two models are produced, one of 600 pounds capacity and the other of 1000. The view

Lumber Loading Device Utilized in Connection with White Truck by Well Known Boston Firm.

Digitized by Google

shown is that of the lighter vehicle chassis.

The motor is a General Electric, 60 volts, and is suspended from the main frame just forward of the rear axle. Power is transmitted to the countershaft by a silent chain enclosed in a dust proof case, and final drive is by roller side chains. The countershaft is of the enclosed type, carried on ball and roller bearings. Annular ball bearings are employed in the motor shaft mounting and roller bearings of ample size in the rear wheels.



The battery is mounted on a sub-frame, immediately in front of the countershaft. The vehicle shown is equipped with 30 cells of the lead plate type, while the larger chassis has 50 Edison A-4 cells. This equipment is said to give a mileage of from 40 to 50 under normal service conditions. Should a higher mileage be required, a larger battery equipment may be had upon special order.

The controller is of the continuous torque type, affording three speeds forward and two reverse. Its location is a departure from ordinary practise, in that it is bolted to the dash and protected by a short hood. This part of the system with its wiring is easily accessible by the removal of the light dash panel, which is held in place by four thumb nuts.

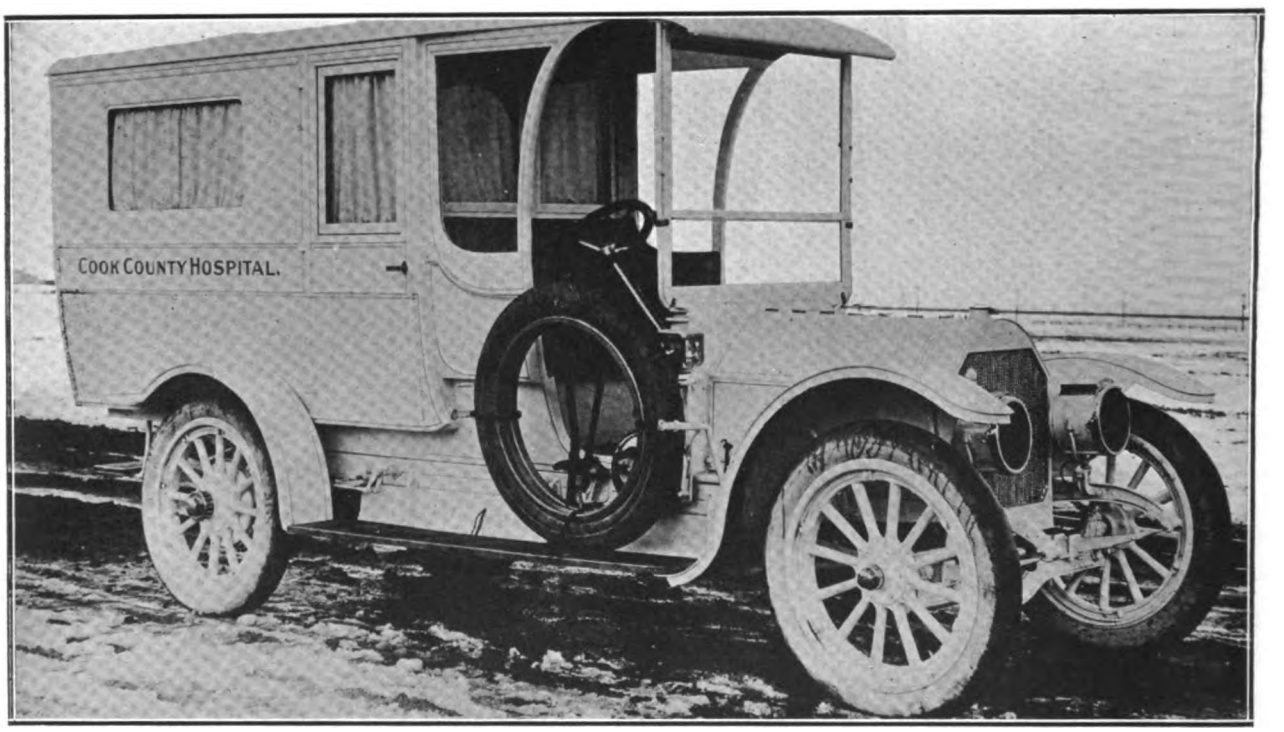
Brakes are two in number and of liberal friction surface. The service member is of the contracting type, operating on drums riveted to the countershaft sprockets and actuated by a pedal through a flexible equalizer. The emergency is of the expanding type, operating on the rear wheels by a latched lever through an evener, which extends through the frame just above the countershaft.

The frame is of channel section pressed steel, with three well gusseted cross members of the same section. Truss rods running from the forward cross member beneath the sub-frame and up to one of the rear cross members, prevent the frame from sagging, and permit a light frame section.

Axles are of I beam section, and the forgings are weldless from end to end. The steering knuckles are of the reversed Elliott type. Springs are semi-elliptic, both front and rear. Wheels are of selected hickory, artillery type, and fitted with solid tires, 34 by 2.5 inches, though pneumatics may be had at an extra cost. Wheelbase is 86 inches and tread standard. A Sangamore ampere-hour meter is attached to the dash. Steering is accomplished through a semi-reversible worm and gear mechanism, and the steering column is raked at an angle of 25 degrees from the vertical, the usual wheel being provided. In the matter of control, the firm has decided upon the left hand location for the driver with the levers in the centre.

Chassis of Kentucky 600-Pound Electric Delivery Wagon, Notable for Accessibility of Mechanism.

MOTOR TRUCK STANDARDIZATION.



Recently the Society of Automobile Engineers appointed the following committee, to consider the matter of motor truck standardization: William P. Kennedy, American Locomotive Company; Eugene F. Russell, Locomobile Company of America; A. H. Ehle, Baldwin Locomotive Works; Bruce Ford, Electric Storage Battery Company; John M. Mack, International Motor Company; P. H. Breed, United States Motor Company; F. W. Trabold, J. H. Williams & Co.; E. R. Whitney, Commercial Truck Company of

Digitized by Google

America; H. F. Donaldson, president, and Coker F. Clarkson, secretary; Robert McAllister Lloyd, General Vehicle Company; W. A. Frederick, Continental Motor Manufacturing Company; Charles B. Whittelsey, United States Tire Company; Charles L. Schwarz, steel manufacturer.

In the preliminary consideration of the matter, it was first decided to attempt to standardize the sizes or capacities of trucks from the purchaser's or user's standpoint, and afterwards to extend the work in the direction of aiding the manufacturers in standardizing design. The next proceeding was to determine the specification of normal load and the overload of trucks from one to five tons, and it was generally decided by vote that each truck should be capable of rendering normal or continuous service under its tonnage rating and have an overload capacity for temporary or emergency service of 25 per cent. of its normal tonnage capacity.

Next, an attempt was made to determine the desirable speeds for various sizes and the following was the result: One-ton trucks, 15 miles an hour; two-ton, 12; three-ton, 10; four-ton, nine, and five-ton, eight.

KisselKar Ambulance Fitted to 50 Horsepower Chassis, in Use by the Cook County Hospital in Chicago.

NEW KISSELKAR AMBULANCE.

In addition to its full line of pleasure and commercial vehicles, the Kissel Motor Car Company, Hartford, Wis., has specialized to a considerable degree in the designing and equipment of municipal service wagons, ambulances, etc. An accompanying illustration presents the new KisselKar ambulance constructed recently for the Cook County Hospital, Chicago.

The interior of the vehicle, which was designed especially for this institution, is equipped with the latest appliances for the care and comfort of the occupants, and all the most modern sanitary features have been incorporated. The exterior is painted white, and is thoroughly in keeping with the use to which the wagon will be put. The best of material has been used throughout and the workmanship is of the highest order.

The chassis is fitted with a four-cylinder, four-cycle, water-cooled motor having bore of 4.875 inches, and stroke of 4.75, rated at 50 horsepower. The cylinders are cast in pairs, and ignition is by a high-tension magneto. The clutch is a leather faced cone member, and the selective transmission provides four speeds forward and reverse. Drive is by shaft. Two sets of brakes are employed on the rear wheels, being of the internal and external contracting type. The wheelbase is 124 inches, and this with well designed springs and large pneumatic tires, makes for easy riding qualities. The shoes are fitted to demountable rims.

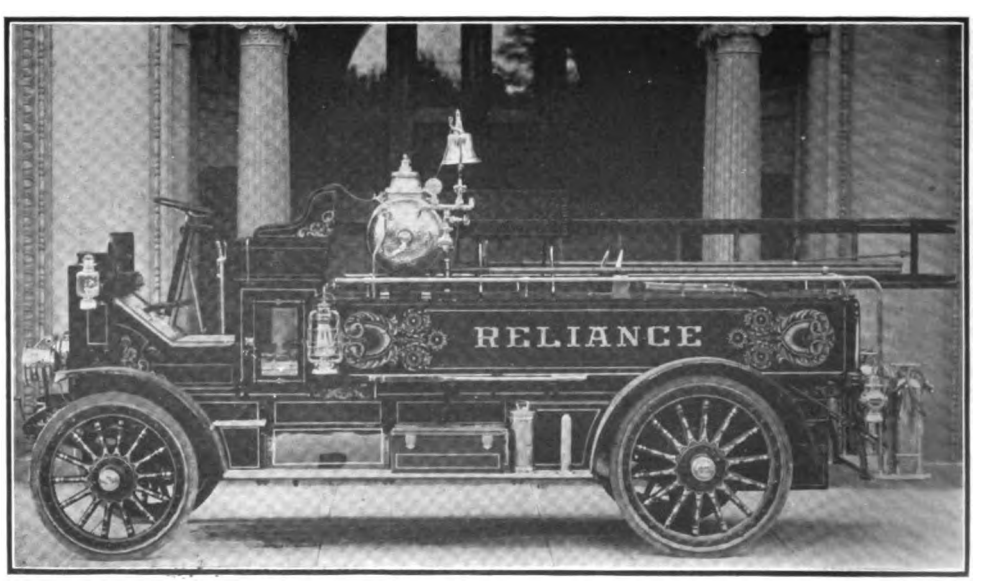
Detroit Electric Delivery Wagon in Grocery Service in Winnipeg, Man.

Car Company, Detroit, in service with the A. Macdonald Company, Winnipeg, Manitoba. The machine has been in use for six months and given the best of satisfaction, despite the fact that it has been compelled to operate some of the time in weather as low as 20 degrees below zero. The battery equipment is 60 Edison cells, on which the machine has averaged 40 to 50 miles a day, even in the coldest weather.



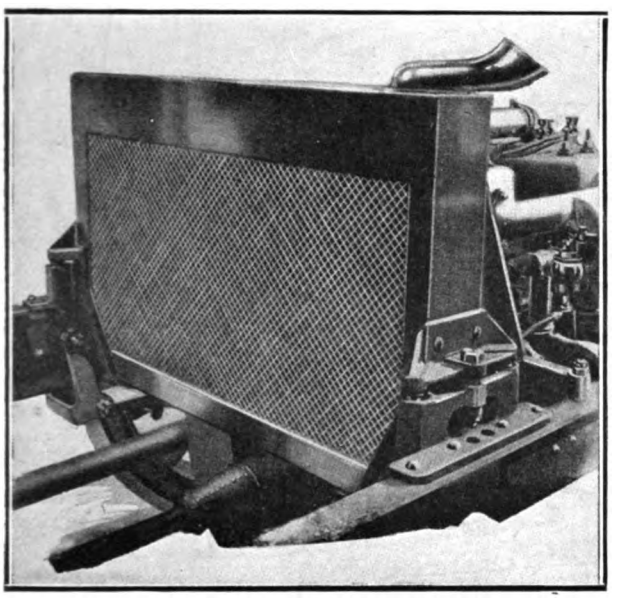
PROTECTING THE RADIATOR.

While nearly all of the American motor truck manufacturers continued to protect the radiator with some form of bumper, the recent shows demonstrated that there is a tendency toward the foreign practise of locating the cooler back of the engine. The most distinctive examples of this are to be found in the Lippard-Stewart, Adams and Universal. In connection with this departure from what may be regarded as standard design in this country, it will prove of interest to note the arguments presented by the makers of these particular vehicles.

The Lippard-Stewart Motor Car Company, Buffalo, N. Y., says: "In placing the radiator at the dash and doing away with the water pump, we have again followed the system in use on high grade foreign cars. As a delivery machine is used mainly in the city, where traffic is heavy, the radiator is in constant danger of damage, if placed in front. If a hole be punched in the radiator, it means that the car is out of service until it can be repaired. By placing ours at the dash, and hanging it in coil springs, to reduce vibration, we practically eliminate another source of trouble. This construction also makes the Lippard-Stewart motor easily accessible for oiling or adjustment, or removal from the car without disturbing other units."

The Adams Bros. Company, Findlay, O., maker of the Adams, utilizes practically the same method of mounting as the Lippard-Stewart, which is shown herewith. The argument used is very similar, being summed up as follows: "To prevent casual injury to Adams trucks, the radiator is placed behind the engine. It is readily filled from either side."

The Universal Motor Truck Company of Detroit, maker of the Universal, carries the matter still further locating the radiator back of the motor and under the seat, where it is cooled by a direct current of air thrown from a Sirocco type fan, contained in the flywheel. Another illustration herewith shows the mounting of the radiator in this machine.



Martin Combination Chemical and Hose Wagon for Department in York, Penn.

Digitized by Google

NEW MARTIN FIRE APPARATUS.

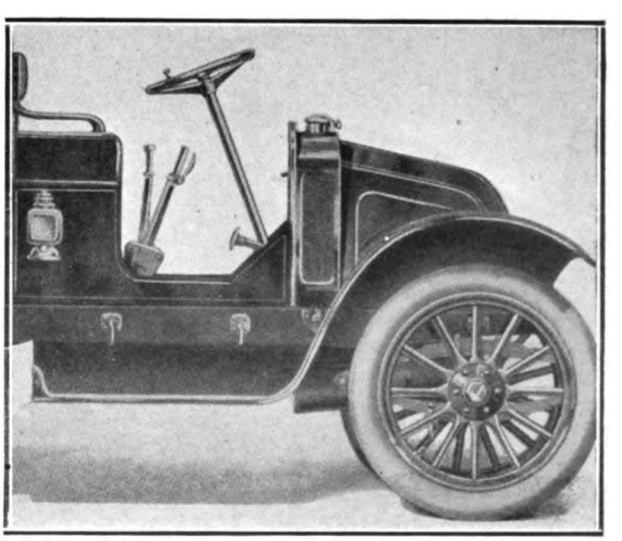
A new combination chemical and hose wagon has been placed in the market by the Martin Carriage

Radiator Mounted Under Driver's Seat on Universal.

Works, York, Penn., a well known maker of commercial vehicles for some few years. As will be noted by the accompanying illustration, the vehicle carries a large chemical tank and hose, as well as the usual fire fighting equipment in the nature of ladders, axes, and other appliances. The body is designed to accommodate a full crew of men.

The chassis is fitted with a four-cylinder, four-cycle, water-cooled motor, with 4.5-inch bore and five-inch stroke. This is rated at 36 horsepower and is located under the seat. Ignition is by magneto with a battery in reserve. A multiple disc clutch is employed, and a selective sliding gear affords three speeds forward and reverse, with direct drive on the third. Final drive is by side chains, and two sets of brakes are utilized, one on the jackshaft and the other on the rear wheels. The springs are semi-elliptic in front and half-platform in the rear. The wheelbase is from 132 to 140 inches, and the tires are solid.

TO AMEND MASSACHUSETTS BILL.



Since the original announcement of the proposed legislation in Massachusetts, seeking to limit the weight of vehicles utilizing the highways in that state, motor truck manufacturers and owners have been decidedly active. A meeting of those interested was held in Boston, Feb. 10, at which steps were taken to secure an amendment to the bill, increasing the weight limit from six to 12 tons. In this amended form, if the legislators take kindly to the suggestion, trucks of five and six tons capacity will be allowed the free use of the highways without a special permit.

There is a strong feeling that the proposed act is much in the nature of class legislation, and that the horsed vehicles were included solely for the purpose of avoiding the question of constitutionality. Another item also has entered into the more recent consideration of the subject, and this has to do with the width of tires on which the heavier loads are carried. While this would have little effect upon the bridge side of the question, it undoubtedly would have a bearing upon the matter of road deterioration. There seems to be every reason to feel that the act will not pass in its original form, although it is expected that some legislation will be adopted with reference to the matter.

PIERCE-ARROW DEMONSTRATION TOUR.

An unusual demonstration trip was undertaken recently by J. E. Cunningham and Fred Bradbury of the J. W. Maguire Company, Boston agent for the Pierce-Arrow worm driven truck, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y. The tour included central and western Massachusetts and Vermont, and proved a decided test for the five-ton vehicle, although it seemed to have no difficulty in completing the schedule as planned.

From Boston the party drove to Worcester, over heavy snow and much ice the greater portion of the way. This continued to Springfield and Greenfield, and in many places sheet ice was encountered, although the truck was able to keep to the road without the use of tire chains. The outward trip ended in Brattleboro, Vt., 163 miles distant from Boston. The running time was 24:18:00, and 39 gallons of gasoline and five pints of oil were utilized.

Inasmuch as there is to be no Prince Henry tour this year, a number of the Continental organizations are planning events of this character. The Imperial Austrian Automobile Club has planned a seven-day endurance test over the Alpine roads for June 16-23. The rules provide that only cars equipped with internal combustion motors are qualified to enter.

The cars must have complete, open, four-seated touring bodies, with hood. All integral parts of the engine must be confined within the bonnet, thus preventing the fitting of exterior pipes. No reserve water tanks on the radiators or elsewhere may be carried, unless such are a part of the standard equipment. The bonnet and the inner dustshield will be sealed at the start. Each machine will be required to carry at least three persons, or two persons and ballast, in addition to the official observer and a specified weight of luggage for him. Time occupied in filling tanks, etc., will be added to the running time.

The route covers 1488 miles, with the following itinerary: June 16, Vienna, Semmering, Tauren Pass, to Spittal; 17, Spittal, Jauffen, Mendal Pass, to Madonna di Compiglio; 18, Madonna di Campiglio, Procene, Rolle, Falzarego, to Toblach; 19, Tolbach, Wurzen Pass, to Trieste; 20, rest day; 21, Trieste to Laibach; 22, Laibach, Ridli Pass, to Graz; 23, Graz to Vienna.

Entries at single fees close May 20, and at double fees, June 5. The chief award is to be the Grand Alpine Challenge cup, given by the club, which will become the permanent possession of the competitor who finishes the runs of 1912, 1913 and 1914 with the best average score.

★

Twenty-eight entries have been made for the Tour de France, which is scheduled to start from Paris, March 1, representing the following makes: Barre, Hurtu, Crespelle, Doriot-Flandrin-Parant, Alcyon, Gregoire, Hupmobile, Corre-la Licorne, F. L., Benz, Ronteix, Luxior, Violette, Ford and Delage.

★

Each year the motorists of Continental Europe spend much time in experimenting with motor sleighs or sledges, although very few of these designs are put to practical use, judging from such information as is received in this country. In some of the northern nations, such as Russia, Sweden and Norway, these vehicles have been utilized more or less during the winter months and with comparatively good success. However, the experimentation is more largely confined to the Swiss mountains, where the results are in the nature of sport rather than utility.

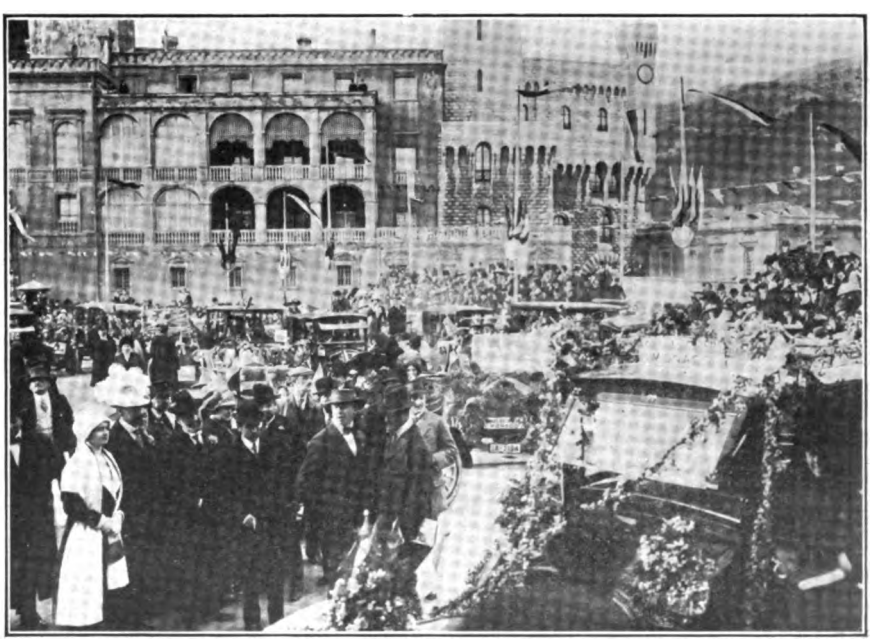
Remisi Motor Sleigh with Novel Driving Arrangement, Recently Tested at Chamounix, Switzerland.

Recently a new vehicle termed a Remizi automobile sledge, was tried out at Chamounix with much success. The machine is presented in an accompanying illustration, and the principal feature is the driving means, which may be considered as entirely new.

Two metal cylinders, around which run spiral plates, are disposed underneath the rear of the chassis. Power is transmitted from

Digitized by Google

the motor by means of a cardan shaft and suitable mechanism, so that the cylinders are made to revolve in opposite directions. In revolving, the spiral plates are caused to dig into the snow and force the runners ahead. It is claimed that speeds up to 31 miles an hour have been attained over hard snow and ice.



★

Switzerland is still passing regulations restricting the use of automobiles. The cantons of Glarus and Zurich have before them orders prohibiting the use of motor vehicles Sunday afternoons and to allow night traffic only during certain hours, except within the city limits of Winterthur and Zurich. As is well known automobiles of every description are excluded entirely from the canton of Graubunden (Grisons).

★

The annual rally of Continental motorists at Monte Carlo, Jan. 28, brought together some 58 cars, although 66 owners entered in the contest from various capitals. Officially, the event was in the nature of an economy run, the highest score going to the cars which maintained an average speed of 15.5 miles an hour. In fact, it was a series of road races, in which nearly all of the competitors tried to cover the intervening distance in the shortest possible time.

Motorists started from Paris, Vienna, St. Petersburg, Berlin, Havre, Boulogne, Brussels, Amsterdam and Geneva at the same time. Twenty-two cars left Paris, one of them being an American Ford. Robert Donocin in a 40 horsepower Gobron drove right through from Paris to Monte Carlo in 24:41:00, or at an average speed of 25.5 miles an hour, only about 40 minutes behind the fastest express train running between the two cities. The Ford averaged 16 miles an hour throughout the entire distance. The only other American car was an E-M-F, which was driven from Vienna, 818 miles, at an average of 10 miles an hour.

Arrival of Continental Motorists at Monte Carlo During the Annual Rally at Monaco.

★

The Imperial Russian Automobile Club will hold its fourth international motor car exhibition in St. Petersburg, early in 1913.

★

A consular officer located in northern Africa has been requested by a leading firm in his district to be placed in touch with an American manufacturer of a low priced, well made automobile, costing the purchaser from $750 to $1500. It is stated that the concern has extensive capital and would like to secure the agency for such cars in this territory. The address may be secured from the bureau of manufactures, Department of Commerce and Labor, at Washington.

★

The first automobile club run ever held in Japan took place early last month, under the auspices of the Nippon Automobile Club. The owners of 37 cars were represented, and the distance covered was nearly 70 miles, from Hibiya Park to the foot of Mount Takao and return. The round trip was made in 3:45:00, and a social stop was made at the turning point.

Fifteen of the cars were owned in Tokyo, while the remainder were from Yokohama. Kihichuro Okura in a 100 horsepower racing machine acted as pacemaker. Three drivers lost their way before getting outside the city limits, but so soon as the country districts were reached the vehicles were all in line. Fully 50,000 men, women and children lined the route throughout the entire distance, and the event took on something of the nature of a national holiday, in consequence.

The result was very similar to a contest covering this distance in America. There was some tire trouble, but practically no accidents. The success of this first venture was such that it already is determined that numerous other runs will be held during the coming season.

★

The three-ton Gramm truck which was shipped from the factory of the Gramm Motor Car Company, Lima, O., to St. Petersburg, Russia, for demonstra-

Digitized by Google

tion purposes last September, has been sold to the Russian government and will be used by the army. For the past two months, the vehicle has been in constant daily service in charge of soldier chauffeurs, and during that time has needed no repairs or adjustments. This is said to be the first American truck to appear in Russia, and now that it has been adopted by the Russian army it is anticipated that a splendid market for American vehicles will result.

★

The Saskatchewan Motor League was organized recently at Regina, the objects being to secure reasonable automobile legislation, promote good roads and seek the enforcement of existing laws. Among the first duties of the official board will be that of working in conjunction with the legislators for the passage of the proposed act regulating the speed and operation of motor vehicles.

The following officers have been elected: President, R. Loney, Moose Jaw, first vice president, Sheriff Calder, Saskatoon; second vice president, Sheriff Cook, Regina; third vice president, E. Williamson, Indian Head; secretary-treasurer, H. V. Bigelow, Regina; executive committee, R. Loney, J. C. Coe, Moose Jaw; Sheriff Calder, W. H. Coy, Saskatoon; H. V. Bigelow, Sheriff Cook, Regina; E. Williamson, Andrew Dickson, Indian Head.

★

The annual meeting of the Ontario Motor League held in Toronto last month, indicated that the affairs of the association were in excellent condition. Substantial progress and growth were noted in the report of President Paul J. Myler. Much time and effort has been expended upon legislative matters, and it was announced that satisfactory results had been obtained for the most part. The election of officers resulted as follows:

President, F. E. Mutton; first vice president, W. G. Tretheway; second vice president, Oliver Hezzelwood; secretary, Main Johnson; honorary secretary, E. M. Wilcox. Mr. Wilcox has been secretary of the league since its organization five years ago, and has worked untiringly for its success. Largely through his efforts the annual shows in the Dominion have become of immense importance to the industry both at home and in the States. At his own request he was relieved of the active work, because of the pressure of private business, but he will take much the same interest in the league's progress.

★

The minister of agriculture in Uruguay is organizing a motor plow competition, which will be held some time during the coming summer.

★

According to returns from 10 different European countries, based upon the licenses and taxes collected, there is a total of 223,882 motor cars owned and operated in these countries, distributed as follows: United Kingdom, 75,600; France, 64,209; Germany, 53,000; Belgium, 11,600; Italy, 6300; Austria, 5900; Switzerland, 3670; Sweden, 2950; Luxemburg, 153.

★

Good roads appropriations will be increased materially in western Canada during the 1912 season, if present reports may be accepted. Twenty-eight representatives of Canadian highways associations recently waited on Thomas Taylor, minister of public works at Victoria, B. C., who told them that a big appropriation would be made by the provincial government for the construction, improvement and maintenance of highways throughout British Columbia.

Hazelton, about 40 miles from the Alaskan boundary, is more than ever anxious to secure a portion of the roads appropriation, since the arrival of P. E. Sands in the Flanders car from Seattle, Wash. Large deposits of coal have been discovered in this immediate vicinity, and improvement of the highways will permit of working these mines at a decided profit.

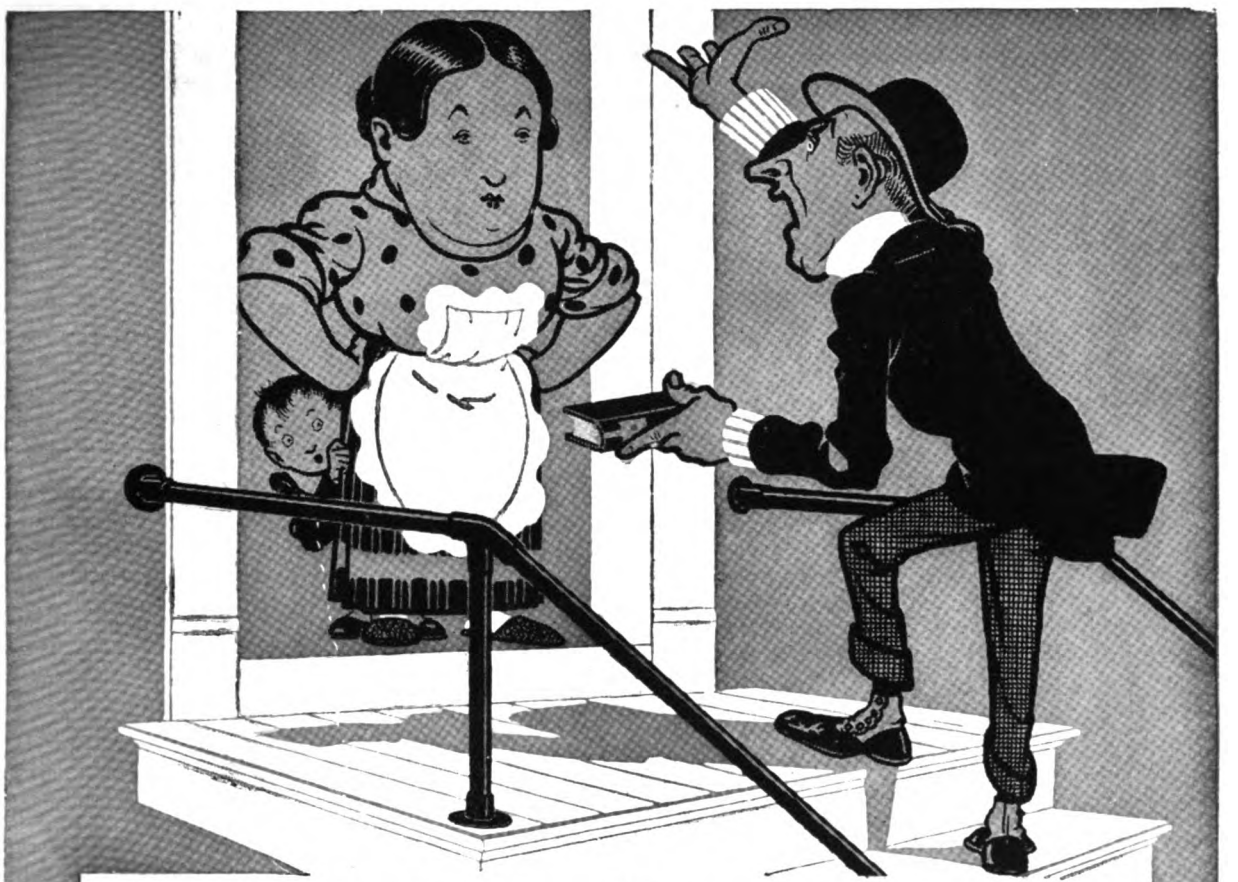
★

Calcutta furnished 120 cars for the Durbar festivities at Delhi, India, among which were 25 Fords (American), supplied by Kilburn & Co. The other concerns represented were: Taxicab Company with 40; T. R. Pratt & Co., with 30, and French Motor Company with 25.

★

The committee which organized the agricultural motor trials at Melun and Laon, France, last year, has decided to hold another competition, Feb. 25-29. Additional tests of a similar character will be held at Bourges, Sept. 26-Oct. 6.

★



The city of Wellington, New Zealand, has been experimenting with wood block pavement, and has come to the conclusion that it is more economical than the older method of utilizing crushed stone. The new pavement costs about $4.38 a square yard, as against $1 to $1.25 for the older, but it is estimated that it will withstand the heaviest traffic for at least 20 years, whereas the crushed stone has demonstrated that it will last no more than three or four. The blocks are made from jarrah wood, imported from western Australia, and are laid on a concrete foundation. The only care is an occasional coating of tar, sprinkled with sand.

It is intimated that American manufacturers might find a market in New Zealand and Australia for motor driven street sprinklers and sweepers, although this subject has been given only casual consideration as yet.

DINGLEY IN 500-MILE RACE.

Bert Dingley will drive a Simplex racing car, entered by W. H. Carlson of Los Angeles, Cal., in the 500-mile race on the Indianapolis speedway, Memorial Day. He also will drive this car, a 50 horsepower model, in the road races at Bakersfield, Cal., May 4.

We Don't Know How to Get More Than Our Goods are Worth

We don't *over-pay* when we buy and we don't *over-charge* when we sell.

We have always credited the *other man* with just as much common sense and just as much commercial judgment as we possess.

We had a *business* training before we had a *speedometer* training and it taught us that the way to make a *lot of money* is to make a *lot of goods* and a *very little* on each sale.

So we aimed at *output* from the very outset.

We built a *factory* that would give us output.

We believed that the automobile business would *grow* and that there was no *risk* in planning to grow with it.

We installed the *finest* machinery that money could buy, and when we could not find it good enough we had it made special.

We calculated that the day would come when speedometers would *have* to be *sold* at a *normal margin*, and when we found the exorbitant profits that were being charged, we figured that the time to start figuring down to bedrock was the *first day* that we went out for orders.

That's why *four cars* out of five carry *Stewart Speedometers*. Eighty per cent of car owners are so level-headed that they make sure they are getting the utmost for their money.

If the *Stewart* were not more accurate—were not built *stronger*, were not more *reliable*—somebody else would be selling *four* speedometers to our one.

There's no *test* like the test of *sales*.

Magnetic principle—jewel bearings—wearing parts hardened and polished—open dial—large figures—easily read—absolutely accurate—100,000-mile season odometer—100-mile trip register, can be reset to any tenth of a mile—guaranteed for five years—strongest flexible shaft drop forged swivel joint—noiseless gears.

IXION TWO-CYCLE MOTOR.

A two-cycle, single-cylinder, water-cooled motor which presents an unusual feature inasmuch as no valves are utilized in connection with the induction of the mixture, is presented in the Ixion, an English product, depicted at Fig. 1. The mixture from the carburetor obtains access to the crank chamber or base of the motor by means of a crankshaft port, as will be noted in the drawing. The terminus of this port registers with the opening of the inlet lead when the piston is making its upward stroke.

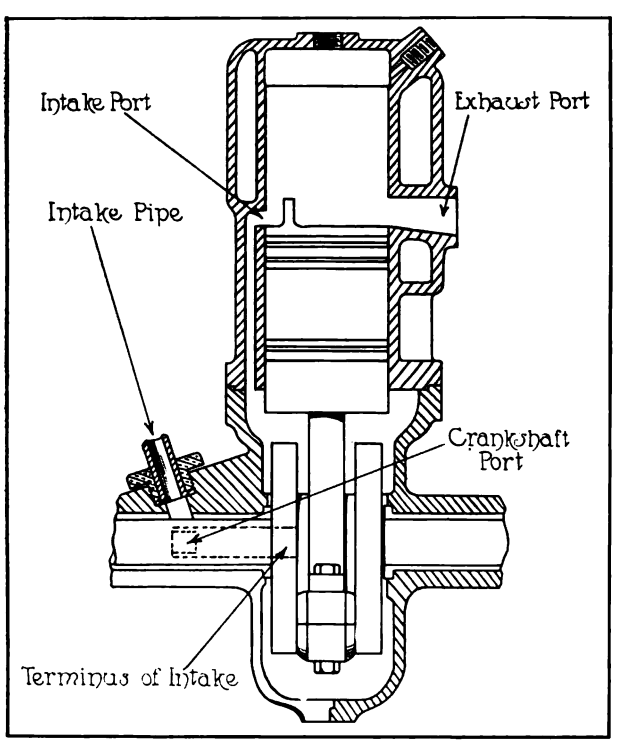

Fig. 1—Two-Cycle Motor the Design of Which Dispenses with Valves in the Induction of the Mixture.

In other respects it is similar to the ordinary two-cycle motor, as the mixture is drawn into the crankcase and compressed to some extent by the downstroke of the piston. The gas escapes from the engine base by an opening formed in the walls of the cylinder, and enters the latter by the intake port which is uncovered by the piston in its movement. The piston head is fitted with the usual baffle plate for deflecting the gas, and the exhaust passes out through another port.

LOCATING CYLINDER CRACKS.

Sometimes a flaw in a cylinder casting will allow a slight amount of water to percolate into the combustion chamber, and when the cracks are not perceptible to the naked eye they may be located by using pressure. The water outlets should be stopped up with one exception, which is coupled to a pipe from the steam vulcanizer and the steam turned on at about 20 pounds or so, when the leak will be detected readily. This may be reached by cutting away the water jacket, and the latter repaired by welding.

GLASS CEMENT.

To cement glass, melt some resin and stir in calcined plaster until reduced to a paste, to which add boiled oil of a sufficient quantity to bring it to the consistency of honey. Apply warm. An alternate method is to mix in the following proportions: Melted resin 180 parts, burnt umber 30 parts, calcined plaster 15 parts, and boiled oil eight parts.

INSTALLING STORAGE BATTERIES.

One of the chief causes of injury to storage batteries is the jolting they receive when the car is passing over rough roads. The cases containing the cells frequently become strained or chafed, allowing some of the solution to leak out, or the active material in the plates becomes dislodged. These troubles may be overcome when fitting battery boxes to the machine

Digitized by Google

by making the container larger than the battery and forcing between the latter and the walls of the box small air tight rubber balls, such as children play with. These will hold the battery in place firmly and absorb all shocks.

PISTON RING DEVICE.

Removing and fitting piston rings requires care upon the part of the workmen as the members are fragile and broken easily. Various devices are made for this work and these range from strips of metal to forms of clamps. A piston ring manipulator has been brought out by an English concern, and it is claimed for the device that rings may be removed and fitted easily without liability of damage, and that the work is much simplified. The instrument is manipulated by turning a wing headed screw, illustrated at Fig. 2 A, and expansion is brought about by a similar operation, the screw drawing up a grooved circular disc which in turn bears upon the inner sides of the sloping toggles. The latter are in duplicate and secured, as shown, to the outer plates, so keeping these vertical and parallel.

UTILIZING OLD HACKSAW BLADES.

In the average repair shop broken hacksaw blades are consigned to the scrap heap although the members may be new and may have snapped near the end, frequently at the first cut or two of the tool. While saw frames are adjustable they usually will not take the broken members, and there also is no provision for clamping the blade.

At D is shown an easily made device for utilizing the broken blades. It consists of a frame made of .75-inch brass or copper tube which is bent into shape as shown. The under corners are flattened to hold the blade, and all sharp edges are smoothed up. Two small set screws are placed in convenient positions to hold the blades.

FILING STEPPED KEYS.

In filing stepped keys for an accurate fit, sometimes it is difficult to obtain correct alignment. At B is presented a jig for this kind of work and the loose top may be adjusted to guide a file as required.

SECURING HAMMER HEADS.

Broken hammer handles are not uncommon, and in fitting a new shaft the following method is employed by a repairman: Turn the end to be inserted to a driving fit, saw a fairly long V slot in it lengthways, and make a wedge that will fit snugly. Next bend a piece of .03125-inch sheet iron to fit over the wedge, and punch a few holes in it with a centre punch, making the outside edges rough as shown at C. Place the sheet iron in the slot, insert wedge and drive both in firmly. It is a good plan to soak the wooden handle in water a few hours before attaching the hammer.

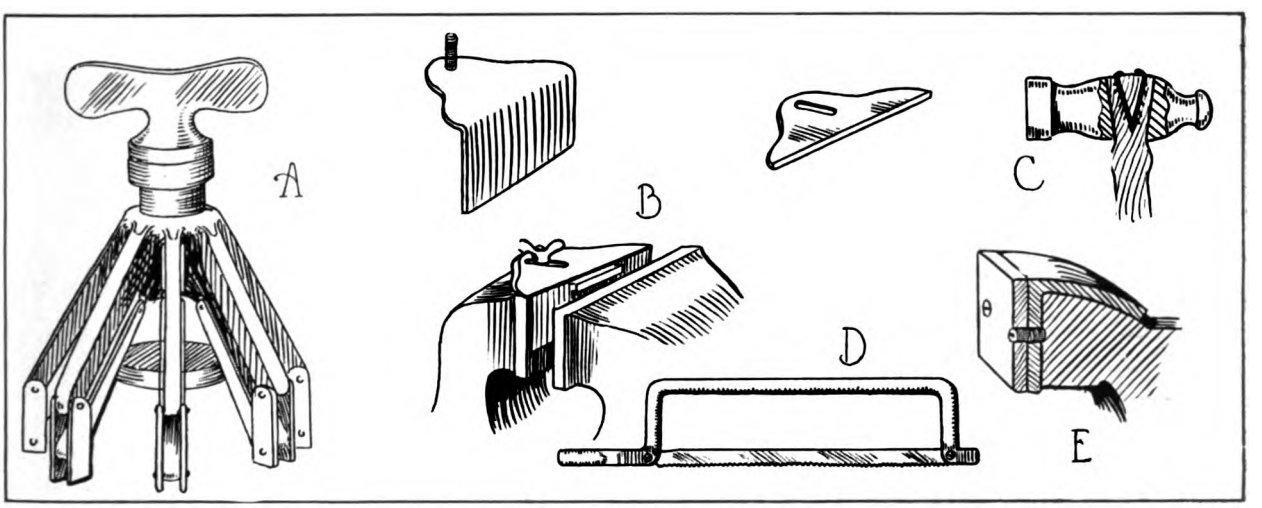

Fig. 2—Some Repair Shop Hints: A, Piston Ring Manipulator; B, Jig for Filing Stepped Keys; C, Wedge for Fitting Handle to Hammer; D, Hacksaw Frame Made of Tubing to Take Short Blades; E, Substantial Vise Clamp.

SOLDERING ALUMINUM.

Small surfaces of aluminum may be soldered by the use of zinc and venetian turpentine. Place the solder upon the metal together with the turpentine and heat very gently with a blowpipe until the solder is entirely melted. Large surfaces cannot be soldered easily because the solder will not flow gently.

Another method is to clean the aluminum surfaces by scraping, and cover with a layer of paraffine wax as a flux. Then coat the surfaces by fusion, with a layer of an alloy of zinc, tin and lead, preferably in

Digitized by Google

the following proportions: Zinc five parts, tin two parts, lead one part. The metallic surfaces thus prepared may be soldered together either by means of zinc or cadmium, or alloys of aluminum with these metals. Any good soldering preparation will answer the purpose.

A good solder for low grade work is the following: Tin 95 parts, bismuth five parts. A good flux in all cases is either stearin, vaseline, paraffine, copaiva balsam, or benzine. In the operation of soldering, small tools of aluminum should be used, which facilitate at the same time the fusion of the solder and its adhesion to the previously prepared surfaces. Tools made of copper or brass should be avoided as they form colored alloys with the aluminum and the solder.

A SIMPLE VISE KINK.

Frequent use of the vise results in the knobs on the handles becoming roughened and when considerable filing is done the hole fills with chips and dirt. This can be prevented by fitting a couple of rings, such as come on mineral water bottles, and placing them just under the knobs of the vise handle.

STURDY VISE CLAMP.

Vise clamps which present a square edge for holding small work and which wear considerably longer than the usual members, may be made from a piece of .1875-inch sheet iron by hammering them to shape in the tightened vise. Next rivet on the inside face of the clamps a squared piece of brass and copper, as shown at E, and trim off the edges with a file.

CARE OF GRINDING MACHINES.

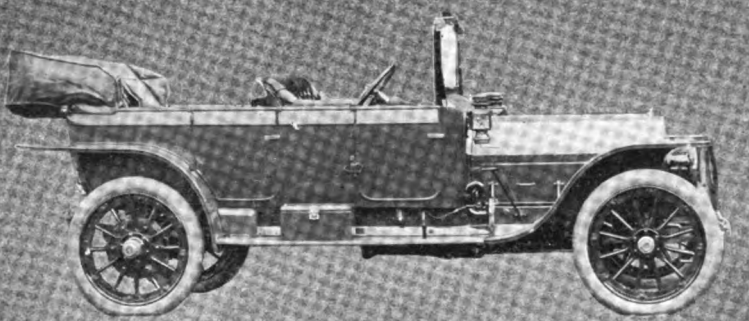
The durability of a grinding machine depends largely upon the care of the operator, and will soon become unreliable if not looked after, no matter how well it may have been constructed. All wearing surfaces should be guarded carefully and kept well supplied with oil. The use of a good quality of machine oil is recommended in preference to cheap grades. Oil holes which are closed with screws usually have the words "oil hole" stamped around them, and care should be used when inserting lubricant to prevent dirt and emery grit from entering the oil.

Grinding machines should be kept as clean as possible and care should be taken that the bearings do not gum up. When opened or exposed for any purpose whatever, they should be wiped carefully before being closed again to eliminate any grit that may have lodged upon the surfaces. The spindle boxes should be clean when assembled and before tightening the caps the oil space should be filled with a good lubricant, not lard oil, and the wheel turned slowly while first one cap and then the other is screwed down until quite tight. The felt that supplies the oil to the spindle also should be kept clean.

Water should always be used on such classes of work as are affected by a change of temperature caused by grinding. It also should be used upon work revolving upon centres, as in this instance a slight change in temperature will cause the wheel to cut on one side of the piece after it has been ground apparently round. In very accurate grinding, water is especially useful, for the exactness of the work will be affected by a change in temperature which is not perceptible to the touch. It is well to use the water over and over again, as there is less difference between the temperature of the fluid and the work than if fresh water be used. Work that will grind smooth with water will often develop minute vibrations when ground dry. There is, apparently, a rapid fluctuation of temperature, which causes the work to approach and recede from the wheel very rapidly, thus leaving a rough or mottled surface.

Emery wheels always should be kept true. This can be done easily by using a diamond tool, known as the black diamond or carbon point, held in the hand or in the fixture furnished with the machine. A new emery wheel should be started slowly and trued gradually. In mounting this, elastic washers always should be placed between the wheel and the flanges. Sheet rubber is recommended for this purpose, but soft leather will answer. In some cases manufacturers attach thick, soft paper washers to each side of the wheel. When this is done it is all that is necessary. A satisfactory emery wheel is an important factor in the production of good work. Too much, however, must not be expected of one wheel. A variety of shapes, sizes and grades is necessary for the grinding machine, the same as are necessary to obtain the best results from the lathe or milling machine.

PRESERVING INNER TUBES.



A repairman with considerable experience in storing machines recommends the following treatment for keeping the spare inner tubes soft: They are taken from the car and immersed in hot water for about 10 minutes, then removed and carefully dried. Another method, which is said to prevent the deterioration of the rubber is to utilize a solution of alcohol and turpentine. The latter is poured into the alcohol, and when applied to the tube the spirit will evaporate, leaving a thin protective coating of turpentine. Tires may be treated similarly.

NO CHANGE IN CALLAN LAW.

Secretary of State Lazansky of New York said recently that he would make no recommendation for a change in the present law, believing that it should be given a fair trial before making any amendments.

Inglis M. Uppercu, manager of the Cadillac Motor Car Company of New York City, has become the head of a manufacturing concern which will produce the Boland biplane, recently invented and flown with success by Frank E. Boland of Rahway, N. J. It is understood that the plant will be located in New Jersey. Boland, who is shown at the wheel in the accompanying illustration, not only designed the machine but the power plant as well.

The Boland biplane has no tail or rudder, being chopped off immediately behind the main planes and the propeller. The elevator is in front. Steering is accomplished by a triangular device termed a jib, two

Frank E. Boland Flying the New Boland Biplane at Mineola, L. I.

of these being fitted on each side between the wing extremities. All the controls are concentrated in a wheel, which is handled exactly like an automobile steering wheel.

The principle of the jib is as follows: Shifting it on its diagonal hinge banks the machine, and makes it turn to whichever side the shift has been made. Whenever a tendency to tip to one side is noted, a corresponding change in the jib restores an even keel, immediately. It is claimed that it is possible to make much more acute angles than have been accomplished with other designs.

The motor is an eight-cylinder, four-cycle, V shaped unit, capable of developing a speed of 60 miles an hour.

For the second time the American Continent had been crossed by aeroplane, when Robert G. Fowler alighted at Moncrief Park, Jacksonville, Fla., Feb. 8. The first transcontinental flight was accomplished by Calbraith P. Rodgers in a Wright biplane. Fowler's machine was of the same make, although it was fitted with a Cole automobile engine, made by the Cole Motor Car Company, Indianapolis, Ind.

It will be remembered that Fowler left San Francisco, Cal., Sept. 11, bound for New York, but found the air current at Emigrant Gap too powerful for his machine, although he made a strong fight for a number of days. He started a second time from Los Angeles, Oct. 21, and met Rodgers on the latter's western trip in Arizona. He covered 1700 miles in 18 flying days to Houston, Tex., arrived in New Orleans, Dec. 31, left that city Jan. 4, and arrived in Brantley, Ala., Jan. 20, having flown but five days in that time on account of storms.

Although the Harvard Aeronautical Society has announced its intention of not holding any further aviation meets at Squantum, Mass., it is stated that a series of competitions has been arranged for this flying field under private management, June 29-July 7. It is understood that the meet will have the sanction of the Aero Club of America, and that the following aviators will be among those who will take part: Lincoln Beachey, Charles Willard and three other Curtiss flyers; Miss Blanche Scott, Miss Mathilde Moisant, Miss Harriet Quimby, and at least two operators of Wright machines.

The Burgess Co. & Curtis, Marblehead, Mass., maker of the Burgess-Curtis and Burgess-Wright biplanes and hydro-aeroplanes, is at work on three new types of military machines in conjunction with army and navy experts. Evidently, this well known concern is to depart materially from its former designs in these craft.

The first type is to be a high speed monoplane, although but little additional information is available.

Digitized by Google

Experiments have been made with a view to determining whether the revolving Gnome or the Renault engine will be utilized.

The second machine is to be a biplane, but with special ability for carrying heavy weight. This also will be equipped with a foreign motor of either 50 or 70 horsepower, giving a speed of 40 to 50 miles an hour while carrying 450 pounds in addition to fuel, water and other supplies.

The third is to be a special navy hydro-aeroplane. The specifications call for a machine that can be taken on board or launched from a ship with ease, and at the same time will permit of being stowed away compactly between decks and quickly assembled.

Announcement is made by the Aero Club of America that the Wright Company, which holds the Wright patents, has granted permission for the use of any and all foreign machines during the international meet of 1912, and particularly during the race for the International cup. It is anticipated that this information will be welcome news to foreign aviators, and that many will make entry who otherwise would have refrained from doing so.

Two German army aviators flew from Doeberitz, near Berlin, to Hamburg, a distance of some 150 miles, without making a landing and at a speed of 66 miles an hour, according to a recent dispatch from the latter city. This speed is a trifle better than that made by Maurice Tabuteau at Pau, France, in January, when he covered 155 miles without alighting at 65.5 miles an hour. Of course, Tabuteau's record was made over a closed circuit, and probably will remain as the official speed mark.

Jules Vendrines, the noted French aviator, has been covering a lecture tour throughout France, his subject being "Aviation," and as becomes a man of his profession, he has been making the journey by aeroplane. Utilizing his Deperdussin monoplane, he flew from Pau to Toulouse, where he filled his first engagement, thence to Castelnaudray, Marseilles and Carcassonnee, at each of which places he was fortunate in not being obliged to disappoint his audience on account of weather conditions.

The first Japanese biplane to be constructed is shown in an accompanying illustration. Recently, a monoplane was brought out in that country, and gave decided satisfaction. The machine under consideration here was designed and built by Baron Schigueno, and is said to have been sold to the Japanese army.

First Military Biplane of Japanese Construction, Built by Baron Schigueno for the Japanese Army.

It is a military biplane, in every sense of the word, and is expected to carry at least one passenger, beside the operator.

In the main, it differs but slightly from accepted standard design as exemplified by a number of French machines although its construction is of steel tubing throughout. The upper main plane has a spread of 29.5 feet, while the lower has but 19.6 feet. The width is about six feet. It will be noted that the trailing edge is more or less flexible, although it is impossible to go into minute details, because of the limited information at hand.

The weight of the complete machine, minus the operator, is 660 pounds. The power plant is a Gregoire Gyp, rated at 30-40 horsepower. The original tests were made in France, where the biplane was constructed under the direction of Baron Schigueno, and it is said to have performed very creditably.

Digitized by Google

Baroness de la Roche, the first woman aviator, who was so severely injured in an accident at Rhiems, France, in July, 1910, that it was feared she never would be able to walk again, to say nothing of flying, was a passenger with Rene Simon in his new Bleriot monoplane over the city of Paris last month. It will be remembered that the Baroness was flying her Voisin biplane near the ground when Lindpainter in a Sommer flew over her so closely as to set up counter currents of air which dashed her machine to earth before she could right it. One of the results of the accident was the establishment of new rules by the Federation Aeronautique Internationale, defining the distance which must be maintained between two machines in flight. It is not announced whether or not Baroness de la Roche will resume the operation of flying machines.

Mail advices from France give the exact figures of the new records secured last month by Leon Bathiat in a Sommer monoplane at Douzy. The old marks were set earlier in the month by Jules Vendrines in a Deperdussin monoplane. Both sets of figures are given below:

Distance		New Record	Old Record
Kilos	Miles	Bathiat	Vendrines
10	6.2	4:08.2	4:13.4
20	12.4	8:13.2	8:26.6
30	18.6	12:25.2	12:40.6
40	24.8	16:33.2	16:53.0
50	31.0	20:43.2	21:04.0
100	62.1	41:29.6	41:56.8

Additional information concerning the proposed aerial tour for the Prince Henry trophy over the upper Rhine circuit in Germany this year, indicates that an effort will be made to limit the speed of the machines. No engine of more than 100 horsepower may be fitted, and each competitor must be accompanied by a passenger.

The first hydro-aeroplane meet ever held will take place at Monte Carlo, Monaco, March 24-29. At present it does not appear that there are sufficient machines of this type being made to warrant the holding of such contests, but the idea seems to be to inspire more attention to this subject. It is understood that military and navy authorities are much interested in the subject, and it is hoped that several constructors who have not given the matter consideration in the past will bring out hydro-aeroplanes at this time.

Louis Paulhan, who has done very little flying during the past two years, except when it has appeared necessary to try out a new machine of his construction, has made entry and will fly a Curtiss hydro-aeroplane, made in America. The only other entrant thus far is Eugene Collieux, who will operate a Voisin canard. It is possible that America will be still further represented by Hugh Robinson in a second Curtiss machine, inasmuch as he is at present at Nice, where he has been giving demonstrations.

A. V. Roe of England, who will be remembered as having taken part in the first Harvard-Boston meet at Squantum, Mass., in 1910, although at that time he was demonstrating his Roe triplane, which was discarded soon afterward for the Avro biplane, has brought out the first Bleriot hydro-aeroplane. This machine consists of an Avro biplane to which has been fitted a pair of floats under the forward end of the fuselage and two smaller floats near the tips of the lower main planes. E. W. Wakefield has been giving the new machine several successful tests at Lake Windemere, and an effort will be made to interest the British naval officials.

Jan. 27 being the birthday of Kaiser Wilhelm of Germany, he announced a prize of 50,000 marks to be awarded the maker of the best aviation motor in Germany previous to his next birthday. The victor will be decided by a commission consisting of representatives of the Imperial Automobile Club, Imperial Aero Club, Association of German Aeroplane Manufacturers, Charlottenburg University, and the ministers of the interior, navy, army and public instruction.

Louis Bleriot has produced another new Bleriot monoplane, this being known as Type XXVII. It was given its initial trials at Etampes, France, last month, and performed so satisfactorily that Rene Barrier has purchased one to use on his forthcoming American tour. The new machine is denominated a "Baby" Bleriot. The fuselage is entirely covered, and with a 50 horsepower Gnome engine is said to be able to attain a speed of 80 miles an hour.

Frank Coffyn made a number of flights over, on and in the Hudson river at New York City early in the month, utilizing a Wright biplane with hydroplane attachments. This machine, or at least the hydro-aeroplane feature, was constructed in the shops of Russell A. Alger at Detroit, and is believed to be the first Wright biplane to be thus equipped. It seemed to matter little whether the aviator was driving it through the open water, over frozen ice or in the air, and Coffyn was satisfied that the new aerial craft was a decided success from every viewpoint.

Clifton O. Hadley in a Baldwin "Red Devil" biplane raced Fred Koenig in a Mercedes automobile from New York City to Tarrytown, Feb. 12, the motor car running over the ice and the aeroplane in its natural element. The latter won easily, and later Hadley raced with the Empire State Express for a considerable distance, arriving in Tarrytown ahead of both of his competitors.

Following the example set by the Connecticut Legislature last year, Senator McManus has introduced a bill in New York for the licensing of aviators in that state. Previous to registration the applicant must be examined under supervision of the secretary of state.

Oct. 5—Fairmount Park race, Philadelphia, Penn.
Oct. 7-11—Reliability run, Chicago, Ill.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

MASSACHUSETTS' LEGISLATIVE PROGRAMME.

No less than 15 proposed amendments to the motor vehicle laws of the commonwealth are before the Massachusetts Legislature for action at the present session. Perhaps the most important is that limiting the weight of vehicles using the highways and bridges, although this is so worded that it does not become an amendment to the motoring law. Some of the others may be outlined briefly as follows:

Requiring all owners of motor cars to file a bond of $5000 as security for any judgment obtained against them for injuries caused by the operation of their cars; requiring motor cars to be run at all times at such speed as to avoid accidents; making owners responsible for all accidents caused by their cars; adopting a uniform signalling device; eliminating the eight miles an hour clause with reference to approaching curves and corners; limiting the size of the top or cover of a motor vehicle unless it is of a certain color; providing for a physical examination of all applicants for licenses; arranging the gearing of motor cars so that they cannot be operated at a speed greater than 30 miles an hour.

ARMY TRUCKS ON ENDURANCE TEST.

Three army motor trucks left Washington, D. C., recently on a 1500-mile endurance run to Fort Benjamin Harrison, Indianapolis, Ind. The route lay through the following cities: Richmond, Va.; Raleigh and Charlotte, N. C.; Atlanta, Ga.; Chattanooga and Nashville, Tenn., and Louisville, Ky. The machines were operated by soldiers and each carried a load of 3000 pounds.

WITHDRAWS INSURANCE ORDER.

Urgent protests from the motorists of St. Louis and Kansas City have induced Supt. Blake of the insurance department in Missouri to withdraw his somewhat drastic order prohibiting insurance companies from writing liability business in that commonwealth. It was pointed out that an uninsured automobile is not only a constant liability to the owner, but imposes unnecessary hazard upon persons who may be injured accidentally by its operation.

DECATUR TRUCK TO MOVE.

A dispatch from Decatur, Ind., announces that the Decatur Motor Car Company, maker of Decatur trucks, will remove to Grand Rapids, Mich. It is understood residents of the latter city have promised to take $100,000 worth of stock in the concern, providing the business is removed as stated.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

THE TRANSCONTINENTAL OAKLAND.

E. V. Shaw and Clarence B. Partridge of Augusta, Me., left that city Jan. 1 at 1 in the afternoon bound for Los Angeles, Cal., in a 1911 40 horsepower Oakland car, made by the Oakland Motor Car Company, Pontiac, Mich. The machine already had been driven more than 46,000 miles, and this trip was undertaken largely as a matter of pleasure, although incidentally, when it is completed the total mileage will have been increased by some 4000.

Six inches of snow had fallen the night previous to the start, and proved something of a foretaste of what was in store for the party before Boston was reached. After spending some little time at the show in New York City the Oakland left for Washington, St. Louis and Kansas City, where the old Sante Fe trail was taken. When last heard from the party was in Galveston, Tex., and had made an average of approximately 140 miles a day.

E. V. Shaw and Clarence B. Partridge of Augusta, Me., on Transcontinental Tour in 40 Horsepower Oakland Car.

The car is fully equipped for touring purposes, particularly at this season of the year. A unique canvas canopy with drop curtains provides sleeping accommodations, which are expected to be needed while travelling through Arizona and New Mexico. Baggage boxes on either side of the tonneau make it possible to attach a slat bed. Shovels, axes, etc., complete the touring equipment.

At Galveston provision was made for crossing the 600 miles of desert in Arizona, although the necessarily increased quantities of water, gasoline and supplies were not to be taken on board until later. The method of return will be decided upon after arrival at Los Angeles. The accompanying illustration presents the party en route.

BURMAN TO DRIVE CUTTING.

Announcement is made that Robert Burman, who holds the world's straightaway record, made in a Benz at Daytona, Fla., last year, will be at the wheel of a Cutting car, made by the Clarke-Carter Automobile Company, Jackson, Mich., in the 500-mile race on the Indianapolis speedway, Memorial Day.

CHURCH-FIELD ELECTRIC CARS.

Two hundred and forty acres of land have been acquired at Wyandotte, Mich., by the Church-Field Motor Company, on which will be erected a plant for the manufacture of Church-Field electric cars. This model was first seen at the recent Detroit show and made a decidedly favorable impression.

E-M-F OWNERS FOR ROAD IMPROVEMENT.

Those who are familiar with road conditions in Alabama, Louisiana, Mississippi and lower Missouri appreciate that it practically is an impossibility to operate any but the sturdiest automobiles in some districts except in the best of weather. In an effort to stimulate interest in the motor car and at the same time establish passable through routes, a large number of E-M-F and Flanders owners have banded informally under the leadership of Maj. Lee Richardson, representative of the Studebaker Corporation in Vicksburg, Miss.

It is Maj. Richardson's idea that the key to the situation lies in the levee which stretches along either bank of the Mississippi river from the northern states to the Gulf. High, dry, and of ample width, he believes that it would be possible to utilize this for through travel, without in any way affecting the rights of the United States government, which exercises supervision over these extensive embankments.

Some improvement will be necessary, and Maj. Richardson proposes a grand E-M-F and Flanders tour over the route in the near future to determine just what work of this nature must be done. He urges motorists to write their congressmen and senators to secure an appropriation sufficient to construct a suitable highway on either bank of the river.

PRESIDENT TO USE A VELIE.

When President W. H. Taft visits Boston to attend the dinner of the Charitable Irish Society on March 18 he will have a Velie six-passenger car placed at his disposal by Harold D. Bornstein, manager of the Boston branch of the Velie Motor Vehicle Company, Moline, Ill.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Next Year's Shows.

Motorcycle manufacturers and riders are considering the show proposition with considerable interest just at present. It is well known that the only exhibitions in which the members of the Motorcycle Manufacturers' Association now take part are those which are held in New York and Chicago. Until last year they were represented at Boston. It is possible that they will not be seen in connection with the automobile displays in the other large cities next year.

The space assigned to the two-wheeled mounts at the Madison Square Garden this year was very acceptable, but at the Coliseum they were classed with the motor trucks as was the case in both cities last season. With the announcement that there will be but one display in New York in 1913, the motorcycle makers are beginning to wonder what plans will be made for their benefit.

Members of the Los Angeles Motorcycle Club on One of Their Recent Runs in the Orange Country.

So far as Chicago is concerned there will be decided objection to exhibiting the mounts in connection with the commercial vehicle show. At present there is a movement on foot to hold a separate show for motorcycles, under the joint auspices of the Motorcycle Manufacturers' Association and the recently organized Chicago Motorcycle Dealers' Association. Whether or no this plan will materialize and extend to take in New York and other cities remains to be seen. It is morally certain that there will be no Chicago motorcycle show during the commercial car display in 1913, whatever the final outcome of the present discussion relative to a separate exhibition.

Manufacturers on Cut-Out.

Action was taken with reference to the use of the muffler cut-out at the meeting of the Motorcycle Manufacturers' Association in Chicago, during the progress of the show. Secretary Cox was instructed to forward a resolution condemning the unreasonable use of this member to the mayors of the principle cities throughout the country. The association decided to hold meetings every two months in the future, and the next one will be held in the Hotel Statler, Buffalo, N. Y., April 10.

Among those present at the Chicago session were: President A. B. Coffman, Consolidated Manufacturing Company; W. G. Schack, Emblem Manufacturing Company, T. W. Henderson, Henderson Manufacturing Company; E. W. Jackson, K. R. Jacoby and Joseph Merkel, Miami Cycle & Manufacturing Company; C. W. Mason, New Era Autocycle Company; A. W. Mitchell, R. W. Gould and Geo. H. Meiser, Black Hawk Motor Company; L. J. Carling, Schickel Motor Company; W. A. Johnson, Pierce Cycle Company; E. J. Knight, Aurora Automatic Machinery Company; George M. Hendee and F. J. Weschler, Hendee Manufacturing Company; Arthur Davidson, Harley-Davidson Motor Company; W. F. Remppis and W. B. Glasser, Reading Standard Company; F. W. Starr, Pope Manufacturing Company, and Ignaz Schwinn, Excelsior Motor Manufacturing & Supply Company.

Los Angeles Club Holds Run.

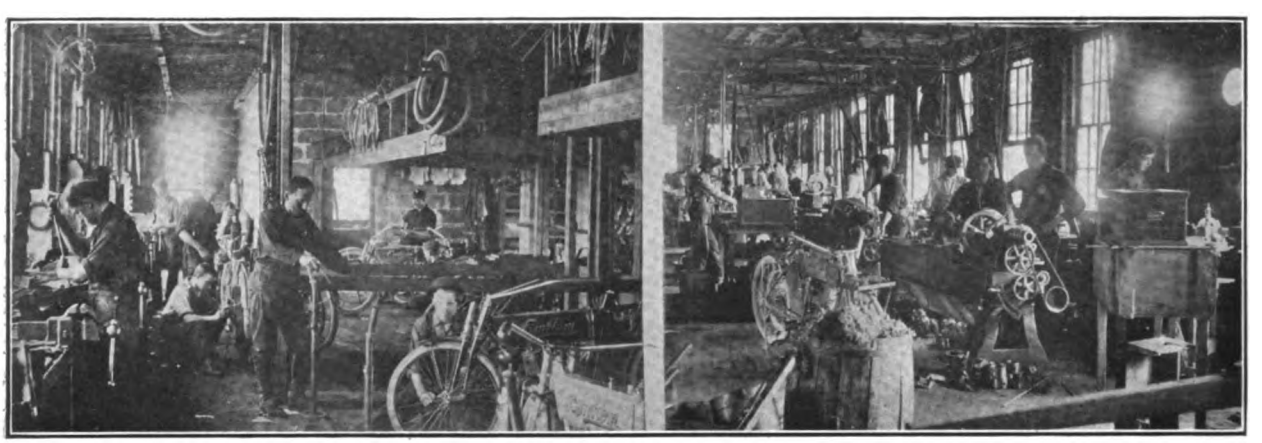
The members of the Los Angeles Motorcycle Club,

Digitized by Google

Los Angeles, Cal., frequently hold runs covering long distances, but it is seldom that it is possible to present a photograph of the riders enjoying the balmy air of southern California. The illustration herewith depicts some 40 members on the return trip from a 90-mile ride to Pomona, during a stop at one of the orange groves in Covina. About this time the East was well covered with snow, and oranges were by no means so plentiful that visitors were invited to eat their fill and take home all they could carry.

Western Tourists Get Certificates.

Some little time ago announcement was made by Secretary G. B. Gibson of the Federation of American Motorcyclists, that certificates of performance had been issued to the members who took part in the eastern district tour to the national convention in Buffalo, N. Y. At that time the list of tourists in the western district had not been filed by Tourmaster P. B. Whitney of Chicago. These were filed this month, however, and certificates have been awarded to the following:



S. T. Barlass, Harry Jacobs, S. W. Nicholson, Edward Schadde, Sam Brown, M. A. Held, J. R. Keif, J. C. Hosman, Alfred Born, N. T. Back, F. M. Reder, E. L. Drummond, P. E. Haller, A. H. Crocker, H. P. Reynolds, F. A. Wilhelm, O. Persons, Roy Bowser, J. R. Purdy, P. B. Whitney, R. D. Wickwire, Thomas Monroe, George Hedges, H. H. Hedges, G. H. Crocker, Charles A. Wellman, Chicago; C. S. Hinckley, R. W. DuSell, Aurora, Ill.; Paul E. Kottowlski, Indianapolis, Ind.; P. A. Heierman, South Bend, Ind.; Emil Perkowitz, Evanston, Ill.; C. J. King, Lewiston, Ill.; E. L. Russell, A. Weitzman, A. F. Gregor, D. E. Miller, Detroit; A. R. Oberwegner, H. Dimke, S. J. Chubbuck, Toledo, O.; E. H. Tracey, H. H. Huntsberry, Cleveland, O.; J. J. Blank, H. A. Waltz, Akron, O.; R. Bouton, Lakewood, O.; R. T. Phillips, Conneaut, O.; W. G. Lauterbach, Mendotta, Ill.; George Kohlhardt, Cudahy, Wis.; Frank Ollerman, Walter Davidson, C. A. Carpenter, George Puls, Milwaukee, Wis.; R. A. Croon, Axel Kling, A. L. Johnson, Alvy Anderson, Rockford, Ill.; W. C. Beeman, San Francisco, Cal.; Edward Harmer, Kenosha, Wis.; H. C. Marquard, Burlington, Ia.; H. W. Cuddington, Peru, Ind.; J. H. Poisson, Roy O. Chipman, Grand Rapids, Mich.; Lynn Jordan, Wilmette, Ill.; R. T. Lantz, La Grange, Ill.; H. Bernard, Oak Park, Ill.; G. W. Williams, Lorain, O.; A. J. Lewis, Alliance, O.; R. E. Underhill, Glendore, Cal.; W. W. Ingram, Rutland, Ill.; J. Speropoulis, Pullman, Ill.; Albert Hanson, Kansas City, Mo.

Emblems in Canada.

Fred T. Kerr of London, Ont., recently secured the agency for the Emblem mounts, made by the Emblem Manufacturing Company, Angola, N. Y. Immediately after receipt of his initial shipment, he was called upon to demonstrate the power of the machines in pulling through snow drifts, and so well did they perform that he booked several sales as a direct result.

Short Grass Planning Tour.

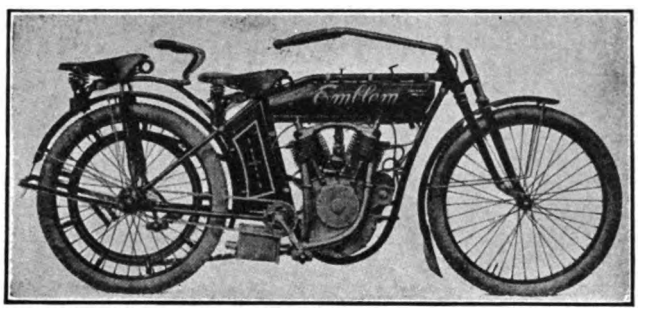
The annual tour of the Short Grass Motorcycle Club in Kansas will be much larger in 1912 than ever before. Already plans are under way looking toward an itinerary that will cover at least four states. In fact, it would appear that the event is to become a district affair, according to information from Dr. B. J. Paterson, vice president of the Central District, F. A. M. The riders will visit the leading cities in western Kansas, western Nebraska, Colorado and Wyoming, during a trip occupying at least 15 days. Two automobiles, carrying full camping equipment, will accompany the tourists.

Two Views of the Emblem Factory: At Left, Assembling the Completed Mount; at Right, Where the Machine Work Is Done.

Motorcycles for Mail Carriers.

C. P. Grandfield, first assistant postmaster-general of the United States, has recommended that motorcycles replace the horse drawn delivery wagons in collecting the mail in Los Angeles, Cal.

Quick Rural Mail Delivery.



According to William Shauger, rural mail carrier and farmer at Elyria, O., it costs him only 15 cents a day and takes him but three hours to deliver mail to the 99 boxes on his route with a motorcycle.

Long Distance Touring Champion.

John Hogan of Saginaw, Mich., announces that he will make a motorcycle trip to the capital of every state

THE EVER ECONOMICAL EMBLEM

HERE'S THE KIND OF DAY IN AND DAY OUT SERVICE YOU EXPECT OF A HIGH GRADE MACHINE AND *GET* WITH AN EMBLEM

Western & Southern Life Insurance Co.

Gentlemen: Kenton, O., Jan. 28, 1912.

I purchased from your agent here a 4 H. P. Emblem motorcycle June 10, 1911, and have used it in my life insurance business to the extent of better than 5,000 miles. My total repair bill was 25 cents for one platinum point spring and packing for left fly wheel. I still have a **new** machine and wouldn't trade my machine for anything I have seen in the motorcycle line up to date.

Signed J. E. PELKIE, Asst. Supt.

"EMBLEM SERVICE IS SATISFACTORY"

EMBLEM MANUFACTURING COMPANY

(Member M. M. A.)

ANGOLA ERIE CO. NEW YORK

in the Union next summer. Apparently, he is looking for the long distance touring championship. It ought to take a rider pretty nearly all summer to make a round of every capital city in the country.

News from Emblem Agents.

F. W. Sandruck of Baltimore, Md., had a number of Emblem mounts on display at the recent Baltimore automobile show. One of the features of the exhibit was the identical Emblem racing machine with which George Evans created the world's record for 100 miles on a dirt track at Cleveland, O., last summer.

Mr. and Mrs. J. W. Kidd, who are well known as long distance tandem tourists, have removed from Oklahoma to Illinois, where Kidd recently took the exclusive agency for Emblem motorcycles in Fisher.

Fred P. Ames, who has done much to popularize the Emblem in Kansas City, Mo., has moved from 1835 Benton boulevard to more commodious quarters at 2112 East 15th street. This action is coincident with the renewal of his contract with the Emblem Manufacturing Company for another year.

Buffalo Dealers Organize.

Following the example of the motorcycle dealers in New York, Chicago and some other cities, the representatives of motorcycles and bicycles in Buffalo, N. Y., have organized the Buffalo Cycle Trade Association with the following officers: President, E. Young; secretary, H. Krigbaum; treasurer, F. D. Barton; directors, A. F. Schwegler, A. Nabinger and George Ferrand.

Reward Works Two Ways.

To apprehend a motorcycle thief in California, find he is an escaped convict from New Jersey, and cause his return to the state prison in the East, is the accomplishment of A. C. Banta of San Jose, Cal. Incidentally his efforts resulted in returning the motorcycle to the owner, O. E. Chase. In compliance with the offer of the Federation of American Motorcyclists for the apprehension of motorcycle thieves, Secretary-Treasurer Gibson has mailed Banta a check for $25.

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

E. M. ESTABROOK

Chairman Membership Committee Federation American Motorcyclists,

This is the fourth reward paid for the conviction of a person taking a mount belonging to a member of the F. A. M.

New Records for Indian.

Ed Hasha, riding an Indian, created three records on the new stadium in Los Angeles, Feb. 11, these being for two, three and four miles respectively. The former marks were held at 1:24.2, 2:05 and 2:47 by Jack De Rosier on an Indian. That is, De Rosier held the official records, and it remains to be seen whether or not Hasha's figures of 1:19.6, 2:01.6 and 2:40.8 will be accepted by the competition committee. The summary of the meet follows:

Two miles, amateurs—First, Montgomery, Excelsior; second, Johns, Indian; time, 1:58.

Two miles, professionals—First, Ward, Indian; second, W. Samuelson, Indian; third, T. Samuelson, Indian; time, 1:30.

Two miles, professionals—First, Hasha, Indian;

Indian Riders Trying Out the Stadium at Springfield, Mass.

second, Wolters, Excelsior; third, Balke, Excelsior; time, 1:19.6.

Two miles professionals—First, Kittle, Merkel; second, Allbright, Indian; time, 1:31.

Three miles, professionals—First, Hasha, Indian; second, Balke, Excelsior; third, Wolters, Excelsior; time, 2:01.6.

Five miles, professionals—First, Ward, Indian; second, Allbright, Indian; third, W. T. Samuelson, Indian; time, 3:53.

Four miles, professionals—First, Hasha, Indian; second, Balke, Excelsior; third, Seymour, Indian, time, 2:40.8.

Four miles, handicap—First, Allbright, Indian; second, Hasha, Indian; third, Wolters, Excelsior; time, 2:39.2.

Incidentally, it may be remarked that the three records were created with an Indian, on which the ignition was supplied by a Bosch magneto, made by the Bosch Magneto Company, New York City.

Club Notes, Here and There.

The San Jose Motorcycle Club, San Jose, Cal., has decided to hold weekly runs to different points in California during the coming summer.

The Rochester Motorcycle Club, Rochester, N. Y., has adopted as its motto for the coming membership campaign, "Make It a 500 Club."

Four members of the Jacksonville Motorcycle Company, Jacksonville, Fla., have made what they consider a record ride from St. Augustine to that city in 1:45:00.

The Ontario Motorcycle Club, Ontario, Cal., which was organized recently, has adopted as one of its first bylaws one providing for a committee to observe whether or not its members are violating the city and county speed laws.

A new motorcycle club with 51 charter members at Augusta, Ga., has scheduled an endurance contest on the Georgia-Carolina fair grounds track.

Pittsburg, Penn., has a new motorcycle club which is preparing to affiliate with the F. A. M. It has been named the Happy Days Motorcycle Club.

The Bakersfield Motorcycle Club, Bakersfield, Cal., is considering the matter of calling a state convention of clubs for the purpose of arranging an annual race meet.

In order to increase its membership, the Marion Motorcycle Club, Marion, Ind., has selected two teams which will compete until April 1, and the losing team is to pay for a banquet to the winners.

Two new clubs have affiliated with the Federation of American Motorcyclists, as follows: Hercules, Chicago, 220, A. J. Foote, secretary, 410 West Adams street, 16 members, and Newark, N. J., 221, Edward Freeman, secretary, 40 Newson street, 12 members.

The following officers have been elected by the Newark Motorcycle Club, Newark, O.: President, W. B. Kinney; vice president, E. R. Francis; secretary-treasurer, L. G. McCormick; captain, Wilbur Parks.

In connection with its annual banquet, the Camden Motorcycle Club, Camden, N. J., elected the following officers for the ensuing year: President, Charles Kenfer; vice president, William Smith; secretary, Robert Smith; treasurer, William T. Reed; captain, George Hardy; first lieutenant, W. Harris; second lieutenant, R. Ward.

Officers have been elected by the Concourse Motorcycle Club, New York City, as follows: President, W. A. McClellan; vice president, George Heining; recording secretary, V. T. Nydrle; financial secretary, L. Herberger; corresponding secretary, C. L. Frobisher; captain, M. P. Sullivan.

The Cedar Rapids Motorcycle Club, Cedar Rapids, Ia., has elected the following officers: President, Dr. C. B. Whelpley; vice president, Frank R. Mason; secretary, Fred Smeten; treasurer, Ben Kubias; assistant secretary, John Stobla.

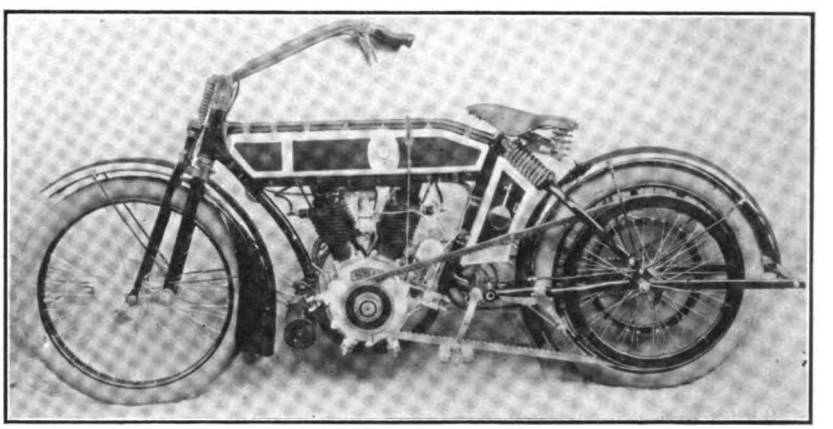
Officers have been elected by the Poughkeepsie Motorcycle Club, Poughkeepsie, N. Y., as follows:

Digitized by Google

President, Thomas Jordan; vice president, Charles Senk; secretary, Harry English; assistant secretary, Eugene Davis; treasurer, Emmett Andrew; captain, Clinton Price; press agent, William Dahoney; assistant press agent, Fred Osborne.

The Riverside Motorcycle Club, Riverside, Cal., has sent a communication to the city council, thanking it for the improvement of a local road.

Few Changes in N. S. U. 1912 Models.



Few changes are noted in the 1912 models of the N. S. U. for which mount the Sun Motor & Supply Company, New York City, is American agent. The light single and twin-cylinder machines are practically unaltered with the exception of a few details which are in the nature of refinements. The two heaviest types, the 3.5 horsepower single and seven horsepower twin, touring models, however, are presented with loop frames, a design heretofore utilized in the lighter machines.

The magneto has been placed on top of the crankcase behind the cylinder, and the carburetor is placed behind this member underneath the fuel tank, a position protecting it from rain and dirt. A new arrangement has been incorporated for operating the inlet valve, the lower angle piece having been superseded by an overhead lever device.

Attention has been given to the steering head, this being constructed to withstand strains of driving at a high rate of speed, and the balls, cups and ball races are of larger dimensions. Considerable improvement has been made in the foot rests, these members now being constructed with aluminum coverings and adjustable in a forward or backward direction so that they may be made narrow or wide as desired to suit the taste of the customer.

Refinement in valve design is noted, these being adjustable. The inlet is operated by a steering rod actuated by a camwheel and steering lever with roller, the latter being located inside the gearcase. The automatic carburetor has undergone a slight change. The port in the piston of the device for the admission of air has been altered so that the correct proportions of air and gas are obtained. The stand has been improved, the arms on which the chain stays rest being constructed of pressed steel, and reinforced throughout.

In addition to the N. S. U. two-speed gear and free engine utilized in 1911, a reinforced pattern two-speed and free engine device of more sturdy construction is being manufactured. This is intended for use with the 3.5 horsepower single and seven horsepower twin when the latter are utilized in connection with a side car attachment. It is fitted with an adjustable pulley, the inside and outside flanges of which are both movable. The gear is equipped with a large metal cone clutch provided with oil grooves and three discs for engagement with the low gear.

Seven Horsepower De Luxe N. S. U. Twin, the Latest Product of the N. S. U. Motor Company.

Police Are Converted.

The police department at Indianapolis, Ind., has been converted to the use of the motorcycle. A two months' trial on a maintenance cost of 90 cents, during which time the officers covered 50 miles a day on each machine, appears to have been the convincing argument.

Shippee in California.

James H. Shippee, until recently manager of the F. N. branch in Providence, R. I., is now in Los Angeles, Cal., where he has taken the outside salesmanship for the Pope mount, represented in southern California by C. L. Smith.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head, as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

Swastika Oil Company, Bay City, Tex.; capital, $5000; incorporators, G. C. Hamill, M. Thompson, A. M. Anderson.

Shirvin Auto Livery, Oklahoma City, Okla.; incorporators, H. M. Little, R. L. Backus, J. F. Pribyl, Clifton Johnson, P. E. Little.

Alhambra Garage Company, New York City; capital, $10,000; incorporators, Joseph C. Graveur, Martha Graveur, Gordon W. Kenney, 1921 Seventh avenue, New York City.

Standard Motor Car Company, New Bedford, Mass.; capital, $5000; president, T. F. O'Brien, Una Moriarty, Harry B. Wing.

Efficiency Supply Company, Boston; capital, $5000; president, William H. Murphy; treasurer, Francis J. Coughlin, 18 Boylston street, Boston.

Eastport Garage Company, Eastport, Me.; capital, $10,000; president, Fred P. Gilson; treasurer, Charles E. Martin; clerk, L. H. Newcomb.

The Motor Truck & Auto Company, Portland, Me.; capital, $10,000; president, Lewis A. Goudy; treasurer, George W. Merrow; clerk, Edward S. Anthoine.

United States Motor Company, New York City.

The Leyman Motor Company, Louisville, Ky., has moved its salesrooms to Third and Breckenridge streets. The concern is local distributor of the Buick line.

Earle C. Anthony, owner and manager of the California Motor Company, Los Angeles, Cal., is erecting a reinforced concrete and steel structure, and plans a house warming upon the completion of the building, which will cost about $150,000.

The Cheeseman Automobile Company, Salt Lake City, Utah, which was organized recently to handle the Stoddard-Dayton, made by the Dayton Motor Car Company, Dayton, O., expects to occupy its new building at 45 South State street shortly. The concern will conduct a service station.

The A. Elliott Ramney Company, Brooklyn, N. Y., is making extensive alterations to a three-story building on Putnam avenue, which will be utilized as a service building for Hudson cars, made by the Hudson Motor Car Company, Detroit, Mich.

W. H. Halliwell, president of the Halliwell Company, Los Angeles, Cal., announces that the concern will occupy new quarters in the near future.

The Corbin Motor Car Company, 1019 South Olive street, Los Angeles, Cal., is under new management, Frank L. Greene and W. B. Goode having purchased the Corbin agency and will represent the car made by the Corbin Motor Vehicle Corporation of New Britain, Conn.

Sales Branch of the Abbott Motor Company, on East Jefferson Avenue, a Prominent Location in Detroit.

The New Columbia Garage Company, West End, N. J.; capital, $10,000; incorporators, Arthur J. Seeney, Stephen C. Fiero, George Feinberg, all Brighton avenue, West End, N. J.

Seymour Auto Company, Seymour, Conn.; capital, $4000; president, Maurice L. Warner; vice president, Thomas S. Coleman; treasurer, Ernest S. Clark.

Fishback Motor Company, New York City; capital, $3,000,000; incorporators, J. J. Wittenberg, Brooklyn, N. Y.; P. R. Galligan, J. W. Ebbs.

GARAGE AND DEALER.

Newton D. Holbrook, president of the Litchfield County Automobile Association, and a director of the Connecticut state association, has resigned as sales manager of the Union Hardware Company of Waterbury, Conn., to become manager of the Ames Motor Company of Owensboro, Ky.

Albert G. Hamer, North Adams, Mass., has sold his business and equipment to the Tower Motor Company, 51 Main street, that city.

The Scott County Mercantile Company, Davenport, Ia., is occupying new quarters at Fourth and Riley streets, formerly occupied by the Buck Carriage & Implement Company. The concern is agent for the Maxwell and Columbia cars, made by constituents of the

The Southwest Auto Company, which maintains its business offices at El Paso, Tex., and which has a large number of agencies, will establish a branch agency in Phoenix, Ariz.

The Reo Pacific Company, San Francisco, Cal., distributor for the Reo and Premier lines, announces the completion of its new three-story building on Fulton street, near Van Ness avenue. The entire lower floor of the structure will be devoted to a spacious show room and offices of the president, Norman Devaux, and the sales manager, H. E. Gilley. In the rear of these rooms will be located the machine shop, access to which is by a small street.

Ketchum & Co., Ltd., Ottawa, Canada, is erecting a new garage on Sparks street, which when completed will be one of the most modern structures of its kind in Canada. The plans call for a 66-foot frontage, while the whole building will be 200 feet in length. Steel will be employed largely. The repair ship will be located on the second floor while the ground floor will be devoted to offices and supplies.

The Universal Auto Repair Company, High and Allyn streets, Hartford, Conn., is planning to enlarge the present quarters to take care of its increasing business. W. J. Langdon is manager of the accessory and supplies department.

The George Grede & Brothers Company, 240 Reed street, Milwaukee, Wis., has been appointed agent for the E-M-F and Flanders lines in Milwaukee and vicinity.

Digitized by Google

The Albany Garage, Albany, N. Y., one of the largest and oldest in that state, will erect shortly a three-story building on Howard street to handle commercial vehicles. The concern has taken the agency for the White line, made by the White Company, Cleveland. Chauncey D. Hakes, who has had considerable experience in the automobile industry, is manager.

The Highland Garage, Birmingham, Ala., has leased the building formerly occupied by Drennen & Co., and will convert it into a show room. This concern also purchased a garage located at Five Points recently.

A. E. Hunter, well known to the automobile men in northern California, has taken the agency of the Firestone-Columbus, made by the Columbus Buggy Company, Columbus, O., for San Francisco, Cal., and will carry a full line including the electric automobile.

Jack Payment and Arthur C. Wagner have formed a company which will be known as the Estarado Auto Company and which will represent the Hupmobile in Denver, Col. A service station will be maintained where the owners of the machine made by the Hupp Motor Car Company of Detroit will be served.

WITH THE MANUFACTURER.

The Willys-Overland Company, Toledo, O., recently made a shipment of 99 Overland automobiles to New York City, whence they were consigned to foreign ports. A special train was made up consisting of 31 flat cars, each laden with three machines. In the accompanying illustration is depicted the train pulling into New York City, where the boxed vehicles were transferred to steamers.

Fred J. Titus, who for the past year has been connected with the retail department of the American Locomotive Company, New York City and Providence, R. I., is now associated with the wholesale department of that company.

The Velie Boston Branch of the Velie Motor Vehicle Company, Moline, Ill., announces the following appointments of agencies to handle Velie pleasure and commercial vehicles: J. T. Curtis & Co., Hartford, Conn.; C. H. Sawyer Company, Manchester, N. H.; Robert Kayser, Concord, N. H.; Walter Velie Johnson, Burlington, Vt.

The Texas Company, New York City, is issuing a neat booklet which tells about motor lubrication and how to remedy oiling troubles.

The Abbott Motor Company, Detroit, maintains a sales branch in that city on East Jefferson avenue, and in the accompanying illustration is presented the structure in which the Abbott-Detroit is displayed. The branch is in charge of E. C. Thomas, who looks after the many cars of that make in service in the city.

The Havoline Oil Company, 17 Battery place, New York City, announces the appointment of new agents as follows: W. A. B. Worley, Jacksonville, Fla., Florida territory; Augusta Overland Motor Car Company, Augusta, Ga., Lincoln, Columbia, Richmond, Warren, Jefferson, Glasscock, Washington and Jenkins counties, Georgia, and Edgefield, Aiken and Barnwell counties in South Carolina; the Euclid Oil Company, 1906 Euclid avenue, Cleveland, O., territory included in northwestern Ohio, Cleveland, Akron and Youngstown; the James Gray Kuhn Company, 5712 Penn avenue, Pittsburg, Penn., for the territory within a radius of 60 miles of that city. The Pittsburg and Cleveland agents exhibited at the motor car shows held recently in those cities.

Nelson S. Riley has been appointed manager of the Kansas City branch of the Studebaker Corporation, Detroit. He was for some time connected with the company's branch at Denver, Col.

Hopkins, Botto & Hocke, New York City, agent for the Abbott-Detroit, made by the Abbott-Detroit Motor Company, Detroit, has moved the Regal cars, made by the Regal Motor Car Company, Detroit, into new quarters at 1668 Broadway. An increase of business required housing these machines separately.

The Heald Machine Company, Worcester, Mass., maker of grinding machines, is issuing to the trade, a neat booklet entitled "Oversized Standards for Pistons and Rings," being a reprint of a paper presented at a meeting of the Society of Automobile Engineers. The booklet is illustrated and teems with interesting features.

The Henderson Motor Sales Company, Indianapolis, Ind., distributor of the Cole line, made by the Cole Motor Car Company of that city, has appointed the following new agents: Richardson-Neighbors Motor Company, 2039 Euclid avenue, Cleveland, O.; Dayton Automobile Company, Dayton, O.; Corning Automobile Company, Corning, N. Y.; Wolcott Motor Company, Elmira, N. Y.; F. B. Porter, Silver Creek, N. Y.; Fisk & Slocum, Morrisville, Vt.; P. C. Rumboldt, Tonawanda, N. Y.; Bellis & King, Watching avenue and Race street, Plainfield, N. J.; Cole Motor Sales Company, 90 Mathewson street, Providence, R. I.; John Hemwall Automobile Company, 4612 Washington boulevard, Chicago; Worley & Terry, Viola, Ill.; C. H. Bergstrom, Neenah, Wis.; Palmer Sales Company, Grand Rapids, Mich.; Cole Motor Agency, Shreveport, La.; Waynesboro Automobile Company, Waynesboro, Va.

E. P. Chalfont, who has been at the head of the E. R. Thomas Motor Car Company of Buffalo, N. Y., since its reorganization, resigned recently to become associated with Harrison Williams of New York City, financier and director of public utility corporations. Mr. Chalfont will remain a stockholder in the Thomas company.

The Nyberg Automobile Company, Chattanooga, Tenn., will begin the extensive manufacture of the Nyberg car in the near future. A building has been leased for a factory and is being equipped with machinery. Several models will be constructed including a commercial vehicle.

The Ford Motor Company, Detroit, will establish a branch factory in Los Angeles, Cal., so soon as a suitable location can be found. The factory will cost about $300,000 and will employ about 800 men. The new plant is intended to supply all Ford cars used in Arizona, Nevada, Utah, California and Japan. The dimensions will be 150 by 500 feet and four stories in height. Electricity will be employed for power.

The Krupps Motor Company, Pittsburg, Penn., will erect a new plant either at Ambridge or Beaver Falls, Penn., and the buildings will be of reinforced concrete. The plans call for five structures, these ranging from two to five stories.

The Croxton Motor Company, Cleveland, O., held its annual meeting recently at which the following officers were elected: President, H. A. Croxton; vice president, Charles Stevens; secretary, O. A. Peters; treasurer, I. Zimmer; directors, J. P. Stoltz, John Stoltz, O. A. Peters, Charles S. Patterson.

The Frontier Tire & Rubber Company, Buffalo, N. Y., which was organized to take over the business of the Frontier Rubber Company of that city, plans the extension of the business. The concern proposes to manufacture about 2000 tires a day and in addition will make mechanical rubber goods. A large number of workmen will be employed.

The Simplex Motor Car Company, Mishawaka, Ind., maker of the Amplex car, announces the opening of a salesroom and repair shop at 853 Carondelet street, New Orleans, La. W. Durand will have charge.

F. R. Humpage, Detroit, who has been with the E. R. Thomas Motor Company, Buffalo, N. Y., for about a year, has been elected president to succeed E. P. Chalfont, who resigned recently. W. L. Gleason becomes vice president, and J. R. Ramsey continues as secretary and treasurer.

The Briggs-Detroiter Company, Detroit, maker of the Detroiter, is now occupying its new factory of reinforced concrete at 475 Holbrook avenue, in that city. The structure is 250 feet long and 100 feet wide, and is equipped to produce 1000 cars before July 1. The foundation is being laid for another building to adjoin the present factory.

The Bellamore Armored Car & Equipment Company, Bridgeport, Conn., has purchased the business and plant of the Bridgeport Vehicle Company of that city and will continue to manufacture bodies and accessories. The general office will be located at 286 Fifth avenue, New York City.

The H. W. Johns-Manville Company, New York City, manufacturer of asbestos products, etc., states that the increasing demand for its product in Pittsburg, Penn., and vicinity, has necessitated a move to larger quarters. The branch is now occupying the entire eight-story stone, reinforced concrete and steel building at the northeast corner of Wood street and First avenue, which has been leased for a term of years. The structure provides a floor space of 23,808 square feet.

Digitized by Google

TROY DRAWS VISITORS FROM MANY TOWNS.

The decision of the Albany dealers not to hold an automobile show this year, placed the second annual display of the Automobile Club of Troy, N. Y., in an enviable position. The event was held in the local armory, Feb. 12-17, and drew visitors from all the cities and towns in that section of New York State, including Albany, Schenectady, Watervliet and Cohoes. The management was placed in the hands of Frank M. Packus and Frank N. Barhydt, and their success was most marked.

Among the exhibitors were: Rensselaer Auto Exchange, Moon, Atterbury truck; Troy Auto Exchange, Pierce-Arrow; Bolton-Myers Auto & Truck Company, Parry, Haynes; Albany Rubber Tire Company, Selden; Alanson A. Aird, Pratt-Elkhart; Congress Auto Company, Nyberg; Scott D. Nichols, Ford; Cohoes Auto Company, Corbin; Abbott-Detroit Motor Car Agency, Abbott-Detroit; Albany Motor Car Company, Cadillac; Betz Auto Company, Oldsmobile; Franklin Automobile Company, Franklin; Mack Bros., Mack truck; W. M. Whitney Company, Fiat; C. S. Ranson, Hudson, Stevens-Duryea, Lozier; Kissel Motor Car Company, KisselKar; Close Bros., Knox; Albany Garage Company, Chalmers, Peerless, Simplex; Buick Motor Company, Buick; A. W. Knapp, Overland, Fred B. Clute, Pope-Hartford; George H. Snyder, Stearns-Knight, Velie; Trojan Garage Company, Locomobile, Stoddard-Dayton-Knight; Payne Auto Company, E-M-F, Flanders; Troy Motor Carriage Company, Mitchell, Speedwell, Kelly truck; C. H. Abbott, Stanley steam; Troy Everitt Thirty Company, Everitt; Wilbur Auto Sales Company, Cole, Regal; Eastern Motor Sales Company, Packard; Burdick & Hartwell, Alco, Hupmobile.

WANT NATIONAL TOUR.

Mayor Samuel L. Shank of Indianapolis, Ind., has filed the first application for the honor of starting the national tour for the new A. A. A. cup. Several cities have been mentioned as the possible starting point, but no definite action has been taken by the American Automobile Association. It is possible that a decision will be reached at the March meeting of the executive committee.

K-R-I-T BRANCH IN PHILADELPHIA.

Harry Lonsdale, formerly with the Fiat car, has been appointed general manager of the new factory branch opened in Philadelphia by the K-R-I-T Motor Car Company, Detroit, maker of the K-R-I-T line. This make of machine has proven very popular in Pennsylvania, and the volume of business has been increasing rapidly of late. The Philadelphia branch will have charge of the entire business transacted throughout the state.

PREMIER BERLIN FOR WINTER.

For many years the family of J. C. Schaff of Indianapolis, Ind., has spent the winter months in Florida or California. Being enthusiastic motorists, Mrs. Schaff and other members of the family have felt it necessary to visit winter resorts in order to enjoy the pleasures of their car. The purchase of a six-cylinder 60 horsepower Premier Berlin limousine, made by the Premier Motor Manufacturing Company, Indianapolis, was the means of changing their minds. Despite the very cold weather of the present winter, Mrs. Schaff and the others have spent nearly every day out of doors, and they are so well pleased with the new car that it is probable they will spend all their winters in the North in the future.

WHITE COMPANY'S PRIVATE EXHIBIT.

During the progress of the annual Newark automobile show in Newark, N. J., the White Company, Cleveland, O., maker of White pleasure and commercial cars, held a private display in its new branch salesrooms and service station at Broad street and Central avenue. The building offers floor space of 12,000 square feet, in which it was possible to display about 25 cars, including touring, roadster, limousine, landaulet and berlin types of pleasure vehicles, and 1500-pound, 1.5, three, and five-ton trucks.

BIG RAMBLER SALES AT CHICAGO.

Announcement is made that the Thomas B. Jeffery Company, Kenosha, Wis., sold 187 Rambler cars in the six days of the pleasure car show at Chicago. This is claimed as a world's record in the matter of sales to individuals. Forty salesmen, represented numerous dealers throughout the United States and Canada, participated in the campaign.

BECOMES FACTORY REPRESENTATIVE.

E. F. White, who has been connected with the automobile industry in various capacities during the past nine years, and has represented the Pullman Motor Car Company, York, Penn., maker of Pullman cars, at Reading, Penn., for two years, has become a member of the factory sales force. He will cover the middle western and southern territory.

FLANDERS POPULAR IN SCOTLAND.

The foreign sales department of the Studebaker Corporation, Detroit, is very much pleased over the closing of large contracts with dealers in Edinburgh, Glasgow, Aberdeen, Fife and several other cities in Scotland. The Flanders car is popular with the Scottish people, whose knowledge of machinery has always been a racial characteristic.

NEW HOME FOR BOSTON FIRMS.

Another handsome building or rather group of buildings has been added to those in Boston in the recently completed structure located at the junction of Beacon street and Commonwealth avenue, which will be occupied shortly by the Premier Motor Car Company of New England, the Ford Company, and the Boston branch of the Firestone Tire & Rubber Company of Akron, O. In general the dimensions of the three buildings are the same with different arrangements of the interiors to meet the individual requirements of each concern.

The structure is six stories in height, of steel and concrete, the entire front and back practically being of glass, so that a maximum of light is afforded. The representative of the Premier Motor Manufacturing Company, Indianapolis, Ind., has a ground space of about 35 by 130 feet, and occupies six stories or about 30,000 square feet of floor space.

The first floor is devoted to the display of new models while the second is utilized for rebuilt cars. The general offices are situated on the third while the fourth is occupied by the garage. The stock room is on the next floor and a portion of this and the entire upper floor is occupied by the shops of the company.

The Ford Motor Company's branch, which is under the management of Charles E. Fay, occupies the building at the right of the Premier, and the lower floor will be employed as the salesroom which is 32 by 85 feet. At the rear will be the shipping room. The general offices will be on the second floor while the entire third will be utilized for a stock room. The remaining floors will be used for the storage of new cars and stock for shipment.

The Firestone branch will be located in the structure at the left of the Premier and in the basement will be a garage 60 by 33 feet. The ground floor will be devoted to the general offices and a reception room. The receiving and shipping departments will occupy the second floor, while the third will be for the storage of pneumatic tires and tubes in systematically arranged racks which provide for 11,000 shoes. The fourth floor will be utilized as a stock room and here will be stored solid tires for trucks and carriages, equipment for rims, tires, etc. A complete mechanical department, including a wood working shop, tire applying machines, etc., will occupy the fifth floor while the repair shop will be on the sixth floor.

In the basement is located a heating plant for the entire building which is lighted by electricity, and current is also employed for operating the elevators which include passenger and freight. All of the modern conveniences in the care of automobiles and their users is incorporated in the structure.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

HARRIS AUTOIL BOOKLET.

A decidedly interesting booklet entitled "How to Tell Pennsylvania Oils" has been issued by J. C. Harris, proprietor of the Harris Oil Company of Muncie, Ind., maker of Harris Autoils. The treatise takes up the subject in a thorough manner, explaining what is meant by gravity, viscosity, flash and fire tests; color, filtering, acid treatment, cold test, etc. Harris Autoils are made in two grades of body, medium and heavy, from Tiona, claimed to be the superlative grade of Pennsylvania crude, and are guaranteed by the maker to give the most efficient service without carbonization. The booklet is free upon request made the company.

CORBIN SELLS ENTIRE OUTPUT.

The Corbin Motor Vehicle Corporation, New Britain, Conn., maker of Corbin cars, has sold its entire output for 1912 to the Miner Garage Company of Hartford, Conn. It appears that the manufacturing concern has been negotiating for this sale for some time, and that a number of other firms were bidding for the opportunity to purchase the 1912 product. As a condition of the sale the Corbin company agrees to maintain its present repair shop and garage with a full line of parts for all models for repair, care and upkeep of all products sold in the past and the cars in the 1912 line for a period of five years, insuring to the owners of Corbin cars the same service which has been maintained in the past.

OPPOSE REAR LIGHT BILL.

Many representatives of the national and state automobile associations are much interested in the bill introduced in the New York Legislature by Representative Stiwell, which requires all motor vehicles to use a rear light, the color of which can be changed from red to green from the driver's seat when the car is to be slowed down. It is claimed that the proposed law is in the interests of a certain patented device, and because of this suggestion is receiving more than usual opposition.

STUTZ TO HAVE SERVICE STATION.

Realizing the value of a service station, M. F. Chase, manager of the Empire Motor Car Agency, Boston, New England distributor of Stutz cars, has leased 4000 square feet of floor space on Bickerstaff street, a short distance from the salesrooms on Massachusetts avenue. Arrangements have been made with the Ideal Motor Car Company, Indianapolis, Ind., maker of the Stutz, to send an expert factory man to Boston to take charge of the station. A full line of spare parts will be carried.

Digitized by Google

HEARING ON LIGHT BILL.

Motorists in Rhode Island were well represented at the hearing of the proposed lighting bill granted by the Senate judiciary committee recently. The rural districts were also in favor of the bill and those who opposed the measure were mostly large trucking and express concerns in the capital of the state. The president of the Team Owners' Association stated that teamsters as a rule were in favor of the act as long as it did not apply to trucks, and that personally he thought a lamp tax was unnecessary, as owners of teams are sufficiently taxed at present. He further declared that the bill was a protection for automobilists, and he did not like the idea of being classed as a criminal or law breaker under the law.

KULICK CREATES ICE RECORD.

Although Frank Kulick announced last summer he was through with racing he was persuaded by the Ford Motor Company, Detroit, to try for the mile ice record of 0:39.8, established by Henry Ford nine years ago with the Ford 999. Kulick's trial took place over the frozen surface of Lake St. Clair near Detroit recently and although the ice had to be scraped free of the snow and was rough the Ford racing driver completed the mile in 0:33.4 with a flying start.

NEW COLE SERVICE STATION.

In keeping with its policy of rendering the best service to owners of Cole automobiles, made by the Cole Motor Car Company, Indianapolis, Ind., the G. E. & H. J. Habich Company, Boston, has completed a new repair shop and service station on Bickerstaff street, near the salesroom of the concern.

PLAN NATIONAL DEALERS' SHOW.

A national dealers' automobile show is proposed closely following the state fair at Detroit, Mich., in October. President Thomas E. Newton of the Michigan State Agricultural Society is highly pleased with the idea, and efforts are being made to ascertain the wishes of the manufacturers and makers in other parts of the country. The arrangement of the buildings is such that the different types of machines could be housed separately while there is ample room for demonstrations, etc.

SUSPEND POLICE HEAD FOR SPEEDING.

Those who operate motor cars at a reckless speed on the Island of Porto Rico lose their licenses when caught. Although the law has been in effect about two years there has not been occasion to suspend a driver until recently when the first to come under the ban was the head of the insular police. A report was made to the department of the interior which has charge of matters pertaining to automobiles, that the chief of police and a member of the Porto Rican House had been racing on the road. The department suspended the licenses of both men for six months, and as the chief's name was ahead of the other's on the license list he was the first to be penalized.

BILL TO DATE TIRES.

A bill has been introduced in the assembly at Albany, N. Y., to prohibit the manufacture, sale or offering for sale, of any tire for a motor vehicle unless the date when such tire was manufactured is impressed or branded upon the material of which it is constructed, or otherwise indicated by a label attached thereto. The penalty for violation is $50 recoverable in civil action by any person who shall sue for same, but one-half goes to the state. The bill is similar to one passed in a western state some time ago.

DEMAGNETIZATION OF MAGNETS.

"While the magnets of a magneto can be demagnetized, this seldom occurs if the maker's instructions are heeded in making connections," says the Remy Electric Company, Anderson, Ind. "Demagnetization is usually caused by passing the battery current through the magneto windings, due to improper installation, and some manufacturers utilize the colored wire cable scheme which facilitates wiring inasmuch as each colored wire is attached to the terminal of the same shade."

WILL ADDRESS STUDENTS.

Two members of the Boston branch of the Velie Motor Vehicle Company, Moline, Ill., have been invited to give addresses upon motor car topics before the students of the new Boston Y. M. C. A. automobile school. Harold D. Bornstein has been invited to talk upon the pleasure vehicle and Lin McKie of the commercial department, upon mechanical transports.

MULFORD TO PILOT A KNOX SIX.

Ralph Mulford, the well known racing driver, has entered the racing branch of the industry on his own account, having just purchased a six-cylinder Knox, made by the Knox Automobile Company, Springfield, Mass. The machine is a regular stock model 6-60 with long stroke motor and will be entered in the 500-mile race at Indianapolis, as well as the Elgin, Fairmount Park, Vanderbilt and Grand Prize events. Mulford is very much pleased with the automobile and is confident of success.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

NOVEL EXHIBIT OF ESTERLINE COMPANY.

One of the interesting features of a commercial vehicle show held at Chicago recently was the exhibit of the Esterline Company, La Fayette, Ind., manufacturer of the Berdon lighting system. A complete outfit, including the electric generator and controlling system, were placed in a large glass jar and the vessel filled with water, to which was added a small amount of sulphuric acid.

The generator and controller were operated continuously during the entire week of the show, the generator being driven as a motor by a six-volt storage battery and through the automatic controlling system. Small electric lamps were placed in front of the device to illuminate the interior of the jar.

In the accompanying illustration is shown the equipment at the end of the week and it will be noted that all metal parts of the generator and controller

Dynamo and Controller of Berdon Lighting System Which Operated Lights in Acid Solution During Week of Chicago Commercial Vehicle Show.

are badly corroded by the acid and the interior of the former is filled with copper sulphate and sediment. Quite a deposit of sediment accumulated in the bottom of the jar and on the board upon which the equipment rested.

The device operated successfully during the show and attracted considerable attention as well as favorable comment. The maker states that while its lighting system is not constructed to be employed in acid baths, it is subjected to a severe test to show that it will operate under unusual and very severe conditions.

CITY ADOPTS SHAWMUT TIRES.

At a recent meeting of the board of supervisors in San Francisco, Cal., it was decided to use Shawmut tires on all the city automobiles during the coming season. This subject has been given considerable thought by the board and its selection of the Shawmut brand is particularly gratifying to the maker, the Shawmut Tire Company, Boston, as well as being another addition to the long list of municipal recognitions of this product.

WORCESTER'S PUSHMOBILE SHOW.

Sometime since the automobile dealers in Worcester, Mass., decided that it would be impossible for them to hold a show this year. This decision does not appear to have appealed to the boys of that city, who have organized the Worcester Pushmobile Club, which held a show of its own early in the month. In practically every instance the power was "boy power" operated from the rear. It will prove of interest to peruse the names of the exhibitors and the makes they displayed:

Frank P. Kendall, 90 horsepower Fiat; Ezra Cutting, 60 Marmon; Russel Keith, 40 American; George Kendall, 33 Hudson; David Smith, 40 National; Helen Lange, 88 Amplex; Allen Russell, 40 Franklin; Alden Adams, 90 Alco; Edmund Guerin, 50 Isotta; Walter Pierce, 60 Benz; Sidney Smith, 33 Mercer; Daniel Goss, 50 Rainier; Lester Willard, 40 Atlas; Roger Heald, 60 National; Richard Heald, 40 National; Franklin Barrett, 40 Knox; George Harrington, 40 Lozier; Harold Finney, 60 National; Philip Bailey, 60 Knox; Albert Hunt, 90 Alco; Donald Vandermark, 30 Benz; Charles Eaton, 88 Amplex; Robert Kendall, 60 Alco.

Some of these various machines were copied faithfully from the cars they were supposed to represent, great pains having been taken in the matter of detail, and the show was staged every bit as grandly as a real automobile exhibit.

AMERICAN DRIVERS IN GRAND PRIX.

Ralph De Palma and David L. Bruce-Brown returned from Europe last week, announcing that they had signed contracts to drive in the French Grand Prix race in June. Bruce-Brown will drive a Fiat, in a car of which make he won the American Grand Prize race for the second time in 1911. De Palma declines to make public the name of his mount, although it is understood it will not be a Mercedes, as was annouced at one time.

STEINBOCK ENGINEERING COMPANY.

Articles of incorporation have been filed in New Jersey for the organization of the Steinbock Engineering Company, with capital of $1,000,000 and the following officers: President, E. J. Forham; vice president, H. E. Steinbock; secretary-treasurer, F. B. Knowlton. Mr. Steinbock was for many years chief designer for the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., now a constituent of the United States Motor Company, New York City, and recently severed his connection with the latter concern.

TAMPA CLUB IS ACTIVE.

The members of the Tampa Automobile Club, Tampa, Fla., have taken a decided stand against the newly adopted ordinance regulating motor car traffic. They desire its repeal and the substitution of a provision imposing a fine on a driver who operates his machine in a reckless manner.

The following committees have been appointed by the club for the ensuing year: Law and ordinance, H. S. Hampton, E. L. Sparkman, D. F. Conoley, A. C. Clewis, D. F. Owen; entertainment, T. C. Taliaferro, Henry E. Snow, George N. Benjamin, W. G. Brorein, D. C. Gilbert; exhibitions and contests, E. E. Bryan, B. M. Reed, L. B. Giles, W. A. Bonacker, W. F. Stovall; good roads, Fred F. Freeman, C. S. Washington, T. M. Wier, F. C. Paul, W. W. Clark, C. G. Memminger, I. S. Giddens, C. M. Price, J. H. Chenney, C. A. Lock, J. L. Greer.

UNIVERSAL LIGHTING IN CALIFORNIA.

The street committee of the board of supervisors in San Francisco, Cal., has a proposition before it to adopt an ordinance providing for lights on all vehicles using the highways of the city during the hours of darkness. As has been the case in other localities, the plan is meeting with strenuous opposition on the part of owners of horse drawn vehicles. Frank Carroll of the Goodyear Tire & Rubber Company's local branch, and J. W. Leavitt, head of J. W. Leavitt & Co., distributor for the Overland and KisselKar lines, are representing the motorists in the matter, and are receiving much valuable support from the press of the city.

RECIPROCITY IN NEW JERSEY.

The new reciprocity bill in the New Jersey Legislature has passed the lower house by a vote of 43 to 15, and those interested in it appear to be certain it will receive favorable endorsement by the senate as well. The proposed law was introduced by Representative Stickel, and permits non-residents the use of Jersey highways without the payment of a fee, the same as all other states. Another feature is the elimination of the "power of attorney" clause, which is alleged to have killed the bill presented last year.

STUTZ AT CHICAGO SHOW.

One of the cars displayed at the recent Chicago show, which caused not a little favorable comment was the Stutz, produced by the Ideal Motor Car Company, Indianapolis, Ind. The concern was unfortunate in that it was unable to secure space except in the Coliseum basement, but the fame of the machine which performed so satisfactorily in the 500-mile race on the Indianapolis speedway last Memorial Day, was sufficient to attract a crowd throughout the entire week. The exhibit comprised a torpedo roadster and stripped chassis, and the sales closed were decidedly in excess of what had been anticipated.

NEW STEVENS-DURYEA FACTORY.

As an indication of the expansion and stability of the motor car industry in New England, it is interesting to note that the Stevens-Duryea Company, Chicopee Falls, Mass., maker of Stevens-Duryea cars, recently awarded a contract for structual steel to the American Bridge Company, totalling approximately 4000 tons. This will be used in the erection of additional buildings at East Springfield, Mass.

Connecticut Shock Absorber Banner—The Connecticut Shock Absorber Company, Meriden, Conn., is distributing a handsome wall banner, which portrays a charming young woman and an excellent illustration of the Connecticut shock absorber. The banner measures 22 by 28 inches, and will be mailed to any dealer or garage owner upon request.

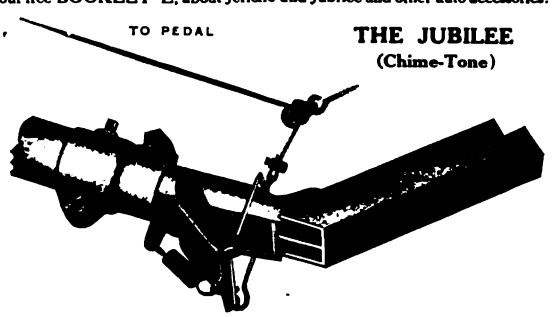
Jericho ONE TONE Horn
Jubilee CHIME TONE Horn



THE SIGNAL OF A GENTLEMAN—WARNS WITHOUT OFFENCE.

Jericho is superior to bulb horns, electrical horns and all other exhaust horns.
It is superior to the bulb horn because it is equally suitable for use on crowded city streets or winding country roads.
It is superior to electrical horns because it costs nothing to maintain the Jericho.
It is superior to all other exhaust horns because Jericho is the ONLY exhaust horn that absolutely WILL NOT CLOG.
Jericho gives a loud, clear signal of a pleasing mellow tone. It is worked by foot pedal connected with the exhaust.
The best horn for both city and country driving.
Equip YOUR car with a Jericho or Jubilee and motor without anxiety.

JERICHO COSTS $7, $8 and $9, ACCORDING TO SIZE.
JUBILEE COSTS $8, $9 and $10, ACCORDING TO SIZE.

Sold by all dealers or direct from us.
Send for our free BOOKLET E, about Jericho and Jubilee and other auto accessories.

Our Space at the Boston Automobile Show is F. 553.

The Randall-Faichney Company,
BOSTON, MASS.

SPLITDORF MAGNETO

"Always There"

With the installation of SPLITDORF IGNITION—SPLITDORF SERVICE is at your command.

And SPLITDORF SERVICE is courteous and thorough and practical—from the factory and main distributing center in New York, through every branch office and other selling artery all over the country, to the crowning detail of personal road men.

And these road men—experts in their calling and human in their intelligence—have one duty to perform and that duty is to give their services to every SPLITDORF user for the asking.

If there is any little "kink" in your ignition system—if it is not "right up to the mark" let SPLITDORF SERVICE straighten it out for you. Your satisfaction is our satisfaction so don't be afraid to call upon us.

Write for our "Racing Record."

ALTHO not in the Garage Building, Selling or Planning business, our wide experience in the exclusive equipment business has led us into every quarter of the globe where we have consulted the world's greatest architects, solving some of the most difficult problems, in providing shelter for one or any number of Motor Cars, **at total building costs from $35 to $2500.** We carefully compiled this valuable data on account of its rare educational value in this comparatively new field, and while the work could not possibly be duplicated under an expenditure of Thousands of Dollars, we will distribute this entire work, together with one complete set of the Garage Beautiful, **working plans absolutely free of cost** to all active or prospective Motorists who are willing to pay for the mailing expense, **Only Ten Cents,** coin or stamps. These Working Plans are complete in every detail and designed to meet a flexible range of requirements both as to size and building material to be chosen, from a construction of wood siding to concrete, at cost estimates to correspond. Our one and only object in doing this is in hope of incidentally acquainting you with our equipment for present or future emergencies, and the expense of this **Free** offering will be charged to our advertising account. Understand, we make this unprejudiced gift absolutely with the fame of our name at stake, and in no way further obligate or annoy you, as we are not in business for such purpose. To any one unable to fully appreciate the value of this exclusive set of plans, worth alone Twenty-five to Fifty dollars, to say nothing of the **innumerable other plans suggested,** we certainly prefer your returning them to us so we can give back your Postage Money at once and send plans to another applicant, as our supply, or sincere motive, will not justify a waste.

There is 100% more value in the

HERZ PLUG

"BOUGIE MERCEDES"

than in any other Plug on the market, at any price.

$1.50 GUARANTEED A FULL YEAR $1.50

The "Bougie Mercedes" stands up under all conditions. It's the only Plug with Indestructible Stone Insulation; the only one guaranteed not to carbonize—not affected by oil.

Since 1894 the standard of Europe and America

HERE IS ANOTHER OF OUR THOUSANDS OF TESTIMONIALS:

I wish to add my testimonial to the splendid qualities of the Herz Plug. I have been using Automobiles in my practice constantly for eight years and of all the best grade of plugs that I have used "The Herz" is the **only one** that is absolutely unbreakable, soot and oil proof and absolutely reliable. I have just taken out a set of Herz Plugs that have been used for 13,000 miles. They have never missed an explosion and are as clean as the day I put them in. The only discernible effects of this 13,000 miles use is a slight pitting of the core at the spark points. No other plug for me. Very truly,

Nov. 15, 1911. (Signed) B. W. Dawley, M. D.

AJAX
TIRES
(Guaranteed 5000 Miles)

EXTRA HEAVY NON-SKIDS MAKE EARLY SPRING BUSINESS

Ajax Non-Skids do not push ahead the wet slippery film of ice or mud, but with the beveled and diamond-shaped corrugations, cut into and secure a firm grip on the solid surface underneath.

This dependable quality of AJAX Non-Skids, together with the well-known fact that they were the tire equipment on all four trophy-winning cars in the 1911 Glidden Tour, will make good business for the AJAX Dealer when others are "waiting for the season to open."

Dealers who want tire business in all kinds of weather, should write today for the AJAX Proposition.

NEW TYR

a waterproof
tire dressing
that beautifies
the car and preserves

THE TIRES

White or Slate Colored

Gives New Life to Your Old Tires
Longer Life to Your New Tires

Far superior to any other preparation on the market for the two-fold purpose of dressing and preserving tires. A rubberized liquid preparation that fills the cracks and holes, prevents sand blisters and keeps the rubber from cracking. New Tyr can also be used on running boards and floor of car if desired with a very dressy effect. Uninjured by temperature or weather—water has no effect upon it. NEW TYR stays put and is applied in the same manner as paint.

Try a pint can of NEW TYR—it means a better looking car and better tires, covers more surface and is far superior to any other preparation on the market. Used in Germany and European motoring countries for years.

PRICE OF PINT CAN, 75c.

A NOISE ANNOYS

Stop that noise; get away from friction and wear; there's no need of these drawbacks to motoring. An adequate lubricant greatly reduces friction and gives you the full driving power of your engine.

It's your gears that you must look to for successful motoring, and it's a "gear" oil you MUST have. Only

INVADER GEAR OIL

is "adequate"—made for gear needs. Tests have proved its superiority, and testimony its popularity. Up-to-date dealers and owners are its enthusiastic users for sliding gear transmissions, differential gears and front gears where a heavy lubricant is required.

Don't Take Our Word For It—ASK SOMEBODY

Can You Adjust and Time a Magneto?

If not,

THE A B C OF

Magneto Ignition Systems

By VICTOR W. PAGE, M. E.

Will make principles of operation, construction, timing, adjusting, and locating trouble clear. A practical treatise for all who motor, written so that you can understand it. Over 30 illustrations and charts. Covers the subject thoroughly and concisely. Sent postpaid to any address in U. S. or Canada on receipt of 35 cents. More Useful Information Than Ever Before Published on This Subject.

WHAT we want you to see, is a practical demonstration of the worth of Truffault-Hartford Shock Absorbers. We're established at all the big Shows to give you just this opportunity. The

Truffault-Hartford SHOCK ABSORBER

will be shown in actual operation of absorbing rough-road shocks.

Learn what you gain by equipping with this efficient device.

More than you imagine, of that we're sure.

—*more in comfort* for the Truffault-Hartford cuts out the jolt and jar and causes the car to rise with delightful ease.

—*more in safety* for the Truffault-Hartford prevents the excess of spring action which results in spring breakage.

—*more in economy* for the Truffault-Hartford keeps the wheels of the car on the ground and thus saves wear and tear on tires.

There are more reasons than these, though, why your car needs the Truffault-Hartford. These reasons will all be made plain to you if you come and see us at the show.

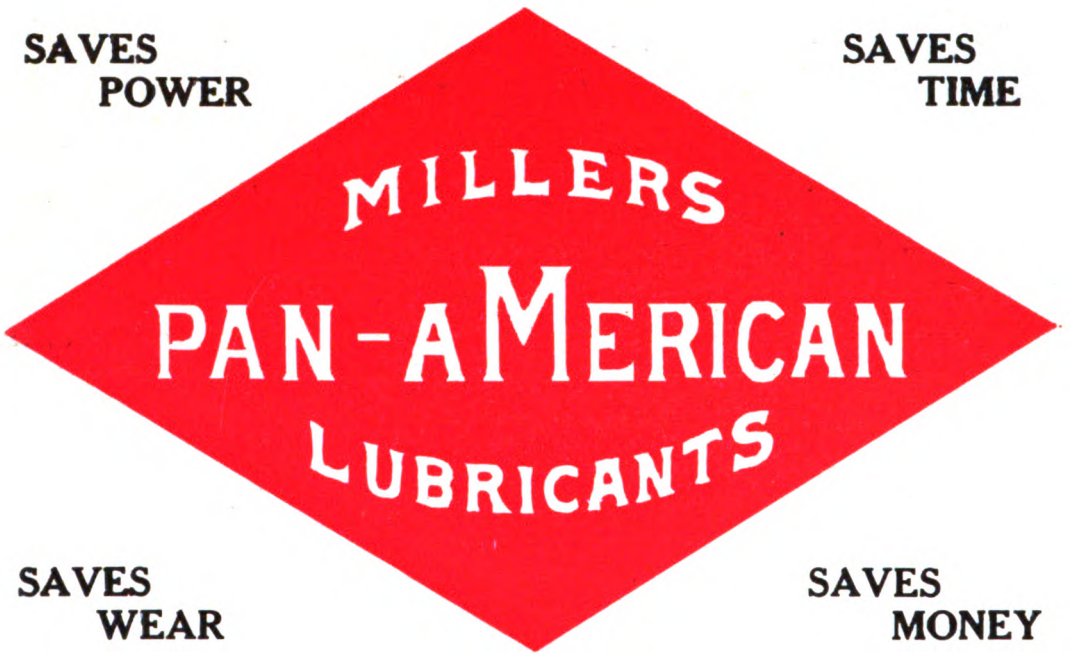
✱ the oil that lubricates most ✱

GARGOYLE

Mobiloil

A GRADE FOR EACH TYPE OF MOTOR

ARE YOU USING THE PROPER OIL ON YOUR CAR?



You can reduce your automobile upkeep expense by giving intelligent study to the question of lubrication, which is a neglected but very important factor affecting the economic operation of an automobile. Improper and therefore ineffective lubrication is most largely the cause of automobile depreciation. Experienced users of automobiles appreciate the benefits of scientific lubrication and the great saving in depreciation and economy of operation derived therefrom. Business concerns of the greatest magnitude, where comparative tests have been made, concede the superiority of Mobiloil for motor truck lubrication.

If oil saves power, it follows that
one oil saves more power
than another.

SILENCE

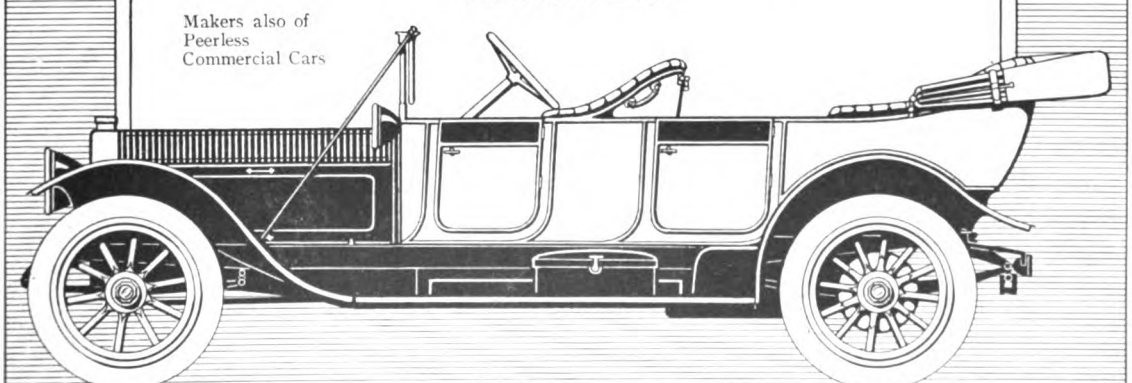
Peerless

COMFORT

ALL THAT THE NAME IMPLIES

Finish

The importance of the finish put on a motor-car is two-fold; it protects metal and woodwork; and it enhances beauty of lines, color and materials.



Appreciating the full importance of a perfect finish to a car of the highest standard in every detail of design and construction, the Peerless Motor Car Company has developed this branch of the art of automobile production to its finest expression. An entire building in the Peerless plant is given over to the Finishing Department; and the materials and processes employed embody the study, experimenting and experience of the whole industry.

Peerless finishing is long and painstakingly thorough. Each coat of paint and varnish on a Peerless body is thoroughly rubbed down with pumice before the next coat is applied. From the "flat lead" and "rough stuff" to the "best color" and "body varnish", the successive coats are laid with scientific care and skill. There are several "rubbing out" and smoothing processes, and the fine touches are put on in a dust-proof room.

Peerless bodies have a perfect surface with an enduring gloss and polish.

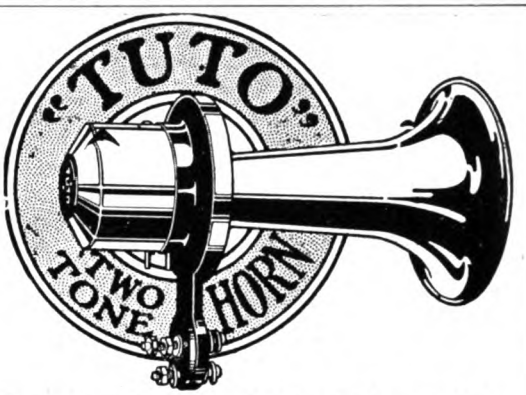
Here's a Few Pleasing Notes

from satisfied users of TUTO Horns. Read them: they will give you a good idea as to **what's what** in electric horns and will help you in deciding what horn you want to put on your car.

I wouldn't sell my Tuto for $100.00 if I couldn't get another one. J. A. KERR
Signs & Novelties
Rockefeller Building
Cleveland, Ohio



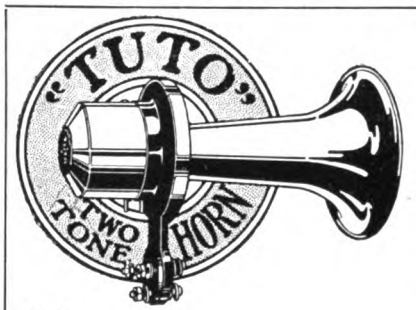
Joseph Mayer,
Room 46 Bailey Bldg.,
27 E. 22nd St.
New York City, N. Y. Oct. 27-1911
Dean Electric Company, Elyria, Ohio,
Gentlemen:—
The Tuto Horns that I purchased from your concern for the shows namely Barnum & Bailey, Ringling Bros., and Forpaugh & Sells shows, have been in use on the automobiles with these shows and have given entire satisfaction in every way, and can recommend them as a first class horn.
Yours very truly,
Joseph Mayer

Fill in the TUTO Coupon—***take it to your dealer.*** He'll put a TUTO Horn on your car for a ten day trial. It won't cost you a cent. After ten days, if you are not satisfied in every respect, drive your car to the dealer who put the TUTO on—he'll take it off without saying a word. If there is not a regular accessory dealer in your district, send your TUTO Coupon to us and we will see that you get a TUTO horn for a ten day trial without a cent outlay.

The Dean Electric Co.

266 Taylor Avenue, Elyria, Ohio.

"Look for Dean where Quality's seen"



TUTO HORN

A Two-Tone Electric Horn

The TUTO Horn is the only electric warning signal having one horn, one button and one connecting cord—yet two strengths of signal notes---a low signal for everyday service, taking the place of the bulb horn, and a loud signal for emergencies, both produced by the same mechanism. No complications or confusion. Simple, reliable and inexpensive to operate. Made in a most substantial manner from the best of materials and will last a lifetime, as there are no bearings or friction surfaces to wear out and require constant attention.

Test the TUTO for Ten Days before You Buy

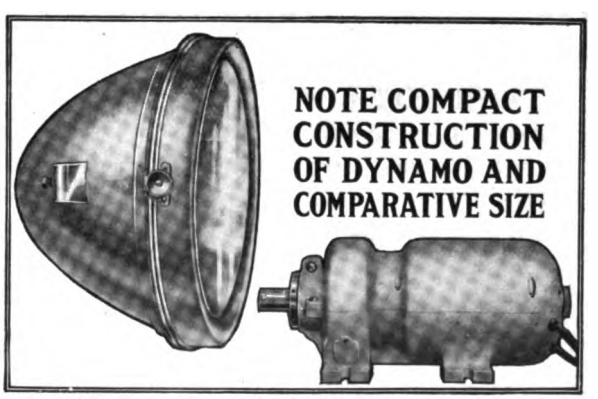
It's Built in New England



And Lights the Roads Everywhere

GRAY & DAVIS

Lighting Dynamo System

No other system in the world like this. No other system gives such real satisfaction. You should have the GRAY & DAVIS Dynamo on your car and realize what motoring comfort is.

It has been in service for years. It gives absolute satisfaction. It has the most necessary "CONSTANT SPEED" feature. Lights lamps irrespective of battery.

Is compact. Weighs but 19 1-2 lbs. Requires no attention and works all the time regardless of running conditions.

There's nothing to it but GRAY & DAVIS. At the Shows, in the automobile factories, on the salesrooms floors—whenever they talk of electric lights it's GRAY & DAVIS.

Tell the dealer to deliver your new car equipped with this system—it will outlast the life of your car and ALWAYS give satisfaction.

WHEN IN BOSTON

Call at our salesrooms—let us demonstrate how highly efficient this Dynamo is. Write for catalog.

GRAY & DAVIS, MANUFACTURERS OF AUTOMOBILE LAMPS **BOSTON, MASS.**

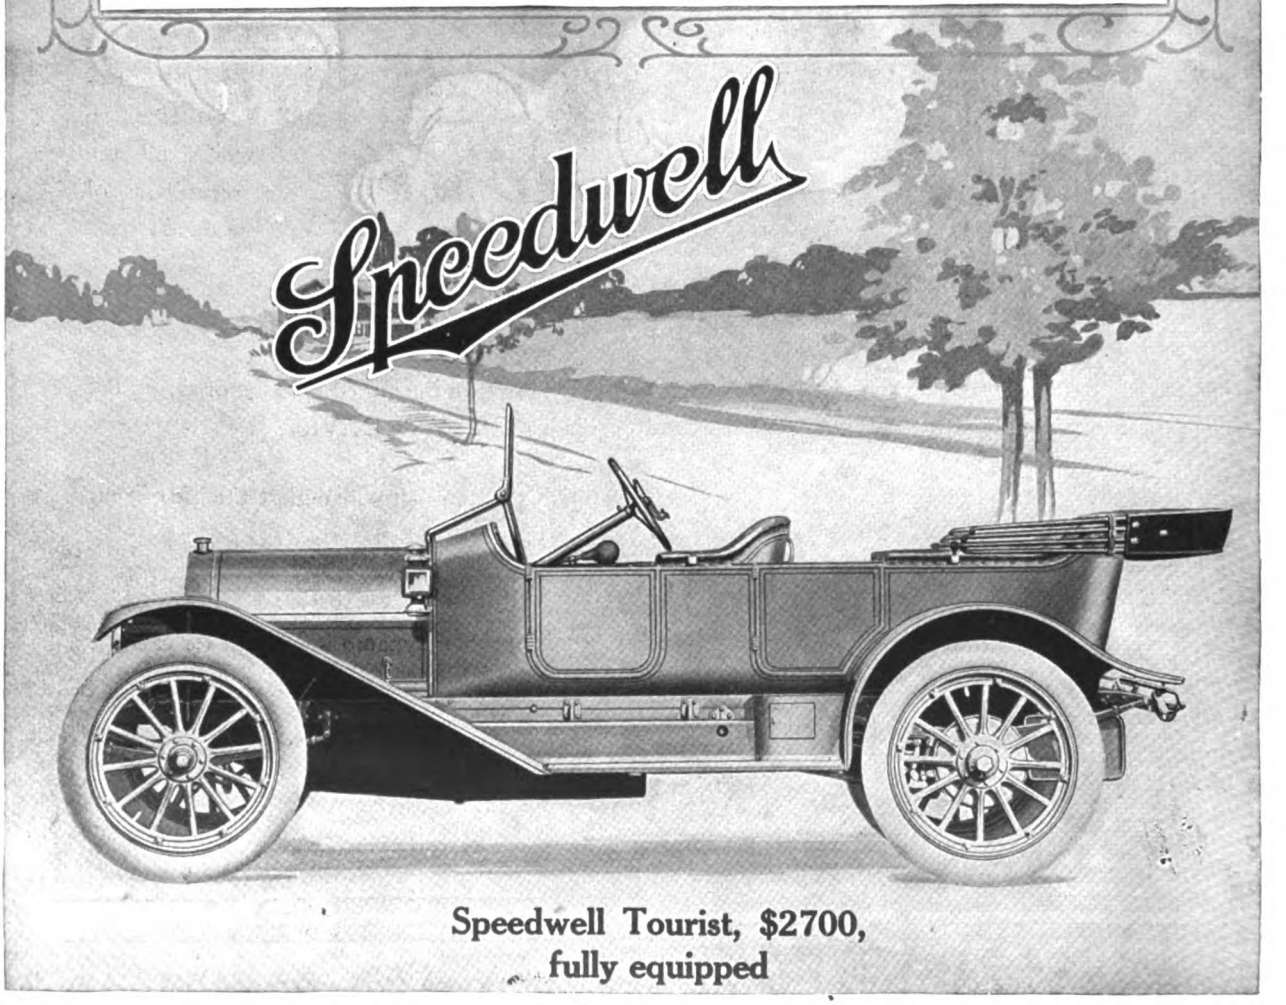
Speedwell Worth

The actual worth of a motor car cannot be measured by mechanical details or lineal specifications---so much for so much money.

The character and length of the service, the riding comfort, the distinguished appearance---that is, the actual quality and satisfaction embodied in a motor car---these are the factors that count.

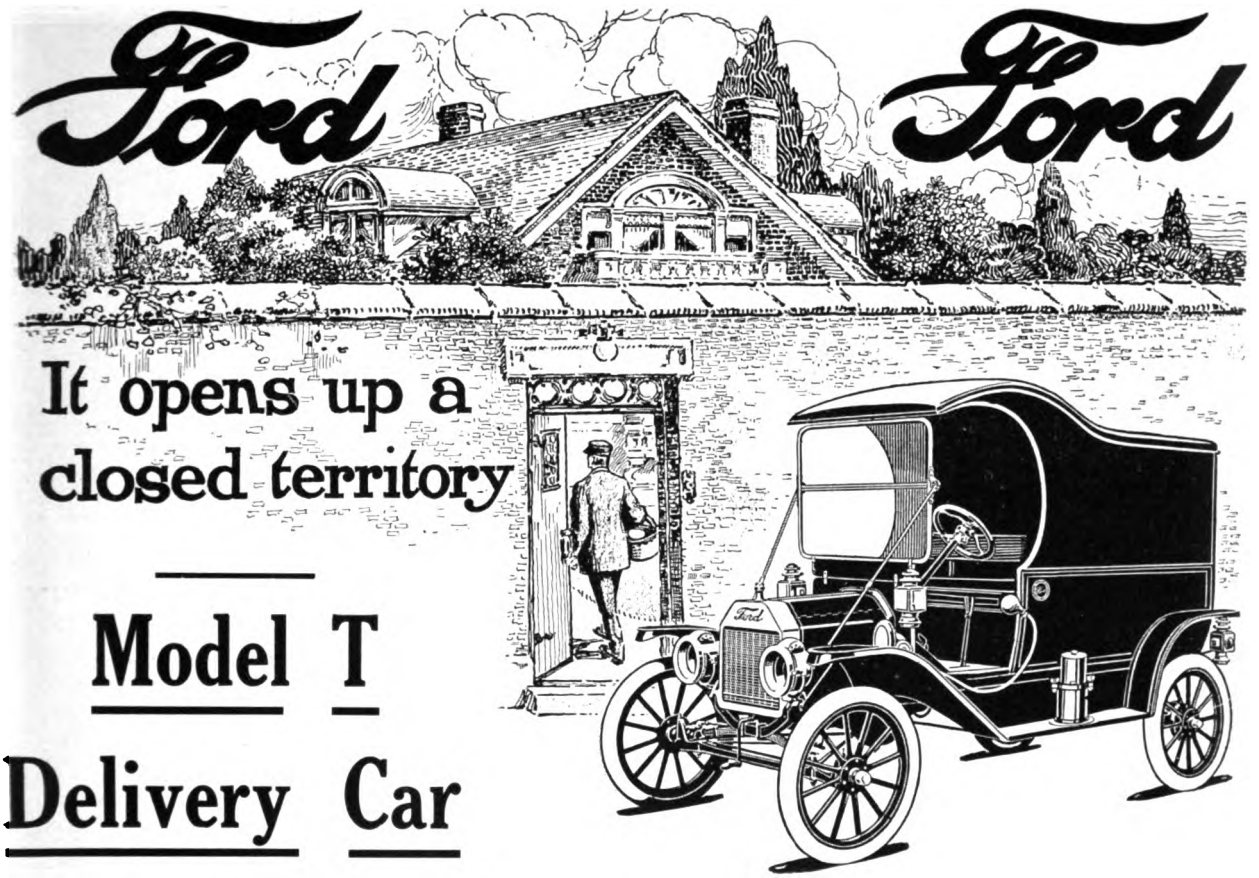
Measured on this real scale of worth Speedwell Motor Cars have no superior.



Literature upon request

The Speedwell Motor Car Co.
80 Essex Ave., Dayton, Ohio.

*** Standard Equipment**



Self-starter,
Full cape top and boot,
Glass front,
Demountable rims,
Gas tank and full lamp equipment,
Tool kit,
Tire kit,
Etc., etc.
One standard chasis—
4 cylinder, 50 H. P.;
123 inch wheelbase;
36 inch wheels.

* Equipment as given above applies to all models except roadsters and limousines, which vary slightly in their standard equipment.

Speedwell Tourist, $2700, fully equipped

Digitized by Google

The Barriers Are Down for all the many lines of business that have been looking for a light, flexible, tough, low-priced, high-quality delivery car. Not a truck nor a van, but a CAR—that can cover the ground, open up new territory, bring in new customers, advertise its owner, extend the business, outwork a team of horses and cut the maintenance bill. **That car is this FORD Model T Delivery.**

$700

This price includes full equipment---Automatic Brass Windshield, Speedometer, Ford Magneto built into the motor, two six-inch Gas Lamps and Generator, three Oil Lamps, Horn and Tools. No Ford cars sold unequipped.

Capacity, 750 pounds of Merchandise.

THERE IS NO CLOSED TERRITORY to the wholesaler, the retailer, the power or light company that uses the Ford Model T Delivery Car. It eats up space and annihilates time. It makes relics of more than a million old style delivery vehicles in the United States. It is the feature of 1912 in commercial automobiles. It advertises its dealers and booms its buyers.

TWO YEARS OF HARD PRACTICAL TEST lie behind this statement of fact. The Wanamaker stores of New York and Philadelphia, and the Bell Telephone Company all over the Country, have taken these Ford Model T Delivery Cars and driven them now for over two years, winter and summer, uphill and down. No factory test here, but the actual grind of work. Result—not a change. The **guarantee of Accomplishment** stands on this car.

Light: weighs 1200 pounds—low tire expense—less fuel, multiplies the actual horsepower—carries 750 pounds of merchandise—carries it anywhere, any time.

Flexible: turns in a circle of 28 feet—accommodates itself to owner's and customers' space.

Tough: the same strong chassis of all Ford Model T cars—same simplicity of operation, same Ford magneto built into the motor, same Vanadium steel throughout (40 locomotives of vanadium at twice the cost of carbon steel are now being considered by the Secretary of War for use at Panama).

Low-priced: completely equipped—$700—no more than a team and wagon.

High-quality: stands side by side with the other productions of Ford genius—with more than 100,000 drivers vouching for them.

Your competition is active. Think hardest and FIRST. Send for our descriptive booklet. Ford branches and dealers everywhere.

Good dealers in unoccupied territory are requested to write us.

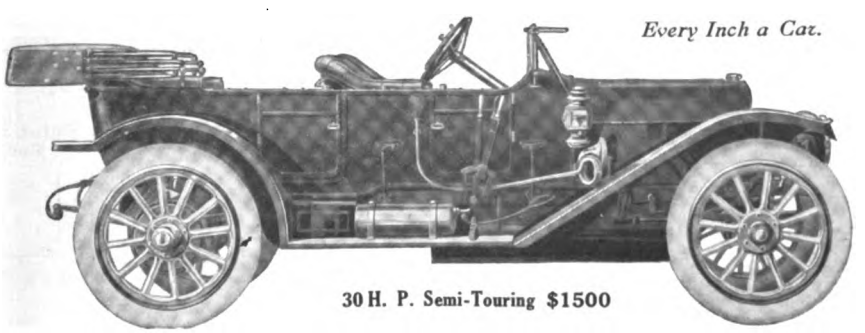
THE ROOMY KISSELKAR

30 H. P.....$1500
40 H. P.....$1850
50 H. P.....$2350
60 H. P. "Six".....$3000
1½ to 2 Ton, 3, 4, 5 Ton Trucks, Delivery Wagons, etc.
Prices include full equipment, except the "Thirty," which has more than regular equipment.

KISSELKARS are generously roomy—more so than other cars. No one is cramped—the driver and his companion in the front seat have as much room as the passengers in the tonneau. This extra roominess is the basis of KisselKar comfort, added to by deep, springy upholstery, deep seats, extra liberal wheel base, extra big wheels and tires and springs of special resiliency. Road vibration is not a fatiguing element in the KisselKar.

The ability, comfort, appearance and construction of the KisselKar are surpassed by no car at any price. You may not be able to investigate every automobile, but the special features and exceptional values of the KisselKar line deserve your special investigation.



WRITE FOR KISSELKAR PORTFOLIO

One of the most comprehensive automobile books ever published. Write for it, and the name of our representative in your territory. This book tells the story of how comfort and low maintenance are built into the KisselKar and pictures and describes the entire KisselKar line.

WHITE *Self-Starting* SIX

THE White Self-Starting Six-Cylinder Sixty presents a striking contrast to the conventional types of six-cylinder motor cars.

This car has been produced to meet the heretofore unfilled demand for a powerful six-cylinder car that is both economical in operation and simple in construction and control.

The White Six embodies all of the principles of motor car design which The White Company has so thoroughly developed, and which have made White Cars world-famous for economy, durability, and simplicity of operation and construction.

Absolutely the latest in every detail of body design, with lines unbroken by hinges and handles, the White Six is the only car to incorporate the entirely new but extremely convenient combination of the left-hand drive with a thoroughly practical and efficient electric starting and lighting system, making it possible, for the first time in motor car construction, to reach the driving seat, start and light the car without the necessity of stepping into the street.

The striking simplicity in the design and construction of the White Six, with its long-stroke, cast-in-block motor, commands the admiration of all who see it; and the owner of a White Car rests secure in the knowledge that it is absolutely the best and most advanced car produced anywhere.

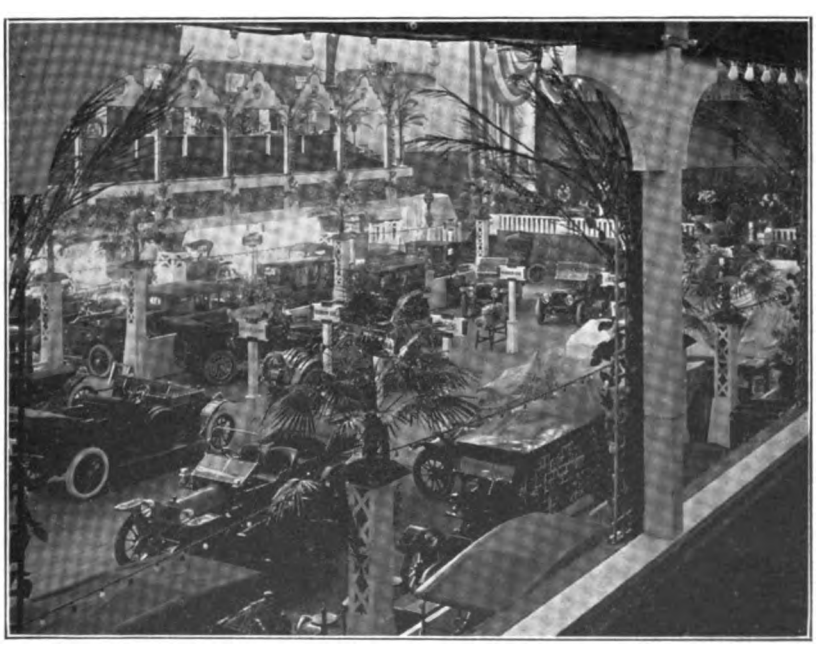
THE AUTOMOBILE JOURNAL



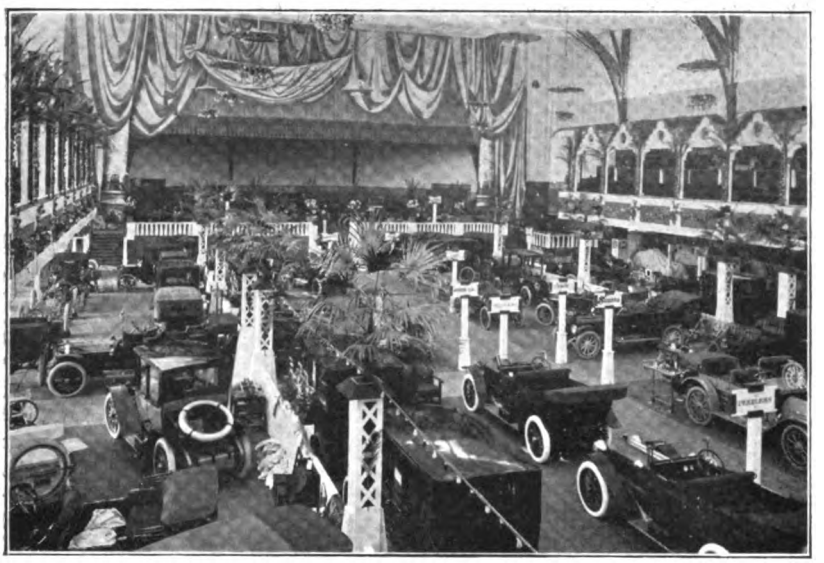
VOL. XXXIII, No. 3 MARCH 10, 1912 Price $1.00 the Year

BOSTON SHOW CREATES NEW RECORDS.

Sales the Largest Industry Has Known—Attendance Exceeds Previous Events by Nearly One-Third—Beautiful Setting and a Remarkable Display.

TWO MILLION dollars worth of automobiles were sold during the seven days and nights of the 10th annual Boston show. As the doors closed, the evening of March 9, the total number of sales reported to the management was 1492. Cars sold ranged in price from $600 to $6000, and a fair average is fixed at $1500. Less than 1000 cars were sold a year ago, and that was considered the best show made by any motor car exhibition ever held.

Very nearly 200,000 people had visited the show Friday evening, and this was increased by approximately 25,000 the last day. A conservative estimate by the management puts the total attendance at 223,841. Of course, it will be expected that these figures will be changed slightly when a more accurate counting has been made. Last year there were 188,000 visitors.



Looking Down from the Balcony in Grand Hall During the Progress of Boston's Tenth Annual Pleasure Car Show.

These figures offer substantial evidence that New England has lost none of its prestige as being the greatest motor vehicle market in the world, and that the Boston automobile show is still able to attract the motoring public. No attempt is made to consider the accessory end of the show, since it practically is impossible to secure reliable statistics as to the business accomplished along this line. It hardly seems probable, however, that the exhibitors of parts, fittings and supplies experienced any other result than that which greeted the motor car dealers.

But it was a great show in other respects. Chicago's best record of 98 makes of pleasure vehicles on display last month was exceeded by nine. New York can boast of but 91, when the 60 makes on view at the Madison Square Garden are added to the 31 at the Grand Central Palace. In total number of cars

Digitized by Google

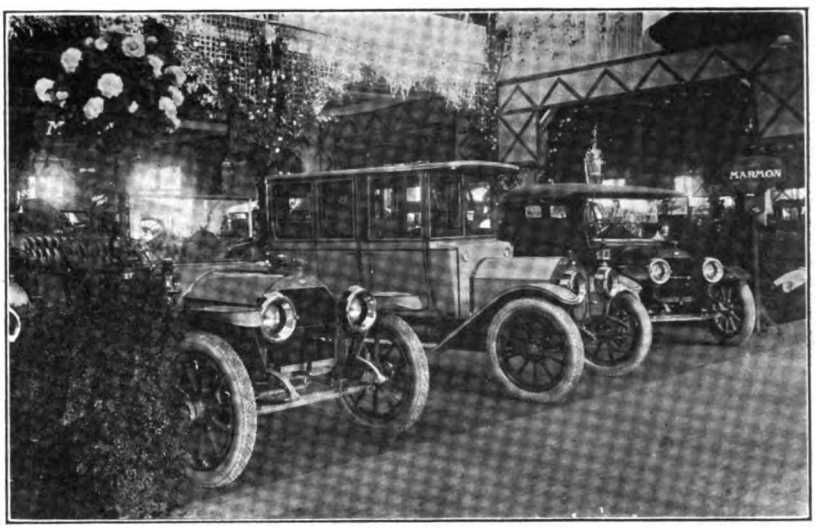
General View of the Main Floor, Grand Hall, with its Spanish Mission Setting.

and chassis on exhibition, the Grand Central Palace had but 163; Madison Square Garden 248, Chicago 344, and Boston 375.

These figures take into account only those cars which were inside Mechanics' Building. Hundreds of demonstrating cars were lined up against the curb on three sides of the building's exterior. This is a feature which is particular to the Boston show. As is well known the so-called national events are staged by the manufacturers in an endeavor to interest the dealers and agents first of all. Demonstrations are by no means as necessary with these. But the Boston show appeals to the would be purchaser. It is the one big sales exposition of the year, and the cars outside the hall are quite as important as those disposed among the decorations inside.

With reference to the decorations: The dainty appeal of the so-called apple blossom show of 1907 will long remain in the minds of those who saw the decorative treatment at that time, but there were many who expressed the opinion that the old English rose garden setting in Exhibition Hall this year exceeded it in point of beauty. There was something about the rich dark green of the boxwood hedges and the brighter hues of the roses that caused the visitor to return again and again to admire the display from another angle. And best of all, there was nothing about the decorative scheme which detracted from the cars themselves. Indeed, they seemed to fit in so naturally that their absence would have been cause for comment.

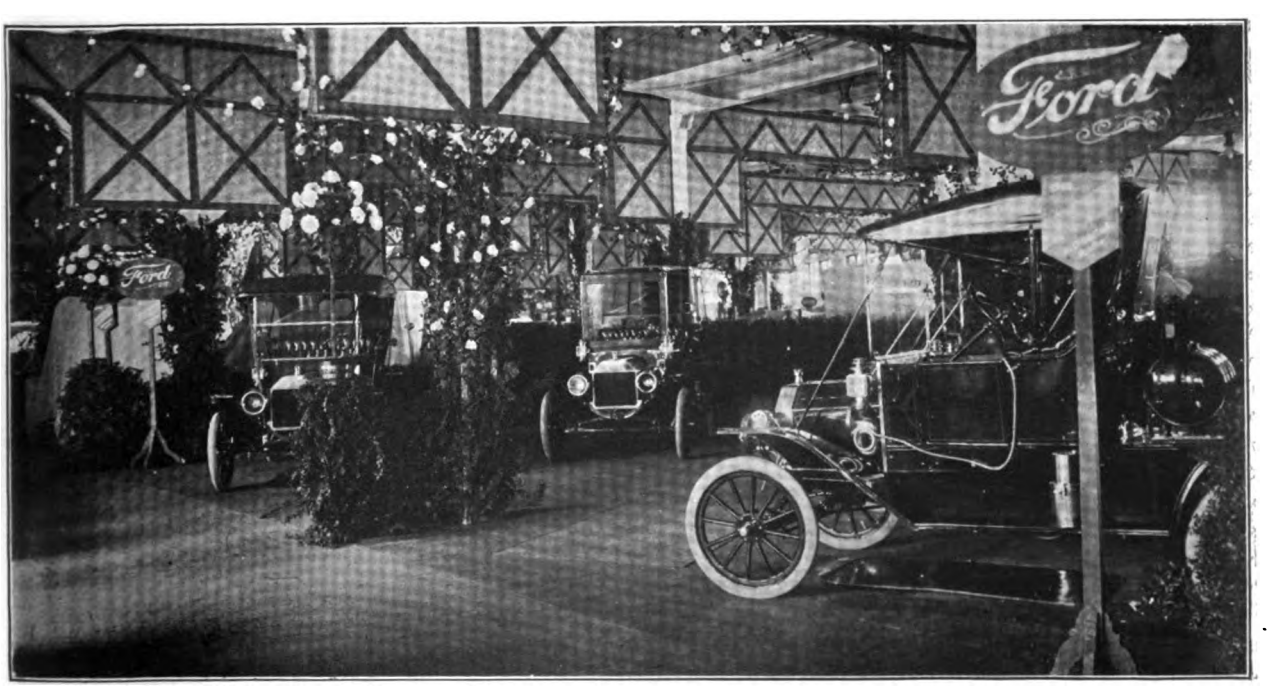
In Grand Hall, the general treatment was that of old Spanish Mission architecture. It was stately in design and gave an idea of permanence which well befits the automobile industry. The view from the balcony, as indicated by an accompanying illustration, was one of remarkable beauty, in which the classic lines and graceful curves of the cars on the main floor



General View of Main Aisle in Exhibition Hall, Showing the Remarkable Beauty of the Old English Rose Garden Setting Employed.

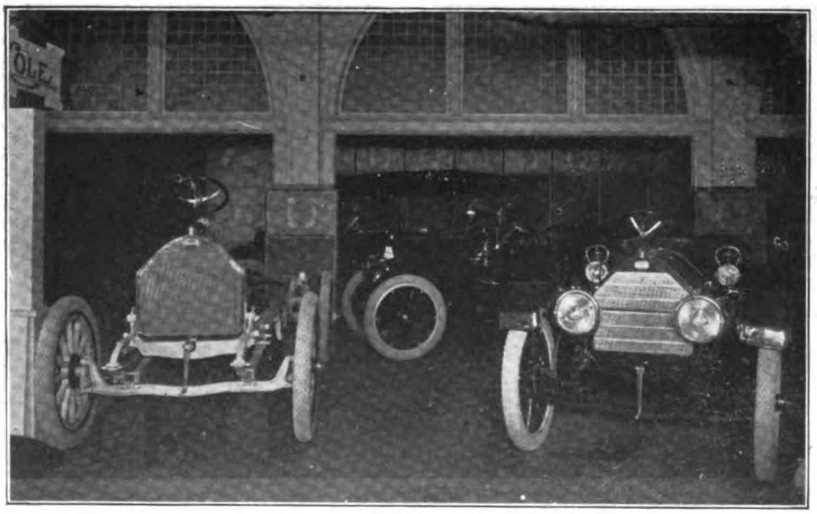
Digitized by Google

added their full quota. The basement does not admit of much in the way of decorative art. Still, bunting and lights were utilized throughout to obtain the best effect. The same thing may be held to apply in the balconies and other smaller halls, in which the accessories were displayed.



Of the 107 makes of machines on view, 14 were new to Boston, never having been exhibited at a show in that city before. These were: Havers, King, Lion, Metallurgique, McFarlan, Nyberg, Norwalk, Ohio gasoline, Ohio electric, Otto, R-C-H, Staver and Stutz. Some of these were not seen at either the New York or Chicago shows, and there were still others, not new to Boston, which were not seen at the other shows mentioned, this year. This list includes: Apperson, Bailey electric, Berkshire, Chadwick, Ford, Lenox, Moyer, Norwalk, Nyberg and Stanley steamer. To these should be added the Atlas Knight, since it was not seen at the other displays, although announced during the exhibit at Madison Square Garden.

A Splendidly Appointed Enclosed Town Car Occupied the Centre of the Marmon Exhibit.



Inasmuch as this was the first opportunity to study the construction of the Atlas-Knight, made by the Atlas Motor Car Company, Springfield, Mass., it will prove of interest to make some mention of its chief characteristics. The motor is changed but slightly from the regulation Knight construction, the movement of the sleeves being slightly less. The four cylinders are cast in pairs with bore of 4.5 inches and stroke of 5.5, the rating being 50 horsepower at 1200 revolutions a minute. Another special feature of the construction is the use of an underslung worm drive. This is believed to be the first instance in which an American made pleasure car has employed the worm for final drive. The Atlas-Knight will be fitted with a self-starter.

Apperson cars are made by the Apperson Bros. Automobile Company, Kokomo, Ind., and it is somewhat surprising to find this concern waiting until the

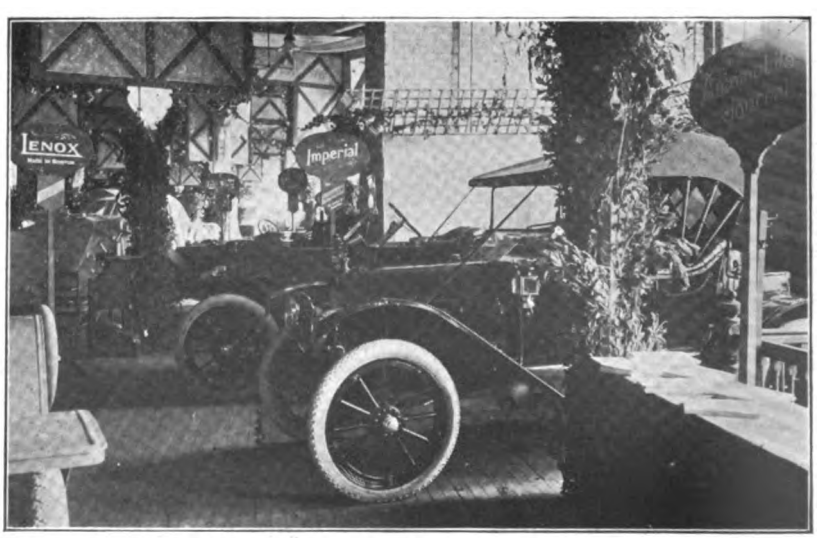
Ford Cars Had a Commanding Position in Exhibition Hall, Being Surrounded by Boxwood Hedges and Rose Trees.

Digitized by Google

Where Cole Cars Were Displayed Under the Balcony in Grand Hall.

Boston show before introducing its new models to the public. The line does not differ materially from from that of last year. The equipment is most complete, including a special windshield ventilating attachment and demountable rims.

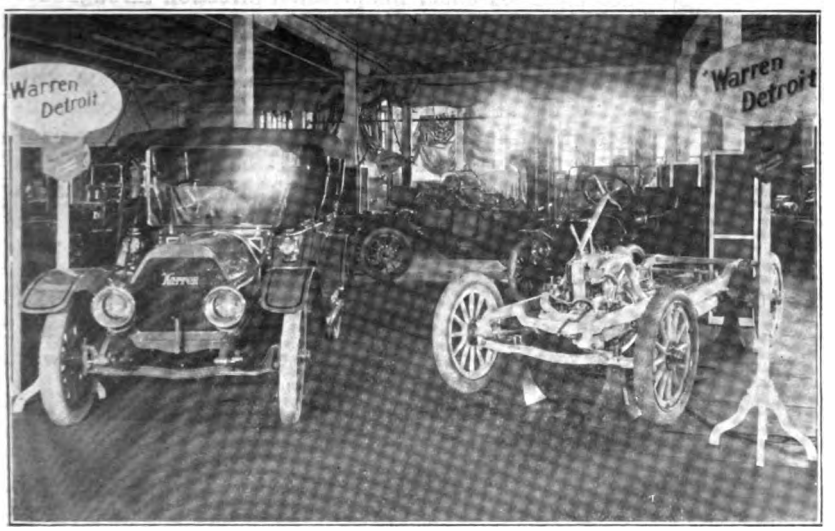
The Bailey electric is made in Boston by S. R. Bailey & Co. Its prominent feature is the use of the Edison battery. The line has been increased by the addition of a roadster, in which the battery is divided, one-half being located under the rear compartment and the other in front under a low hood. It is claimed that this machine will average 20 miles an hour with a run of 80 to 100 miles on a single charge.



Berkshire cars are produced by the Berkshire Motors Company, now located at Cambridge, Mass. Two chassis are presented, a four-cylinder and a six. To the former of these five bodies are fitted, and four to the latter. The changes in mechanical construction are not many, and in the main the Berkshire 1912 models are similar to those which have won for this make an enviable reputation throughout New England. Equipment includes a self-starter and demountable rims.

The Chadwick is made by the Chadwick Engineering Works, Pottstown, Penn., in six-cylinder models only. Several mechanical features, which may be regarded as distinctive of the Chadwick design, are still retained without material change. Special attention has been paid to the system of brakes and spring suspension, and the side chain drive, with which this car is equipped, is enclosed in a dust and dirt proof chain case.

While conditions have changed materially in the automobile industry during the past year, it would appear that the Ford Motor Company, Detroit, maker of Ford cars, is not yet ready to display at the shows under the management of either national organization of automobile manufacturers. Ford cars always have been seen first at the Boston show, and this was true again this season. The standard chassis has been changed but slightly during the past year, and is almost too well known to need extended description.



The Lenox Motor Car Company, Boston, Mass., which brought out its first Lenox car just previous to the Boston display of last year, has added two new body designs, one a speedster and the other a limousine. The changes in design and construction are such as are intended to make for economy and comfort. Heavier wheels are used throughout, and the rear axle is of Krupp steel. Standard equipment includes demountable rims and one extra rim. While a self-starter and electric lighting will be fitted at an extra charge at present, it is understood that the company is experimenting in connection with Gray & Davis, Amesbury, Mass., for the production of a combined electric starter and lighting system which will be adopted as regular equipment.

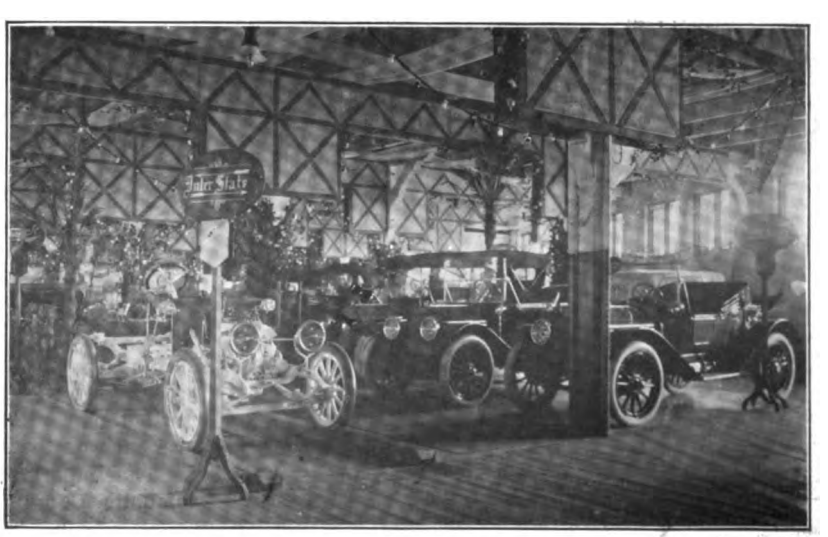
Moyer cars have been manufactured for two years by W. A. Moyer, Syracuse, N. Y., but this was the first time they have been displayed at any show, outside of their home city. The maker has had long experience in the production of wagons and is well and favorably known in that field. There are two chassis, a four-cylinder and a six, the former rated at 30 horsepower and the latter at 45. The motors have the

Imperial and Lenox Models Were Shown Side by Side in Exhibition Hall.

Digitized by Google

Warren Display, Indicating Decorative Treatment in the Basement.

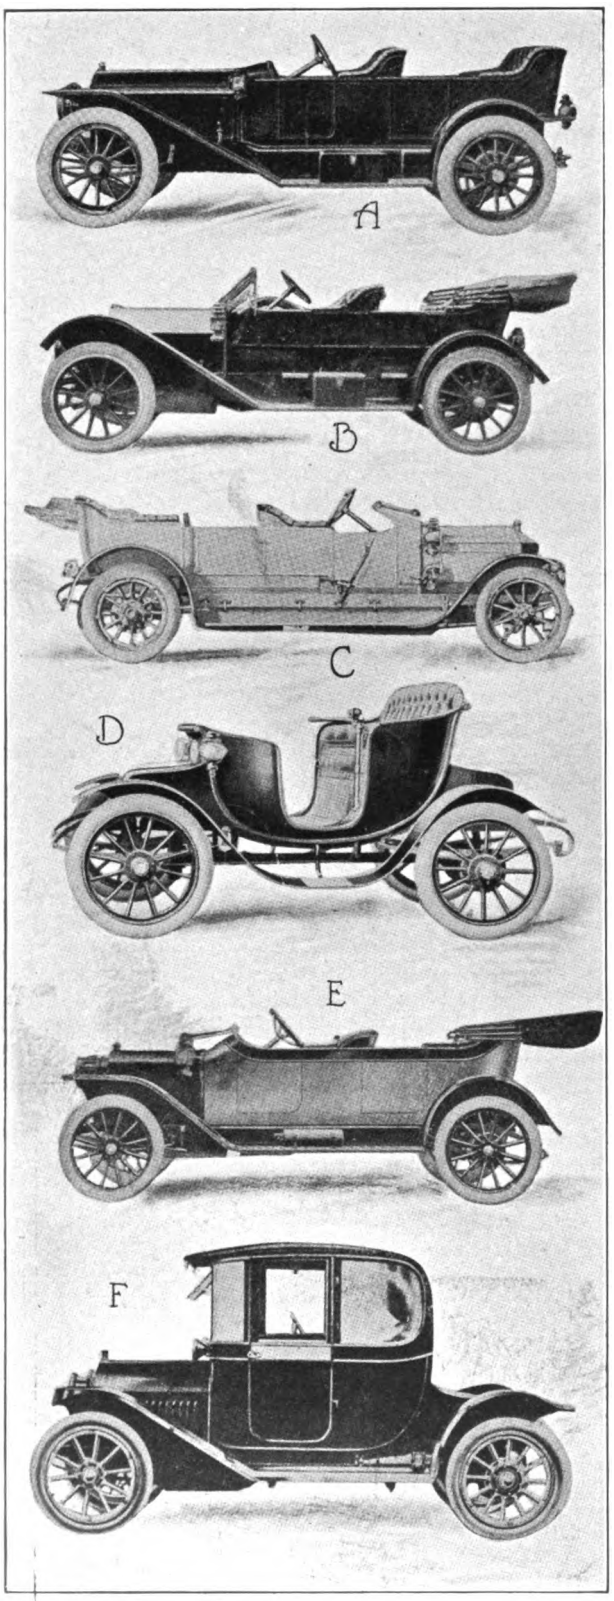
same bore and stroke, 4.25 by five inches. A particular feature of construction is the spring suspension. Two semi-elliptic members are utilized in front and two three-quarter elliptic members in the rear, the latter being connected by an equalizer at each end. It is claimed that by this method, no matter how the car is loaded, both sides of the frame will be depressed equally. Equipment includes electric lighting, Blitzen self-starter, tire carrier, quick detachable rims and provision for the acetylene tank in the tool box.



What is claimed to be the first underslung six-cylinder car is found in the Norwalk, made by the Norwalk Motor Car Company, Martinsburg, W. Va. It would appear from an examination of the chassis, that about all that was removed from Norwalk, O., to Martinsburg, in the recent reorganization of the company, was the name. The old Norwalk car had a four-cylinder motor rated at 45 horsepower. The new six-cylinder engine is expected to develop from 54 to 62. Cylinders are cast in pairs with valves in removable cages in the head. The bore is four inches and the stroke five. Equipment is most complete and includes electric lighting and Prest-O-Starter.

The Nyberg is made by the Nyberg Automobile Works, Anderson, Ind. The construction follows standard lines throughout the two chassis, one of which is fitted with a four-cylinder motor rated at 40 horsepower, and the other a six, rated at 60. The engine is a Rutenber of the latest long stroke type, the bore being 4.25 inches and the stroke 5.25. Several types of bodies are fitted, including delivery wagons and fire apparatus.

As is fitting in connection with the Boston show, held in the city in which the first automobile show was conducted in the days when steam was regarded as the only ideal propulsive agent, the Stanley steam car, made by the Stanley Motor Carriage Company, Newton, Mass., was shown again this year. While several changes have been made in the mechanical construction, they cannot be regarded as radical. The chief difference lies in the appearance, a fore door torpedo body having been added both for the touring car and roadster models. The line is sold fully equipped this year.



Concerning the other lines shown, all of which were seen either at New York or Chicago, brief descriptions have appeared in The Automobile Journal in connection with the review of those displays. A few of these exhibited new features, however, and it will be proper to make mention of these here.

The Peerless line, for instance, included an advance model in which were incorporated a few features which will be seen in the 1913 design. The changes are not what may be regarded as radical, but with a view to offering even more comfort and economy than has been exemplified in previous Peerless models. Of particular interest was the berlin limousine in rich royal purple, with beautifully executed landscape panels vignetted centrally upon the body. The interior treatment was in handsomely grained, soft-toned Circassian walnut, embellished with hand painted Louis XVI decorations. This design was by John L. Snow of the Boston branch and the work was

Inter-State Cars Drew a Splendid Location in Centre of Exhibition Hall.

Digitized by Google

Seen for the First Time in Boston: A, Havers; B, McFarlan; C, Metallurgique; D, Ohio Electric; E, R-C-H; F, King.

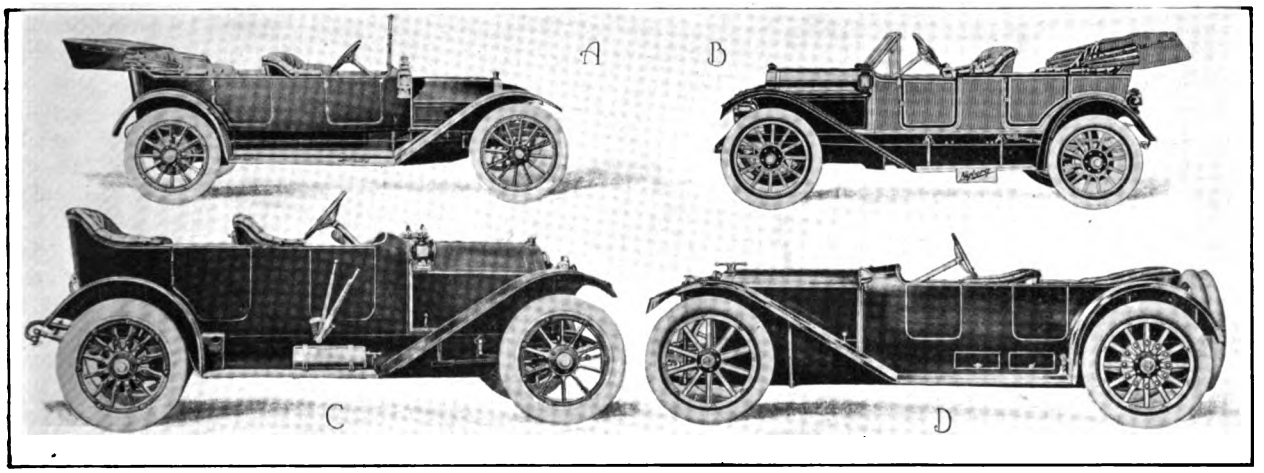
accomplished under his personal direction throughout.

Another enclosed car of Boston construction was that designed by F. E. Wing of the F. E. Wing Motor Car Company, agent for Marmon cars. In this, the driver's seat was completely shut off from the remainder of the interior, an extra seat in front being provided for the third member of the party. This also was handsomely appointed and finished both inside and out, and attracted unusual comment.

A berlin limousine finished in mahogany was shown at the booth of the Underhill Company, agent for Knox cars. The rich coloring, resembling the grain of the wood, as have all of the Knox show cars this year, was particularly effective. One feature was the locking of the doors by means of Yale locks, so that it would be possible to leave wraps inside the machine, while attending the theatre, making calls, etc.

The White Company displayed one of its four-cylinder cars equipped with the new White self-starter. It will be remembered that only the new six-cylinder White machine was thus equipped at New York and Chicago. In the future, all White cars will be fitted with the self-starter, including the limousine.

White, Ware & Leatherby displayed the new 40 horsepower Bergdoll, both in the chassis and as a torpedo model. This was shown for the first time in New York City, but not in such complete form. It does not differ materially from the older 30 horsepower car, except in the motor, which is of the long stroke design, being with bore of four inches and stroke of six.



The KisselKar New England branch presented the new seven-passenger six-cylinder 60 horsepower KisselKar, which was seen for the first time in the East. The particular features of this model, besides the usual KisselKar quality, are the long wheelbase, 132 inches; large tires, 37 by five inches, and the very complete equipment. Electric lighting and self-starter may be had at a slight additional expense.

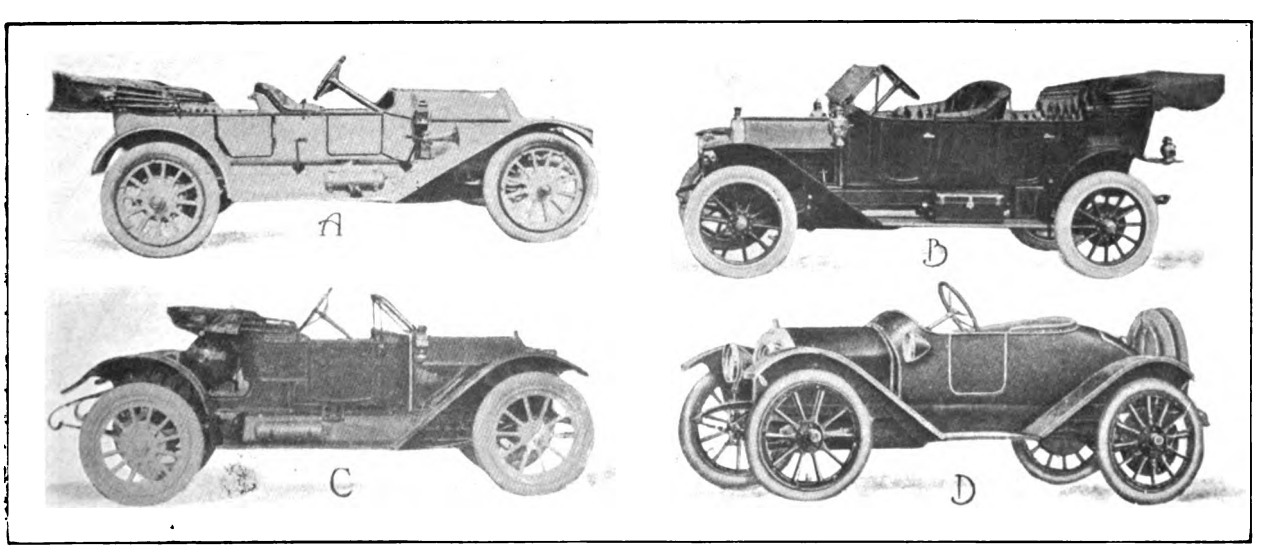
The Stutz line attracted considerable favorable comment, largely because of the announcement just before the opening of the show of its victory in the recent road race at Bakersfield, Cal. Inasmuch as this is the first time the Stutz has been seen in Boston, the Empire Motor Car Agency, local representative of the maker, the Ideal Motor Car Company, Indianapolis, Ind., was kept exceedingly busy demonstrating its merits.

F. N. Smith displayed the new Mercer raceabout, this particular machine being the one with which Hugh Hughes of the Mercer Automobile Company's racing team created a New York-Boston road record, March 5. The mechanical construction is the same as that shown at New York City in January but the particularly pleasing appearance of the new body was such as to occasion much favorable comment.

The Imperial line was shown by the Imperial Automobile Company, Jackson, Mich., several factory representatives being in attendance. The week was one of decided success for this make, a number of

Digitized by Google

Other Makes of Machines That Made Initial Showing in Boston: A, Otto; B, Nyberg; C, Stutz; D, Norwalk.



agencies being closed in this territory and in central New York State. It was announced that during the coming season the 44 horsepower chassis would be fitted with a limousine body and the 33 with a coupe.

The latest type of detachable demi-tonneau body on the Flanders was shown by the E-M-F Boston Company. This is mounted on the regulation Flanders chassis, and permits the use of the car as a utility vehicle. Three possible conditions are brought about by this arrangement. The demi-tonneau is removable, allowing for the use of an open flare board or enclosed delivery body. This is expected to have a decided appeal for merchants, florists, plumbers, etc.

Particular attention was paid to attracting and retaining the interest of women during this show. Several car representatives presented souvenirs, among which may be mentioned the Whitney-Barney Company, agent for the Selden; Chauncey Thomas & Co., Cunningham; and many others.

In fact, this was the first automobile show, that may be regarded as of national importance, in which women were exhibitors. Miss Virginia E. Aiken of Brookline, Mass., but 16 years of age and holding the distinction of being the youngest automobile agent in New England, becomes the first to display motor vehicles. She represents the Babcock electric, made by the H. H. Babcock Company, Watertown, N. Y.

Another woman, Miss Margaret E. Knight of South Framingham, Mass., is the first to display in the accessory division, her exhibit being the product of her inventive genius—the Knight-Davidson motor. This is a sliding sleeve engine, in which the sleeves are crescent or semi-circular in shape, and are arranged concentrically about the piston between the cylinder walls and water jacket. The details of the scheme have been worked out with commendable success. The bore is four inches and the stroke six, giving an S. A. E. rating of 25.6 horsepower, although the engine is said to have developed in excess of 50 on an actual

Four Cars Never Before Displayed at the Boston Show: A, Staver; B, Moyer; C, Lion; D, Ohio Gasoline.

Digitized by Google

brake test. Its development will be awaited with interest.

Two other motors were displayed, these being designed more particularly for aviation use, although they may be applied to automobile or motor boat construction as well. One of these was the R. V., made by the Raymond Engineering Company, Boston, this being a six-cylinder V motor rated at 75 horsepower, and operating on the two-cycle principle. The other was an eight-cylinder Frontier motor, also of the V type, made by the Frontier Iron Works, Buffalo, N. Y.

EDWARDS IS MARQUETTE MANAGER.

Clifton C. Edwards, well known to motorists throughout New England, has been appointed manager of the Boston branch of the Marquette Company, maker of Marquette cars, at 733 Boylston street. He assumed his new duties immediately preceding the Boston show, and was busy throughout that exhibition receiving the congratulations of his many friends who visited the Marquette display.

Clifton C. Edwards, Manager Marquette Boston Branch.

Mr. Edwards has been connected with the automobile industry for a number of years. For the past two years he has been connected with the E. R. Thomas Motor Car Company, Buffalo, N. Y., representing the Thomas car in the South and in Mexico. Previously, he was associated with the sale of Panhard cars in New York City.

He is best known in New England through his interest in the old Crown garage, closely allied with the Crown Hotel, in Providence, R. I., where he handled the Oldsmobile, Premier and other lines. Inasmuch as many tourists make their headquarters at the Crown when in Providence, Mr. Edwards had abundant opportunity to secure a wide circle of acquaintances and friends, all of whom are glad to learn of his latest appointment.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

SEAMLESS BOOSTERS "SMOKED."

During the exhibition of the pleasure cars at Boston an exceedingly pleasant incident for the representatives of the Seamless Rubber Company, New Haven, Conn., was a "smoker" tendered to them at the Hotel Oxford by Vice President and Sales Manager Henry G. Pagani. The principal part of the entertainment was an admirable dinner, to which all did justice, and at which decidedly pleasing souvenirs. useful to every smoker, were distributed. Following the menu was a period of informal speeches, which naturally assumed the character of trade "talk." The company was presided over by R. L. Kingston, manager of the Seamless Boston branch. Those participating were: Henry G. Pagani, R. L. Kingston, C. H. Teahan, Ware, Mass.; C. E. Walsh and C. H. Stoddard, Worcester, Mass.; David McConnell, Fall River, Mass.; H. L. Waite, Providence, R. I.; C. B. Thomas, Watch Hill, R. I.; George A. Clark, Westerly, R. I.; W. I. Willard, New Haven, Conn.; James A. Murray, New Haven, Conn.; R. E. Steer, Boston, Mass.; E. S. Steer, New Haven, Conn.; E. M. Schwarzenberg, Boston, Mass.; Percy I. Reynolds, Lynn, Mass.; W. I. Bissell, Northampton, Mass.; J. H. Atwood, Boston, Mass.; William Perdue, New York, N. Y.; John E. Reed, Brockton, Mass.; Thomas H. Steerworth, New York, N. Y.; George P. Brophy, Boston, Mass.; A. Mansfield, Boston, Mass.; W. R. Blodgett, New York, N. Y., and William W. Scott, Providence, R. I.

MUCH INTEREST IN MULTIBESTOS.

A feature of the Boston show which was particularly gratifying to the Standard Woven Fabric Company, Worcester, Mass., was the amount of interest taken in its product, Multibestos brake lining. It would not seem at first thought that the owner or prospective purchaser of a motor car would be greatly concerned with brake lining, inasmuch as cars come completely equipped with this material and it is not a component which wears out easily. However, this company found that the crowd about its booth was much interested, both in the product and the method of manufacture. Early in the week it was deemed necessary to telegraph the factory for additional demonstrators in order to explain adequately the virtues of Multibestos.

ISSUES ATTRACTIVE POSTER.

The American Lava Company, Chattanooga, Tenn.. maker of Alco acetylene burners recently issued a copyrighted eight colored poster entitled "The Brightest Light on the Highway." Placed in a special frame, and being particularly appropriate, it is unusually attractive.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

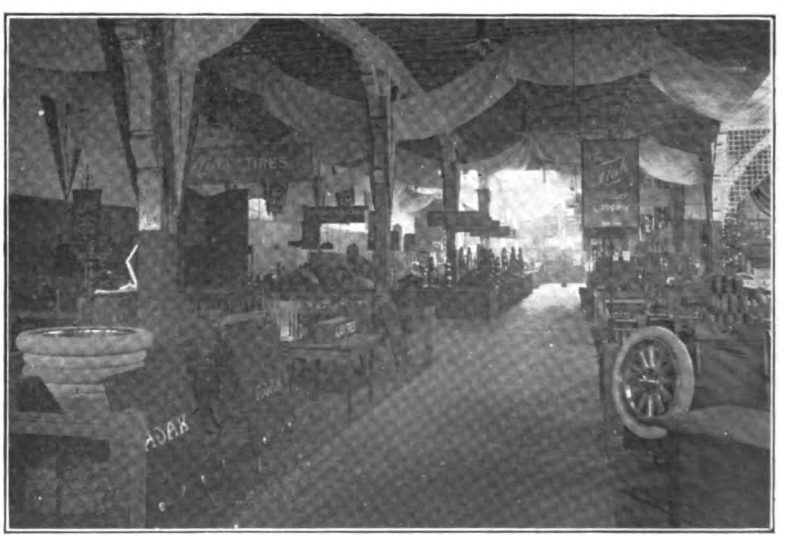
ACCESSORIES AT THE BOSTON SHOW.

THE DISPLAY of accessories at the 10th annual Boston automobile show was very large and comprehensive, it being the best ever made in connection with a Boston exposition. It was particularly notable for the considerable number of comparatively small devices. Several machine and shop power tools were exhibited, these being operated and practically demonstrated by skilled mechanics. Many of the exhibits shown were those prepared for the New York and Chicago shows and these were in charge of capable demonstrators. The following briefly describes some of the principal displays:

An Aisle in the Accessory Department Above Machinery Hall, Looking Toward Paul Revere Hall.

TIRES.

Ajax-Grieb Rubber Company, Trenton, N. J.—Displayed a full line of Ajax pneumatic shoes and tubes for pleasure cars with both round and anti-skid treads.



Boston Tire & Rubber Company, Boston, Mass.—Showed the Boston shoes and tubes for pleasure vehicles with round tread made in both the clincher and quick detachable types by the single cure wrapped tread processes.

Cataract Rubber Company, New York, N. Y.—Boston Motor Company, Agent—Cataract quick detachable and clincher shoes in plain and break-skid treads, and the Cataract gray and Selector red tubes.

Century Tire Company, New York, N. Y.—Showed the Century "custom made" shoes in both round and "guard" treads, the "guard" tread being surfaced in large blocks by hand-cut grooves. These shoes are of wrapped tread construction.

Empire Tire Company, Trenton, N. J.—Displayed a full line of the Empire shoes in clincher types, the gray and red tubes, and the Empire demountable rim for clincher tires.

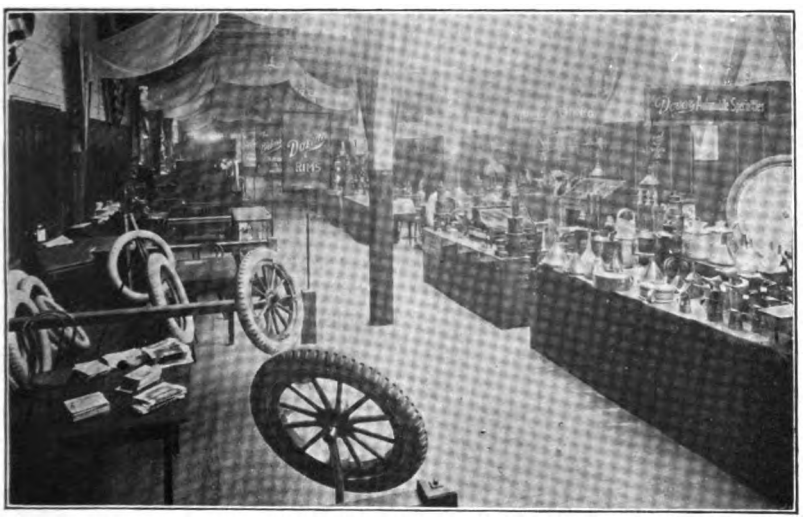
Firestone Tire & Rubber Company, Akron, O.—The Firestone display included the Firestone pneumatic shoes and tubes for pleasure vehicles in clincher and quick detachable treads, the Firestone solid tires for pleasure vehicles, the Firestone solid tires for power wagons, the Firestone quick detachable rims for pneumatic shoes, and the Firestone demountable rims for solid tires for wagons and trucks.

South Aisle of the Accessory Division Above Machinery Hall from Among the Tire Exhibitors.

Goodyear Tire & Rubber Company, Akron, O.—Showed the full line of the well known Goodyear "oversize" shoes and tubes, both round and anti-skid, for pleasure cars, and the Goodyear quick detachable rims. One feature was the double-thick non-skid tread, especially adapted for winter driving.

Fisk Rubber Company, Chicopee Falls, Mass.—Displayed the Fisk shoes of the bolted-on and clincher types, the Fisk demountable rim, the Fisk tubes for pleasure cars, and the latest Fisk production, the dual equipment for power wagons. This consists of a special rim adapted for the installation of dual pneumatic tires on machines up to 5000 pounds capacity, practically of the same design as the well known Fisk removable rim for pleasure cars.

Motz Tire & Rubber Company, Akron, O.—Exhibited the Motz solid tires, adapted for pleasure cars and for use with service wagons of varying capacities, these shoes being designed for constant service and not for track or racing work



Michelin Tire Company, Milltown, N. J.—The Michelin shoes and tubes for pleasure cars, the casings being either clincher or quick detachable, and round or the steel-studded anti-skid, were shown with the Michelin quick detachable rims for both automobiles and service wagons, the latter being of the dual type, and a full line of the Michelin tire tools and the Michelin materials for making temporary or permanent repair.

John Lewis Morse, Boston, Mass.—Made demonstration of the Brown perfection tire tube, which is constructed with a thick tread so designed that the internal pressure when inflated will close a wound effectually without leak or loss of resiliency.

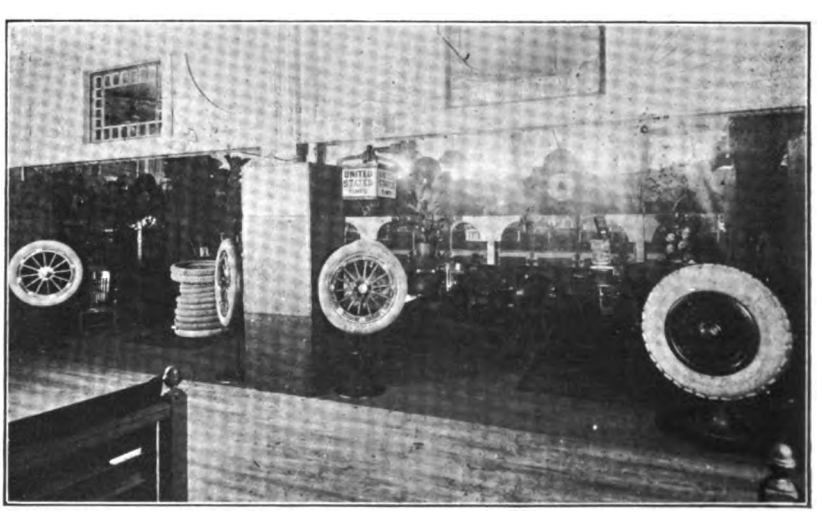
Seamless Rubber Company of New York, New York, N. Y.—Showed the Seamless shoes, both round and anti-

Digitized by Google

skid types, and the gray and red tubes. The maker claims for these tires not only superior quality because of the materials used and the workmanship, but maintains that they will endure the use of tire chains in any legitimate manner without undue wear.

Looking Through the South Section of the Accessory Department in Machinery Hall Balcony, Showing the Displays of Dorian Rims, Dover Automobile Specialties, and Havoline Oils.

Shawmut Tire Company, Boston, Mass.—Shawmut shoes of standard types were shown by this concern, together with regulation tubes. For these tires the highest construction methods and best of materials are claimed by the maker to justify a guarantee of service that is very broad.



Standard Tire & Rubber Company, Boston, Mass.—Displayed Standard tires in clincher, quick detachable clincher and Dunlop types, with either round or 10-strike grip casings, the last mentioned tread being scored with a straight line and an X alternating the circumference of the shoe.

Star Rubber Company, New York, N. Y.—Shown by C. J. Downing—Displayed Star tires and tubes, with round tread and constructed by the wrapped tread and single cure processes, and Excelsior tires and tubes. The former is made in clincher and quick detachable and the latter in these and the Dunlop types.

Steel Cushion Tire Company, New York, N. Y.—Demonstrated the Ellis steel cushion tire, the device being a series of helical springs arranged in pairs in a channel formed by steel flanges extending beyond the face of the felloe and attached to the rim, carrying a solid rubber shoe. As the wheel is revolved the weight forces the rim carrying the solid rubber shoe between the side flanges and this produces a tension on all the series of springs, which is claimed to equal the effect of resiliency in a pneumatic tire. The tire is made for both pleasure and service vehicles.

Tyer Rubber Company, Andover, Mass.—Showed Tyrian shoes and tubes for pleasure vehicles, these being of clincher type and with either round or hold-tite treads, the latter having two circumferential channels and a series of tranverse channels at either side, which are claimed to be so efficient as to preclude the need of chains.

United States Tire Company, New York, N. Y.—Showed at its stands the differing products of the Hartford Rubber Works Company, the Continental Caoutchouc Company, Morgan & Wright and the G & J Tire Company, including the standard and the special lines. These were specialized principally for the pleasure vehicles and included the clincher, quick detachable and the Dunlop types, both in round and anti-skid treads. One feature was the Nobby tread shoes of Morgan & Wright and G & J make. In addition there was the Hartford solid tire demountable equipment for service wagons, this being a special rim designed to minimize time in replacement should a shoe be damaged or shed.

The Exhibit of the United States Tire Company in the Balcony Overlooking Grand Hall.

Voorhees Rubber Manufacturing Company, Jersey City, N. J.—Besides the regular lines of tire and tube repair material a feature of this display was the reinforcing stock for relining shoes, made in 50 and 100-foot lengths and in differing widths and packed on reels, for use in repairing.

Walpole Rubber Company, Walpole, Mass.—Displayed Walpole shoes of the quick detachable types with either plain or Bailey treads in all standard sizes, Walpole tubes, Walpole motorcycle tires and tubes, and Walpole tire accessories.

LUBRICANTS, GREASES, ETC.

Borne, Scrymser & Co., New York, N. Y.—Exhibited the complete line of Colonial motor oils, Colo transmission grease, Colonial timing oil and Silex grease for heavy duty gears and continuous service, in display and sales containers.

Joseph Dixon Crucible Company, Jersey City, N. J.—Made a showing of the Dixon graphited greases suited for gear and transmission lubrication and the stick grease recently produced for bearings and similar work where a fluid could not be used.

Eagle Oil & Supply Company, Boston, Mass.—Display was made of Eagleine No-Karbon oils of varying grades for internal combustion motors both in the regular packages and in tubes to illustrate the clarity and viscosity of the different qualities.

A. W. Harris Oil Company, Providence, R. I.—Every quality of the Harris oils, suited for gas engine use, was displayed, this being supplemented by a demonstration of the Harris trans-compound, a grease made purposely for transmission

Digitized by Google

and differential gears, by gears driven by an electric motor.

Havoline Oil Company, New York, N. Y.—Made demonstration of the varying grades of Havoline oils for internal combustion engines and of the greases made for use with gears and bearings in the customary sales packages and by exhibition in glass tubes to evidence the purity.

Charles F. Kellom & Co., Philadelphia, Penn.—Invader lubricants, especially refined for gas engine service, and in grades to meet every requirement, were demonstrated in display tubes and in usual containers, while a feature was made of Invader gear oil, a product made purposely for transmission, differential and other heavy gear work.

New York Lubricating Oil Company, New York, N. Y.—The exhibit of the Monogram oils was in all the grades produced suited for automobile service, as well as the transmission gear and differential greases manufactured under the same name as the oils. A feature of the display was the new sealed can.

New York & New Jersey Lubricant Company, New York, N. Y.—Motorol oils of differing qualities and consistencies were demonstrated together with the Non-Fluid oils, which are especially suited for service with gears and bearings enduring heavy duty.

George A. Hawa, New York, N. Y.—The showing of Panhard oils in containers conspicuous for the checkered color border effect, and in glass that illustrated the viscosity and color, effectually demonstrated these well known lubricants.

Standard Oil Company, New York, N. Y.—The exhibit of this concern was largely given over to a demonstration of the different grades of Polarine, a lubricant especially produced for gas engine service and marketed in all forms of containers convenient for use in the garage or on the road.

Texas Company, New York, N. Y.—Texaco motor oil in grades especially adapted for automobile engine lubrication was demonstrated in the sales packages, these being cans containing one and five gallons and sealed so that they may be sold with the original contents. This feature is claimed to be exclusive with the Texaco products.

Vacuum Oil Company, Rochester, N. Y.—The exhibit of Gargoyle Mobiloils, which lubricants are made in numerous grades and suited to practically every type of motor, was very complete, there being, aside from packages of differing sizes, a comprehensive demonstration of purity and viscosity in tubes graduated by colors.

Stand of the Weed Chain Tire Grip Company, Showing the Increase of Production of Weed Chains on a 72 by Six-Inch Tube.

Valvoline Oil Company, New York, N. Y.—This concern displayed the Valvoline products which have been known in the market for years, and which included standard lubricants of all kinds.

Wolverine Lubricants Company, New York, N. Y.—Packard oils and greases and Wolf's Head oils of different consistencies, were demonstrated at this stand, these being produced to meet every requirement for motor vehicle and motor yacht use. The Packard lubricants are prepared especially for use with cars of the same name.

SPEEDOMETERS.

Jones Speedometer Company, New York, N. Y.—All models of the 1912 Jones speedometers and clock-speedometer combinations, the Jones recorder, and the Jones hub odometer for service wagons were shown, both on a tablet and in cases, together with sectional instruments for the illustration of the mechanical construction and the operation of the different parts. One feature is the reset of the trip odometer to tenths of a mile.

Stewart & Clark Manufacturing Company, Chicago, Ill.—One of the features of the new Stewart speedometers is the micrometer adjustment by which the instruments may be made to establish an exact result. The Stewart speedometers are made in numerous models and are suited for all vehicles and all purposes.

Warner Instrument Company, Beloit, Wis.—Display was made of the latest Warner auto-meters, which have been improved in several details, among which is the device by which the trip odometer may be reset for the convenience of making a digression from a mapped route and for taking up the journey without recourse to notes and figures to learn a position with reference to any given point.

SPARK PLUGS.

Blake Spark Plug Company, Cambridge, Mass.—The Blake quick detachable spark plug consists of a brass shell of conventional pattern, a long porcelain core with an electrode extending through the centre that terminates in a cap at the base, through which the centre of the electrode projects. Attached to the porcelain is a heavy loop of wire that is set with the bottom of the loop at the proper distance from the electrode point. The usual bushing is replaced with a brass fitting that carries a small vulcanite handle. The upper terminal of the core is finished with a metal cap and an adjustable nut for securing the terminal. The fitting drops into the bushing through slots, and lugs on the fitting engage in grooves so that by turning the fitting a quarter-turn with the handle the core is firmly engaged and there is no possibility of leakage. The core may be removed in a second without removing the terminal, the bushing serving the purpose of a priming cup, or the plug may be tested while holding it.

Autoparts Manufacturing Company, Jersey City, N. J.—The E-Z quick detachable spark plug shell is machined to have a pair of lugs at the upper edge 180 degrees apart. The core is mounted in a fitting that has a recess to take the upper part of the shell and the sides are cut to permit the fitting to slide outside of the shell and then to be

Digitized by Google

turned, the lugs engaging in the slots and bringing the fitting and its packing down on the shell, making a gas tight assembly. The fitting carries the loop electrode and the core electrode is centred above this. The core is retained in the fitting by a nut which also retains a winged member by which the fitting is turned. The upper terminal of the plug is capped and there are two nuts by which the cable terminal is retained.

K-W Ignition Company, Cleveland, O.—The Vim spark plug shell is formed with the bottom bullet-shaped and in the centre is a small hole into which the core electrode is set. The chamber of the shell enlarges below the base of the core and the conical-shaped core, either of mica or porcelain, but partly fills the chamber. The bottom of the shell is bisected at right angles by two thin slots. As the plug is used the bullet-like bottom of the plug becomes heated. As the gas is compressed in the cylinder chamber the spark plug shell chamber is filled, the heat causing more complete vaporization. As the spark is made the gas within the chamber is ignited and the explosion within the plug chamber forces a jet of flame through the slots of the shell into the centre of the cylinder, making for thorough combustion and efficient ignition. It is claimed that the shell protects the plug against soot or oil accumulations and that it does not require cleaning. It is made with mica and porcelain cores.

Ideal Switch Company, Inc., Plainville, Conn.—The Ideal spark plug shell is Tobin bronze with flat bottom, there being a hole in the centre into which the electrode of the core is set. The porcelain core is carried in a bushing in the usual manner of construction. There is a chamber within the bushing that protects the electrode against carbonization and fouling with oil. The core electrode and terminal are mechanically fastened so as to form one piece and cannot become separated under any conditions of use.

Mac-Kae Manufacturing Company, Boston, Mass.—The Mac-Kae spark plug is made with either porcelain or mica core and the porcelains are made with the central electrode of platinum alloy baked into the core, which, having the same coefficient of the electrode, is not affected by the extremes of heat. By unscrewing the bushing the core may be removed as one piece. The central electrode of the mica core is wound laterally with sheet mica, about which the mica washers are forced, making a perfect, gas tight construction. Both porcelain and mica cores are interchangeable.

C. F. Splitdorf, New York, N. Y.—The Splitdorf spark plug has been perfected by the form of the central electrode of the mica core, which is formed tapering, so that when wound with sheet mica and the mica washers forced on by heavy pressure the core will endure under any gas pressure. The plug has been improved in appearance by the addition of brass washers to the external insulation.

Progressive Manufacturing Company, Torrington, Conn.—The features of the Black Eagle plug are the shell electrodes, which parallel each other with the core electrode between them. It is claimed that the rounded surfaces of the electrodes resist the pitting and destructive influences of the sparks. The terminal of the central electrode is solid and capped and between this and the binding nut is a sliding collar that is forced downward toward the binding nut by a spring, and a cable terminal placed between the collar and the binding nut is held fast and cannot be shaken loose. This device is known as the Universal Spring Cap.

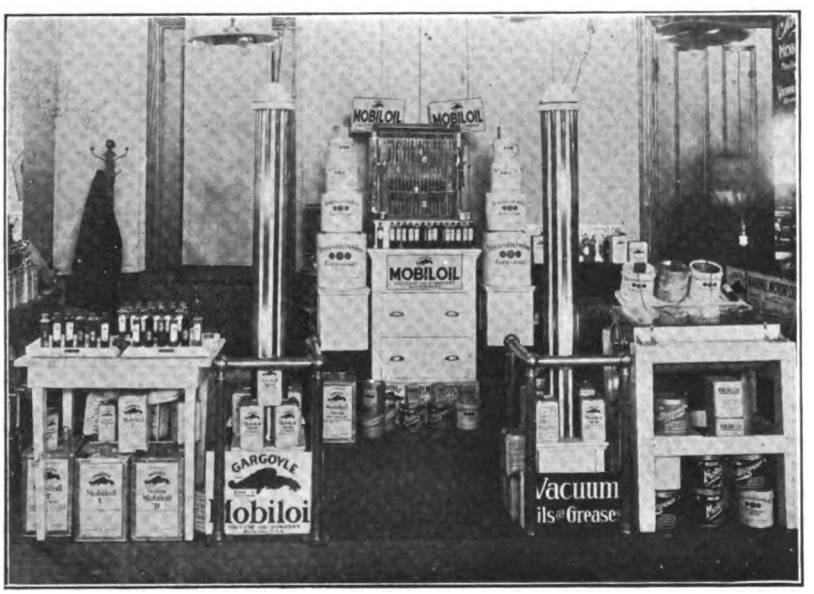
SHOCK ABSORBERS.

Gabriel Horn Manufacturing Company, Cleveland, O.—The Gabriel rebound snubber was displayed with other products, this being a device in which a frictional belting is wound on a spring expanding reel as the vehicle spring is compressed and resists the recoil through the medium of the spring and the friction of the belting.

The Exhibit and Some of the Demonstrators of Eagleine No-Karbon Auto Oil, Representing the Eagle Oil & Supply Company.

Hartford Suspension Company, Jersey City, N. J.—The Truffault-Hartford shock absorber was demonstrated by this company by two miniature motor cars, one fitted with shock absorbers and the other with the ordinary suspension, installed over revolving cams which imitated the road obstructions and contacted with the wheel tires. The other illustration was of a spring which was compressed and released with and without a shock absorber attached to it.

Knojah Shock Absorber Company, Lexington, Mass.—The Knojah shock absorber is of the hydraulic type and is produced in two patterns. The piston device consists of a metal cylinder in which is fixed a second cylinder with perforated walls. There is a space between the walls of the two cylinders and when a piston is moved up and down within the inner cylinder the oil with which the cylinders are filled is forced through the perforations below the piston into the outer chamber and thence through the perforations above the piston into the inner cylinder. The perforations are graduated in size and the resistance is greater at either end of the stroke of the piston as the holes are smaller. The box type consists of a triangular shaped case with the shortest angle curved instead of straight. Following the line of this curve is a metal wall that is perforated similarly to the inner cylinder of the other type. Centred in the apex of the triangle is a shaft that carries a piston arm that contacts with the perforated wall at the widest end. The space within the casing is filled with oil. The case is attached to the frame of the car and to the axle is fixed the lever arm installed on the shaft. As the vehicle springs are recoiled the lever moves the shaft and the piston arm and the oil within the case is forced from below or above the piston through the perforations and the shock is cushioned effectually. The pistons are packed to prevent leakage and being operated in lubricant there is practically no wear of the moving parts.



Ariston Company, New York, N. Y.—The Mondex shock absorber is of the friction type with two lever arms carrying discs with surfaces shaped to form a series of inclines.

Digitized by Google

which are placed with elastic packing between them. As the arms are moved by the compression or recoil of the vehicle springs, the movement causes a wedging effect that is resisted by the packing and the form of the discs.

LIGHTING SYSTEMS.

Apple Electric Company, Dayton, O.—Shown by Charles A. Jackson Company—The Aplco system consists of a dynamo built for three different speeds, a current regulator that controls the generating capacity of the dynamo, an automatic cut-out that governs the volume of current supplied, a volt-ammeter and storage battery that is charged and from which the current is supplied as needed for the illuminating of the lamps. The elements of the system are constructed to endure under all conditions of service and are protected against every influence that might cause deterioration and failure.

How the Quality and Purity of Mobiloil Was Demonstrated and the Types of Containers Shown by the Vacuum Oil Company.

Detroit Electric Appliance Company, Detroit, Mich.—The Deaco system is designed for automobile and motor yacht lighting and it includes a lighting dynamo, a regulator that may be adjusted for amperage production, a dynamo switch and a storage battery that is charged according to the rate of discharge and its efficiency maintained.

Esterline Company, Lafayette, Ind.—The Berdon system is constructed to afford lighting, or lighting and ignition in combination. The installation consists of a magnet generator that has but one moving part, the armature, an automatic controller that makes and opens the connection between the battery and the generator, a fuse panel for protection against short circuiting, the lighting switch and the storage battery. Construction that makes for long endurance, simplicity that insures continuity of service, and protection against all probable causes of failure and deterioration are qualities claimed for this system.

Holtzer-Cabot Electric Company, Boston, Mass.—The Holtzer-Cabot electric lighting system for automobiles includes a dynamo of the direct current type, an automatic switch that controls the current supplied to the storage battery, a storage battery, a dash switch and connections for lighting and for ignition, if this is in combination. This system is claimed to give service with the dynamo driven in either direction.

Gray & Davis, Amesbury, Mass.—The Gray & Davis system of automobile lighting is one of the best known in motor vehicle service and it has been specially developed with reference to the needs of the motorist. The elements of the installation have been designed to insure efficiency under all conditions and to endure any service, uniformity of lighting at all speeds being the chief aim. It has been brought to a perfection that is known to all automobilists.

K-W Ignition Company, Cleveland, O.—The several K-W lighting systems are designed for differing service and for use with vehicles of differing types, one of these being adapted especially for Ford cars, while others are for machines requiring separate generators, for which the K-W systems have been designed. These systems are standard with motorists and are widely and favorably known.

U. S. Light and Heating Company, New York, N. Y.—The U-S-L system includes a dynamo that is totally enclosed, with but one moving part, an automatic switch and regulator combined, and storage battery. The regulation is accomplished with complete independence of the storage battery, an insurance against burning out the lamps in the event of a break in the circuit.

Vesta Accumulator Company, Chicago, Ill.—Showed the Vesta systems of lighting, the first being by the use of a magneto-generator, automatic control of the current charged in and sent from a storage battery, and the usual lighting equipment, and the second by utilizing the current generated by the magneto and being adapted to Ford cars only.

Remy Electric Company, Anderson, Ind.—The Remy magneto lighting installation consists of a magneto, dash coil box, storage battery and distribution block, and a fuse block for connecting the horn, speedometer lamps, etc. This is made in two forms for four and six-cylinder cars. The system affords both lighting and ignition. The control is automatic and positive and the efficiency has been practically insured.

C. F. Splitdorf, New York, N. Y.—The Splitdorflite system consists of two forms really, one of which will furnish lighting only and the other both lighting and ignition. With the first mentioned the installation includes a magneto-generator, a fuse box and an ammeter; with the second there is a switch in combination with the ammeter and a coil. The construction is such that very high efficiency is obtained. The generation of the current is controlled so that when required for charging it is supplied and when not required it is automatically cut out. The variable character of the current does not affect the quality of the lighting or the ignition.

SELF-STARTING DEVICES.

E. A. Whitehouse Manufacturing Company & LeCompte Manufacturing Company, Newark, N. J.—Bi-Motor Equipment Company—The Safety self-starter is an installation by which a supply of acetylene gas is furnished from the regular lighting tank and sent to the intake manifold of the engine, whence it is distributed in the usual manner to the cylinders as needed. The engine is cranked to fill the cylinders with the gas without the spark being advanced. When the spark is advanced the engine will start and will run with the acetylene gas until it is shut off, although gas will be taken in through the carburetor after the engine has been started.

Cox Brass Manufacturing Company, Albany, N. Y.—The Crankless self-starter system is a means for supplying acetylene gas from the tank to the intake manifold of the engine and thence to the cylinders, where the gas is exploded by a spark made in the cylinder in which the charge is compressed. The control is by a foot button in the floor.

J. W. Tudor, Boston, Mass.—The Tudor starter is of the mechanical type, the power being furnished by a spring that is at first wound by hand. Thereafter it is wound by the engine movement, being disconnected when at full tension. The starter is bolted to the front of the car and connected with the forward end

Digitized by Google

of the crankshaft. It is operated by means of a pedal.

Hartford Suspension Company, Jersey City, N. J.—The Hartford electric system for starting automobile engines as shown was the same as was displayed at the New York and Chicago expositions, but no details of its construction are made public. The device is small and is installed at the side of the engine, where it is operated by conventional means.

LAMP LIGHTING SYSTEMS.

G. C. A. Manufacturing Company, Pittsfield, Mass.—With this system one operation, turning a hand wheel, supplies the gas from the tank to the head lamps and lights the lamps. The coil and control mechanism are included in one assembly, grounded on the car frame, and but two wires are necessary.

Motor Specialties Company, Boston, Mass.—The Flash auto-lighter installation consists of a controller, an induction coil and a pair of special burners. The controller combines a gas valve and an electric contact switch. As the gas valve is opened a spark is produced at the burners of the lamps. A single movement completes the operation.

Aristos Company, New York, N. Y.—The Mondex-Frary lighting system provides for turning a cut-off valve in the supply from the gas tank and making a spark at the lamp burners, the simplicity and efficiency of the device being strong recommendations for it.

SIGNALLING DEVICES.

Minerva Hardware Manufacturing Company, Minerva, O.—The Minerva is a horn with three tubes affording three tones musically attuned, that is attached to the exhaust pipe of the engine and is actuated by a pedal.

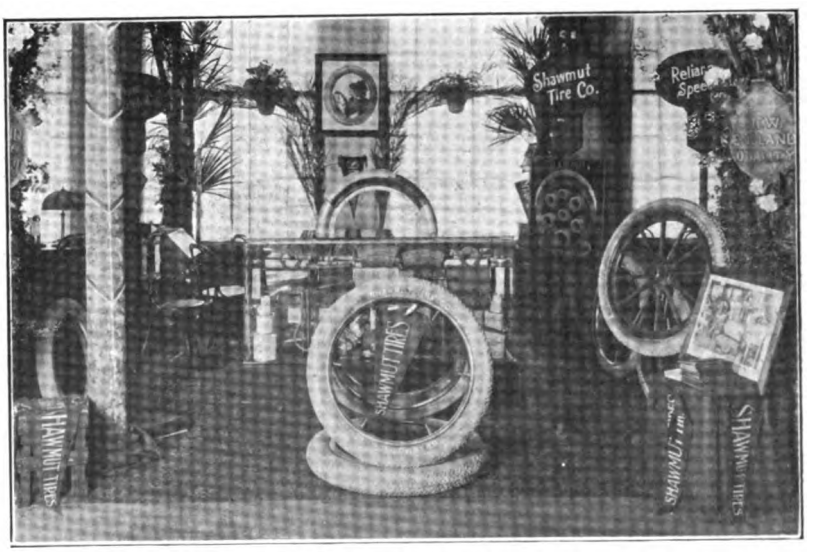
Electric City Manufacturing Company, Buffalo, N. Y.—The Mellotone gives a single tone when operated by a pedal, being blown by the exhaust pressure from the engine. It is made in two sizes, and is adapted for use with any car.

Randall-Faichney Company, Boston, Mass.—The Jericho and the Jubilee exhaust horns are attached to the exhaust pipe of the car and are operated by pedals, giving blasts of any length or volume as desired. Both of these are well known in the market.

Gabriel Horn Manufacturing Company, Cleveland, O.—The Gabriel exhaust horn is one of the best known devices of this type, it being made in differing sizes, ranging from the single tone to the 10-tube horn that is actuated by a keyboard and on which a limited musical selection may be played.

CARBURETORS.

Excelsior Needle Company, Torrington, Conn.—Bi-Motor Equipment Company—The Excelsior carburetor is constructed with a U shaped tube in which is placed a steel ball that governs the supply of gas fed to the engine, this being accomplished by the position of the ball which is moved upward as the velocity of the current of gas is increased, affording a larger volume to pass through at increased engine speed, and automatically dropping as the velocity becomes less. There are two adjusting valves that are fitted with numbered dials and may be set to a printed table with greatest exactness. Once adjusted the ball governor in the tube supplies the precise volume of gas to insure great efficiency and economy.



Planhard Manufacturing Company, Kokomo, Ind.—The Planhard carburetor is of the float feed type with a central draft and two venturi tubes in which the supply of air is graduated by the velocity of the draft actuating auxiliary air valve. It has one adjustment and an interchanging nozzle to meet exact operating conditions. It is claimed to be the only carburetor on which the auxiliary air valve may be adjusted while the motor is in operation.

Harry Elsner & Co., Boston, Mass.—Among other specialties this exhibit included the Geiszler storage batteries, which are of the non-sulphating type and are so constructed as to be guaranteed by the maker for long and continuous service. These batteries are made in all sizes and to meet any requirements.

MAGNETOS.

Marburg Bros., Inc., New York, N. Y.—The Mea magneto in all sizes and types was displayed by this firm, this being practically the same interesting exhibit that has been shown at the different important shows throughout the country.

C. F. Splitdorf, New York, N. Y.—Splitdorf magnetos in all types and the other Splitdorf electrical products were displayed at this stand, there being the giant magneto that attracted much attention elsewhere as a central attraction.

Where the Shawmut Tires Were Shown in the Aisle at the Rear of Grand Hall.

BATTERIES.

Narragansett Chemical Company, Providence, R. I.—Meteor storage batteries are supplied in different sizes for ignition or lamp lighting, or for both in combination, and are claimed to have unusual qualities for durability and efficiency. This concern also specializes in lighting outfits adapted for different types of cars.

U. S. Light and Heating Company, New York, N. Y.—National storage batteries are made in varying sizes and adapted for ignition, lighting, combinations of lighting and ignition, and for use in combination with dynamos for these purposes.

Burn-Boston Battery & Manufacturing Company, Boston, Mass.—These are a combination of a wet and dry cell suited for any purpose, any form of battery being used, and are especially adapted for ignition in motor vehicles and motor yachts.

JACKS, JACK-TRUCK.

Ames Auto Jack-Truck, Franklin, Penn.—The Ames jack-truck consists of a set of two frames having two long and two short arms mounted on rollers. One frame carries at the ends of the long arms two heavy screws with U shaped heads. One of the short arms is jointed at the main member. The screws are upright and are adjustable for height. The other frame is similar save that the upright screws have at the upper ends members shaped to fit the bottom, side and top of an I section axle, above these being crescent shaped rests for round axles. The jointed arm is at the back of the jack. The other arm is socketed for a lever. The jack is pushed beneath the axle at an angle and then the lever is considerably elevated. When this is depressed the jack rests on all four arms and the supporting members

Digitized by Google

are upright. So secure is the support that a car may be raised and moved from one part of a garage to another without possibility of damage. The operation of raising and lowering may be accomplished in seconds and without effort.

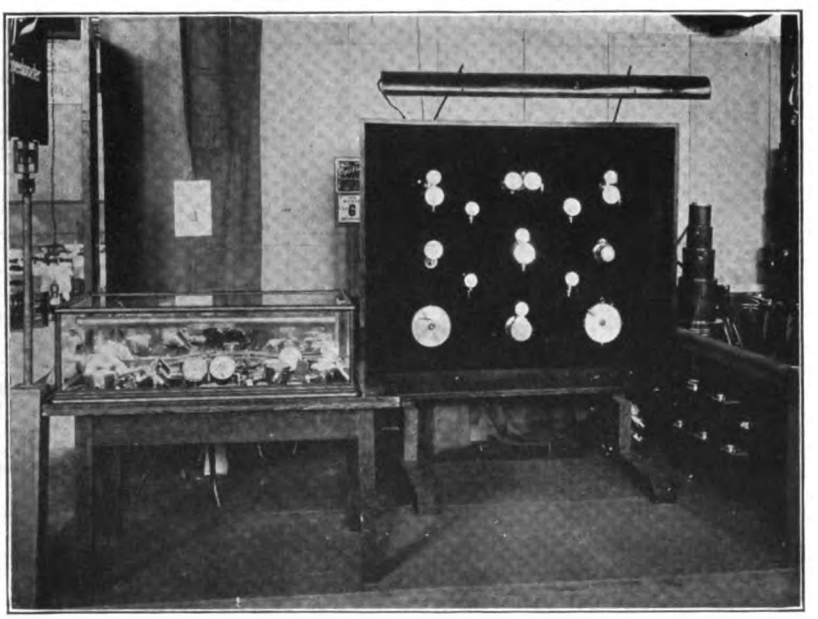
Motor Specialties Company, Boston, Mass.—The A B C jack has an extension of 5.5 inches and among other features has a cut steel rack and a self-locking iron handle that cannot slip from the socket.

Hartford Suspension Company, Jersey City, N. J.—The Hartford auto-jack was shown by this concern, this being a specially constructed tool that has unusual efficiency and endurance under hard service.

WINDSHIELDS.

Eagle Company, Newark, N. J.—Bi-Motor Equipment Company—The Eagle windshields are made in both the clear vision and rain vision types and in different forms to be adapted to any form of vehicle dash. These are fitted with multiple disc hinges and are manipulated with one hand by the driver. The Standard windshields are fitted with a combination of friction and ratchet and pawl hinge.

Columbia Tire & Top Company, Boston, Mass. — Columbia windshields are constructed of leather or fabric leather and celluloid panels that are formed to protect the driver or the occupants of the tonneau seats, having a folding upper panel when fitted to the dash. They are adjustable to many positions and are ventilated for warm weather. The tonneau shield may be folded and rolled across the back of the driver's seat.



Smalley Daniels, Boston, Mass.—Boreas ventilating and rain vision windshields are made in single and double section and in any form with the upper section automatic one-hand control. The hinge is of the friction disc type and may be adjusted in many positions.

Standard Auto Supply Company, Boston.—The Deflector windshield has a metal frame and a large panel of celluloid at the front with leather or fabric sides that practically enclose the car forward of the seat. The form is such that the current of air is directed above the heads of the occupants of the seat.

TIRE ACCESSORIES.

Auto Time-Saver Repair Kit Company, Boston, Mass.—Displayed combination rubber and metal tire tube repair plugs with tools for making emergency repairs that are maintained to be permanent so far as endurance is concerned.

A. J. Bennett, Providence, R. I.—Showed Bennett tire spreader, a metal device for spreading a tire shoe either off or on the wheel for work or examination.

The Showing of Jones Speedometers, Odometers, and Recorders Made at the Stand of the Jones Speedometer Company.

Boston Tire & Rubber Company, Boston, Mass.—Presented Challenge blow-out patches, for all sizes of tires; lapped-end reliners for tire shoes, and endless tire preservers.

C & T Auto Specialty Company, New York, N. Y.—Exhibited Universal blow-out patches in five sizes, designed to prevent creeping when in use, for use with all types of tires.

J. N. Macdonald & Co., Wethersfield, Conn.—The Necessity tire chain repair tool, adapted for opening and closing the links of a tire chain when under tension were seen at this booth.

James L. Gibney & Bro., Philadelphia, Penn.—Diplayed the Gibney multiple tube vulcanizer and the Gibney line of electric and steam vulcanizers for use in the private garage or on the road.

W. L. Johnson & Co., Endicott, N. Y.—The Utility blow-out boot is a sleeve of specially treated leather studded with steel heads on the tread, fitted with metal lugs that clamp under the wheel rim and are secured by the inflation of the tire. The boots are water proof and are made to fit clincher or quick detachable tire shoes, mounted on any type of rim.

O-Tak-A Tire Remover, Le Roy, N. Y.—The O-Tak-A tool is clamped on the wheel rim and a plunger operated by a lever may be forced against the shoe to relieve the strain on the locking rim, and the rim and shoe removed. It is maintained with this tool a woman may remove or replace practically any tire.

C. A. Shaler Company, Wanpun, Wis.—This exhibit was of the steam, alcohol-heated and electric vulcanizers for private garage or road tire repairing, as well as materials and tools for preparing for such repairs.

C. O. Tingley & Co., Rahway, N. J.—The full line of C. O. T. tire repair kits and repairing materials were shown, these including those adapted for the service station and for the private motorist who desires equipment for roadside emergencies.

T. F. Russell & Co., Boston, Mass.—The Q-D tire iron is for the removal of tires from any wheel rim without loss of time or damage to the tire or tube.

MISCELLANEOUS.

Auto Towing Device Company, Cleveland, O.—The Jarless towing device is a length of steel chain with an end fast to the plunger in a metal casing, the plunger being normally held at the end of the casing by a heavy spring. At the plunger end of the casing a second length of chain is attached to a swivel. Both free ends of the chain are fitted with hooks. The chain is used for towing, the spring compensating the jars.

F. Shirley Boyd, Boston, Mass.—Exhibited the Dorian demountable rims, a device well known in the motoring world, and the R. I. V. ball bearings, these being of all the types and adapted for all purposes, not only for motor vehicles, but machine and factory use.

B. B. B. Combination Terminal Company, Boston, Mass.—Showed a spark plug cable terminal that is adapted for use with any form of spark plug, and which has a special fitting for use with the Rajah type of plug, there being a vulcanite handle through which the cable is passed and fastened permanently by a finger nut. The terminal may be removed at any time and used to test the ignition without fear of shock.

Cox Brass Manufacturing Company, Albany, N Y.—The X-Ray indicator is a device for testing the ignition, locating spark plug defects, defective coils, short circuits, weak

Tarvia

Preserves Roads
Prevents Dust~

U. S. Naval Training Station, Great Lakes, North Chicago, Ill., Roads treated with Tarvia X.

Tarvia at a Government Station

THE new Great Lakes Naval Training Station near Chicago rivals Annapolis and West Point in its fine equipment and the thorough and finished development and beautification of the property.

It has many macadam roadways, some of which carry an especially heavy traffic, built with Tarvia X, for the purpose of keeping down maintenance costs.

In appearance, these roads are clean, firm under foot and free from dust.

In durability, they will, of course, far exceed ordinary macadam, for they are bonded with the dense viscid Tarvia for several inches in depth.

The Tarvia fills the voids, keeps the stone from creeping or shifting under the weight of traffic, eliminates abrasion due to internal movement of the stone, excludes water and frost, and best of all permits the use of the more durable large stone close to the surface.

It has long been recognized by engineers that large stone pulverized and wore away much more slowly than the carpet of fine screenings with which ordinary macadam roads must be covered, but the tendency of the large stone to shift and ravel has previously prevented the use of the large stone in this way.

Tarvia X makes it possible to use materials to vastly better advantages and preserves the road so long that the cost of the Tarvia itself is more than paid for.

The government engineers chose Tarvia for economy. Incidentally, they secured dustlessness, a reduction of noise, freedom from mud and an improved appearance.

current and faulty magneto generation by producing a spark between electrodes visible through a hole in the shell of the indicator.

Coes Wrench Company, Inc., Worcester, Mass.—The display of Coes wrenches was of all the types and sizes turned out by this concern, as well as of wrenches that had been in service for long periods in shops and works. The exhibit was of decided interest because it indicated the resources of the maker, the quality and character of the material and the workmanship, and the endurance of the wrenches in every day usage.

Connecticut Telephone & Electric Company, Meriden, Conn.—The Connecticut plug coil is a combination intended for marine service, though it may be used with any type of jump spark ignition. The base for the coil is brass and attached to the base is the plug. Mounted on the coil top is the standard vibrator. The

View of the Accessories Display in the Balcony of Grand Hall, Showing the Stand of A. R. Mosler & Co.

secondary winding of the coil has more than double the resistance of the ordinary coil for marine work. The coil top and vibrator are housed in a metal cap that locks securely and gives complete protection. The plug is of the petticoat type and is connected automatically with the secondary winding of the coil. There are two primary wires, one from the battery to the coil and the other from the coil to the timer. When desired the coil is supplied with a removable switch lever, combining the coil and switch, so that with the lever removed it is impossible to start the engine.

Ideal Oil Pump & Tank Company, Boston, Mass.—The exhibit of Ideal long distance self-measuring outfits, non-measuring outfits, Ideal portable wheel tanks for gasoline and lubricants, storage tanks and pumps, recording meters, cabinets, oil wagons and self-measuring tanks was very complete and a full demonstration of the equipments designed for use by railroads, mills, and works of all kinds, as well as for use with public service stations and public garages.

Hartford Pump & Manufacturing Company, Boston, Mass.—The Hartford friction tire pump is driven from the flywheel of the motor by friction and may be hung in any position. The pump is well constructed and should endure any service, it being a permanent installation and capable of operation to produce any effect. The Hartford gear tire pump is designed to be driven by a gear attached to the magneto or pump shaft.

Standard Woven Fabric Company, Worcester, Mass.—The exhibit of Multibestos, a special frictional material designed for use as brake lining for motor vehicles, showed the degree of endurance under varying conditions of wear. It is claimed for this material that under careful and scientific tests the endurance shown was especially satisfactory. The fabric is not combustible and its efficiency is not affected by water, dust, mud, or lubricant. Multibestos is produced for numerous purposes and in all standard sizes, widths and thicknesses.

Standard Oil Company, New York, N. Y.—A full line of the Gilbert & Barker underground storage tanks, with measuring and non-measuring pumps, for gasoline, naphtha and lubricants, was exhibited, together with hose connections, filling cocks, extension pumps, gasoline filters, portable tanks, adjustable measuring outfits, transfer pumps, funnels, gasoline gauges, and other equipment.

Standard Wrench & Tool Company, Providence, R. I.—Fitzall wrenches are made for pipe and nut work and are adjustable by a sliding tooth block that cannot slip and affords a grip that is positive.

Weed Chain Tire Grip Company, New York, N. Y.—One of the most conspicuous features of the display of the well known Weed chains was a tire tube 72 by six inches, fully inflated, about which was a tire chain 18 feet 10.25 inches in length. Within the tube was a tabulation showing in prominent figures the enormous increase in the quantity of chain necessary to supply the demand for Weed chains, there being nearly 100 per cent. more required in the last year than in the corresponding period that preceded. The growth of the industry was demonstrated in a very striking manner by this statement, which included each year of the company's existence.

Aristos Company, New York, N. Y.—The Disco self-starter is a system for supplying acetylene gas from a tank through a distributor and suitable piping to each cylinder of the engine and firing the charge. The operation consists of turning a small handle attached to a disc on the dash and then throwing over the switch. A complete charge is supplied to each cylinder, sufficient to cause from 10 to 12 full revolutions of the engine. The device may be attached to practically every make of engine. An ordinary gas tank contains sufficient gas to start an engine approximately 3000 times.

Dean Electric Company, Elyria, O.—Showed the Titanic cranking and lighting system, this including a positive cranking device that is operated by an electric motor by current supplied from a storage battery of large proportions. This motor is designed to operate as a generator when the car is moving and furnish current for the battery, which is also drawn upon for the energy for a lighting system. In this, simplicity has been sought, and high voltage and complicated wiring has been dispensed with, so that the owner and the garage repair man can master the care and maintenance without special training. The Dynalux, a system of car lighting by electricity was exhibited, this consisting of a highly perfected generator, designed for special service, which is geared or belted to an engine crankshaft, that charges a storage battery, the charging being regulated automatically and constantly maintained. Low or high speed of the engine is controlled so the battery is never overcharged nor excessively drawn upon. But two wires are attached to the generator, these leading to the storage battery, the construction being such that either lead may be attached to a battery terminal without derangement of the system. The control of the lights is at a push-button switch located on the dash. This lighting system may be utilized for ignition and for sounding a horn. Besides these the Tuto electric horn, which has a widely varied tone adapted for both city and country driving, operated by a push button on the steering wheel, the Tuto-ette electric horns, and the Tally-ho bulb horns, were shown.

My Ideal of a Car

By R. E. Olds, Designer

Reo the Fifth—My Farewell Car—in every detail marks the best I know. If any man can build a car better, he's a better manthan I.

Most makers say that the best in a car can't be given for $1,055.

And I am inclined to agree with them.

The initial price on this car I consider too low. I doubt if we can maintain it.

It is subject to advance. And conditions, I fear, will compel that advance.

But this I know:

While I direct the making, Reo the Fifth will mark the best I can do, regardless of price or profit.

After 25 Years

I have spent 25 years in building automobiles. And Reo the Fifth—my 24th model—marks the cap-sheaf of my career.

All I have learned in a lifetime's experience is embodied in this car. All I have gained is staked on its performance.

Never was a car watched in the making as I watch Reo the Fifth.

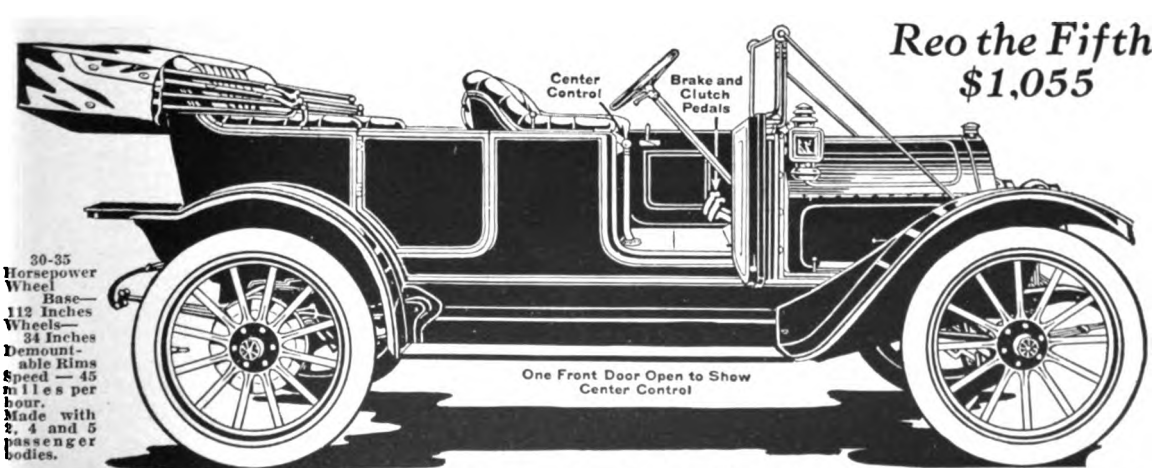
And there will never be built, in my estimation, a materially better car.

Center Control

This car introduces my cane-handle control. All gear shifting is done by moving this lever less than three inches in each of four directions.

There are no side levers in the way of the driver. Both brakes are operated by foot pedals. Thus the driver may sit, as he should sit, on the left-hand side.

Ask for Book



This car is the season's sensation. Every motor car lover should know all about it. Send for our book, giving all the details and picturing the various bodies.

At the present price, no car on the market begins to give so much for the money. Address

R. M. OWEN & CO. General Sales Agents for

REO MOTOR CAR CO., Lansing, Mich.

Canadian Factory, St. Catharines, Ontario.

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip-cover, windshield, gas tank and speedometer—all for $100 extra. Self-starter, if wanted, $20.00 extra

September.

Sept. 2—Speedway meet, Indianapolis, Ind.

TRUFFAULT-HARTFORD PATENT DECISION.

Judge Gray of the United States Circuit Court of Appeals has handed down a decision in the case of the Hartford Suspension Company, Jersey City, N. J., maker of the Truffault-Hartford shock absorber, against the Westen Manufacturing Company, in which the decision of the lower court is upheld. The suit was brought for alleged infringement of United States reissue letters patent No. 12,437, granted Jan. 16, 1906, to Edward V. Hartford and George H. Hartford, upon the invention of J. M. M. Truffault for frictional retarding means for spring vehicles. The former decree held the letters patent valid and infringed by the defendant and ordered the usual accounting for damages and profits.

CELEBRATES TENTH BIRTHDAY.

The American Automobile Association celebrated its 10th birthday, March 4, having been organized as a national body of American motorists March 4, 1902. It is now composed of 42 state organizations and some 320 local clubs, besides thousands of individual members, and its work during the 10 years of its existence has been of inestimable benefit to the cause of motoring. In his congratulatory letter to the presidents of the state associations on the anniversary date, President Robert W. Hooper gave the following as his sentiments:

"Never before in its history has the American Automobile Association been better prepared to serve the purposes laid down for it by its founders, who recognized that in the growth of a great pastime and industry, wherein healthful recreation and the benefits of commerce were blended, there was need of a national organization which would assist in the general progress of the motor driven vehicle by safeguarding the interests of the user and at the same time aiding the maker in perfecting a better car. We are doing a most important work in furthering good roads, and our national board of this character is accelerating the movement throughout the entire country. Legislation affecting the use of the motor vehicle itself has not yet reached a finality, and there is an imperative demand to keep thoroughly in touch with the legislative mills that grind out laws both good and bad, and sometimes pass ill considered statutes.

"In preparing and disseminating information required by the growing volume of intrastate and interstate travel, our touring information department has amplified its facilities. In the conduct of contests the governing rules were never more impartially enforced than at present. I look forward to multiplying of membership during the present year, and believe that before it is concluded we will have well organized bodies in every commonwealth in the Union."

RAYFIELD CABRURETORS SELL WELL.

Sales Manager Charles K. Stein of George Sumner, Inc., 1841-43 Broadway, New York City, Eastern distributor for the Rayfield carburetor, made by the Findeisen & Kropf Manufacturing Company, Chicago, reports that this concern not only will continue to handle this product but will engage in the manufacture of certain other automobile specialties. Mr. Stein spent the entire week in Boston, visiting the show, and finds that the Harry F. Grant Company, 1008 Boylston street, which handles the Rayfield in this territory, is particularly pleased with the sales to date. The Sumner concern states that more carburetors of this make were sold during February than during any previous month since the business was organized.

No-Rim-Cut Tires

10% Oversize

Three Times Last Year's Demand

This is what happened when men proved that tire bills could be cut in two:

In 1907 we sold 28,685 tires.
In 1908 we sold 51,542 tires.
In 1909 we sold 105,127 tires.
In 1910 we sold 210,762 tires.
In 1911 we sold 409,521 tires.

That's pneumatic automobile tires alone.
So far this year the demand has run three times that of 1911.

This is what happened when motor car makers made their final comparisons:

44 makers in 1910 contracted for Goodyear Tires.
64 makers in 1911—
127 makers for 1912.
And these makers know tires.

No-Rim-Cut tires now far outsell all others. And the demand is six times larger than two years ago. *It's the coming tire.*

Are They Mistaken?

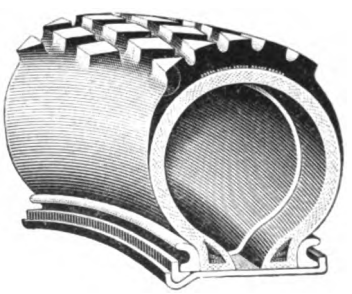
Are these men mistaken—these tens of thousands of users who have come to this patented tire?

Can they be mistaken, after 900,000 of the tires have been tested out?

Or are you mistaken—you who still cling to the old-type clincher tire?

Loss—$20 Per Tire

We figure the loss at $20 per tire for men who don't use No-Rim-Cuts.



This varies, of course, with the sizes. And care or abuse affects it.

But we figure like this: Statistics show that 23 per cent of all ruined clincher tires are rim-cut. No-Rim-Cut tires wipe out this loss entirely.

Ten per cent oversize, under average conditions, adds 25 per cent to the tire mileage. And No-Rim-Cut tires, measured by air capacity, average 16.7 per cent larger than five leading makes of clinchers.

And No-Rim-Cut tires now cost no more than other standard tires. They used to cost one-fifth extra. The saving is entirely clear.

You are bound to find, as all these others have found, that it pays to get Goodyear No-Rim-Cut tires.

GOODYEAR

No-Rim-Cut Tires

Part. III—Wiring With Junction Boxes.

THOROUGH and perfect insulation is essential to the success of the lighting system and ordinary wiring methods are not applicable because of vibration and other unusual service conditions. While splices or other connections may be taped successfully, a better and more complete system has junction, terminal and fuse boxes. These devices not only protect wiring joints from accidental injury or strain, but make for accessibility and reliability; in fact, their primary function is protection.

A type of main junction box is outlined at Fig. 19 and it will be noted that it contains the necessary leads going to the head, side and tail members, and that provision is made for a speedometer light, horn or coil. The box in this system should be located, if possible, under the engine hood on the front of the dash and it should be so placed that crossing of wires is avoided.

Outlet Boxes.

Outlet boxes are utiized when a particularly reliable connection is desired between the lamp socket and branch circuit. These are made in two forms, one having a fuse, which is an advantage in a circuit when a mechanical generator is fitted as it protects that member. They are not absolutely essential, however, but are recommended when a complete system is installed. When a fused outlet box is incorporated in the battery circuit the fuse will prevent premature discharge and injury to the battery in the event of a short circuit. Fuse boxes should be so arranged as to use the standard, new code, 15-ampere fuses, which can be obtained at any electrical supply house.

All boxes should be made as compact as possible and the use of aluminum is recommended as it is excellent material, light in weight and presents a neat appearance. When they are exposed they may be with enamel corresponding in color to that of the car. The members supplying the head lights should be placed in wooden blocks and fastened into the recess on the inside of the spring forks next to the radiator. Those for the side lamps should be placed on the front of the dash at either side, or if the latter

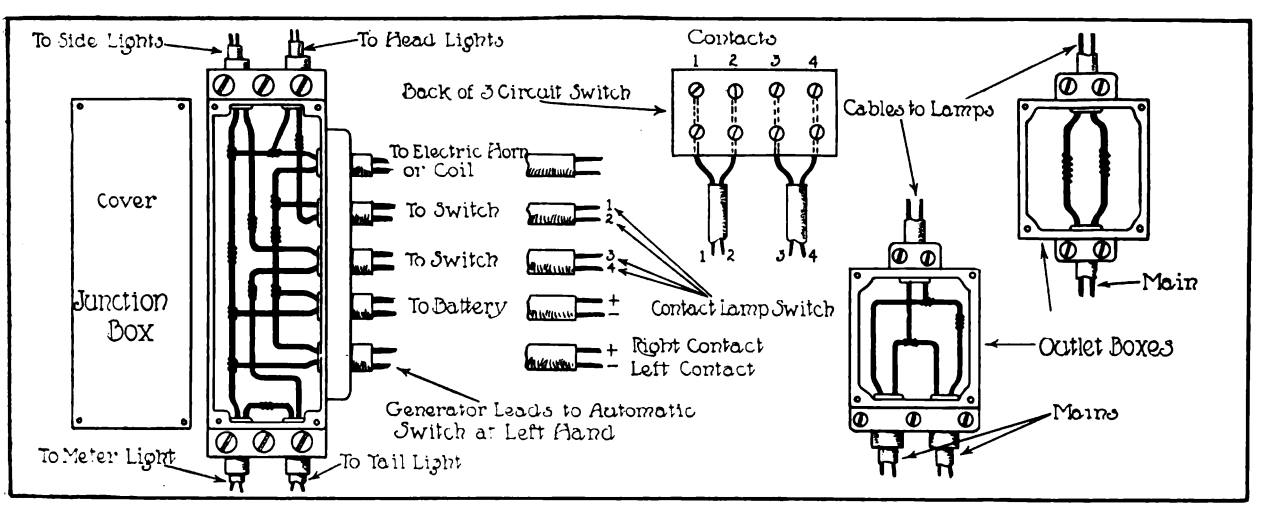

Fig. 19—Depicting the Construction and Components of Main Junction and Outlet Boxes, and Method of Installing Wires.

Digitized by Google

is covered with a round hood the boxes should be placed on the side of the hood as near the lamps as possible. That for the tail light should be attached to the rear portion of the frame. The outlet box for the battery or generator should be bolted to the frame near these members.

The three-circuit switch utilized with the wiring diagram depicted at Fig. 20 should be placed either on the dash near the centre or on the front board under the seat at the centre, between the two passengers. The dash location is preferable as it permits the removal of the body of the car without disturbing the wiring installation. The diagram referred to is for a complete system including automatic switch, battery and generator. The brass armored cable, previously described, is recommended and where it passes through a metallic part of the car it should be covered with a short piece of circular loom. Ordinarily the armor of the cable would be sufficient to protect the wire, but constant vibration might destroy the covering.

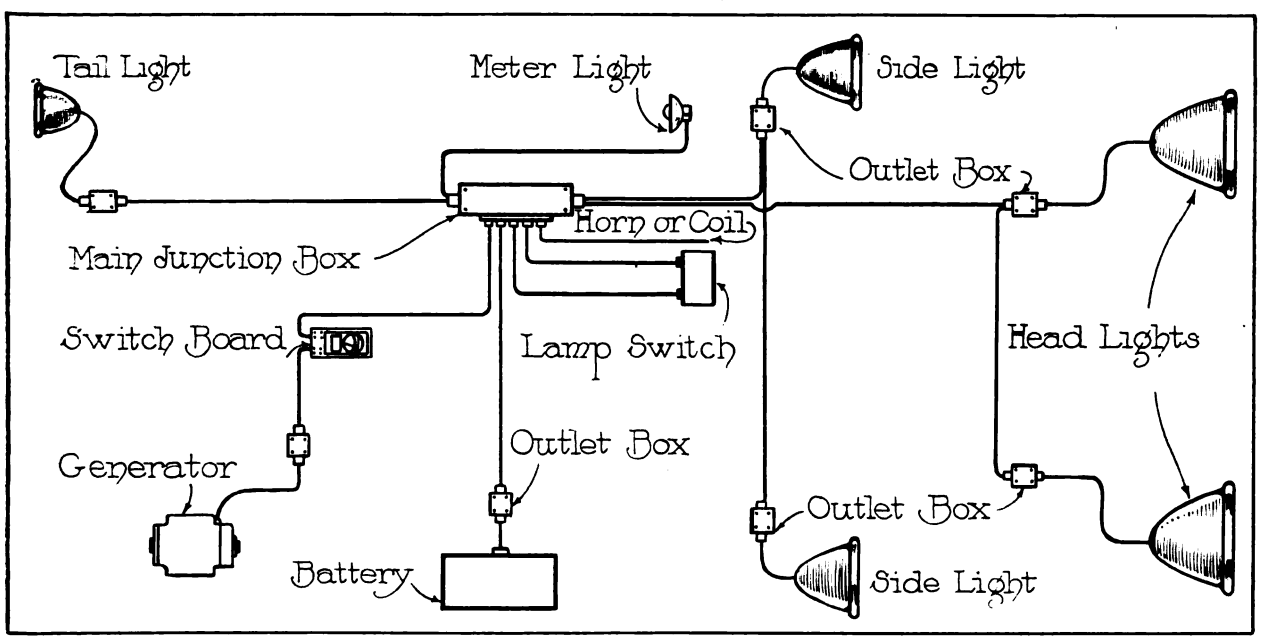

Fig. 20—Outlining Wiring Plan for Group of Five Lamps, Current for Which Is Supplied by a Mechanical Generator and Storage Battery.

Wiring Junction Box.

When wiring the junction box, the following suggestions will be of service: First, cut off the cable and armor squarely, then pull the armored covering back about an inch. This operation will be similar to that of pulling the finger of a glove off the hand as the armored insulator will telescope. The frayed ends of the metal should be well taped, making three or four turns of the material. Next remove the insulation from the wire and place the exposed ends in the junction box and clamp the wire into position, the clamp being over the portion taped. This will make a secure fastening as the tape will adhere to the parts on the box which clamp it. If the speedometer light be not desired the meter light wires should be short circuited. It will be noted that in the wiring diagram outlined at Fig. 20 is incorporated a generator and that between the latter and the junction box is placed a switchboard which comprises an automatic switch and ampere meter the functions of which will be explained in proper sequence.

Generator and Battery System.

Having considered the straight storage battery system, the original method of lighting the motor car, the equipment which includes means of charging the battery without removing it from the machine is next in order. This makes for the ideal system, as the battery is automatically charged and its capacity maintained by a generator. This system may be subdivided into two groups, one in which the generator is employed solely for supplying current to the battery and the latter utilized for lighting, and the other where the battery is employed to assist the generator when this is operating at a low speed or when the car is standing still.

With the second plan, the battery is said to be floated upon the line. The mechanical device supplies current direct to the lamps and when this is employed it is necessary that some method of regulating the dynamo be incorporated; that is, to take care of the wide variation in the driving speed peculiar to the automobile. It would be a simple matter to construct a small generator to charge a storage battery providing it was operated at a given speed, but as that of the automobile engine varies greatly, different devices are incorporated and these may be classified under three heads; namely, mechanical, electrical and electro-mechanical.

Digitized by Google

Controlling the Current.

The mechanical takes advantage of slipping belts or clutches and in this manner the speed of the armature is kept constant which assures a practically constant voltage. Electrically operated devices tend to distort and weaken the field while the electro-mechanical method combines the principles of the two described. Centrifugal devices in combination with field resistances serve as the voltage governor. Some machines also employ a load regulator, which increases the field current as more lamps are turned on.

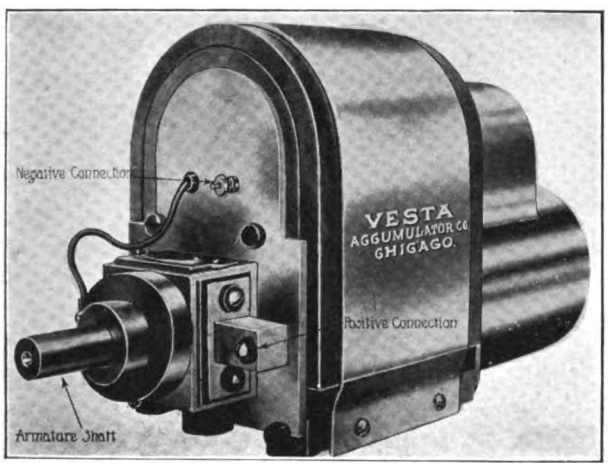

Fig. 21—Vesta Magneto Generator Employing Permanent Magnets and Making for Simplicity.

In designing devices to take care of the variation in speeds, etc., another factor has to be considered and that is a method of disconnecting the generator from the battery when the speed of the car falls to such a value that the voltage of the battery exceeds that of the generator. Should this occur the battery would discharge through the generator and would tend to run it as a motor, thus short circuiting the battery. The fact that some operators drive considerably at night while others use the lamps but little, also enters into the matter of controlling the current generated.

These devices will be explained in connection with each system outlined and may be termed automatic switches, these opening and closing according to conditions and the equipment. An ampere meter or voltmeter is usually employed in connection with the switch and mounted with it, to show the condition of the current and how much is passing from the generator to the battery. The ampere meter should have a dead beat action with a divided scale, reading from 0 to 10 to the left and 0 to 25 to the right.

Magneto Lighting Systems.

In connection with the generator it may be stated that its current may be utilized for ignition purposes, thus taking the place of the usual magneto. Several equipments of this type are manufactured and will be described in logical sequence, as will those furnishing current for lighting, ignition and starting. As previously stated, it is not the intention of the writer to confuse the reader with a technical description of the components of generators and their operation, but to make clear their practical features and installation so that in selecting the equipment the principles of the system will be understood.

The size, shape and weight of the device are important to the motorist desiring to install a lighting system when the car is not provided with a standard position for the generator. It is interesting to note that there is a growing tendency on the part of the manufacturer to provide for the installation of electric lighting and this is to be commended as it eliminates special equipments. Regarding the drive, it should be positive. The gear and silent chain are recommended as friction and belt methods sometimes cause trouble by slipping, although they are utilized abroad.

VESTA MAGNETO GENERATOR.

The lighting equipment manufactured by the Vesta Accumulator Company, 1336 Michigan avenue, Chicago, comprises the straight storage system and the Vesta magneto generator which is driven direct from the engine, maintains a storage battery in a fully charged condition, and is automatically controlled. A feature of the generator is the device employed for regulating the flow of the current generated by the magneto to the battery and the method employed in keeping it constant after the armature has reached a certain speed. This is obtained by mechanical means and is simple in construction, consisting of two weighted arms which operate inwardly and outwardly, depending upon centrifugal force. It will be noted

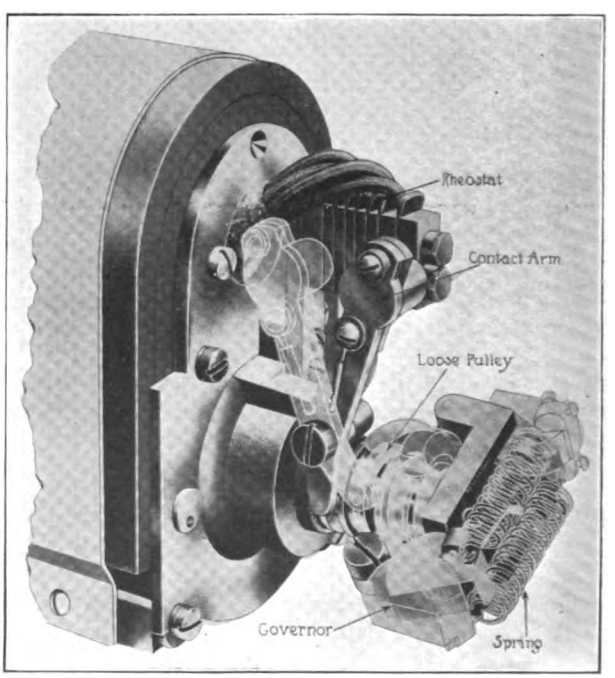

Fig. 22—Depicting Mechanism Controlling Flow of Current to Storage Battery and How Circuit Is Broken by Rheostat Arm.

that the armature shaft is fitted with a loose pulley and pivotally connected to the latter is a lever termed the contact arm.

This arm is fitted with two iridium points, the extra member being employed as an auxiliary, thereby insuring perfect operation under all conditions. These points are in contact with a form of rheostat to which is led a number of wires connected with the generator. The arm is securely but lightly held against the rheostat member and is free to move backward or forward when actuated by the loose pulley on the armature shaft.

This rheostat arm works in conjunction with two weighted arms which are much the same in construction as the old and well known ball governor employed on steam engines of the stationary type. Two springs are fitted on the governor of the Vesta generator and to charge a battery at the normal rate given by the maker and this may vary according to the design and capacity of the member. In the Vesta device the current is prevented from flowing to the battery by the rheostat arm until the generator attains a certain speed which is adjusted to approximately 400 revolutions a minute when the speed of the automobile is about six miles an hour. The charging rate when the current first cuts in is from .5 to one ampere, and as the speed of the generator increases so does the ampere flow until it reaches a fixed point, that of six amperes in the type 6 generator. The current is held constant at this point by means of the governor, which automatically inserts such resistance in the circuit as is necessary to maintain the constant amperage.

The rheostat arm moves backward and forward on the rheostat, travelling inwardly toward the generator

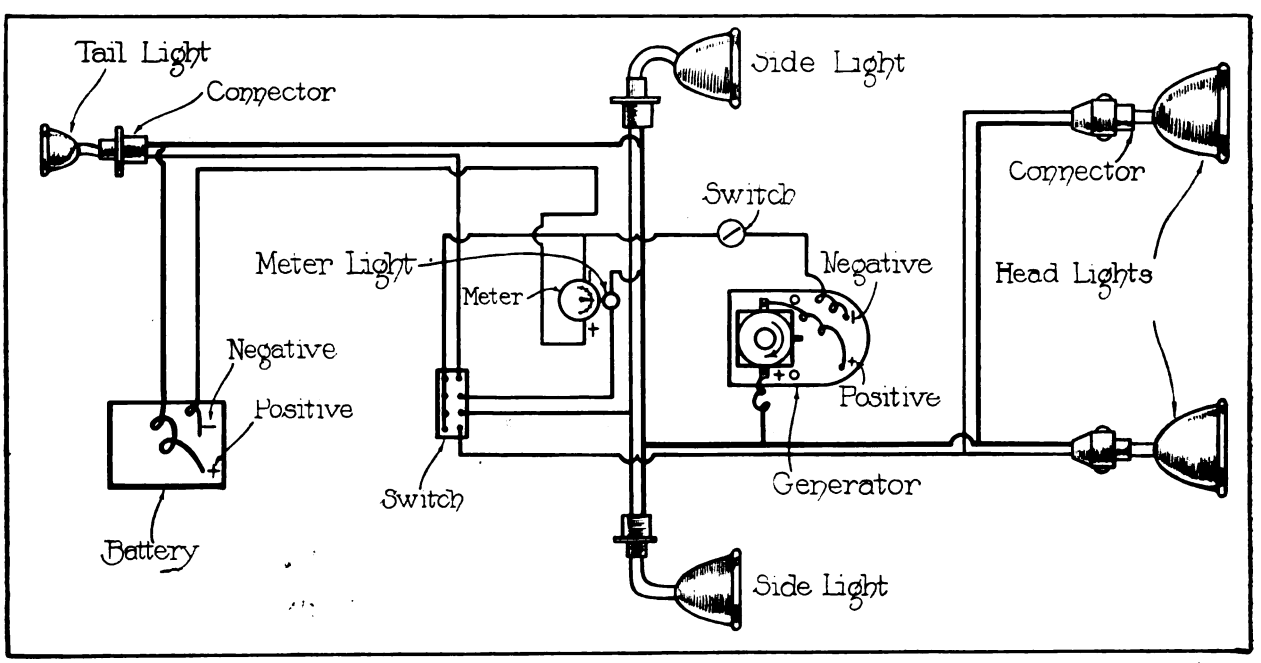

Fig. 23—Wiring Diagram of Vesta System, Showing Position of Generator, Switch and Method of Connecting Leads—These May Be Reversed According to Location of Generator.

these are utilized to counteract the centrifugal force against the weighted arms. Both springs are adjustable. One governs the time at which the circuit is made and broken, and the other the amount of resistance inserted into the circuit at the varying speeds.

Regulating Current Flow.

A feature emphasized in the Vesta system is that by its principle the battery is properly and fully charged and the current is not cut off prematurely. The breaking of the circuit by the voltage of a battery attaining its maximum before being fully charged is eliminated by the controlling mechanism. It is also pointed out that in the case of a sulphated battery with which the voltage would increase immediately upon application of the charging current, the member would not be cut out but fully charged.

As has been explained previously it is necessary proper as the speed of the armature shaft increases with that of the car, and when the energy of the engine ceases, the rheostat arm flies back to normal position, preventing the battery from discharging through the generator. These movements are outlined at Fig. 22, which depicts the controlling device with hood removed. The phantom imprint denotes the position of the arm when the armature is revolving at high speed and resistance is incorporated in the circuit. With its adjustable features as previously explained, and the fitting of an ampere meter in the circuit, the flow of current may be controlled and the life of the battery lengthened thereby.

Lubrication and Attention.

It is claimed by the maker that the generator requires no other attention than oiling about every 500 miles and as the armature shaft revolves on high grade

ball bearings these do not require lubrication more often than 1000 miles. The fields of the generator are of the permanent magnet type, constructed of a very high grade tungsten steel. The working parts are fully protected against dust or dirt, a removable hood being fitted over the governor, etc., while the generator proper is solidly enclosed. It is compact in size, being about seven inches high, 4.5 wide and about nine inches long, the latter dimension including the extension of the armature shaft.

A positive drive is recommended, either by silent chain or gears. As the generator develops six amperes at a speed of 1300 revolutions a minute with a six-volt battery in circuit, it is obvious that the gearing should provide for that number of rotations when the car is travelling at about 18 miles an hour. It is estimated that the average motor turns up at about 600 revolutions a minute under the above conditions which would require a two-to-one gear ratio, although this may vary according to the design of the power plant of the automobile.

In the installation the generator should be mounted upon a base of non-magnetic metal such as brass or aluminum and operated in a clockwise direction when looking at the brush or commutator end. The brush on the right hand side of the machine is positive and when operating in an opposite direction is negative.

Method of Wiring.

At Fig. 23 is depicted the plan of wiring the leads from the generator to the lamps, the diagram providing for two head, two side, a tail and a meter light, although additional circuits may be incorporated for the horn and speedometer if desired. In addition the battery may be utilized for ignition. In connection with the wiring diagram outlined, should the generator be installed so that it run in an anti-clockwise direction, the leads of the generator should be reversed. This arrangement simplifies installation where a choice of direction of drive is not optional.

(To Be Continued.)

SASKATCHEWAN FRAMES MOTOR LAWS.

Owing to the concerted efforts of the motorists of Regina, Saskatchewan, Canada, the act to regulate motor vehicles was referred to a special committee for a general and detailed revision, and that body practically drafted a new bill the feature of which is that there is no speed limit, the clause reading as follows: "No person shall drive a motor vehicle on a public highway recklessly, or at a speed, or in a manner which is dangerous to the public, having regard for all circumstances of the case, including nature, condition, and use of the highway, and the amount of traffic which actually is at the time or might be reasonably expected to be on the highway."

The interests of the farmer have not been overlooked and if the horse becomes frightened the operator of the automobile must stop the machine and motor as well, and render aid to the driver of the horse drawn equipment. A clause is inserted providing a penalty for any person tampering with a machine other than his property or casting missiles. Regarding lights none commonly known as a searchlight will be permitted. So-called "joy riding" is strictly prohibited and it is interesting to note that machines going north and south have the right of way over those proceeding east and west. The initial registration fee is $10 and annual renewals $3, while motorcycle fees are $5 and $3. Non-residents will have a 30-day privilege without payment of any fee but must display the license mark from place of registration. The clause providing for the impounding of the machine in the event of a third conviction has been eliminated.

ATTACK CALLAN LAW AMENDMENT.

Charles Thaddeus Terry, chairman of the legislative committee of the American Automobile Association, has served notice on the New York Legislature that his organization is prepared to attack the constitutionality of the proposed amendment to the so-called Callan automobile law, providing it is placed upon the statute books. The bill was introduced by Senator Long, and provides that the moneys received from licensing automobiles and drivers shall be divided among the towns and cities of the state.

Mr. Terry maintains that the original Callan law was unconstitutional, but the motorists have decided to pay the tax willingly so long as the funds are used for highway construction and maintenance. He holds that under the proposed amendment the cost of administration would prove so excessive that little would remain for highway work.

SUSPENSION FOR CANCELLING RACES.

The contest board of the American Automobile Association has suspended E. A. Moross and his agent, W. H. Wellman, for 60 days as the result of cancelling the proposed race meet at New Orleans, La., Feb. 17-18, without first securing permission from the contest board. It appears that the sanction was issued in proper form, but two days before the meet was to have been held the dates were cancelled without furnishing reasons therefor to the sanctioning authority. The suspension holds until April 20.

KENTUCKY'S NEW AUTOMOBILE LAW.

The lower house in the Kentucky Legislature has passed the so-called Knight bill, in an amended form, which leaves the license fees as at present, $5 to $20, according to the horsepower of the car. Under the provisions of the new law motorists of other states are permitted to operate their cars in Kentucky without a Kentucky license. Operators must bring their cars to a stop when approaching a horse drawn vehicle and cities and towns are permitted to regulate speed.

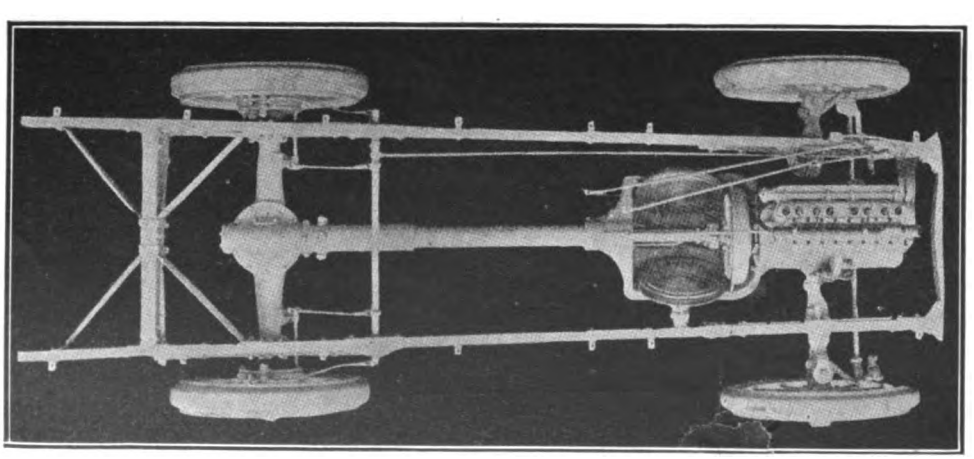
IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

BOSTON'S FIRST TRUCK SHOW.

The remarkable success which has greeted Manager Chester I. Campbell and the Boston Automobile Dealers' Association in the pleasure vehicle section of the 10th annual Boston automobile show, just closed, is sufficient indication of what the Boston Commercial Motor Vehicle Association may expect at its first separate motor truck show in Mechanics' Building, March 13-20. The event will be under the direction of Mr. Campbell, whose long experience in the management of similar exhibitions is assurance that it will be accorded the same generous support by the public.

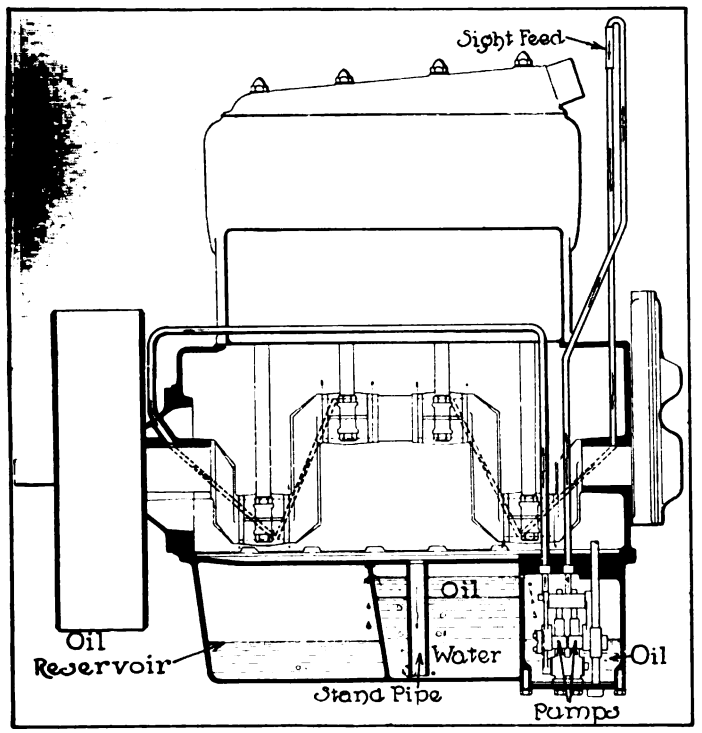


As soon as the pleasure vehicle section was closed Saturday evening, arrangements were completed for the removal of the passenger conveyances to make room for the industrial transports. Some of the larger wagons will have to be completely dismantled in order that they may pass through the entrances, but so well has the problem been thought out that everything will be in place when the doors are opened Wednesday afternoon.

Interest in the power wagon throughout the entire New England States has been awakened through the remarkable possibilities. In this section, as in no other, the practicability of motor transportation has been amply demonstrated. Towns and cities are located so close together that there has been no difficulty in bringing home the fact that decided economy may be effected through the use of motor trucks.

There remains only the necessity for an opportunity to compare the merits of the various productions, and this will be afforded by the forthcoming exhibition. Most of the makes which have been displayed at other shows this year, will be on view, and as the list of exhibitors indicates a much larger representation than was present at the recent Chicago show, looked upon as the greatest collection of industrial transports ever assembled, it follows that several makes will be seen here for the first time. Some of these are manufactured in New England or in states closely adjacent thereto, while others are of western production. In any case, there will be every chance to see and make note of the best the industry has to offer.

GREAT DAIN ONE-TON WAGON.



Among the new vehicles first placed in the market this year, few present more distinctive features than the Great Dain, made by Joseph Dain, Ottumwa, Ia. This is a one-ton vehicle, with driver located at the left and centre control. The motor is a four-cylinder water-cooled unit, with cylinders cast en bloc, the bore being 3.75 inches and the stroke five. Ignition is by K-W high-tension magneto. Lubrication is by forced feed.

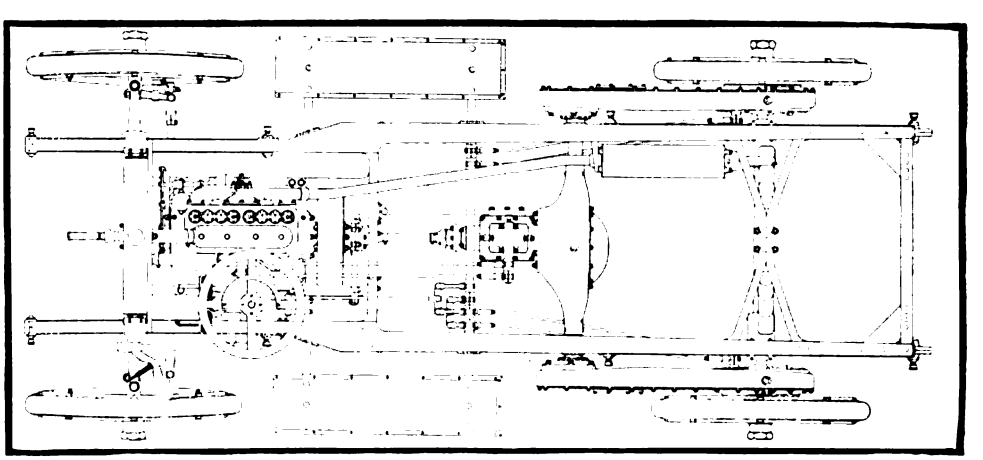
Novel Friction Transmission and Three Point Suspension Utilized in Great Dain Chassis.

The transmission scheme is of decided interest, inasmuch as friction discs are employed, but only for low speed and reverse, the direct drive being through a cone clutch. This whole assembly is made a part of the mo-

Digitized by Google

Interesting Lubrication System Employed on Natco Vehicles.

tor, providing a unit power and transmission plant. In addition, it is claimed for this construction that it provides a perfect three point suspension, power being transmitted at all times directly from the engine to the rear axle in a straight line, no universal joints being used.

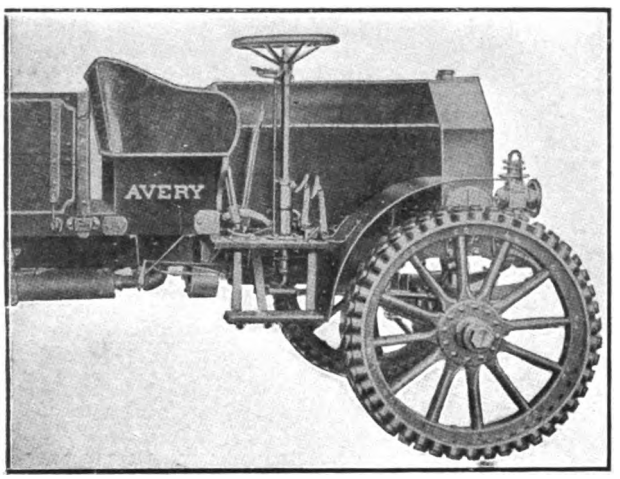


The transmission proper consists of two discs set at an angle to each other, which on low speed and reverse are rotated by the rim of the flywheel being brought into frictional contact with their edges. A friction wheel slideably connected with the propeller shaft and mounted between the discs, receives the power from the faces of the discs. When shifting the friction wheel across the faces of the discs, or to disengage the power when using the transmission, the driver may by a simple movement of the foot, lift the friction wheel out of engagement with the discs and thereby release the contact between it and the faces of the discs. The discs being mounted with their faces at an angle to each other, or in other words, the friction wheel being in wedging contact with the faces of the discs, makes it possible to relieve the frictional contact by lifting the friction wheel instead of moving the discs. To shift from low to high speed, or from transmission to direct drive, the friction wheel, which carries one member of a cone clutch, is moved out of contact with the faces of the discs and into engagement with the other member of the cone clutch formed in the flywheel. Doing this moves the flywheel out of contact with the edges of the discs and leaves them dormant. The power is disengaged when on the direct drive by releasing the clutch with the foot lever.

With reference to the three point suspension it may be said that the drive shaft is encased in a tube which has a slip joint near the rear end. The torque is cared for by this tube, and there are means of taking this away from the drive shaft, these being in the nature of buffers located immediately in front of the back axle. The slip joint is designed to prevent any tendency to transmit radial strains through the transmission or motor.

Final drive is by a Hindley full floating worm drive axle, in direct line with the drive shaft and motor. The axle itself is of the semi-floating type, and an auxiliary cross spring is carried on the back cross member, this being braced on either side to the frame member by pressed steel straps, concaved to add strength and rigidity.

NEW NATCO VEHICLE.



Another new one-ton truck which has attracted no little attention wherever shown this year, is the Natco, made by the National Motor Truck Company, Bay City, Mich. This also has a four-cylinder motor, left hand position of driver and central control levers. The engine is located under a hood in front, but this is so short that it is brought up close to the seat, giving an effect similar to the so-called motor-in-the-cab design. Cylinders are cast en bloc, with bore of 3.5 inches and stroke of five. Cooling is by water, ignition by high-tension magneto, and lubrication by force feed.

Chassis of One-Ton Natco Wagon, Presenting Relation of Parts.

Digitized by Google

When the hood is raised the entire mechanism is exposed, the motor and transmission being supported on a sub-frame. The leather faced cone clutch is supported on compression springs. The jackshaft is of the full floating type, the housing being attached to the underside of the frame. Final drive is by double side chains, which are encased and run in oil. An auxiliary spring is carried under a double cross member in the rear, this converging at the centre and supplying an additional brace.

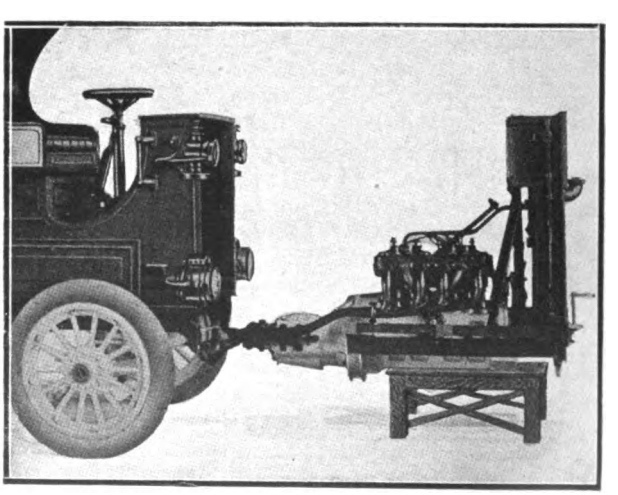
Seat Location and Wood Plug Tires on Avery Truck.

A particular feature is the method of lubrication, in which the oil is filtered through water. The main reservoir of six quarts capacity is attached to the bottom of the engine case, and the pumps, which are gear driven by camshaft, are located in a compartment at the forward end of the motor. The oil is forced from the pumps to the end bearings, through the crankshaft to the connecting rod pins. The excess returns to the main supply tank through the standpipe, which extends to within .375 inch of the bottom of the water compartment, and owing to the difference in specific gravity between water and oil, the latter rises to the top of the water and overflows into the main reservoir. During the passage of the lubricant through the water, carbon which is collected by the oil while performing its lubricating function, is precipitated to the bottom of the water compartment, which can be cleansed thoroughly at certain intervals. In addition to the clarifying of the oil, it also is cooled. Lubricant in the forward pipe line flows through the sight feed on the dash.

AVERY'S WOOD PLUG TIRES.

The matter of tires is a problem which interests the truck manufacturer as well as the user. Several concerns have been trying out substitutes for rubber of one nature or another, and many of these have turned their attention to wood. One of the latter is the Avery Company, Peoria, Ill., maker of Avery trucks and tractors. Rubber tires are still fitted as standard equipment by this maker, although the wood plug members are furnished without extra charge.

An accompanying illustration shows the front wheels of an Avery truck equipped with wood plug tires. It will be noted that the plugs are disposed in regular formation around the periphery of the wheel, which is made with cast steel rims. It is claimed for these tires that they have splendid wearing possibilities and that their construction is such that the truck is able to traverse country which would not permit of the use of rubber.



T. W. Thrash of Tarboro, N. C., has an Avery truck thus equipped with which he hauls brick, wood and other merchandise over country ways, making two and three such trips a week, besides covering an oil route. He declares he is very well satisfied with his wood plug tires, and expects that several of his neighbors will order them on their new vehicles.

B. E. Baker of Spooner, Wis., utilizes another Avery truck with this equipment in hauling and general farm work. E. W. Parsons of Jennings Kan., uses one in covering an oil route, and states it does the work of three four-horse teams. All are loud in the praise of the wood plug tires.

ACCESSIBILITY OF SANDUSKY TRUCK.

The subject of motor accessibility is occasioning considerable interest this year, as would appear from the number of attempts to solve the problem and at the same time so dispose of the motor that the greatest possible carrying space may be available. The Sandusky Auto Parts & Motor Truck Company, Sandusky, O., presents a rather novel scheme on its 1.5-ton vehicles.

It will be noted by the accompanying illustration that the power plant is located under the floor on a sub-frame, which can be withdrawn bodily from the chassis. The radiator and fuel tank are connected with the motor, so that the entire assembly is free to

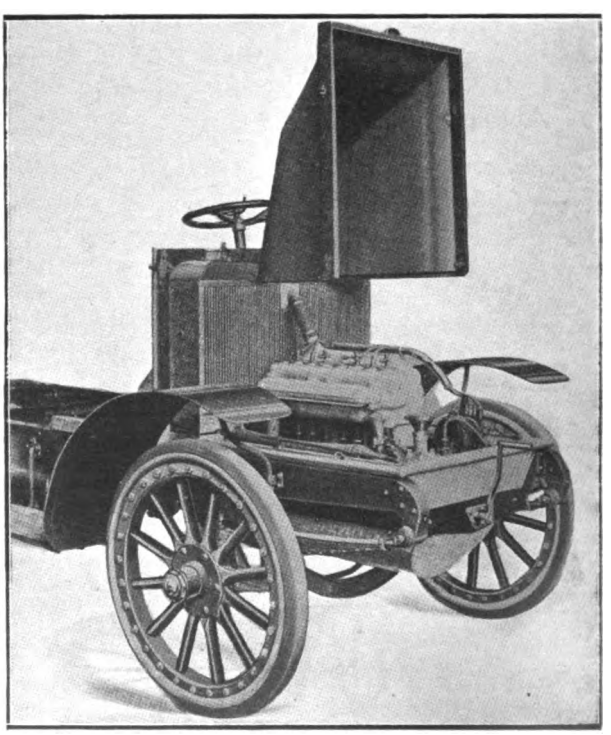
slide out like a drawer. The removal may be made without breaking water, fuel or electric connections. This is accomplished by withdrawing six spring controlled plungers, raising the steering column and operating two levers. This releases the sub-frame, which drops down onto rollers, and all that is necessary to complete the work is to place the proper support in position to receive the assembly.

SULLIVAN ICE CREAM BODY.

The difficulty presented by the proper loading of certain commodities affects materially the saving which a motor truck is able to accomplish in these fields. Special mention may be made of ice cream delivery, since this product usually is handled in tubs and pails, which cannot well be packed on top of each other. It follows that to secure the utmost value of the truck it is necessary to utilize all of the floor space it is possible to get.

The Sullivan Motor Car Company, Rochester, N. Y., recently constructed the body shown in an accompanying illustration for an ice cream dealer in that city. It will be noted that the driver's seat is designed to take up but half of the room in front, and that it is possible to utilize space on either side for carrying packages of varying size.



The body has a width of 46 inches, inside, and that portion back of the seat is seven feet six inches in length. One-half of the body has a carrying space of nine feet nine inches, and this additional two feet and three inches is of decided value in the ice cream business.

The vehicle as shown was displayed for the first time at the Rochester automobile show last month, and created a decidedly favorable impression. As has been stated, it was designed especially for the ice cream dealer in question, but several orders for duplicates were taken during the week of the exhibition. Three of these wagons went to plumbers, while a fourth was purchased by a carpet and rug concern, which stated it had been experiencing difficulty in securing a wagon which would accommodate its largest rugs.

ADAMS RADIATOR LOCATION.

It would appear that American makers were giving considerable thought to the matter of radiator location. Recently, several instances were cited in these columns, in which the radiator was located elsewhere than in front, following the practise of certain foreign manufacturers. Herewith is presented another illustration of this nature, the truck being a one-ton Adams, made by the Adams Bros. Company, Findlay, Ohio.

It also will be noted that the hood is hinged at the top so as to afford complete accessibility to the power plant, which is mounted on a sub-frame and can be removed readily. A long propeller shaft connects

Radiator Mounting and Power Plant on Adams Trucks.

Will You Spend $3.00

To Save 10% to 25% Gasolene and Greatly Improve Your Engine?

GYREX
· THE MIXER ·

GYREX fits intake pipe. It is a small all-metal device through which the mixture passes. The little nickel-steel turbine spins around at great speed and and "beats up" every globule of gasolene—thoroughly diffuses the real essence of the mixture so that the cylinders get a rich mixture that means more power and speed with one-third less gasolene.

You don't have to disturb engine. GYREX can be attached in five minutes. It economizes, prevents stratification and missing. Those who use the GYREX say that they will never be without one.

Beautifully constructed, made of the best German steel and mounted on imported ball bearings.

Get Your GYREX To-day. Money Back If Not Satisfactory.

WE SEND IT ON TRIAL

Send us $3.00 and we will mail you a GYREX, and if it does not prove its worth you can return it within ten days and your money is cheerfully refunded. Send name, model and year of your car or inside diameter of intake pipe at carburetor flange.

THE ROYAL EQUIPMENT COMPANY

with the change speed mechanism, supported in front by a single cross member from one point and at two points on another cross member in the rear. The jackshaft bearings are bolted to the underside of the frame members.

SAMPSON ARMY WAGON.

One of the few motor wagons purchased by the quartermaster's department of the United States army is a Sampson, made by the Alden Sampson Manufacturing Company, Detroit, a constituent of the United States Motor Company, New York City. The vehicle is shown herewith, and it will be noted that it does not differ widely from standard practise, with the exception that the tires are 42 inches in diameter, both front and rear. It is claimed that this size is necessary because of the clearance required in traversing rough country roads.

Sampson Wagon Designed Especially Upon Order for the United States Army.

As the mule is called upon to ford streams, travel through open fields and over stones, etc., the government requires that its successor shall be equipped for similar purposes. To haul this car out of mud or places where traction cannot be secured, the wheels are constructed so that winch heads may be attached by means of simple hook bolts. The rope is fastened to some fixed object and a few turns taken around the winch heads. The slipping of the wheels winds the ropes, drawing the car from its psition.

The motor is located under the seat, being a four-cylinder, water-cooled unit, having a four-inch bore and five-inch stroke. The inside body dimensions are nine feet in length by three feet eight inches wide. It may be added that this car was sent to the Mexican border recently, where it will be given a thorough test under severe conditions of service.

ELECTRIC MEN CELEBRATE.

The first anniversary of the organization of the Boston Electric Vehicle Club was celebrated by a dinner in the Hotel Thorndyke, Boston, March 9. About 150 members and guests were present, including many leading business men of the city, electric vehicle agents and representatives of electric car manufacturers. Day Baker, president of the club, presided at the after dinner exercises, and F. S. Mansfield of the Boston Edison Electric Illuminating Company was toastmaster. The principal address of the evening was delivered by P. D. Wagoner, president of the General Vehicle Company, Long Island City, N. Y. He said in part:

"I think it must be conceded that when hundreds of the largest firms in the country officially adopt the electric for their city delivery service, they must consider it perfected, at least to the extent of being superior to horses, and more economical than non-electric trucks for this work. When I tell you that 100 firms already use 1009 electric trucks of one make—that two express companies have purchased no less than 356, three brewers 172, three packers 119, three delivery contractors 93, and three central stations no less than 158, and when you consider that in the case of the express companies, the brewers and the central stations, many of the electrics now operated by them have been in service from six to 11 years, you must admit that such extensive buying not only voices confidence in the electric, but demonstrates as well that the electric truck gives a larger return on the investment that other types of commercial vehicles.

"This is certainly true of city work, and the bulk of the heavy trucking and deliveries is in the city. The fact that in changing from horses to electric trucks it is possible to utilize the old horse driver, does much to simplify the operating and economic problem of many who are adopting motor vehicles. Many of these drivers possess a valuable knowledge of the firm's routes and methods of delivery.

"The motor truck is a money saving proposition, yet the world is going to have it because it is up-to-date—a part of modern business. Electricity provides the solution of most city transportation problems."

"John! You Must Get Weed Chains For Our Car Today"

Nine-tenths of all automobile accidents are caused by skidding. Hardly a day goes by but the newspapers chronicle some startling mishap entailing broken limbs, smashed cars and tremendous expense.

Careless drivers and foolish "joy riders" are not the only ones who get into trouble. The *most careful driver*—the man who says and thinks *he* never takes chances is often "up against" serious difficulties. When motoring on wet, muddy, snow-covered roads or on icy, slippery, greasy pavements, try as he may, and even if he exercise every possible precaution, he *cannot prevent slipping and skidding* unless his car is equipped with

Weed Anti-Skid Chains

No Trouble to put on

A well known editor of one of the largest automobile papers thus expresses his views: "The fact remains that no other device will do just what *Weed Chains* will do. The Weed invention is one of the most remarkable in the history of the Motor Car industry. When first put upon the market, its *effectiveness* was self evident, but the skeptic said it would ruin tires and that something far better would be forthcoming. The fact is that it *constantly creeps and does not ruin tires* any more than the ordinary use of the tire—without the chains—wears it.

"*Another fact* is that Taxicab companies, who do everything that money can do to minimize accidents, universally use *Weed Chains* because *no other device at any price is equally effective.*"

When Used on the Front Wheels, Too

Weed Chains give comfortable, easy steering; no cramped fingers; no cramped arms; no sore muscles—out of car tracks, ruts, snowdrifts and "heavy going"—*just like steering on smooth roads.*

Even if you don't value your own life—what right have you to imperil the lives of others. *For your own safety*, for the safety of the public, stop at your dealer's today and fully equip your car with *Weed Chains.*

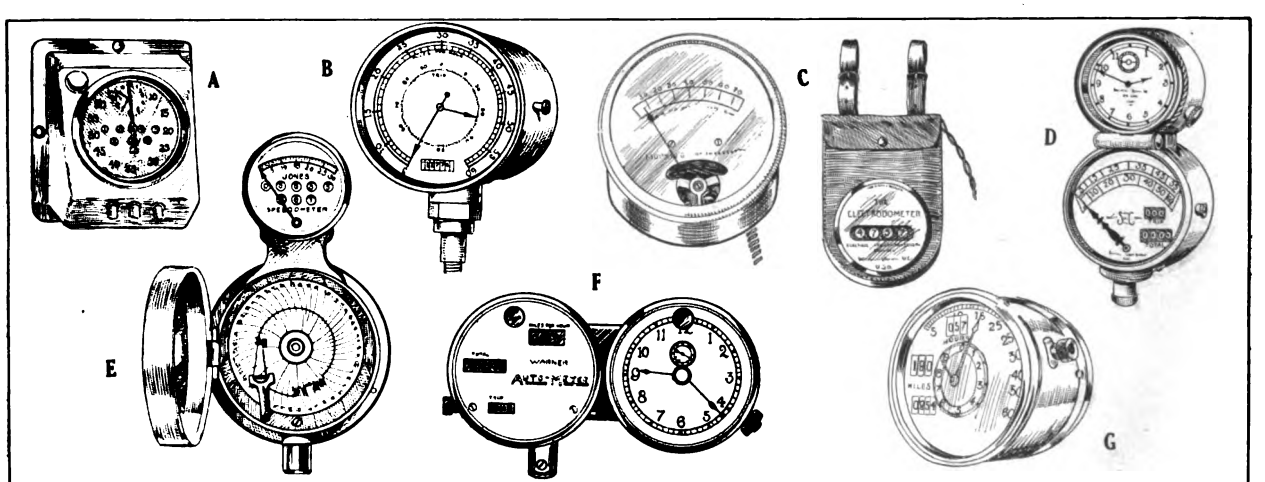
Recommended and sold by all reputable dealers.

Weed Chain Tire Grip Co., 28 Moore St., New York

Digitized by Google

CONTINUING the discussion of prominent accessories begun in the last issue of The Automobile Journal, herein is set forth in a comprehensive manner many of the leading makes of supplies and fittings designed for the proper maintenance of the car or the convenience and enjoyment of motoring. As has been stated, many cars are sold today with what is known as complete equipment, but in spite of this the purchasers often have occasion to add details which more nearly approach their ideals, and there are some so-called accessories which require renewal from time to time. In any event it is desirable to become thoroughly acquainted with the standard productions. The illustrations and brief descriptions below will serve to call more forcibly to mind those devices or supplies which have been most extensively exploited and therefore recognized as measuring fully up to the demands of the modern automobile.

SPEEDOMETERS.



The automobile owner who would comply with the requirements of the laws will find one of the most necessary equipments for his vehicle to be a speedometer, and these instruments have been improved and perfected in many ways. There is a very wide range of qualities and values in these indicators.

Stewart.

The Stewart, made by the Stewart & Clark Manufacturing Company, Chicago, Ill., is produced in numerous models and in combination with clocks suited for all purposes. The principle of operation is by magnetic influence. One feature is a provision for the regulation of some models by micrometer. Another is that the trip register may at any time be set to any tenth of a mile. Besides refining and improving the indicators, the shafts and fittings have been considerably perfected.

Jones.

Besides the standard Jones models, produced by the Jones Speedometer Company, New Rochelle, N. Y., which have been little changed, aside from the use of nickel and black enamel for case finish, the truck service types have been improved by heavier fittings. There is in addition the Jones hub odometer for service wagons and there is as well the Jones recorder, which will register the period of service, distance and speed, when the vehicle is in motion, duration of stops and driving, on a chart that may be removed and preserved for record.

Speedometers: A, Stover-Lang; B, Reliance; C, Hopkins (Electric); D, Sears-Cross; E, Jones; F, Warner, G, Cleveland.

Digitized by Google

Warner.

Made by the Warner Instrument Company, Beloit, Wis., the Warner is the pioneer magnetic instrument and has been so perfected that little change has been made in the 1912 models other than to install a reset for the trip register on the bezel types. This is designed for the benefit of those who desire to make deviations from routes and yet be able to employ the routed information without recourse to making notes.

Hoffecker.

The new instruments made by the Hoffecker Company, Boston, Mass., include model D, which has a 100,000-mile register and a trip register that may be set to zero at will by a side button reset, or to a tenth of a mile. Model H is a vertical type of combination clock and speedometer designed for use with cars of moderate cost. The other types have not been changed, save in minor detail.

Veeder.

The Veeder indicator is made by the Veeder Manufacturing Company, Hartford, Conn., and with a tube containing colored fluid mounted in a metal frame carrying a scale. There is a reservoir for fluid and the momentum of a small centrifugal pump carrying this fluid upward into the tube indicates the speed of the car. There is a trip and season odometer, the assembly being operated by a flexible shaft from the vehicle wheel.

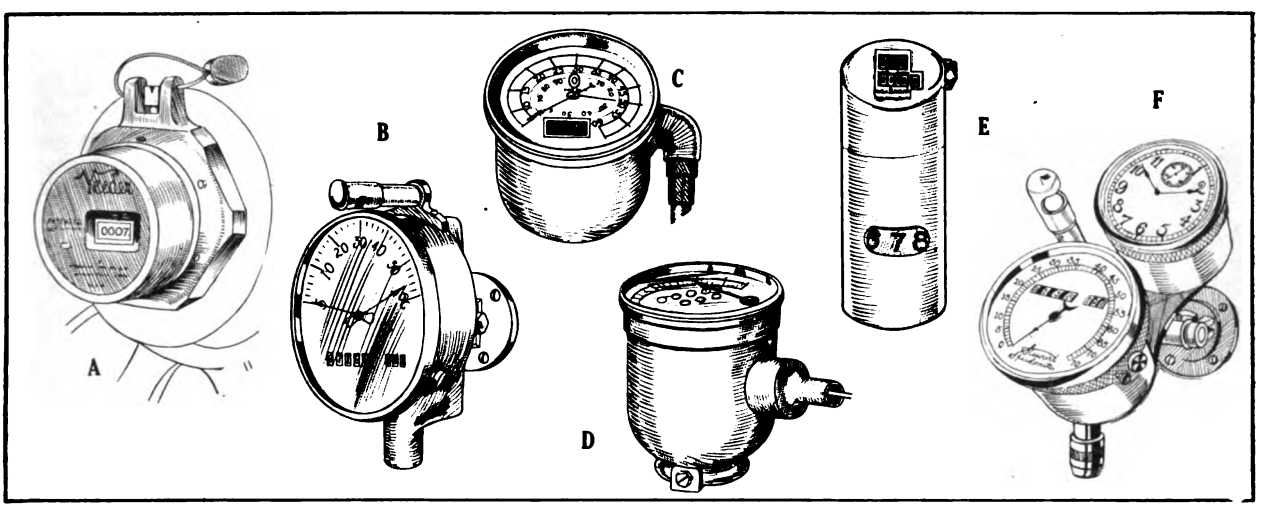
Forse.

Produced by the Forse Manufacturing Company, Anderson, Ind., this instrument has been improved by the change of the shaft opening to eliminate a turn in the flexible shaft. The type is centrifugal and the construction well designed, there being double ball bearings for the governor shaft, radial raceways and four point suspension. No springs are required for steadying the indicating hand. The drive is by a special cable of piano wire in a steel-lined brass tube.

Sears-Cross.

The 1912 model of the Sears-Cross, made by the Sears-Cross Company, New York, N. Y., is built with a double governor, the second functioning after a speed of 15 miles an hour has been reached, the one first used steadying the hand. The instrument as built is assembled within a case and this is installed withing the housing. An odometer reset is a feature. There are six sets of ball bearings in the fittings.

American Metric.



Made by the American Eveready Company, New York, N. Y., these instruments are in 12 models and are of the magnetic type, the former centrifugal constructions being abandoned. They range from 50 to 80 miles an hour indication and vary in size and price. Besides these changes a swivel joint is now used at the steering arm and the flexible shaft has been decidedly improved.

Hopkins Electric.

This device, produced by the Electric Speedometer Company, Washington, D. C., includes a direct current generator geared to the vehicle wheel, a voltmeter, a commutator, an indicator, a revolution counter and an electrodometer. There are gold brushes for the commutator and the voltmeter, sapphire bearings and exceedingly accurate and careful construction. The electrodometer is for the use of the tonneau passengers. The record is of speed, distance, and travel in a given period.

Cleveland.

Made by the Cleveland Speed Indicator Company, Cleveland, O., this instrument is intended to register by indication speed averaged for each 176 feet of distance traversed, trip miles, actual running hours for the trip, average speed for trip or day, complete season's mileage, actual running hours for the season and average speed for the season. The indicator is a clock with registering device governed by a shaft driven mechanism, and it is self-winding.

Speedometers: A, Veeder; B, American Metric; C, Hoffecker; D, Forse; E, Casgrain; F, Stewart.

Digitized by Google

Reliance.

Produced by the Reliance Speedometer Company, Boston, Mass., extreme accuracy is claimed for these instruments through the use of a flexible driving shaft carried on ball bearings, which shaft has a swivel union at either end. All extreme movements of the indicating hand are eliminated by this shaft and mounting. The method of attachment is such that the driving pinion is always in the same plane as the ring gear on the vehicle wheel.

Casgrain.

In this speed and distance indicator, made by the Casgrain Speedometer Company, Boston, Mass., the register is by figures carried on a cylinder that is actuated by the motion of the fluid contained within a sealed glass casing. The movement is by a rotary pump turned by a shaft driven by a flexible shaft from the front wheel. The device is carefully calibrated and as the shocks are cushioned by the liquid it is said that it is free of all influences that might in any way disturb its accuracy.

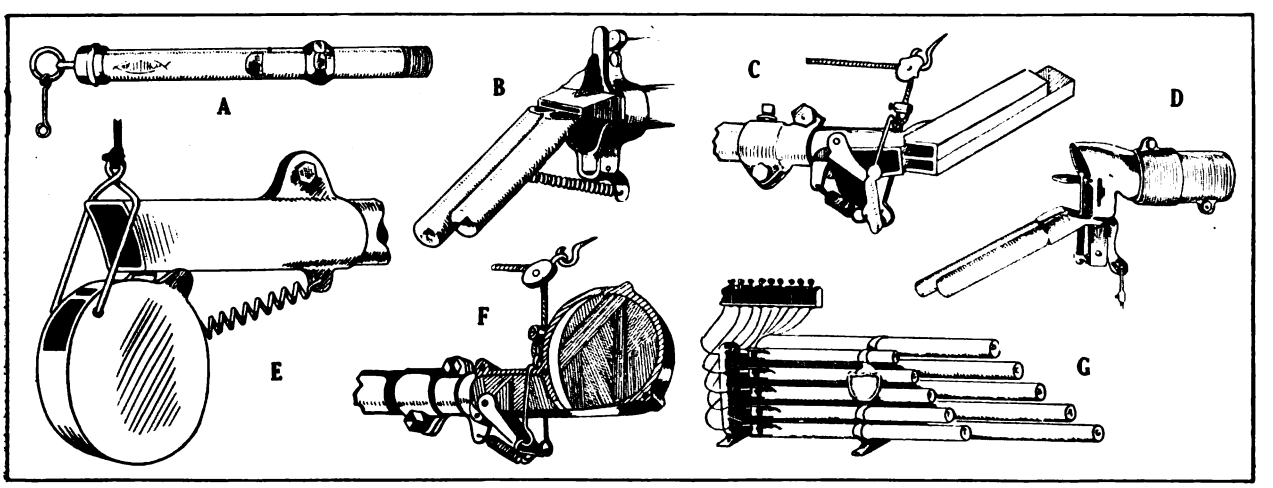
Troy.

The Troy Carriage Sunshade Company, Troy, O., produces the Troy pneumatic speedometer, which is actuated by an air draft forced through a flexible tube and which operates the indicating device. In a test, an instrument was driven 2508 hours at speed of 120 miles an hour, a total of 300,960 miles, and after this run by micrometer measurement no part showed measurable wear.

Stover-Lang.

In the product of the Stover-Lang Company, Boston, Mass., the rate of speed, distance and time are recorded by a combination clock and recorder. A clock escapement is automatically wound by force of air driven through a tube every half-revolution of a wheel by a diaphragm. Every five seconds the wheel revolutions are counted and recorded. There are no springs, cams or magnets used in this device, which is claimed to be absolutely accurate.

HORNS AND SIGNALLING DEVICES.



While bulb horns are still offered, many concerns have turned their attention to the production of electrically or exhaust operated devices in addition to the older lines. Some of these present new shapes and designs, and taken as a whole the signalling situation has changed quite as much as any other in the so-called accessory field.

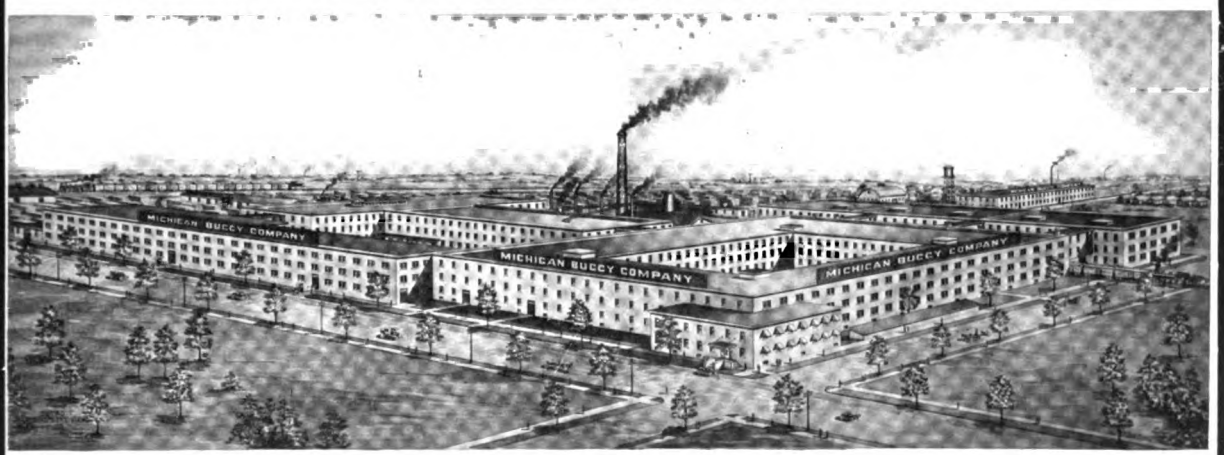
Sonora.

In the Sonora, made by the Sonora Motor Horn Company, New York City, the usual diaphragm has no button or stud riveted into the centre. Instead a little spring member beats against this drum head disc, producing a deep toned whistle. It is claimed that it may be operated an entire season on one set of batteries.

Newtone.

The Auto Supply Manufacturing Company, Brooklyn, N. Y., is featuring the Newtone Torpedo electric horn, in which the motor comprises a field of 75 laminated pieces. By the adoption of a vanadium steel diaphragm .03125 inch in thickness, it is claimed that the consumption of current has been reduced some 40 per cent. The same quality of construction is maintained in other members of the line.

Exhaust Horns: A, Nightingale; B, Exo; C, Jubilee; D, Waymaker; E, Hough; F. Jericho; G, Gabriel.



Tuto.

The Dean Electric Company, Elyria, O., continues the Tuto horn, electrically operated, with which a button is attached to the steering wheel spoke, and the cord is encased in a fixture on the steering column. Pressing this button instantly causes the device to give forth a mellow note, while additional pressure brings about a more penetrating sound. An addition to the line is the Tutoette, a smaller replica of the Tuto, and a new bulb horn, known as the Tally-O-Horn.

Monoplex.

The Monoplex is made by the Atwater Kent Manufacturing Works, Philadelphia, being presented in

The Factory Back of the Car

Means as Much to You as the Car Itself

Suppose you were to put $1,500 on deposit. There are two banks side by side. One old and established, with a capital and surplus of millions. The other a newcomer, unknown, and behind it just a few thousands. Which bank would you choose?

The same principle applies to the automobile business. You want to buy your car from a concern with an *already established* reputation. One of large capital, that will always be right there to back up its cars and take care of its customers.

Such a concern is the Michigan Buggy Company. It has been in existence for thirty years. It will be in existence thirty years from now. It has built up a reputation that is world-wide.

Michigan 40

The Michigan Buggy Company guarantees every car it turns out. Not for one year, two years, or even five years. The Michigan guarantee is for life. If at any time there develops a flaw in material or workmanship, we will be here to make it right—every time.

Every Big Selling Feature Included in the Michigan "40"

Motor—40 horsepower. Four cylinders, 4¼x5¼ inches. Three-bearing crankshaft. Enclosed valves.

Self-starter—absolutely efficient; light in weight; non-injurious to motor.

Dual ignition. Briggs guaranteed magneto.

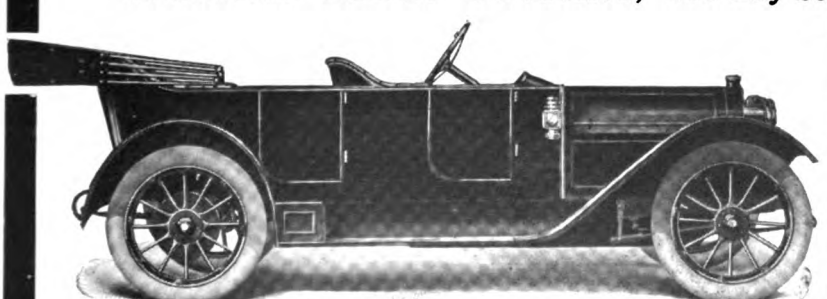
Three-speed selective transmission.

Three-quarter floating rear axle, possessing all the advantages of both full-floating and semi-floating types with none of the disadvantages of either.

Multiple disc dry plate clutch.

Frame—extra strong, 5-32-inch steel. Four inches deep, 3½-inch flange.

Shortsville wheels, 34x4-inch tires and demountable rims—just to make sure that MICHIGAN owners will not be bothered with that bugbear of motordom, tire trouble.



Fourteen-inch brake drums. One square inch of braking surface to every eight pounds.

White nickel mountings throughout.

116-inch wheel base, long 50-inch springs and luxuriously comfortable cushions insure perfect-riding qualities.

A life guarantee on every MICHIGAN car—backed up by an old-established concern.

MICHIGAN BUGGY COMPANY, 166 Lay Street, Kalamazoo, Mich.

Electric Horns: A, Klaxon; B, Oneita; C, Duplex; D, Hipwell; E, Typhoon, and Attachment for Bulb Horns.

three types, A and M for automobile service, and D for marine use. The operating button is clamped to the spoke of the steering wheel, and the principle of operation is that of a steel diaphragm being struck by an electro-magnetic mechanism. The sound thus produced is intensified by the bell of the horn.

Klaxon.

The product of the Lovell-McConnell Manufacturing Company, Newark, N. J., is almost too well known to need comment. Practically no change has been made in the Klaxon, but the Klaxonet is now offered as a combination instrument, which may be used as an electric device or as a bulb horn. For the first time the line is being offered in colors to match the cars on which the members are to be used.

Typhoon.

The Typhoon is produced by the Typhoon Signal Company, Chicago, and is a motor driven electric horn. The interior mechanism is new, and patent claims have been allowed, which the company holds is proof that it does not infringe upon any other device. In addition to the regulation Typhoon horn, the compartment containing the sound producing mechanism is furnished for attachment to the ordinary bulb horn if desired.

Hipwell.

An electrically operated horn, for which simplicity of internal mechanism is the prominent feature claimed, is the Hipwell Autophone, made by the Hipwell Manufacturing Company, Pittsburg, Penn. All working parts are sealed and water proof. Operation is by push button on the steering wheel.

Oneita.

The Mutual Auto Accessories Company of America, New York City, is placing in the market the Oneita electric horn, for which it is claimed that it has a tone 50 per cent. louder than usual. A large hammer vibrator is used, striking a 5.5-inch diaphragm, which, due to the peculiar construction of the casting, is held under considerable tension and causes the deep, clear tone. This casting is of solid brass, absolutely water and dust proof.

Duplex.

The Electric Auto Horn Company, Pittsburg, Penn., makes the Duplex, which operates from either the regular ignition or lighting battery, six-volt storage or six dry cells. The construction is held to be so simple as to present nothing to get out of order. With each horn is furnished a special steering wheel push button and three-way cable for connecting.

Jericho and Jubilee.

The Randall-Faichney Company, Boston, Mass., continues its Jericho exhaust horn with practically no change. This is installed in the rear of the muffler, either by clamping over the muffler stem by a double clamp coupling, or by screwing into the muffler by a threaded coupling. A simple pressure of a pedal gives a pleasing tone, clear and distinct, at any speed without racing the motor. This concern also makes the

Digitized by Google

Jubilee, a chime horn, operated in the same manner as the Jericho.

Gabriel.

The Gabriel Horn Manufacturing Company, Cleveland, Ohio, has brought out a new form of its 10-tone Gabriel musical horn. Heretofore, this well known signalling device has been designed primarily for use on high powered cars, but the new instrument enables the owner of a 30-horsepower machine to utilize one of these as well. The line also includes musical signals of one or more notes, all operated by the exhaust.

Clymax.

The Nonpariel Horn Manufacturing Company, New York City, presents the Clymax, an electrically operated signalling device. Within the rear end portion is placed a small electric armature, which a flow of electricity causes to rotate and drive forward four striking points, which hit the metallic diaphragm at three spots, set 120 degrees apart around the circumference. The point is that the action is not a continuous hammering on one place, but with this distributed over a series of places.

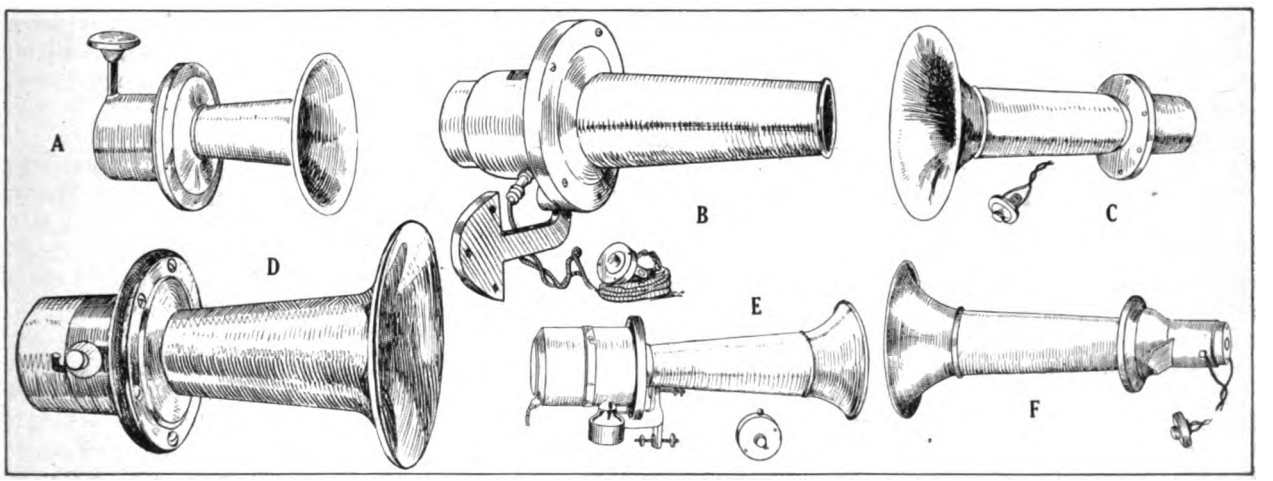
Long Horn.

The G. Piel Company, New York City, produces the Long horn, operated by hand. Any volume of tone desired is said to be at the command of the operator, a sonorous and penetrating note being obtained instantly. The weight of the Long horn installed complete is about five pounds, which is cited as of special importance in selecting such equipment.

Exo.

The Troy Auto Specialty Company, Troy, N. Y., makes the Exo, which is a double-toned exhaust horn, attached at the rear of the muffler. When in use the exhaust gases pass through the two pipes, giving forth a clear, well defined note. A spring pulls it back out of the way, when not in use.

Waymaker.



The Lee Tire & Rubber Company, Conshohocken, Penn., produces the Waymaker, a double-toned instrument operated by the exhaust. When brought into use by the depression of a pedal the exhaust gases are deflected by means of a centrally located valve, being thrown through a thick slot immediately across the ends of the chime tubes.

Nightingale.

The Nightingale whistle is made by the Riley-Klotz Manufacturing Company, Newark, N. J. This is an exhaust device, connected at the rear of the muffler, where it causes no back pressure and operates as well at low as at high speeds. The interior is designed so as to present a chromatic scale of bird-like notes.

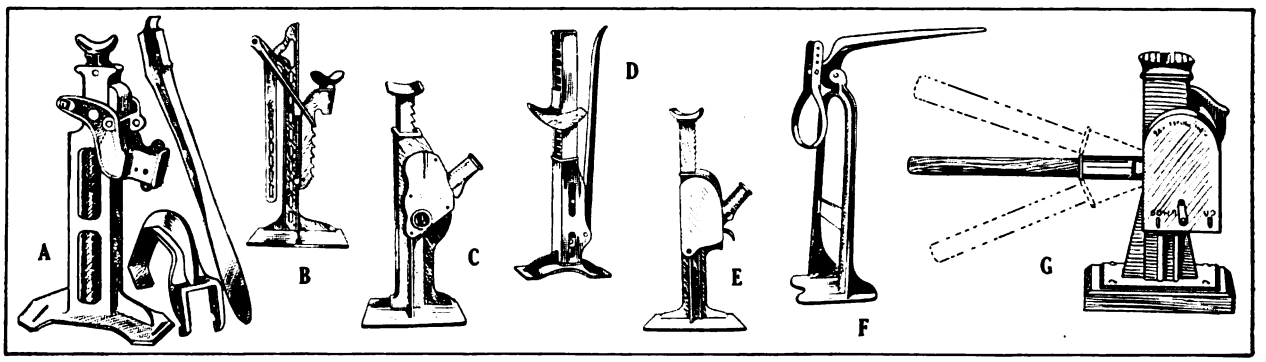
Hough.

The Auto Improvements Company, Bristol, R. I., presents the Hough exhaust whistle, designed primarily for use on model T Ford cars. It is attached easily and quickly to the rear of the muffler by means of a tapered tube, which is split at one end and locked by a threaded bolt and nut. The other end fits over and partially closes the opening of the drum member.

Electric Horns: A, Long Horn; B, Newtone; C, Sonora; D, Monoplex; E, Tuto; F, Climax.

JACKS.

One of the tools which are indispensable around the garage is a jack. Several forms have been in the market for a number of years and still continue to offer as good service as when they were originally brought out. A few new designs have been produced.



Hartford.

The Hartford Auto-Jack is produced by the Hartford Suspension Company, Jersey City, N. J. It is claimed for it that a pressure of 15 pounds on the handle will lift 1000 pounds on its rack. Gears, cut from steel and hardened, ingeniously arranged, wonderfully multiply the little power applied to the long lever with its short stroke.

Raiswell.

The Raiswell, made by the Lovell-McConnell

Digitized by Google

Jacks: A, Peerless; B, Reliable; C, Miller; D, Oliver; E, Buckeye; F, Moore; G, Hartford.

Manufacturing Company, Newark, N. J., has its entire mechanism enclosed in a neat housing, this being a series of gears. The only exposed portion is the thumb wheel on which fits the brace bit designed for turning these gears and lifting the load.

Barrett.

Barrett jacks, made by the Duff Manufacturing Company, Pittsburg, Penn., may be regarded as standard for motor car use. They come in four sizes, designed for light and heavy cars, trucks and general garage work. The construction is simple and compact, and the various models are as light as consistent with the work for which they are intended.

Oliver and Peerless.

The Oliver, made by the Oliver Manufacturing Company, Chicago, has a straight lift of 1.5 inches and locks by passing the centre. The bracket slides up and down on a standard and is instantly adjusted to any height. The same concern makes the Peerless, which not only is smaller in size but may be utilized in removing the tire from the wheel, by placing the bracket between the spokes of the wheel and using the handle as a tire tool.

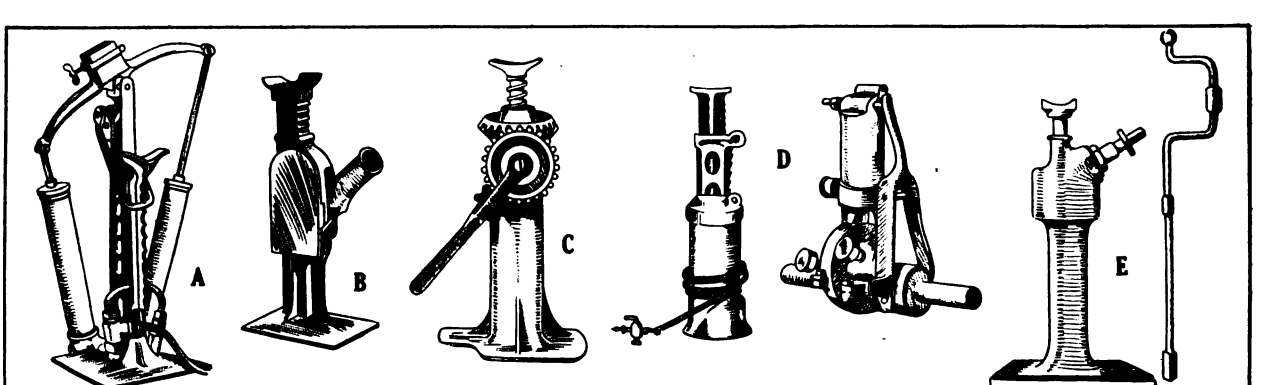
Miller.

The Miller, produced by Chas. E. Miller, 97-103 Reade street, New York City, is a quick acting, automatic lowering jack, designed especially for automobile use, and is adapted to the factory or garage, as well as being so arranged as to be carried as a part of the regular car equipment. The construction is of the best material and every part is machine finished.

Reliable and Ideal.

The Reliable is made by the Elite Manufacturing Company, Ashland, O. With the Ideal, produced by the same concern, this line is fitted with swivel tops to permit of their being set in the most convenient position for operation. They are strong, compact and small, occupying very little space in the tool box, and yet large enough to do their work well.

Moore.



While J. C. Moore & Co., Racine, Wis., has brought out a full line of Moore lifting jacks, suitable for every class of automobile work, the new tire saving jack of this name is of particular interest. The loop is placed over the hub, and the handle pushed down until the car is lifted to the desired height.

Buckeye.

The Buckeye Jack Manufacturing Company, Alliance, O., is making a full line of Buckeye automatic jacks, which are intended for the use of owners who desire a safe, reliable tool, designed with the idea of not being able to drop with the load. The material is drop steel forgings, and the workmanship and finish is of the best.

Ten Eyck.

Designed for use in connection with the Ten Eyck tire pump, the lifting jack of the same name, made by the Auburn Auto Pump Company, Boston, Mass.,

Jacks: A, Warner Service and Pump; B, Barrett; C, Ideal; D, Ten Eyck and Pump; E, Raiswell.

SAY! But Business is Fine—

Dealers and Owners are proving the soundness of our prophecy that this would be QUALITY year by recommending, specifying and buying the Warner Auto-Meter, "The Aristocrat of Speed Indicators." Warners are now the style the country over on even low-priced cars.

Auto Dealers As a Class Always Suggest the Warner FIRST

Because Buyers, as a rule, know the Warner to be the BEST Speed Indicator—Accurate, Reliable and Durable.

—So when a dealer recommends the Warner **FIRST** it convinces his prospect that he **KNOWS QUALITY.**

—And then if the buyer finally takes something just as good at a low price, because he "can't afford" Warner Quality—**the dealer cannot be blamed** if the buyer has trouble.

On the other hand the buyer more than ever respects the dealer's judgment and knowledge of values.

A good way to avoid trouble, disputes, annoyance and myriad other bothers is to pay a few dollars more and get the **Perfected** Speed Indicator—the WARNER AUTO-METER—"The Aristocrat of Speed Indicators."

WARNER INSTRUMENT CO. MAIN OFFICES AND FACTORY: 1266 Wheeler Avenue **Beloit, Wisconsin**

Branches Maintained in the Following Cities { Atlanta, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Denver, Detroit, Indianapolis, Kansas City, Los Angeles, New York, Philadelphia, Pittsburg, Portland, Ore., San Francisco, Seattle, St. Louis.

is regulated so that when it reaches a certain height, the control valve of the pump is closed and the air from the pump escapes through a vent which is auto-

Lubricants: Havoline and Colonial.

matically opened. The operation of the pump is automatic, the driving clutch being engaged by a small piston which is forced up by the back pressure from the tire, the instant the tube is attached to the valve. Of course, it is operated by the motor.

Warner-Service.

Another combination jack and pump is the Warner-Service Jackpump, made by the Warner-Service Manufacturing Company, Jersey City, N. J. It is claimed that this device will lift the car three inches off the ground with one stroke of the lever. Connected with the jack are two high pressure compound pumps capable of delivering 60 cubic inches a stroke at a pressure of a 150 pounds. These cylinders are made of special heavy gauge seamless brass tubing, and the jack, yokes and levers are of the toughest malleable iron.

LUBRICANTS.

Of prime importance in the proper functioning of the motor and other mechanical parts of the automobile is the matter of lubrication. Most manufacturers of oils and greases produce special preparations for the work they are intended to perform. This is a situation that had been developed with the motor car industry, until it is possible now to secure a grade of oil or grease designed especially for practically every make of car.

Motorists cannot afford to experiment with lubricants of unknown or doubtful quality. The manufacturer of any product adopts a trade mark, or distinguishing feature, for the protection of the public. By continually making this feature prominent the user soon becomes familiar with the product and is intuitively warned against accepting substitutes under the plea that they are just as good.

Manufacturers of motor oils and greases have adopted distinguishing names and special cans whereby it is an easy matter for the motorist to recognize the article which he has found to be best suited to his needs. These names and cans, therefore, become the proper protection of the public, and their continued use insures to the purchaser that he will be able to rely upon the product which they represent.

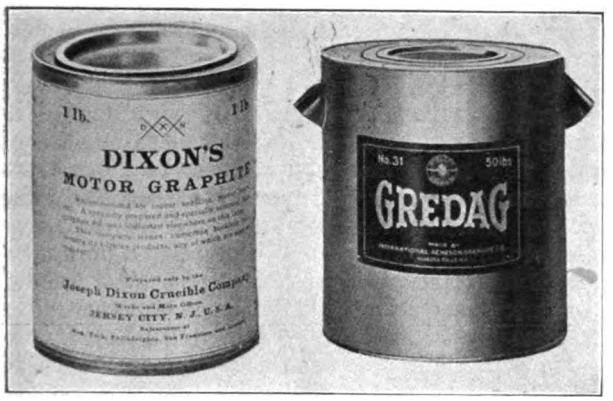
Too much stress cannot be placed upon the admonition to see that the goods are delivered in the original package. Many makes are extensively exploited, and these have come to be recognized as standard productions. Herewith are presented a number of the better known oils and greases, the illustration of the cans being with the idea of causing them to be even more familiar. A brief description of the various products will suffice to indicate their particular features. The list is by no means complete, but includes those most extensively exploited.

Colonial.

The Colonial brand, made by Borne, Scrymser & Co., New York, Philadelphia, Boston and Fall River, includes Colonial motor oil, Colo grease, Colonial timing gear oil and Silex grease. The concern has been producing lubricants for 30 years and has an enviable reputation for the high standard maintained by its products. Colonial oil is made in varying consistencies for the differing designs of motors, while Colo grease is particularly adapted for use in the transmission gears, being made especially for gear lubrication. Colonial timing gear oil also has a special purpose as indicated by its name. Silex grease is a product designed to lubricate and last, and at the same time to reduce noise in an appreciable degree.

Dixon's Graphite.

The line of graphite products made by the Joseph Dixon Crucible Company, Jersey City, N. J., is most complete. Inasmuch as the object of lubrication is that of providing a film sufficiently viscous to prevent



Lubricants: Panhard and Pan-American.

the metal surfaces from coming in contact, it is held that flake graphite will attach itself directly to the metal, filling all the microscopic depressions and

Digitized by Google

forming a smooth, tough, durable coating. For transmissions, flake graphite grease is recommended, and in this a proper amount of finely ground fibre is thor-

Lubricants: Dixon's Graphite and Gredag.

oughly mixed. Graphite cup greases are made in six degrees of hardness, varying from the consistency of vaseline to that of tallow.

Eagleine No-Karbon.

Eagleine No-Karbon oil is made by the Eagle Oil & Supply Company, Boston, Mass. It is held to possess the proper viscosity and to be pliable under all conditions of heat and cold, working well in the heat of the cylinder and feeding perfectly from an oil receptacle exposed to severe cold. Special attention has been paid to the matter of carbonization, and the addition of No-Karbon in the name of the product appears to be warranted by the success which has attended its use under most severe conditions. The line includes oils and greases for varying purposes, and Solarine polishes.

Harris.

Harris oils, the product of the A. W. Harris Oil Company, Providence, R. I., are made in various degrees of consistency, each for the special purpose for which it is intended. The highest grade of Pennsylvania crude is utilized as a basis and the process of filtration is carefully watched and inspected. The ingredients which tend to form soot deposits are eliminated by a special process, and the result is such that the maker claims it is impossible to secure a higher degree of quality in this respect. Harris trans-compound is prepared for use with transmission gears and the same extreme care is taken in its production. A heavier bodied lubricant is provided in the gear and transmission oil made by this concern, which also specializes in a superheated steam cylinder oil for steam vehicles.

Havoline.

The Havoline Oil Company, New York City, absolutely controls its own oil fields, thus being supplied with a uniform quality of crude, which forms the basis for the well known Havoline oils. In its four refineries it maintains laboratories in charge of expert chemists who are constantly at work maintaining the standard set by this product. After the laboratory investigation and tests, which include a thoroughly scientific system of filtration for the removal of carbon producing elements, the oils are tested in engines on the block and on the road. Among the recent additions to the line is a special oil of heavier body and higher viscosity for motor truck use.

Invader.

Chas. F. Kellom & Co., Philadelphia, has been producing Invader oils and greases for automobile work since the very inception of the industry, and of course, was interested in the manufacture of lubricants for many years previous to that time. About a year ago, it brought out the Invader gear oil, a special preparation for use in timing gears. This is a semi-fluid compound designed especially for the work it is to perform, and so successful has it been from the first that it has been adopted by numerous manufacturers for exclusive use in their machines. About the same time, a special motor truck oil was brought out as well.

Kincaid.

William T. Kincaid of the Kincaid Oil Company, Providence, R. I., is well known as a racing driver, although his attention has been turned toward the production and sale of lubricants in more recent years. His connection with the racing end of the industry placed him in close touch with the needs of automobile engines with respect to lubrication and this knowledge has been of material aid in the production of Kincaid oils. It does not follow, that Kincaid oils are designed especially for racing machines. The same qualities are needed for every day driving as in winning contests. These qualities, Mr. Kincaid has studied with the mind of an expert, and Kincaid oils are the result of this scientific and practical experience.

Lubroleine.

Lubroleine oils are made by the Fiske Bros. Re-

Lubricants: Harris and Vacuum Mobiloil.

fining Company, New York City, in three grades—heavy, medium and light. They are refined and made from the highest grade Pennsylvania crude, and are

Digitized by Google

designed to meet the most exacting requirements of automobile, motorcycle, aeroplane and motor boat lubrication. The line also includes Lubroleine gear-

Lubricants: Lubroleine and Polarine.

case compound, a highly viscous grease of proper proportions; Phoenixo gearcase lubricant, in fluid, semi-fluid and heavy densities; and Slimax-Synovia, a solidified oil or cup grease. Special features claimed for all these products include their purity and uniformity, as well as their adaptability under any working and atmospheric condition.

Mobiloil.

The Vacuum Oil Company, Rochester, N. Y., produces the Mobiloil line. Of the Mobiloils it may be stated that grade E is a light colored oil for cylinder lubrication. A is of medium body and is intended to hold its body under extreme heat. It may be used in electric vehicle lubrication as well as in gasoline engines. C is a heavy dark oil for transmissions and differential gears, especially for ball or roller bearing types. D is a heavy oil for steam cars. Arctic is a light colored oil which flows freely in the coldest weather. Vacuum transmission greases, made by the same concern, are in three densities. Vacuum Mobilubricant is a newer product, especially adapted for use in compression cups and for packing steering gears. All are of the best quality and have enjoyed a world-wide reputation for efficiency under all conditions of service.

Monogram.

The New York Lubricating Company, now consolidated with the Columbia Lubricants Company of New York, has changed the style of its cans materially, the principal object being to insure that the purchaser shall receive Monogram oil just as it leaves the refinery. The cans are filled at the plant, and the sealed pouring spout is attached afterward. Monogram oil, therefore, comes to the user thoroughly sealed, and he must break the seal before it is possible to utilize the contents of the can. The maker has studied carefully the requirements of various cars and the lubricants are made in four grades, light, medium, heavy and V, for different makes of machines. Special attention is paid to the matter of eliminating all carbon producing impurities, and the success which has attended the use of Monogram oils in contest and road work is well known.

Motorol.

Motorol is made by the New York & New Jersey Lubricant Company, New York City, in varying densities to meet the requirements of a large number of cars. This is a cylinder oil designed to possess the most lubricating body with the least carbon. The same concern manufactures Non-Fluid oil for bearings, transmissions and differentials, this being a pure mineral oil lubricant which is claimed to possess decided advantages over greases and compounds. This latter oil is marketed in a patented can, styled Kejex, with a long grease gun spout and a key in the bottom to force the lubricant through this into the various grease cups, etc.

Oildag.

The International Acheson Graphite Company, Niagara Falls, N. Y., is producing a line of graphite products in which the term Dag is used. The word "Dag" is made up of the initial letters of "Deflocculated Acheson Graphite." Therefore, Oildag is deflocculated Acheson graphite in oil, while Gredag is the same substance in grease. Mineral oil is utilized in Oildag, and it is claimed that this mixture will not deteriorate under any change in conditions of use. Gredag is made in four grades, semi-fluid, soft, medium and hard.

Pan-American.

Miller's Pan-American oils are made by Chas. E. Miller, 97-103 Reade street, New York City. They are refined from the highest grade Pennsylvania crude; are pure, distilled, highly filtered mineral oils, possessing a high fire test, low cold test, and are claimed to be unaffected by climatic changes. Three grades

Lubricants: Kincaid and Invader.

are provided for varying requirements. Under the same name is produced Miller's Pan-American transmission gear lubricant, also with low cold test and

LUBRICANTS

HARRIS

TRADE MARK-REG. U. S. PAT. OFF.

OILS

You get greater mileage out of HARRIS OILS because they are ALL lubrication—there is no waste. This is an established fact—not an advertising claim. No other lubricants are made with the same conscientious care.

We take pride in our product. We don't try to make as much as we can, but the best. That principle of manufacture has placed HARRIS OILS in the front rank.

We buy the finest grade of Pennsylvania Crude—what is called "Premium" Crude. We pay a premium to get this particular stock and we won't use anything else.

That is why HARRIS OILS cost considerably more to manufacture than ordinary oil. That is why they are best—surely you realize the absolute necessity of giving your engine the highest grade of lubricant the market affords. Nothing else compares with HARRIS OILS.

There's over a quarter of a century of experience back of HARRIS OILS. This experience enables us to "know how"—the extra mileage, the real lubrication efficiency is the result and it's yours in every can of HARRIS OILS. Get a package to-day. You'll be more than pleased.

Made in three bodied consistencies.

LIGHT, MEDIUM, HEAVY. Sold in barrels, 1-2 barrels, 2-5 gals. in wood case, single 5 gal. can cased, and 1 gal. cans. Ask your dealer or garage man.

Ask for HARRIS OILS. If your dealer does not sell them, send 80 cents (for 1 gal. can) or $3.75 (for 5 gal. can) and we will send same prepaid.

A. W. HARRIS OIL CO.

143 No. Wabash Ave., CHICAGO, ILL.

Digitized by Google

high melting points. This is made in three densities, light, medium and heavy, for transmission, sliding and planetary gears, respectively, the latter also being intended for cardan joints, ball and roller bearings, etc.

Texaco.

Another oil which is guaranteed not to congeal at any temperature down to zero is the Texaco, produced by the Texas Oil Company, New York City, which has large oil fields in many sections of the country. Special filtration methods are employed for the purpose of entirely eliminating the carbon depositing features, thereby insuring that it will burn up cleanly after performing its legitimate function. The various grades are of uniform quality throughout and each is prepared with a view to performing its work perfectly under all conditions of service.

Panhard.

Panhard oil, made by George A. Haws, New York City, is refined exclusively from Pennsylvania crude and is held to be absolutely uniform in quality at all times. Six grades are provided, light, medium, heavy, extra heavy, special motorcycle and marine motor. They have been in the market since the automobile industry was in its infancy, and have been tested thoroughly in all classes of work. Other members of the line are the following: Panhard heavy gear oil for transmissions and differentials; gear compound, of similar design but of stiffer consistency; anti-fluid transmission greases, in three grades; cup grease, graphite lubricant and cork graphite compound.

Polarine.

It is not surprising that the Standard Oil Company, New York City, should have entered into the matter of producing automobile oils. With its vast resources in the production of crude oil, and its experience in handling oils of all character, it possesses an experience which should be of service in solving the problem of proper motor car lubrication. Polarine oil embodies all the resources and experience of this concern. As its name implies, it has a low cold test, flowing freely at temperatures down to zero. Special processes of distillation, pressing and reducing enter into its manufacture. Other members of the line are Polarine transmission lubricants, Polarine fibre grease and Polarine cup grease.

Wolf's Head.

The Wolverine Lubricants Company, New York City, produces Wolf's Head oils, these comprising a full line of cylinder and other lubricants, each prepared with special care and for a particular purpose. The basis is the best crude, and the process of refining is in charge of experts who have made a study of automobile lubrication since the very inception of the industry. The result is a cylinder oil in which the carbon producing feature has been eliminated and which will burn up cleanly under exacting conditions. Before being placed upon the market, the product is subjected to severe tests to determine that it measures fully up to the standard set by the concern.

Valvoline.

The Valvoline Oil Company, Boston, Mass., owns and operates three large refineries, in which Valvoline oils are produced from the best Pennsylvania crude. This crude is piped directly to the refineries through the company's own pipe lines, and it is claimed that the Valvoline Oil Company thus controls the product from the oil well to the consumer. The refining process is designed to eliminate the possibility of carbon deposits, and the product is not adulterated in any manner whatsoever. The cylinder oil is made in four grades, white, light, medium and heavy. In addition the line includes a solidified mineral oil for gears and differentials and a mineral grease for bearings.

Lubricants: Valvoline, Texaco, Motorol and Monogram.

SPARK PLUGS.

The spark plug industry has been increased the past year by advent of a number of enterprises that produce plugs as a whole or a part of their manufactures, some of them on extensive scales, but there

Digitized by Google

has been comparatively little brought out that is really new. There have been no radical changes in principle, and aside from construction or methods of manufacture the variance is trifling. There is no question, however, that there has been endeavor made to secure more enduring and more reliable plugs, and this has led to improved workmanship and more careful production with a view of eliminating conditions that make for failure under the extreme heat and the continuous vibration. Of course the main proposition with all manufacturers has been to develop plugs in which a spark of sufficient proportions will be produced under the widest change of operation, and to obtain such results attention has been directed toward more accurate machine work and especial care in assembly and test of the finished product.

The introduction of highest class machinery has been a reason for material improvement, and the utilization of special gaskets to insure against leakage and loss of compression, the adoption of forms to eliminate or minimize twisting and breaking stresses, the better insulation of the electrodes and the protection of the mica and porcelain cores, the shaping of and placing the electrodes to make certain the creation of a sufficient spark, and the installation of means for visual observation of the spark, are among some of the features of the latest plugs. It will be understood that the use of special machinery means interchangeability of the parts, which makes for decided economy when a motor is in operation for a season in a vehicle. Though there are those who specialize the cheaper forms of spark plugs there are others who are producing the highest classes and the prices range over quite as wide a scale as in previous years.

Bull's Eye.

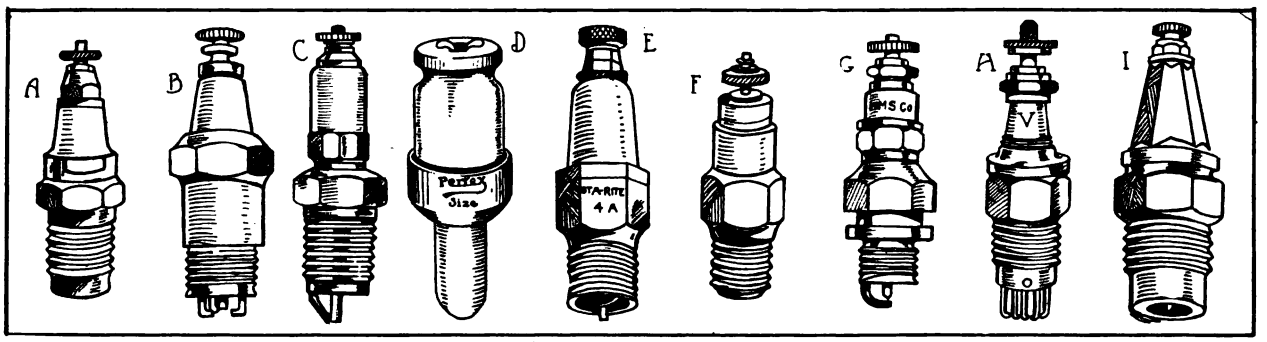
One of the most interesting of the new plugs is the Bull's Eye, made by the G. C. Blickensderfer Company, Stamford, Conn. This plug has a heavy brass shell with the upper end forming a hexagon seat for the wrench. Three sides of the hexagon are drilled and into these threaded holes are seated heavy quartz lenses. The core is in two sections with the electrode divided to form a spark gap. The lower part of the core is contained in the shell and the upper section in the bushing. The bushing is seated into the shell bringing the electrode ends into correct relation. At the base of the core the electrode projects below the base of the shell and the shell electrode is extended toward the centre, forming the second spark gap of the plug. The core is of porcelain and it is capped with metal, above which is the terminal. As the spark is made it appears in the chamber of the spark plug as it ought to appear in the cylinder. It is claimed that by the use of this plug it is possible to detect a defective circuit, faulty carburetion or leaky valves, and to maintain a condition insuring satisfactory combustion, as well as protecting the engine against carbonization.

Visible.

Somewhat similar to this is the Visible spark plug, made by the Visible Spark Plug Company, Detroit, Mich., which has a porcelain core through which is a transverse hole. This hole is open to the air and it exposes the core electrode which is divided with the parts so set that they require the current passing through the electrode to jump the air gap. Through the hole the size and color of the spark may be observed. Aside from this the construction of the plug is conventional, the core electrode projecting and the shell electrode extending toward and below the centre of the core. For this plug the maker claims that the condition of the electrodes, the quality of the ignition and the efficiency of the battery and the magneto may be learned by observation; the engine may be timed without trouble, and the firing spark is intensified with more instantaneous combustion and greater power.

Rex.

The Rex spark plug, made by the Rex Ignition



Lubricants: Eagleine No-Karbon and Wolf's Head.

Manufacturing Company, New York City, is another production for which particularly strong claims are made. It is the manner of construction that is maintained to give unusual results, in that the plug is guaranteed not to be short circuited through soot or from any other cause, and it is held that with the unusually hot spark produced the electrodes are constantly free and clear. The plug is exceedingly simple and it is made in all sizes for automobile, yacht and motorcycle engines. The porcelains are of finest material and guaranteed to withstand the heat. The electrodes are of specially imported wire which will not burn under intense heat.

All-in-One.

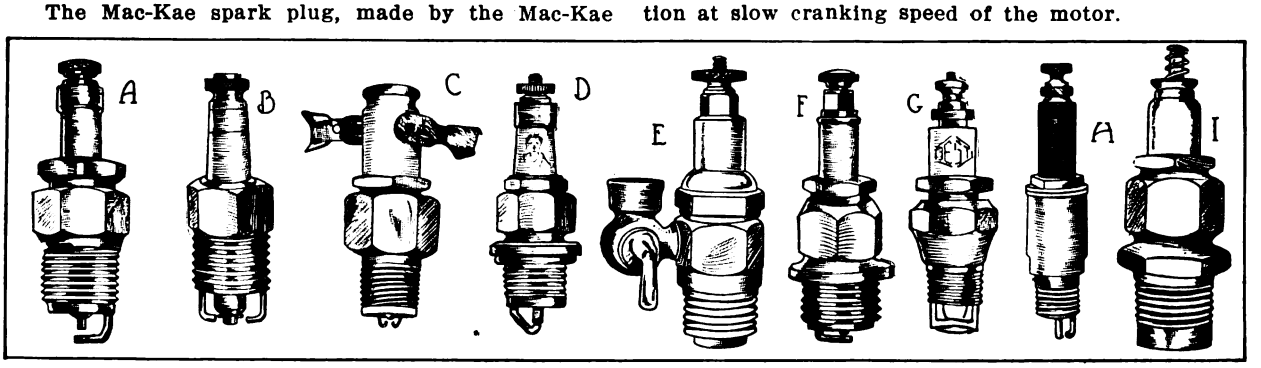
The All-in-One spark plug, made by the Frontier Specialty Company, Buffalo, N. Y., is of conventional design aside from the installation of a compression relief and priming cock at the top of the shell. These cocks are of differing shapes and lengths to permit in-

Digitized by Google

Spark Plugs: A, Miller; B, Bosch; C, Mosler; D, Perfex Porcelain; E, Sta-Rite; F, Hers; G, H. M. S.; H, V-Ray; I, Splitdorf.

stallation of the plugs in motors of various types, whether conventional, horizontal or with recessed plugs. These are specially adapted for engines which are not equipped with compression release cocks, either for automobile or marine purposes. By priming the motor at the spark plugs it is claimed that starting is facilitated under any circumstances, while cleaning may be accomplished without difficulty by use of gasoline on the spark plugs, or kerosene may be utilized for freeing the cylinders of carbon.

H. M. S.



The H. M. S. spark plug is made by the Hartford Machine Screw Company, Hartford, Conn., under pending patents and was designed with experience obtained in the manufacture of more than thirty millions of plugs for others. The porcelain, for instance, is made from imported clay and it is of a form that is claimed to give heretofore unknown strength. The porcelain has but one gasket for making up the joint in the body, the design being such that the expansion and contraction of the core and the metal parts are practically in one direction, minimizing all possible strains. The plug is gas tight and has survived every test. The core and core electrode are assembled as one unit and can be removed from the shell by unscrewing the bushing. The core electrode extends below the shell and the shell electrode curves under it. The design is such that an unusually hot spark is created and it is claimed that if the electrodes are completely immersed in oil the plug will spark continuously and indefinitely and without miss.

Mac-Kae.

The Mac-Kae spark plug, made by the Mac-Kae Manufacturing Company, Boston, Mass., is claimed by the maker to give a very large and efficient spark and to afford superior ignition under all conditions. It is made with either porcelain or mica core. The porcelain cores are made with the core electrode of an alloy of platinum-iridium and nickel baked into the core, and as this electrode has the same coefficient of the porcelain, is not affected by the extremes of heat. The cap of the core is keyed on by a patent process, a solid unit being formed. By unscrewing the brass bushing of the plug the core may be removed as one piece. With the mica cores the centre electrode is wound laterally with sheet mica which is surrounded with mica washers, compressed and securely locked. Both porcelain and mica cores are interchangeable with any Mac-Kae plug. These plugs are sold with a guarantee against any defect of material or workmanship. They are made in all sizes.

Bosch.

The Bosch spark plug, made by the Bosch Magneto Company, New York City, is designed specially for high-tension magneto service. The plug consists of three parts, a steel shell, a one-piece insulator and the core electrode. The insulation is of steatite, which is not brittle and will not deteriorate through extreme heat, great pressure or free lubrication, the material and form eliminating all joints and insuring against leakage under a pressure of 750 pounds to the square inch. The shell electrodes are three in number and are crescent shaped, which form is claimed to have less electrical resistance and to produce a spark that is a sheet of flame, giving an efficient ignition at slow cranking speed of the motor.

Spark Plugs: A, Hot-Spark; B, Jewell; C, Edison; D, Red Head; E, All-in-One; F, Firefly; G, Best; H, Sootless; I, Black Eagle.

Digitized by Google

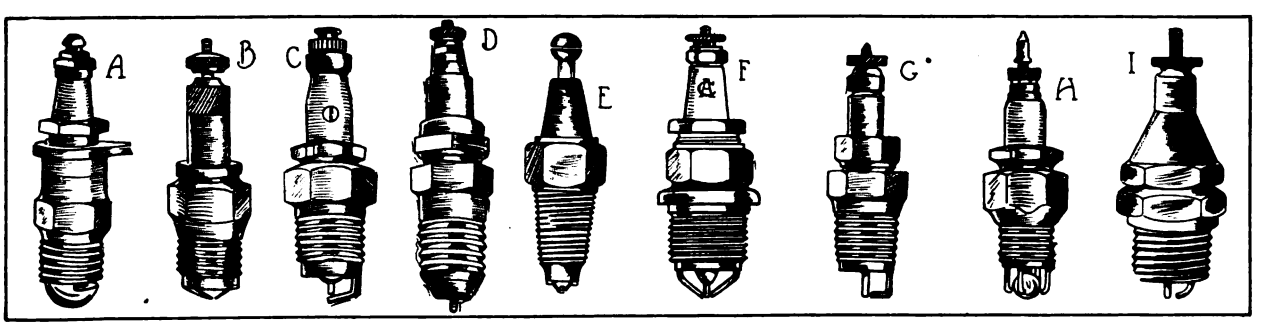
V-Ray.

The V-Ray spark plug, made by the M. M. M. M. Company, Marshalltown, Ia., is assembled with a deep shell from which four long electrodes extend downward and turn sharply toward the centre, penetrating the combustion chamber of the motor to a much greater depth than the average plug. The points of these electrodes are tapering and they converge close to the end of the core electrode, which is made with a semi-circular groove in the end. The core electrode is increased in diameter before it enters the core and it is firmly assembled and retained by a nut at the top, on which is fitted the terminal nut, which is long and tapered. It is claimed that the plug will produce an unusually fat and powerful spark and that it will not soot or corrode, the peculiar form of the electrodes making them self-cleaning. The porcelain is said to be fracture proof and the plug is sold with a very broad guarantee.

Black Eagle.

The Black Eagle spark plug, made by the Progressive Manufacturing Company, Torrington, Conn., is a new product that is popular in price and has qualities that are claimed to be unusually efficient. The shell is of metal into which is seated a brass bushing carrying the porcelain core and electrode. The two shell electrodes are parallel and midway between them is the core electrode, and as the round surfaces of the electrodes are presented to the sparks as they are formed, this minimizes or prevents pitting and destruction of the sparking points. Between the solid cap of the core electrode and the binding nut of the core there is a sliding collar and it is normally kept in contact with the binding nut by a spring between the collar and terminal cap. Any wire winding or terminal placed between the collar and the binding nut is firmly held by the tension of the spring. This device is patented and is known as the Universal Spring Cap.

T-A-D.



The feature of the T-A-D Flash Ball spark plug, made by the Toledo Auto Devices Company, Toledo, O., is the formation of the end of the core electrode, which is a ball. The shell electrodes are four in number and these extend downward into the combustion chamber and turn sharply at right angles, the ends of the electrodes being in proximity to the greatest diameter of the ball. As the current is distributed four sparks are made simultaneously in the cylinder. The area of the ball is such that the plug is self-cleaning as well as there being elimination of all possibility of pitting and destruction of the electrode points, as might be possible with a single air gap. The plug has a porcelain core and is otherwise conventional.

Splitdorf.

The well known Splitdorf plug, made by C. F. Splitdorf, New York, has been improved so far as the construction of the mica cores are concerned, this being by increased taper of the steel rod forming the core electrode. This rod is wound with selected sheet mica and the mica washers are forced on under heavy pressure, the construction being such as to insure against any possibility of leakage. The appearance of both mica and porcelain plugs has been improved by the addition of ornamental washers at the top and bottom of the external insulation.

Herz.

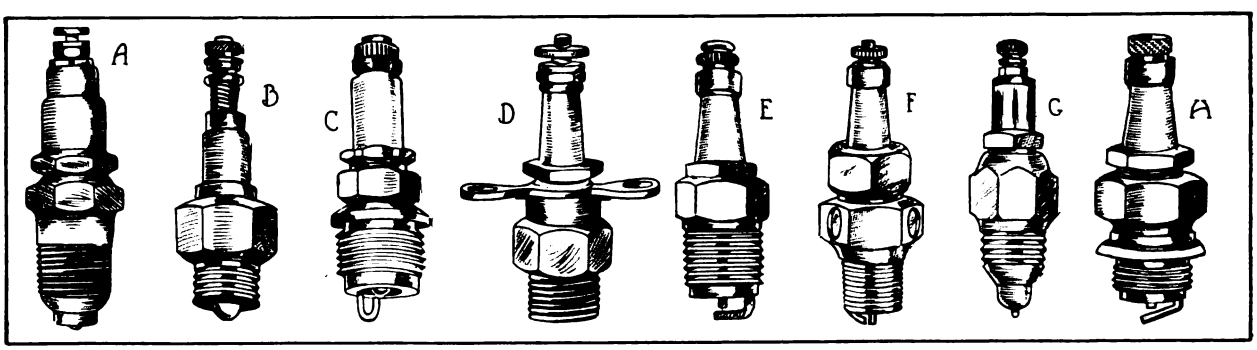
The imported Herz Bougie Mercedes spark plug, for which Herz & Co., New York City, is American sales agent, has been perfected by installing at the base of the shell in the place of the shell electrode a disc into which four holes are cut so as to remove the centre and leave four points which are equally spaced from the core electrode. When the current is made and broken four sparks are formed simultaneously and there is proportionately increased combustion in the cylinder. The insulation of the plug has been protected by a coating of blue enamel, which adds to its appearance.

Spark Plugs: A, Spitfire; B, National; C, Visible; D, Never-Miss; E, Anderson; F, AC; G, Benford; H, T-A-D; I, Kingston.

AC.

The Champion Ignition Company, Flint, Mich., has produced the AC Star spark plug in which the porcelain insulation is in three parts and the electrode is divided. The base carries the core electrode and there is a recess about the upper parts of the electrode into which a porcelain tube that surrounds the electrode is fitted. Above the tube is a spring that surrounds and contacts with the lower end of the electrode in the upper porcelain section. About the upper section is the bushing that seats into the shell. This construction is said to insure against breakage from vibration, heat or expansion. There are two shell elec-

Digitized by Google



trodes and two sparks are made in the cylinder at the same time. The AC Waterproof plug is made with practically the same construction as the AC Star, but it has a peculiarly formed porcelain hood and combination terminal that is connected with the cable and clamped on to the plug in place of the upper porcelain. The other lines of this concern have not been changed.

Champion.

The line of the Champion Spark Plug Company, Toledo, O., which is said to be produced in the largest spark plug factory in the world, includes six models, five of them with porcelain cores and one with mica core. These are to meet differing needs with different types of motors—in fact the company claims to make a plug for absolutely every type of engine. These plugs are sold with a guarantee against breakage by heat.

Miller.

The Miller spark plugs, manufactured by Chas. E. Miller, 97-103 Reade street, New York City, include mica, porcelain and magneto types. The magneto plug is made with a shell, the circular base of which forms the electrode. From the porcelain core the electrode terminates in a disc with a serrated edge, and between the points of the disc and the shell a number of sparks are formed each time the current is made and broken. The Miller mica plug has been manufactured for seven years and the porcelain plug was produced to meet a demand for this type. It has a deep seat in the cylinder and a long centre electrode, insuring rapid and complete combustion in the engine cylinder.

Spark Plugs: A, Mezger; B, Ballite; C, Reliance; D, E-Z; E, Mac-Kae; F, Bull's Eye; G, Sharp; H, Rex.

Flash Light.

The Flash Light spark plugs, made by Janney, Steinmetz & Co., Philadelphia, Penn., have been continued without material change in design and are produced with the same care and with the superior facilities and material that has established them as a standard product in the market.

Standard and Reliance.

The Jeffery-Dewitt Company, Detroit, Mich., has increased its product by the addition of the Standard, a popular priced spark plug which has many of the qualities and features of the Reliance line, which is finished a dull black. With the Reliance plugs a feature is that the core electrode is a fine platinum wire baked into the porcelain and finished flush with the lower end, this being amply protected, while the intense heat generated by the spark has a cleaning influence. This company also produces the Edison Double Spark plug, which has not been changed in design.

Sta-Rite.

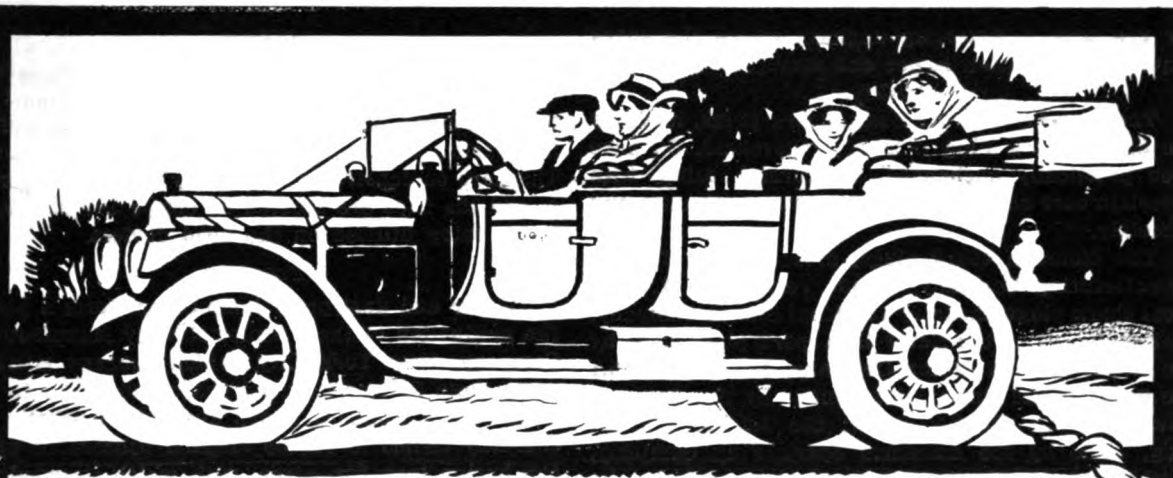
The production of the R. E. Hardy Company, Chicago, Ill., which includes the Sta-Rite, Venus, Vulcan and Gotham spark plugs, have been practically unchanged, these products being sold under a broad guarantee of satisfaction. The Hardy line has been developed and manufactured on nine years' experience.

Best.

The Best plug, made by the Best Ignition Equipment Company, New York City, is designed with a bushing that affords direct pressure on the porcelain core without a twisting stress, and the core electrode is a circular disc centred in the base of shell, the spark forming at varying points the entire circumference of the disc.

Delta.

Practically no change has been made in the models made by the Delta Manufacturing Company, Bloomfield, N. J., these being continued because of the extreme satisfaction obtained through long and continued use.



Spitfire.

The buyers of Mosler Spitfire and Breechblock plugs are now offered the option of purchasing porcelain cores in which the electrodes are tipped with platinum, as a further resistant to deterioration. Other than this the plugs are made to the original designs by A. R. Mosler & Co., New York City.

Hot-Spark.

The Hot-Spark spark plug, made by the Hot-Spark Plug Company, Detroit, Mich., is composed of five pieces, the shell, bushing, gasket, porcelain core and electrode and the terminal nut. These are solidly constructed and the bushings are case hardened to resist contact with wrenches. They are especially designed

for use with self-starting engines, where the spark required for ignition is hot and strong.

Fire-Fly.

The Fire-Fly and the Sharp spark plugs, made by the Sharp Spark Plug Company, Cleveland, O., have been practically unchanged, the former being with porcelain core only, and the latter with both mica and porcelain.

The Monarch spark plugs, made by the Benford Manufacturing Company, Mount Vernon, N. Y.; the Ideal spark plugs, made by the Ideal Switch Company, Plainville, Conn.; the Never-Miss spark plug, made by the Lockwood-Ash Motor Company, Lansing, Mich.; the Sootless and Comet plugs, made by the Oakes & Dow Company, Boston, Mass.; the Anderson spark plug, made by the Anderson Spark Plug Company, Washington, D. C.; the E-Z spark plug, made by the Autoparts Manufacturing Company, Jersey City, N. J.; the Kingston spark plug, made by the Kokomo Electric Company, Kokomo, Ind.; the Mezger spark plug, made by C. A. Mezger, Inc., New York, N. Y.; the Jewell, made by the Pittsfield Spark Coil Company, Dalton, Mass.; the Ballite, made by the G. A. Walker Machine Company, Boston, Mass., have been

Hopewell Lamp Covers: A, Square Side; B, Tail; C, Searchlight; D, Round Side.

continued practically without change. These are all standard plugs, are well known in the market and are e: ısively used.

LAMP COVERS.

The benefits accruing from fitting covers to the lamps of the motor car are numerous, and there is a growing tendency to protect the lights from moisture and the inclemency of the weather. Where gas and oil members are employed particles of dust find their way into the burners, etc., impairing service. In traversing muddy roads the covers not only prevent the accumulation of dirt but preserve the brightness of the metal.

Hopewell.

The design of the lamp covers manufactured by Hopewell Bros., Newton, Mass., is such a perfect fit is assured, and these members are made to conform to the shape of any standard lamp. They are made for head, side and tail lights, and generators as well. The lamp covers are of rubber, fleece lined, although fabric leather in colors is produced. The devices are fastened easily by a patent clasp, are inexpensive, and are unaffected by heat, water, grease or dirt.

Gilbert.

The Gilbert Manufacturing Company, New Haven, Conn., makes a specialty of covers for side, head and tail lights for automobiles. These are manufactured in a variety of designs to meet different requirements. They are so constructed that they fit the lamp snugly and the flaps are secured by clasps and straps, the latter being utilized on the head devices.

Premier.

Water and dust proof lamp covers form a part of the production of the Premier Novelty Manufacturing Company, New York City, which concern manufactures these devices in many shapes and sizes to conform to the standard lamps upon the market. The company claims to be the original concern to utilize the button lock flap cover, with which its goods are equipped.

Cowles.

C. Cowles & Co., New Haven., Conn., produce a large variety of lamp covers, these being made in standard forms to fit oil, gas and electric lamps. The covers are water proof, with seams sewed and cemented, and the material comprises a lustre or a dull finish. The concern makes a specialty of covers for limousine lamps, these being of the seamless head type.

BUTLER MAGNETO TESTER.

A device for locating ignition troubles, known as the Butler magneto and electrical apparatus, has been brought out by the Butler Manufacturing Company, Carthage, Ind. It is a small, compact device mounted on a cast aluminum bedplate, at one end of which is located a supporting table, provided with adjustable means to accommodate all types of magnetos, and for making rigid attachment of the instrument to be tested. The spindle of the device is equipped with a universal chuck which permits of coupling to any shaft or flange. This spindle is revolved by a small hand crank, affixed to the flywheel. A protractor, graduated to 360 degrees, is mounted on the headstock of the spindle, and this is provided with means which enable it to show distinctly the exact point at which the ignition spark occurs in each cylinder. The device may be operated by power or hand crank, the stock model being designed for the latter method.

GEORGIA CLUB'S OFFICERS.

The recently organized Automobile Club of Georgia at Atlanta, Ga., has selected the following officers: President, George W. Hanson; vice president, Edward M. Durant; treasurer, J. D. Rhodes; secretary, Howard Gilbert; governors, Walter P. Andrews, Inman Gray, W. G. Humphrey, Charles I. Ryan, R. R. Arnold, John J. Woodside, Jr., Charles H. Black and J. T. Tucker.

BOSCH

A Product of True Merit

When A Car Is Purchased

the source of ignition is generally a Bosch Magneto, but other units of the ignition system are seldom of equal quality unless the owner insists on Bosch Ignition Products throughout.

Bosch Spark Plugs

are made better than actually required—every purchaser is sure to be permanently satisfied. A slip of the wrench will not break the insulator—the steel body will not warp—the nickel electrodes will not burn—the spark is made more efficient—and they are absolutely gas-tight always.

There are many other points of superiority which you will appreciate when you see this perfect plug.

$1.00 Everywhere in the U. S.

FOUR MODELS OF 1912 IMPERIAL CARS.

THE Imperial Automobile Company, Jackson, Mich., is building this season two types of chassis, that for model 44 being the larger, while the other, for models 34, 33 and 32 differs principally in minor proportions. Of these models 44, 34 and 33 are fitted with five-passenger touring bodies and model 32 with a roadster body. Model 44 chassis has a floating rear axle, and the other models have semi-floating rear axles. Other than this there is practically but one design.

The main feature with Imperial cars is the power plant, which has motor clutch and transmission gearset in a unit assembly, and is installed on three point suspension. The three elements are carried in the chassis protected from every influence that might cause wear, loss of power or failure, and it is maintained that the design insures the greatest efficiency and economy, and unusual endurance under severe and continued service. The unit power plant construction has been adopted by a considerable number of the leading makers of cars and this is evidence of the approval given by those who have had abundant experience with differing types.

The Imperial Model "44" Five-Passenger Touring Car.

For the purpose of description the power plant of model 44 chassis is sufficient, it differing with the others merely in proportions. With this the cylinders are four in number with bore of 4.5 inches and stroke of 5.25, the stroke being 1.167 in excess of the bore. The cylinders are of the L type with the valves at the left side. They are cast in pairs with the water jackets integral and with space below the valve pockets so recessed that the valve stems, springs, tappet rods and guides may be completely enclosed. The water jackets are liberal in size and the cylinder units are with the valve pockets so designed that they are covered with a plate carrying the spark plugs and the compression relief cocks. These plates are retained by seven studs each and by removing them the valve pockets and valves are exposed, so that the valves may be ground or the compression chambers and the pistons cleaned of carbon.

The valves and ports are 2.25 inches in diameter, a size permitted by the cylinder design, affording full charges of fuel and complete scavenging of the cylinders. The water jacket inlets are at the right side, centred at the base of the jacketing, and the outlets are centred in the heads of the units. The pistons are 5.375 inches in length and are of the same metal as the cylinders, a soft gray iron, weighing 4.75 pounds each. The cylinders are carefully bored and ground to size. The pistons are turned and ground accurately. The pistons carry four rings each, .37 inch width, split at a bevel and ground on the edges.

Engine Case in Three Sections.

The engine case is of aluminum and in three sections, there being upper and lower halves and the cover for the timing gear. The rear ends of the main sections extend and house the flywheel, to this extension being bolted the circular section containing the clutch and the transmission gearset. In the flywheel and the clutch housings are large handholes, and a plate covers the gearset, these mechanisms being readily accessible. At either side of the flywheel casing is a heavy arm that supports the rear of the assembly in the chassis frame, the forward end being carried on a chassis cross member.

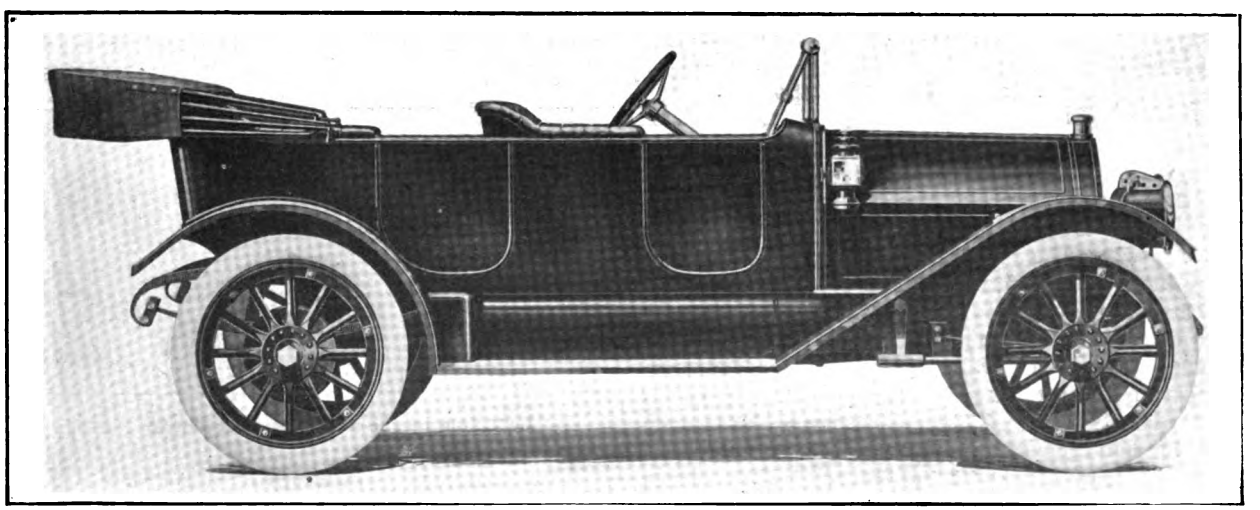
The crankshaft is drop forged from high quality steel, specially ground and heat treated. It is carried on three die-cast main bearings of Parson's white bronze having a total length of 11.5625 inches, the forward and rear journals being three and five inches length respectively. The crankpin bearings are 2.75 inches in length. The single camshaft of crucible steel is one inch in diameter and it has bearings as

Digitized by Google

liberal as the crankshaft. The connecting rods are drop forged and the piston wristpins are fixed in the small ends, oscillating in bosses on the piston walls, having about 20 per cent. more bearing surface than were the wristpins fixed in the pistons. Oil pockets on the small ends of the connecting rods supply the lubrication direct to the wristpin bearings.

Turning Gears Are Adjustable.

A web across the forward end of the engine case sections carries the forward main and camshaft bearings and the bearings for the timing gears. The gears are one inch face and are cut spiral so they may run noiselessly and without material wear. There is an eccentric adjustment for the idler gear by which timing gears may be adjusted, this being an extremely desirable quality and a distinct advance in motor design. The magneto is installed at the right side of the motor and is driven by a shaft having a bearing four inches long, and the connection with the magneto driving shaft is made with an Oldham coupling, the coupling being enclosed.



pacity is six quarts. A gauge gives external indication of the quantity of oil in the engine.

Bearings Retained by Through Bolts.

All the bearings of the motor are die-cast Parson's white bronze. Every main bearing and the connecting rod bearings are retained by through bolts instead of studs, this insuring against a journal loosening under strain.

The carburetion of the fuel is by a standard carburetor of the automatic float feed type, with hot air intake. The ignition is by low-tension magneto and coil, having a high-tension system, with a battery of dry cells for starting or for a reserve.

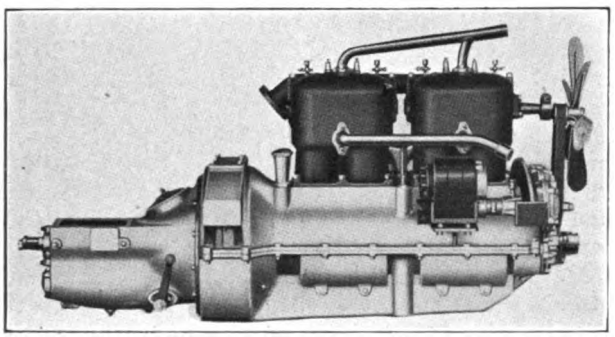
The clutch is of multiple disc type and is composed of a series of 51 saw steel discs beveled to an angle of 20 degrees, with bearing surface .315 inch in width and a mean radius of 6.27125 inches. Into the flywheel are cast lugs which support steel pins on which the disc assembly is mounted. The transmission is a selective type with nickel steel shafts and gears fitted with New Departure bearings, giving three for-

The Imperial Model "34" Five-Passenger Touring Car.

The cooling is by thermo-syphon system, there being large water manifolds and connections, using a large radiator and a fan mounted on the forward cylinder and driven by a belt from a pulley on the extension of the camshaft. By an eccentric in the fanshaft mount the belt may be adjusted for tension by loosening and tightening a single belt.

The lubrication is by splash, the base of the engine case being divided by webs that form reservoirs into which the big ends of the connecting rods sweep. The overflow from these reservoirs is carried to the sump at the rear of the case and the excess is drained to the base of the flywheel housing, where it is picked up by the flywheel and carried to a reservoir at the top of the housing, where it flows by gravity through a large channel and is distributed to the several chambers. All sediment in the oil is deposited in the sump and with the large channels there is positive flow of oil and no possibility of clogging. The oil ca-

ward speeds and reverse. At the centre of the transmission case is located the speed-changing lever, as well as the emergency brake lever, this affording centre control and removing the levers from any connection with the chassis frame.



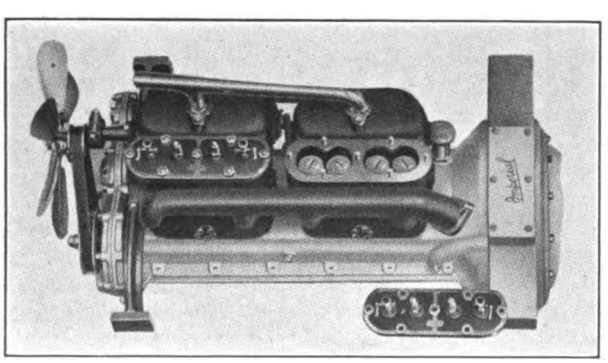
Power Plant Suspension.

At the forward end of the engine case, directly centred above the crankshaft main bearing and behind the timing gear case, is anchored the support for the forward suspension of the motor assembly, which is attached to a curved steel member that is firmly fixed at either side of the chassis frame. The power plant is not subjected to strains because of the stresses from the distortion of the side members of the frame.

Directly behind the extension of the transmission main shaft is a heavy frame cross member, to which is attached the yoke ends of the housing of the driving shaft. Within this yoke is the universal joint con-

Digitized by Google

necting the transmission and the driving shafts, the shaft housing having a movement corresponding to the rise or fall of the body on the springs. This yoke

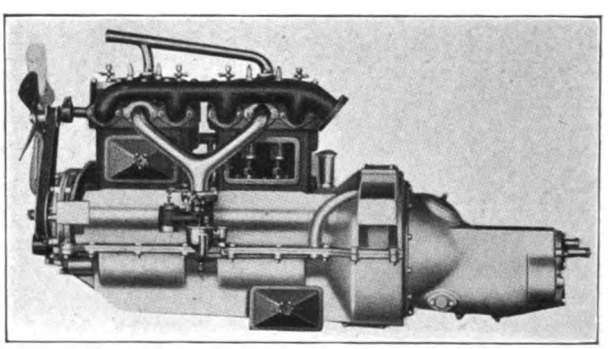


Right Side of the Imperial Unit Power Plant.

carries the forward bearing for the driving shaft. Directly behind this yoke is another smaller yoke to which is made fast the ends of the radius rods, which are carried to and fastened under the spring seats of the rear axle. The driving shaft housing is a heavy tube that is carried to and is bolted on to the rear axle differential housing.

Rear Axle and Frame Details.

The rear axle is the full floating type with a shell of steel. It has a differential of large proportions with extra large nickel steel gears. The pinion shaft is 1.37 inches diameter and the axle shafts are 1.625 inches diameter. The bevel gear is of unusual size and strength. The pinion shaft, axle shafts and the differential are mounted on large double New Departure ball bearings throughout. The brakes are operated on drums 14 inches in diameter on the rear wheels. The service brake is actuated by a pedal and the external contracting bands about the drums are lined with Raybestos. The emergency brake is operated by hand lever and is internal expanding, the shoes also being faced with Raybestos. The rear wheels



Top of Cylinders with Valve Pocket Cap Removed on Rear Unit, Showing Accessibility of Valves and Combustion Chamber.

are mounted on New Departure ball bearings.

The chassis frame is of pressed steel channel section, the edges of the channel being widened for that portion between the spring shackles to insure against sagging. The frame has heavy cross members and these are reinforced by gusset plates. The front axle is an I section steel drop forging with the spring seats integral and with very large steering knuckles. The wheels have ball and cone bearings. The tiebar is placed behind the axle to protect it against contact with road obstructions. The frame is mounted on semi-elliptic forward springs 37.5 inches in length and two inches in width, and on three-quarter elliptic rear springs 49.5 inches in length and two inches in width. The rear springs are mounted outside the frame, this giving increased steadiness in rough riding.

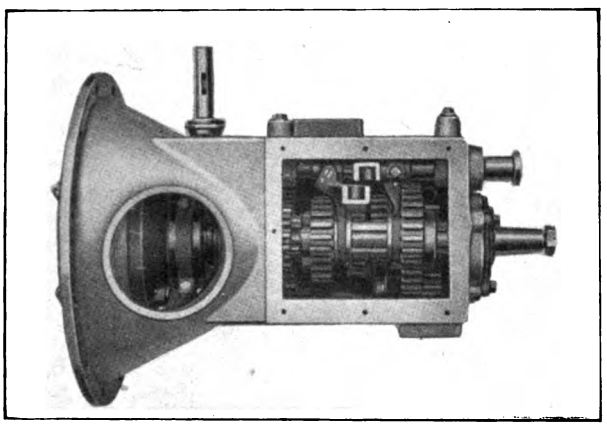
The control is by an 18-inch steering wheel with a right and left worm with double cam movement, there being no backlash or lost motion. The ignition advance and the throttle lever are mounted at the top of the steering column. The service brake and the accelerator are operated by the right foot with pedals, and the left pedal is the clutch.

The wheels are 36 inches in diameter, of the wood artillery type and have very large hub flanges, every spoke being bolted. These are fitted with demount-

Left Side of the Imperial Unit Power Plant.

able rims and with 34 by four-inch tires all around.

This brief description gives a general idea of the mechanical features of the chassis, which has a wheelbase of 120 inches. The capacity of the fuel tank is 15 gallons.



Details of Smaller Chassis.

With model 34 the motor has a cylinder bore of 4.3125 and stroke of 5.25, this giving a ratio of stroke to bore of 1.217, this being an increase as compared with model 44. Of course the power plant components are proportionate to the changed dimensions. The specifications stated for model 44 apply to this to the rear axle, which is of the semi-floating type and it is constructed with high duty Hyatt roller bearings throughout; to the wheelbase, which is 116 inches, and to the wheels, which are fitted with 34 by four-inch demountable rims and tires.

Model 33 and 32 motors have cylinder bore of 4.125 and stroke of 5.25 inches, this giving a ratio of stroke to bore of 1.272, this being the longest stroke of the Imperial engines. This necessitates a change of dimensions for components as compared with the other

Digitized by Google

two power plants. Beyond this, however, the only other changes are 12-inch brake drums and 114-inch wheelbase and 34 by 3.5-inch demountable rims and

Top of the Clutch and Transmission Case, Showing the Large Inspection Holes.

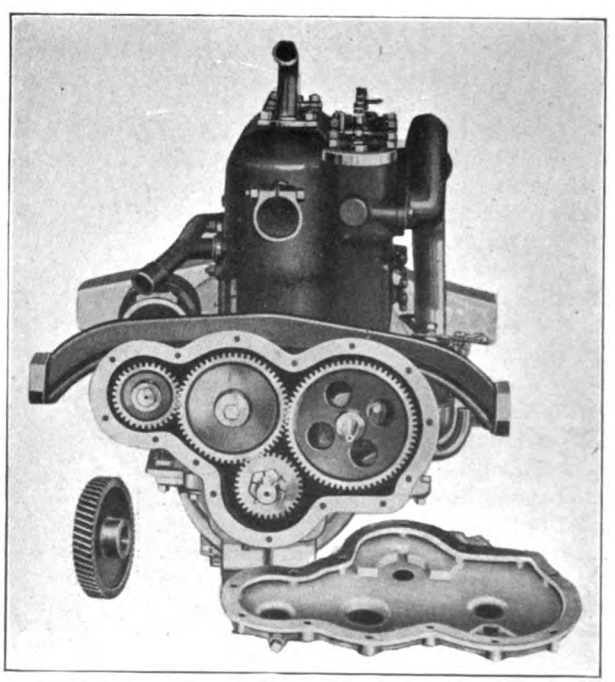
tires. These models have 15-gallon gasoline tank, save model 33, which has 20 gallons capacity.

Upholstery and Body Finish.

With these chassis models 34 and 32 are five-passenger touring bodies, and model 33 is a two-passenger gentlemen's roadster. The upholstering for model 44 is somewhat higher in quality, and special Turkish back springs and Rough Rider cushion springs are used. With the model 44 body the entire finish is black with fine striping of ivory white. Model 34 is with Brewster green gear and body finish with the hood and fenders of black. Model 33 is with Brewster green gear and body finish with single line glazed carmine stripe and black hood and fenders. Model 32 is with French gray gear and blue body finish with single blue stripe.

All models except model 32, which is brass trimmed, are trimmed with nickel fittings. All are furnished with equipment, there being some difference according to the model and price, and all purchasers have the option of a self-starting device at a charge additional to the list price.

The Imperial machines are designed with regard to comfort. The suspension is such as to insure ease in riding and minimum wear of the mechanism, the upholstery is luxurious, the bodies are spacious and the seats are wide and amply cushioned, the workmanship and finish are of uniform excellence throughout, and construction is in every way mechanical and with sufficient margin for safety. The bodies are comparatively low, without sacrificing road clearance, and the centre of gravity is established to afford unusually good balance. The touring bodies are all with fore doors, and with the centre control either side of the vehicles may be next the curb without obstruction to the ingress or egress of the passengers. The roadster body is equally satisfactory as to comfort and abundance of space.



The body designs are such as to give conservative torpedo effect with models 44 and 33, and there is a striking scuttle dash for the roadster, which is fitted with exposed tank behind the seat and a large trunk on the after deck. The fenders are ample and of graceful design and there are body skirts that effectually protect the passengers from dust and mud.

Throughout all models there has been an attention to detail that will appeal to the experienced motorist. Every phase of use has been considered and the machines are suited for every purpose and every condition in which an automobile vehicle may be used.

FIRESTONE TIRE DATA.

The Firestone Tire & Rubber Company, Akron, O., is issuing a booklet entitled "Minor Repairs and the Care of Tires," which contains information of more than ordinary interest to users of tires. The most effective methods of repairing shoes and inner tubes are outlined and a number of suggestions made on the care and preservation of these members. The booklet will be sent free upon application.

The company is also mailing a brochure calling attention to the important features of the Firestone quick detachable demountable rim. The publication calls particular attention to the fact hat the base of the rim is unbroken, either across the rim or around

Timing Gearcase Removed, Showing the Spiral Gears and the Eccentric Adjustment.

it, also that the inner tubes may be changed with the rim on or off. The mechanical features and others are illustrated clearly.

IDEAL OIL AND FUEL EQUIPMENT.

In storing and handling gasoline, unless the equipment be designed especially for that purpose, the loss

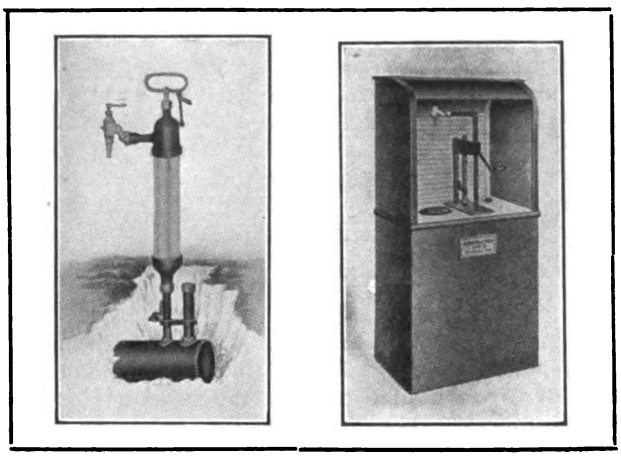

Fig. 1—Ideal Tanks and Pumps: At Left, Equipment Designed for Yard or Driveway; at Right, Roll Top Cabinet with Self-Measuring Pump.

by evaporation will be considerable. When the fluid is stored in ordinary cans this depreciation is very marked and more or less danger of explosion or fire is experienced. When the highly volatile commodity is stored in properly constructed containers buried in the ground and these connected to a pump by suitable piping, there is absolute protection against fire and evaporation; buying in large quantities is permitted and convenience is an item for consideration as well. When such a system is utilized the economy will pay for the original investment.

The Ideal Oil Pump & Tank Company, 146 Summer street, Boston, New England distributor for the equipment produced by Kupferle Bros. Manufacturing Company, St. Louis, Mo., markets a number of different equipments, these being constructed to meet the requirembents of both the public garage and the owner. The tanks are made of heavy galvanized sheet steel, painted with three heavy coats of best mineral paint and are rust proof. They are guaranteed to be air tight and to eliminate evaporation. They are equipped with a double heavy metal filler tube, the lower end of which is enclosed in a fine mesh screen and rests upon the bottom of the tank, and the top of the tube is fitted with a screen for straining, also a removable locked and vented cap.

The Ideal pumps are a combination force and suction, constructed entirely of metal and so arranged that a gallon, half-gallon, quart or pint may be drawn accurately at each stroke. They are fitted with double brass valves, brass stuffing boxes, automatic brass checks, anti-drip nozzles with lever shut-offs, 10-gallon discharge registers and a special locking device. The latter makes it impossible for anyone to operate the pump without adjustment, and this may be locked with a separate key lock attachment on the outside.

At Fig. 1 is depicted an equipment designed to meet the demand for a low priced storage tank and pump to be buried underground in the yard or near the driveway. The pump is a suction member fitted with hose connection, and is detachable so that it may be removed when not in use. With this equipment the fuel tank may be filled easily and accurately.

At Fig. 2 is presented a more complete equipment. Here the tank is buried underground outside and piped to the pump in the garage. This is styled the long distance self-measuring equipment and is fitted with a hose for filling the fuel tank of the car, this arrangement permitting the use of the pump in the usual manner. The latter may be adjusted to measure the desired quantity of gasoline and is equipped with the improved gallon meter which registers accurately all fluid drawn by the pump from the tank. It also acts as a check on losses and mistakes. The meter registers up to 9999 gallons, then repeats. It is so constructed that it is impossible for anyone to tamper with its working or mechanism. By this device a daily, weekly or monthly record of sales may be ascertained readily.

In addition to tanks for gasoline the company produces a number of oil equipments, the tanks of which are constructed of heavy galvanized sheet steel. The pumps are self measuring and can be so adjusted as to discharge quarts, pints and half-pints at a stroke. Anti-drip levers are employed and metal is utilized throughout. That illustrated at Fig. 1 is the roll top cabinet design. These are constructed of metal and equipped with a gauge to check up receipts and to show the amount of lubricant in the container. The Ideal Oil Pump & Tank Company markets oil equipments to meet all requirements.

VALVE ADJUSTMENT AND GRINDING.

MOTORISTS who enjoy working about their own cars are interested in suggestions concerning the proper care and maintenance of their machines. The following communication on valve adjustment and grinding is submitted by T. A. Peck, manager of the technical department of the Abbott Motor Company, Detroit, maker of the Abbott-Detroit line. While it is to be presumed that Mr. Peck's advice holds particularly true of cars made by his concern, it will be found equally applicable to other makes and should prove decidedly timely and instructive.

Editor, Automobile Journal:—

Automobile owners as a class are growing more intelligent, more discriminating, and consequently less arbitrary. This is a most encouraging sign of the times to manufacturers and dealers in general, and this condition particularly applies to the firm whose product is sensibly designed, substantially constructed and sold under a life guaranty.

An automobile has to stand rougher usage and gets less attention, as a rule, than any type of mechanism in the world. The machine is yet to be made which will operate without proper lubrication and occasional adjustment. Fortunately, automobile owners are coming to recognize this fact and to realize that one-tenth the energy expended in grooming a horse will keep a car in commission indefinitely.

It is my opinion that a fair proportion of gas engine troubles arises from a failure to accord attention to minor details, a negligence which is not necessarily wilful, but is due, rather, to ignorance of the real function of each particular part and of the importance of keeping the same in condition for it to perform its duty properly. To reduce the upkeep to the minimum and insure safe motoring, it is advisable to be always on the alert for possible derangements, thoroughly inspecting the mechanism as frequently as is convenient. No eccentricity of action should be neglected and the trouble must be traced to its source and remedied immediately. I do not wish to convey the impression that the average car requires continual inspection, but I do believe that an odd half-hour spent now and then in cleaning and tuning up, even though the machine be giving perfect satisfaction, is productive of both pleasure and profit to the owner. He is amply repaid for the time and trouble by the improved action of his engine and the man imbued with the spirit of the true motorist derives a pleasure from adjusting and understanding the power plant of his car, which is second only to the joy of driving it. All of which brings us to the question of valve grinding and adjustment. If the average car owner only realized the importance of keeping all valves properly seated!

A great many car owners make a practise of adjusting valves while the motor is hot. This is a grievous error. It is proper to note any abnormal condition like this which develops but advisable to wait until the engine is cold before making any changes. If this suggestion is not heeded, particularly with motors of overhead valve design, the adjustment will be inaccurate, valves will not seat properly, resulting in weak compression and the entire action of the engine will be impaired on account of trying to correct one fault by committing another.

An adjustment too tight on intake valve or too loose on exhaust valve permits the fuel to escape, thus reducing the compression and diminishing the power of the explosion stroke. An adjustment too loose on intake valve also reduces the compression by shortening the length of the compression stroke. The exhaust valve under loose adjustment opens late. This retards the engine action as the exploded gases do not have prompt exit and a portion of the power intended for compression stroke is wasted in recompressing dead fuel, which would have been expelled had the exhaust valve opened soon enough.

Bear in mind these remarks are confined to one cylinder only. When one remembers there are four cylinders each requiring equal exactitude of adjustment to keep the valves of one cylinder from "crossing" or overlapping those of another, the importance of doing the work right is emphasized. That is one of the reasons why an engine throbs and lunges and misses and backfires and "lays down" on a hill; improper valve adjustment nine times out of 10. This leads up to the point of valve grinding.

Too much emphasis cannot be placed on the necessity of examining the valves carefully at regular intervals, even though the compression is apparently normal and uniform in each cylinder. The exhaust valves are especially susceptible to corrosion on account of the intense heat of the escaping gases. The seats soon become pitted, the carbon dust and vapor is caught and confined in every little crevice and in an incredibly short space of time the valves, if neglected, will be covered with a deposit of carbon which will affect the running of the motor to a marked degree. The only remedy is to grind them.

There are several good grinding compounds on the market. It is advisable to use a coarse grade in the first operation and then finish off with a finer one to impart a nicely polished surface. A very good home made mixture is obtained by making a thin paste of a couple of teaspoonfuls of kerosene, a few drops of oil and enough fine flour emery to thicken the preparation to a consistency where it will not run too freely.

Remember, even the minutest particle of this grinding abrasive must be kept from finding its way into the combustion chambers. Pack a good, generous quantity of waste or rags well soaked in gasoline around the valve seat and take due precaution to leave the inside of the cylinder casting perfectly clean.

Apply a moderate coating of the compound to the bevel face of the valve and return it to its seat. Next rotate the valve forward and back until the entire bearing surfaces are polished bright and smooth and the full width of the face. If the guide be worn or the stem bent, great care must be exercised or the valve will not be "true," i. e., the bevel face will not be flat but a trifle convex. The valve should never be turned the whole way round. Oscillate it back and forth a quarter-turn at most under light pressure, lifting it up frequently and turning it half way round before seating it again. This method distributes the friction evenly and eliminates the possibility of the emery scoring the bearings. If no valve grinding tool be available, I would recommend the use of a carpenter's bit stock as a much smoother movement is obtained than by using a screw driver.

After working up a good clean seat entirely free from spots or pits wash the valve, valve seat and guide thoroughly in gasoline. If the stem be rough or gummy, smooth it up with emery cloth, but clean it afterwards before replacing it in the guide. To test the effectiveness of the work, mark the valve seat in several places with a lead pencil and turn the valve around a few times. If the marks be entirely rubbed off, the work may be considered well done.

Very truly yours,

T. A. PECK.

Detroit, Mich., Feb. 26.

BUYS ALCO TOURING CAR.

Mrs. Frank L. Perin, of Cincinnati, O., sister of President Taft, has purchased a six-cylinder Alco touring car, made by the American Locomotive Company, New York City and Providence, R. I. The machine selected by Mrs. Perin has long, straight lines and is distinguished by a broad white stripe about the body. It is fitted with an electric light beneath the tonneau door which when opened illuminates the step at night.

MOTORING NEWS OF NATIONAL IMPORT.

Commercial Vehicle Manufacturers Confer with Reference to Standardization and Overloading---Splendid Business Marks Exhibitions in Many Sections of the Country---Canada Holds Biggest Display at Toronto.

About 40 representatives of commercial vehicle manufacturers met in New York City, March 4-5, for the purpose of discussing the matter of motor truck standardization. Several points were brought up for discussion, and it practically was decided to accept the recommendations of the Society of Automobile Engineers in this respect and to co-operate with that organization in furthering this line of action.

Perhaps the most important decision of the meeting was that it was inadvisable to encourage the belief that a truck is designed to carry any weight in excess of its rated capacity, or to permit a warranty to apply to any truck which is overloaded. A standard form of warranty was adopted and it was suggested that all motor truck manufacturers use it in the future. This incorporates the above recommendation with respect to overloading.

In the matter of speed ratings, it was decided that 16 miles an hour should be the maximum for half-ton vehicles, and that this should be reduced by half-miles to and including five miles for 10-ton trucks. A standard body weight of 500 pounds was recommended for the half-ton wagons, this increasing by 100 pounds for each half-ton up to and including 2400 pounds for 10-ton vehicles. This means that a five-ton truck, for example, should be fitted with a body weighing 1400 pounds and that the maximum speed should be nine miles an hour. Under the same rule, a three-ton vehicle should have a 1000-pound body and the speed should be 11 miles an hour.

Those present included: S. D. Waldon, Packard, presiding; W. E. Metzger, Everitt; Charles Clifton, Pierce-Arrow; Benjamin Briscoe, Sampson; B. A. Gramm, Gramm; F. I. Harding, Peerless; H. Kerr Thomas, Pierce-Arrow; G. J. Loomis, Speedwell; Vincent Link, Universal; M. T. Pilcher, Federal; Albert L. Pope and W. C. Walker, Pope-Hartford; C. E. Stone and P. K. Hexter, Gramm; A. M. Chase, Chase; E. O. Sutton, Knox; A. W. Robinson, Locomobile; A. J. Doty, Lansden; Will H. Brown, Mais; Walter C. White, White; H. F. Flowers, Alco; Peter Dumont, Baker; H. S. Diller, Lauth-Juergens; Morris Grabowsky, Sampson; H. S. Stebbins, G. M. C.; C. H. Wallerich, General Industrial & Manufacturing Company; Herbert G. Streat, Knickerbocker; J. T. Langhorne, Packard; E. W. Curtis, Jr., General Vehicle; Alfred Reeves; David Beecroft; S. V. Norton; C. W. Fletcher, Walter; G. A. Hedges, Mack, Hewitt and Saurer; David S. Ludlum, Autocar; George B. Kelly, Baker; H. E. Coffin and R. D. Chapin, Hudson.

BIG BUSINESS MARKS SECOND DISPLAY IN BROOKLYN.

The success which attended the first annual show of the Brooklyn Motor Vehicle Dealers' Association, in the 23rd Regiment Armory, Brooklyn, N. Y., in 1911, was repeated at the second display of the organization in the same building, Feb. 24-March 2. Although so close to the big national exhibitions in New York City that it would appear at first thought that residents of Brooklyn might visit these easily, there seems to be every reason why the dealers of that section should call the attention of their immediate clientele to their wares in a more direct manner. From a business viewpoint, the second Brooklyn show was amply justified this year.

The decorative scheme was based upon the Spanish order, and blue and white bunting was used unsparingly in transforming the ceiling and side walls. The floor space was divided by six aisles, each marked by lattice work uprights, bearing the name of the exhibitor, connected by low railings. Electric effects brought out the particular features of the display and helped to make the interior of the building as light as noonday.

Charles H. Green, who has had long experience in the management of events of this character, was in direct charge of the exhibition, while the show committee consisted of W. H. Kouwehoven J. D. Rourk, C. F. Batt, I. C. Kirkham and C. M. Bishop. Eighty-two makes of pleasure and commercial cars were shown, as well as 23 exhibits of accessories. The complete list follows:

Pleasure cars—Bishop, McCormick & Bishop, Cole, Ford; I. M. Allen Company, Stevens-Duryea; American Locomotive Company, Alco; L. J. Bergdoll Motor Company, Bergdoll; A. W. Blanchard, Case, Fiat; Bruns Automobile Company, Chalmers; Buick Motor Company, Buick; Cartercar Company, Cartercar; Carpenter Motor Vehicle Company, E-M-F, Flanders; Central Motor Company, R-C-H, OttoMobile; Cumberland Garage, Speedwell, Velie; Detroit-Cadillac Motor Car Company, Cadillac; Detroit Electric Car Company, Detroit electric; A. Taylor Company, Wenz-Ludy Equipment Company, Hercules Waterproofing Company.

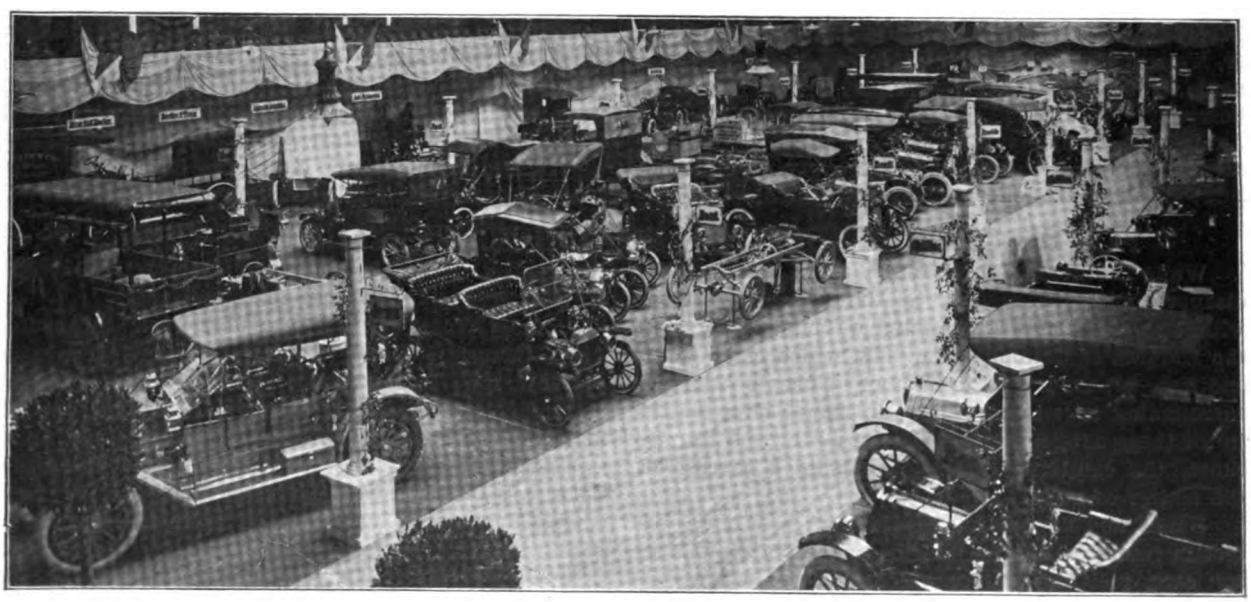
TORONTO'S SECOND OPPORTUNITY TO VIEW SEASON'S MODELS.

Toronto is following the example of many cities in the States this year by holding rival shows. The second event, this being under the auspices of the Toronto Automobile Trade Dealers' Association, was held in the Armouries, Feb. 21-28. The other display was handicapped materially by the fact that several American machines were held up over customs difficulties. Several of these secured space later in the Armouries exhibition, although it was found necessary to erect tents in the rear of the main building for the overflow.

Forty-five exhibitors displayed 76 makes of cars, of which 56 were of American manufacture, 17 Canadian, two English and one Italian. Several models of commercial cars were shown, and these attracted widespread interest. In every way, it was the largest and most representative display of automobiles and accessories ever held in Canada. The attendance was decidedly satisfactory and much business is expected to result. The exhibitors follow:

Automobiles—Automobile & Supply Company, Pierce-Arrow, Stoddard-Dayton, Reo, Hupmobile; Baker Bros., Cole; Brockville Atlas Auto Company, Brockville Atlas; Imperial Motor Car Company, Oldsmobile, Oakland; Hyslop Bros., Cadillac; Pope-Hartford Motor Company of Canada, Pope-Hartford; Montreal Locomotive Works, Alco; Russell Motor Car Company, Russell; Tudhope Motor Company, Tudhope; Ontario Motor Car Company, Packard, Detroit electric; Ford Motor Company of Canada, Ford; White Company, White; KisselKar Sales Company, KisselKar; Schacht Motor Company, Schacht; E-M-F Company of Canada, E-M-F, Flanders; A. E. Wilson, Jackson; Riverdale Garage & Rubber Company, Lion; Dominion Automobile Company, Peerless, Napier, Stevens-Duryea, Hudson, Autocar; Warburton Bros., Maxwell, Inter-State; McLaughlin Motor Car Company, McLaughlin-Buick, Fiat, Rauch & Lang electric; Shaw Overland Sales Company, Overland, Garford, Gramm truck; Auto Sales Company, Mitchell, Moon, Colonial electric; G. E. McCulloch, Kelly truck; White-American Sales Company, American; Bouvier & Son, Winton; Virtue Motor Sales Company, R-C-H; Clinton Motor Car Company, Clinton; T. Easton Company, Lozier, Chalmers, Waverley electric, Saurer truck; Wolseley Tool & Motor Company, Wolseley; Krit Motor Car Company, K-R-I-T; Industrial Motors, Ltd., Commer trucks; Canadian Motors, Ltd., Galt; Rambler Motor Sales Company, Rambler; Petrolia Motor Company, Petrolia truck; J. A. Fitzsimmonds, G. J. C.; Peck Electric, Ltd., Peck electric; Jones & Glassco, Foden steam wagon; Watson Carriage Company, Watson-Commerce; E. A. Greene Company, Ward electric truck; International Harvester Company, International truck; Flanders Electric Vehicle Company, Flanders electric.

Motorcycles—F. H. Lemon & Co., Indian; Percy A. McBride, Excelsior, C. C. M.; Motorcycle & Equipment Company, Flanders, Rudge-Whitworth, N. S. U.; Walter Andrews, Pierce; Tangent Cycle Company, Triumph; License Bros., Harley-Davidson; Humphrey Bicycle & Motor Company, Merkel.



Accessories—Canadian General Electric Company, K-W ignition specialties, etc.; Canadian National Carbon Company, batteries; Queen City Oil Company, Polarine oils; Leather Tire Goods Company, Wood-

worth treads; Gutta Percha & Rubber Manufacturing Company, Kelly-Springfield tires; J. Millen & Son, Simms magnetos; Russell Motor Car Company, Remy and Connecticut magnetos, Stewart speedometers, Motorol, Michelin tires, Shaler vulcanizers, Pittsfield coils, etc.; Marburg Bros., Inc., Mea magnetos; Triple Tread Manufacturing Company, triple treads; McCord Manufacturing Company, McCord radiators; Canadian Consolidated Rubber Company, Canadian tires; Electrical Specialties, Ltd., Weston shock absorbers, Ford specialties, etc.; Stepney Motor Wheel of Canada, Ltd., Stepney wheels; Bosch Magneto Company, Bosch magnetos; Dunlop Tire & Rubber Company, Dunlop tires; S. F. Bowser & Co., Bowser storage systems; Independent Tire Company, Independent tires; Hall Motor Supplies Company, Red Head spark plugs, etc.; Canadian Carbon Company, Ltd., batteries; Warner Instrument Company, Warner autometers; Pollock Manufacturing Company, lamps, generators, etc.; Diamond Tire Company, Diamond tires; Auto Tire Company, Goodrich tires; National Equipment Company, Wayne storage systems; Death & Watson, Ltd., batteries and lamps; Conboy Carriage Company, windshields; Toronto Auto Top & Body Company, bodies, tops, windshields, etc.; Croftan Storage Battery Company, batteries and lamps; Indian Refining Company, Havoline oils; Goodyear Tire & Rubber Company, Goodyear tires.

PATERSON THOROUGHLY ENJOYS ITS FIRST SHOW.

The first organized show in Paterson, N. J., was held in the local armory, Feb. 26-March 2. Many of the cars which were seen at the Newark display during the preceding week were arranged for the inspection of Paterson people, and the recently organized Paterson Automobile Trade Association was so well pleased with the success of the venture that an annual show is a foregone conclusion.

Paterson Armory During the Progress of the First Automobile Show Held in That City.

The hall was prettily decorated with bunting, the association's colors, pale green and blue and white bsing displayed at every turn. The large girders were entirely hidden by its folds, and the tints were blended in a most pleasing manner. Each exhibit was marked by pretty white colonnades, and the cars were disposed so as to make a decided impression on the visitor.

Cars were displayed by the following: Eastside Auto & Repair Company, Marion; Riverside Garage, Abbott-Detroit; Bender Motor Company, Havers; B. F. Clicker, Velie; Vernon Ettinger, Reo; Paterson Fire Department, combination chemical and hose wagon; Auto-Shop, Chalmers; Hudson Company, Hudson; Penn Motor Car Company, Penn; Studebaker Corporation, E-M-F, Flanders; E. A. Browne Auto Company, Maxwell, National; J. Garlick, Stearns-Knight, White; Ford Auto Company, Ford, Everitt, Thomas; Hughes Garage Company, Franklin, Buick, Kelly truck; Pope-Hartford Company, Pope-Hartford; Centre Garage, Overland; W. J. Tynan, Columbia-Knight; Autocar Company, Autocar; Crescent Automobile Company, Mack and Saurer trucks; Veerac Sales Company, Elmore; Passias Auto Company, Cutting; Paterson Vehicle Company, International; S. F. Holden, Metz.

Other exhibitors were: Alling Rubber Company, rubber goods; W. F. Davis, typewriters; F. Dorant, valveless motors; N. E. Heil, motorcycles; H. L. Smith, sundries; Suspended Pneumatic Tire Company, tires; Standard Oil Company, Polarine oils; Wayne Oil Tank & Pump Company, Wayne storage systems.

SNOW DELAYS RECEIPT OF EXHIBITS IN DES MOINES.

The third annual show of the Des Moines Automobile Dealers' Association was held in the Coliseum, Des Moines, Ia., March 4-9. Owing to the heavy snow storm of the previous week, several of the dealers were disappointed in not receiving their show cars in time for the opening night. Many of these machines were shipped direct from the factories, and while demonstrators were on hand to take their places, the beauty of the display was slightly marred in consequence.

An entirely new decorative scheme was worked out, in which an elaborate electric illumination played a prominent part. W. E. Moyer, president of the association, was chairman of the committee and was assisted by C. G. Van Vliet in making the event one long to be remembered in local motoring circles. The business transacted was quite satisfactory in every way.

Among those who displayed cars were: Brown-Corley-Ellis Company, Marion, R-C-H, Auburn, Lozier, Everitt, Flanders electric; Moyer Automobile Company, Hudson, K-R-I-T; Bernhard & Turner Auto Company, Columbus electric; Van Vliet-Fletcher Automobile Company, E-M-F, Flanders; Herring Motor Car Company, Ford; Riddell Auto Company, Overlang; Thomas B. Jeffery Company, Rambler; White Motor Company, White; Cole Motor Company, Cole; Iowa Motor Truck Company, Gramm truck; D. S. Kruidenier, Cadillac; Means Auto Company, Marathon, Moline; Ryan Motors Company, Paige-Detroit, Pierce-Arrow, Chalmers; Sears Auto Company, Mitchell, Hupp-Yeats electric; Stearns Auto Company, Stearns-Knight; Strong Motor Car Company, Winton; J. I. Case Threshing Machine Company, Case; United Motors Des Moines Company, Columbia-Knight, Stoddard-Dayton-Knight; Ideal Auto Company, Oakland; Interstate Auto & Supply Company, Reo, Apperson; Capital City Carriage Company, Jackson; Cunningham Auto Company, American, Hupmobile, Clark; Buick Motor Company, Buick, Marquette; Spaulding Manufacturing Company, Spaulding; Great Western Automobile Company, Great Western; Iowa Auto & Supply Company, National, Marion, Staver, Locomobile, Woods electric; Cartercar Iowa Company, Cartercar; Port Huron Machine Company, Havers; Kissell Motor Company, KisselKar; Ohio Motor Sales Company, Ohio gasoline, De Tamble; Auto Distributing Company, Cutting; Alpena Motor Car Company, Alpena; Johnston Motor Company, Abbott-Detrit; Olds Motor Works, Oldsmobile; Velie Motor Car Company, Velie; Dain Manufacturing Company, Great Dain truck.

FORT DODGE EXHIBITION DRAWS MANY TO THAT CITY.

While the dealers in Fort Dodge, Ia., feel a trifle disappointed with respect to the attendance from within the city, the first annual automobile show in the Knights of Columbus building, which came to an end Feb. 24, drew a large number of people from the surrounding towns and cities. Inasmuch as a majority of these out-of-town people came prepared to purchase, the exhibition was an unqualified success in the matter of sales.

Palms and flowers were utilized with splendid effect in transforming the interior of the building. Racing cars, included among which was the Abbott-Detroit, one of the winners at the Elgin road races of last summer, proved an attractive addition to the makes on display. At the conclusion of the show, the dealers held a banquet and discussed the possibility of arranging for more space next year.

Among those who made display were: Duncome Auto Company, Ford; Johnston Motors Company, Pierce-Arrow; P. J. Tierney, Stearns-Knight; Cadillac Sales Company, Cadillac; Tremain & Rankin, Indian motorcycles; Fort Dodge Auto Company, Snow Auto Company, Black & Kirkpatrick, Eilers Automobile Company, International Harvester Company, Reimer-Gibson Company, Rice & Dayton Manufacturing Company, Leighton Supply Company, Cedar Rapids Oil Company, Plymouth Clay Products Company, R. M. Stevens & Co., H. E. Peterson Company, Herring Auto Supply Company, Marshall Oil Company, Monogram Oil Company, Standard Tire Protector Company.

THIRD DISPLAY IN DAVENPORT A SUCCESS.

The third annual show of the dealers in Davenport, Ia., was held in the Coliseum in that city, Feb. 28-March 2. Every inch of available space was utilized with the best effect, and the attendance was much larger than ever before. The event was under the management of F. W. Skinner, who left nothing undone to bring about success.

Among the exhibitors were the following: Scott County Mercantile Company, Columbia-Knight, Maxwell; H. E. Ross Electric Company, Ohio electric; Oldsmobile Sales Company, Oldsmobile; P. C. Petersen Auto Company, Pope-Hartford; Buck Motor Car Company, Velie, Packard; L. P. Strayer, Hevers; Thomas Auto Company, Thomas; J. A. Zeman Auto Company, Mitchell; Roeske & Sindt, Ford; Witt & Lembrecht, Firestone-Columbus, Columbus electric; Klemme Auto Company, Buick; Brown-Burnap Auto Company, White; Iowa Auto & Tire Company, Cadillac; Yeggy-Don Sales Company, Knox, Woods electric; H. F. Bierkamp, Overland; Trevor & Snider, Stearns-Knight; Mason Carriage Works, Pierce-Arrow, Chalmers, Baker electric; Inter-State Auto Company, Inter-State, E-M-F, Flanders; Toten Auto Company, Abbott-Detroit; Plow City Garage, Warren; Davenport Auto Company, K-R-I-T, Michigan; H. W. Neuman Machine Company, Auburn, Gramm truck; Western Implement & Motor Company, Colby; Horst & Streiter, Moline; Harry Schuttler, Case; Midland Motor Company, Midland; Shallberg Auto Company, Stoddard-Dayton-Knight, Rauch & Lang electric.

BIRDS SING AS ELMIRA INSPECTS LATEST MODELS.

Under a gorgeous canopy of pale blue, dainty pink and pure white, the second annual show of the Elmira Automobile Club was held in the State Armory, Elmira, N. Y., Feb. 27-March 2. Dozens of canaries were hidden away among the greenery of the decorative scheme and added their song to the martial music of the band. It was a decidedly inspiring scene, but of still more importance, the various models were so disposed that the flood of electric light set them off to the best advantage.

The event was under the management of Louis Blumenstein, assisted by the following show committee: F. C. Ogden, Fred M. Jones and George W. Middleton of the automobile club, and Guy Shoemaker and Ward LaFrance of the local automobile dealers' association. The attendance throughout the week was such as to inspire confidence in the local situation, and there is much reason for believing that the season of 1912 will be the most prosperous the Elmira dealers have known.

Cars were shown as follows: J. W. Cook Company, Cutting; C. W. Bishop Company, Buick; Gates & Strong, E-M-F, Flanders; LaFrance Garage, Reo, Chalmers, Hupmobile; South Tier Motor Company, Overland, Peerless, Franklin; Wolcott Motor Car Company, Pierce-Arrow, Cole; A. M. Zimbrick, Stoddard-Dayton-Knight, Haynes, Flanders electric, Gramm truck; R. H. Wickwire, R-C-H; F. E. Smith, Warren; T. Wrayburn Keeton, Rambler; E. T. Crane, Winton, Maxwell; Hatfield Motor Truck Company, Hatfield trucks; Bishop & Whitney, Ford; Electric Garage, Detroit electric; J. F. Rhoades, K-R-I-T; Genesee Motor Car Company, Cadillac; Chemung Motor Car Company, Hudson, Oakland, Oldsmobile, Marmon.

Other exhibitors were: Elmira Arms Company, Harley-Davidson motorcycles; P. B. Rutan & Son, Indian, Merkel and Excelsior motorcycles; G. B. Ellis, motorcycles; F. C. Tomlinson, insurance; Barker, Rose & Clinton Company, sundries; Standard Oil Company, Polarine oils; W. D. Barron, Hanna self-starter; George O. Baxter, tires; Frontier Specialty Company, spark plugs; F. A. Hilliker, tire tools; B. W. Hollingshead Company, Whiz polishes; Wayne Oil Tank & Pump Company, Wayne storage systems.

FIRST MOTOR CAR EXHIBITION IN NORTH CAROLINA.

The increasing interest which has been manifest in automobiles during the past year or two in the South had its culmination in Charlotte, N. C., during the week of Feb. 26-March 2, when the first motor car show ever held in North Carolina was held in the Auditorium in that city. The event was under the auspices of the recently organized Charlotte Automobile Dealers' Association, and was quite as pretentious as any display ever held in the smaller cities of the country.

The interior of the hall was transformed by the liberal use of bunting and greenery. From the centre of the ceiling the white and green bunting fell in tent-like folds to the railings of the balcony, and 3000 bunches of smilax and wisteria aided in producing the desired effect. The attendance was thoroughly satisfactory and betokens an excellent year's business in this section. It is probable the Charlotte show will become an annual feature.

Those who displayed cars were: United Motor Charlotte Company, Columbia-Knight, Maxwell; C. C. Coddington, Buick; American Motor Car Company, Everitt, Whiting; Osmond L. Barringer Company, Reo, Packard; R-C-H Corporation of Atlanta, R-C-H; Charlotte Motor Car Company, Hudson, Hupmobile; Mecklenburg Automobile Company, Pullman, Marathon; Piedmont Motor Car Company, Lozier, Stoddard-Dayton-Knight, Rauch & Lang electric; Woodside Motor Car Company, E-M-F, Flanders; Corbett Automobile Company, Corbett.

KEENE MOTORCYCLISTS HOLD FOURTH ANNUAL DISPLAY.

One of the few motorcycle organizations in the country to venture upon the scheme of holding an annual motor vehicle show, which includes automobiles as well as the two-wheeled mounts, is the Consolidated Motorcyclists of Keene, N. H. For four years this plan has been in vogue and each season has seen an increasing interest in the display with a corresponding success for the promoter. The fourth annual display was held in the City Hall, Feb. 22-24, under the management of C. C. Wilber, formerly vice president of the Eastern District, Federation of American Motorcyclists.

The hall was decorated with flags and bunting, and numerous potted plants were utilized to good effect. Inasmuch as the initial Keene show was the first held in New Hampshire this annual event still retains its important place in the industry in that state. The list of exhibitors was somewhat larger than usual this year, and several makes of machines were seen for the first time in Keene.

Among the exhibitors were the following: Lester M. Lane, Overland cars and Hydraulic windshields; Robertson & Bennett, Stanley steam cars, Jackson and Stoddard-Dayton-Knight; Louis E. Roundy, Ford; F. A. Ordway, Hudson; Guy F. Fairfield, Cadillac; O. L. Blake, Chalmers; Wellington & Webster, Maxwell, Regal; Henry D. Allison, Rambler; Manley Bros., Lion; J. H. Watson, New Way engine for farm use; C. C. Wilber, Harley-Davidson motorcycles; James L. Perry & Co., Pope motorcycles and accessories; Keene & Manchester Oil & Supply Company, lubricants; C. H. Stoddard, vulcanizing; B. F. Walsh, Indian motorcycles; W. F. Mann Motor Company, Thor and Merkel motorcycles.

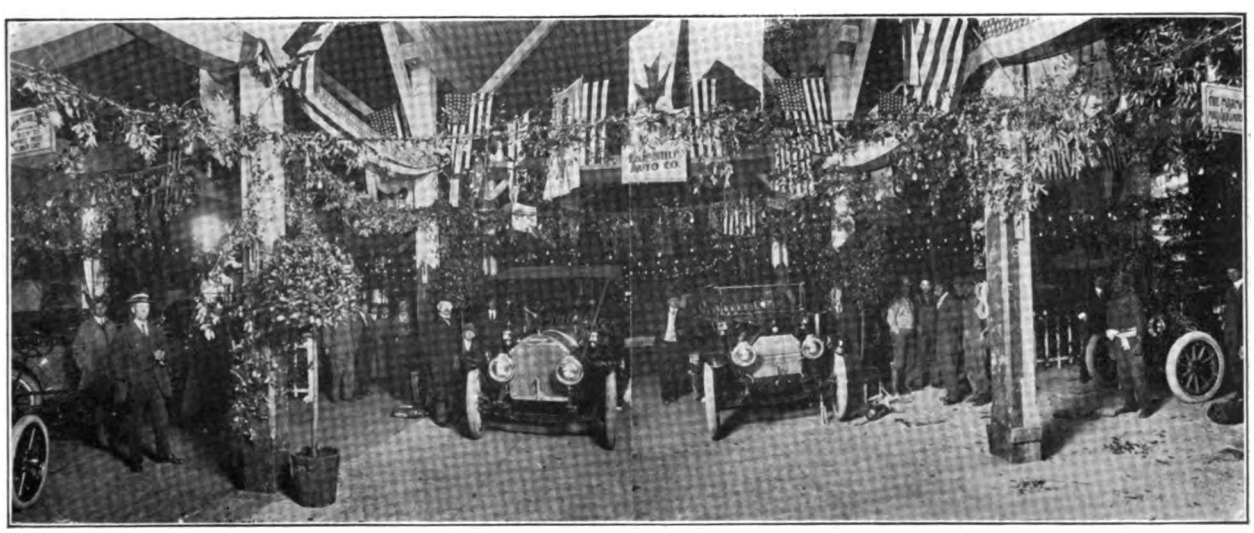
PRIVATE ENTERPRISE ARRANGES TAUNTON'S INITIAL SHOW.



Last year O. D. Corbett of New York City held an automobile show in Fall River, Mass., and while some of the local dealers did not respond as readily as he expected, he found many of the agents in Taunton, Mass., anxious to take space and present their cars for inspection. This year, the Fall River dealers were organized and held their own show. As a result, Mr. Corbett moved on to Taunton.

The first automobile display ever held in Taunton took place in Odd Fellows' Hall, Feb. 24-27. The available space was decidedly limited but good use was made of what there was, and the exhibition was representative in every sense of the word. Floral decorations combined with bunting was utilized in transforming the interior of the building, and the attendance was sufficient to warrant the probability of an annual event in the future.

The following were the exhibitors: Brownell & Burt, E-M-F, Flanders; Perry Motor Car Company, Reo, Ford, Rambler; Fred Fuller, Mitchell; Sumner Staples, Paige-Detroit; Pugh Bros., Palmer-Singer, Marion; Providence Motor Car Company, Stoddard-Dayton-Knight; Washington Street Garage, Warren; Watuppa Auto Company, Crawford; ————, Everitt; Easternhouse Engine Company, Pearl Marine Motors.

NEW ORLEANS EXHIBITION A MARDI GRAS FEATURE.

As is the usual custom in New Orleans, the annual display of the Automobile Dealers' Association in that city was held in conjunction with the Mardi Gras celebration, Feb. 21-25. The event was under the management of T. C. Campbell, and was held in Washington Artillery Hall. The decorative scheme was that of a springtime scene, in which Southern flowers played a prominent part. From the ceiling were draped numerous flags, adding to the holiday aspect of the display.

Interior of the Washington Artillery Armory During the Progress of the Recent Automobile Show in New Orleans.

Among those who exhibited cars were: Zilberman & Fogarty, Oakland, Commerce truck; Joseph Schwartz Company, Buick, G. M. C. trucks; Crescent City Auto Company, Hudson, Thomas; Gus D. Revol, Cadillac, Chase truck; Demack Motor Company, Knox, Detroit electric; Myatt-Dicks Motor Cab Company, Marmon, Stoddard-Dayton-Knight; Day-Rice Auto Company, Paige-Detroit, Alco, Winton; Chalmers Motor Company, Chalmers; Russell Motor Car Company, Ford; Shep D. Hogue & Son, Overland, Garford; Abbott Automobile Company, Abbott-Detroit, Packard, Baker electric; Lyons-Barton Motor Car Company, Pierce-Arrow; Fairchild Auto Company, Peerless, Pathfinder, Reo; Gulf Motor Company, De Tamble; Commercial Truck & Automobile Company, Gramm truck; A. L. Ducote, E-M-F, Flanders; Cooke Auto & Taxicab Company, Locomobile. In addition Chas. E. Miller had on display his complete line of accessories.

WEEK OF SALES MARKS NEW HAVEN'S ANNUAL DISPLAY.

If sales are any indication as to the success of an automobile show, and there seems little question that the displays are held for that purpose, the second annual exhibition of the dealers in New Haven, Conn., Feb. 26-March 2, was a decided success. The doors of Music Hall hardly had been thrown open before announcements of sales were recorded. Cars were sold to people residing along the Connecticut shore as far east as New London, and throughout the entire Naugatuck Valley.

Seventy-one cars were disposed about the interior of the building, each separate exhibit being marked

Digitized by Google

with lamp posts of colonial design. The color scheme of the decorations was red and white, and hundreds of electric lights were utilized in the illumination. In every way it was the most complete automobile exhibition ever held in New Haven, and one which drew many people to the city for the week.

Cars were displayed as follows: Knight's Garage, Velie; Brown & Underwood Auto Company, Cadillac; Howards Company, KisselKar; Biever Motor Car Company, Columbia-Knight, Maxwell; Bradford-De-Bussey Company, Locomobile, Alpena, K-R-I-T; Yale Auto Garage Company, R-C-H, Cutting; R. L. Bishop, American, Hupmobile; Bunnell & Doolittle, Regal; Marion Garage, Marion; Elm City Auto Company, Buick, Dart; General Motors Service & Truck Company, G. M. C. trucks; D. W. Flint, Ford; J. F. Goodrich & Co., King; National Motor Car Company, National; S. E. Campbell, Rambler.

MISSISSIPPI VALLEY DISPLAY LIMITED TO QUINCY.

Although it was termed the second annual Mississippi Valley automobile show, the display at Highland Park, Quincy, Ill., Feb. 26-March 2, was limited in its scope to the dealers of that city. Last year, a few out-of-town agencies were represented, but for some reason it was deemed best to eliminate these this time. The attendance was unlimited, however, and it is anticipated that the event will prove of decided benefit to Quincy dealers.

The decorative scheme was in purple and white, the ceiling and side walls being draped with bunting. Special attention was paid to the illumination, thousands of electric lights being utilized to good advantage in bringing about the effect sought. Fifty makes of cars were represented, among them being the following:

Fischer Motor Car Company, E-M-F, Flanders, Brush, Abbott-Detroit; Beatty Automobile Company, White, Rauch & Lang electric; Reid Motor Company, Hudson; Gem City Auto Exchange, Cartercar, Elmore, Michigan, Metz, Great Western; E. W. Fuhr, Maxwell; H. A. Geise, Cadillac; Laughlin & Dick, Buick; Charles Johnston, Mitchell, Hupmobile; T. C. Nichols Motor Car Company, Chalmers; John E. Dick, Glide; Kurz Machine Company, Overland; Collins Plow Company, Richmond.

COLUMBUS AUTOMOBILE CLUB REVIVES EXHIBITION PLANS.

Utilizing the old Postoffice building in Columbus, O., the Columbus Automobile Club held the first motor car display in two years in that city March 2-9. Practically 30 per cent. more space was afforded than under the old arrangement, and still there was insufficient room for all who desired to exhibit. The event was in the hands of the following committee: Perin Moneypenny, Charles E. Firestone and D. Hoch.

The decorative scheme was thoroughly in keeping with the magnitude of the undertaking, bunting, potted plants and electric lights being utilized to splendid effect throughout. The attendance was decidedly encouraging, as has been true of all the shows held in the Middle West thus far this year, and indications point to a successful business season. It is probable the club will hold another show next year.

Among those who made display were: Edward Miller, Premier; Ohio Auto Sales Company, Ford; Kimmel Bros., Speedwell, Cole, Empire; Snyder Automobile Company, Abbott-Detroit; W. D. Short, Metz; United Motor Columbus Company, Columbia-Knight, Maxwell; Broadway Motor Car Company, Paige-Detroit; Oscar Lear Motor Car Company, Oldsmobile, Oakland, Kelly truck; United States Carriage Company, Great Eagle, Rauch & Lang electric; De Tamble Sales Company, De Tamble; Frank J. Girard, R-C-H; Bausch-Selbach Wagon & Auto Company, Marathon; Gwinn Sales Company, Davis, Alpena; Adamson Auto Company, Jackson; J. C. F. Mott, Grabowsky truck; E. E. Avery, Packard; Broad-Oak Company, Chalmers; S. W. Schott, Brush; Hudson Sales Company, Hudson, American; Columbus Auto Inn, Reo; Winton Motor Carriage Company, Winton; White Company, White; Ohio Motor Car Company, Ohio gasoline; Simplex Automobile Company, Simplex; Columbus Buggy Company, Firestone-Columbus.

CONCORD PRESENTS SEASON'S MODELS FOR FIRST TIME.

For the first time in the history of Concord, N. H., an organized automobile show was held in the City Auditorium under the auspices of the Capitol City Automobile Association, Feb. 22-24. The attendance was by no means confined to Concord, large delegations coming from Manchester, Nashua and still more distant points. The number of sales was quite sufficient to warrant the holding an annual event of the same nature.

White and blue bunting was utilized in the decorative scheme, and an entirely new system of electric lighting aided materially in bringing out the general effect. While all the available space was taken, there was sufficient room to display the cars so that it was an easy matter to compare their respective merits. Each exhibition space was marked by potted plants and palms, adding a touch of greenery to the other coloring.

Those who displayed cars were: Concord Auto Sales Company, Cole, Hudson, R-H-C; Fred S. Johnson, Buick; H. G. Fletcher Auto Company, Elmore, Metz; John K. Martin, Bergdoll; L. Dale Brown, Rambler; Perley Badger, Maxwell; H. S. Putney, Cadillac; L. E. Gray, Overland; A. C. Pollard Auto Company, Stevens-Duryea, Chalmers. A large number of accessory exhibitors also were represented.

BOSTON RETAINS ITS LEAD.

In the matter of attendance and sales the 10th annual Boston automobile show has surpassed even the best expectations of the management and the industry. There is no gainsaying the fact that the national exhibitions in New York and Chicago were a trifle disappointing in the matter of attendance and business transacted. While the figures indicate that more people were present throughout the week in each case than was true last year, the increase was by no means as large, proportionately, as previous experience would lead the industry to expect.

At Boston, conditions were exactly reversed. The result of the shows in the larger centres had been such as to offer the suggestion that the Boston show could not expect to attract in the same degree as in the past. However, the management and the industry were pleasantly disappointed. From the opening night, the attendance was much larger than on the corresponding dates last year, and Wednesday, Society Day, when the admission fee was doubled, Mechanics' building was uncomfortably crowded.

That it was by no means a crowd bent upon satisfying its curiosity alone is borne out by the announcements of sales made. Of course, this feature cannot be judged entirely, until complete returns of the business transacted are at hand, but there is every reason for believing that in this respect, as well, the 10th annual Boston show far outranked all its predecessors.

One point stands forth pre-eminently in this consideration, and that is that New England has lost none of its prestige as the greatest motor vehicle and accessory market in the world. Nothing can indicate more clearly the attitude of the prospective purchasers in this section. The display of commercial vehicles is yet to come, and if the success of the pleasure car division is any criterion, the business transacted during the second week should exceed that of any previous display, no matter where held.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

RECIPROCITY IN NEW JERSEY.

It is indeed welcome news that the lower house of the New Jersey Legislature has decided in favor of complete reciprocity in the matter of non-resident motorists. The public is now awaiting similar action on the part of the Senate. Those who claim to be familiar with the situation in that commonwealth say that there is little doubt the bill will be passed in practically its present form.

New Jersey has earned an unenviable reputation since it began to discriminate against motorists from other states. Its position that the roads of that commonwealth were so excellent that tourists should pay for the privilege of riding over them did not hold good. Tourists have found that other states possess good roads as well as New Jersey, and the business men of that commonwealth have learned that the deflection of trade of this character is of decided importance.

However, if New Jersey places the present, very liberal reciprocity bill upon the statute books, motorists will be disposed to forgive and forget. It will take the state some time to regain that which it has lost, but it is safe to predict it will find in the end that touring motorists leave quite as much money behind them as they cost in road repairs.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

OVERLOADING THE TRUCK.

The action of some 40 representatives of the motor truck manufacturers at their meeting in

Digitized by Google

New York City early in the month marks a somewhat new departure in the matter of commercial vehicle rating. While other features of the business were discussed, it hardly will be denied that the most important result of the meeting was the decision that it is inadvisable to encourage the belief that a truck is designed to carry any weight in excess of its rated capacity, or to permit a warranty to apply to any truck which is overloaded.

This is a subject which has occasioned considerable discussion in the industry and among prospective purchasers. There never has been any real justification for the suggestion that a truck will carry a substantial overload, except that users are prone to exceed the rated capacity and it is best to provide for this. However, this is a decided fallacy, in that it is just as probable that users will attempt to carry more weight than the truck is designed to handle, even considering the permitted overload. In other words, there is no reason for calling a five-ton vehicle a three-ton truck, because if the user is informed he may overload to that limit, he is just as liable to carry it still further and attempt to haul loads of six tons or more.

Educational campaigns are now considered necessary in furthering the intelligent use of industrial transports. One of the first principles which should be enlarged upon is that if a motor truck owner habitually carries more load than that for which the vehicle is intended, he does so at the expense of his investment. Obviously, the manufacturer is taking the proper stand when he decides not to provide for overloading and makes his warranty apply only when the vehicle is used as intended in the design and construction.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

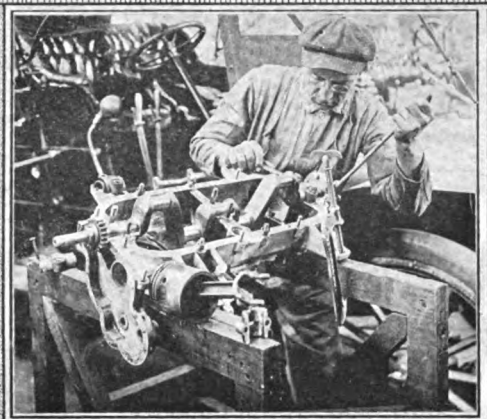
AS TO NEXT YEAR'S SHOWS.

The decision of the National Association of Automobile Manufacturers to hold the 1913 New York show (there will be but one next year) later in the season, appears to be in line with the plan followed by the Boston dealers. The Chicago display is to be held later as well, so that the two big national exhibitions will come nearer to the date of the Boston display, and therefore much nearer the actual opening of the motoring season.

Within the past year the so-called minor show circuit has been extended very rapidly. The main object with these appears to be that of stimulating business in the immediate community, and there is little question that the manufacturers may support the local dealers with decided profit. In many instances, an effort has been made to hold these displays before the national exhibitions, and it will be possible to carry out this plan more advantageously under the new arrangement.

As a result, the three largest shows of the year, those at New York, Chicago and Boston, should prove to be the culmination of a nation wide campaign for the exploitation of the 1913 models. The minor circuit will stimulate business locally, and at the same time awaken interest in the larger displays. The plan ought to be of decided advantage to the industry.

It may be suggested here that the personal campaign which was waged both in 1911 and 1912 in connection with the commercial vehicle show in Chicago has demonstrated its value sufficiently to warrant its being tried at New York and Boston. If the manufacturers will co-operate to the fullest extent with the dealers in the minor shows, it will be possible to secure a valuable list of "prospects," which can be followed up in this manner, and the national displays will reap the benefit of the entire campaign.



Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

THE LEGISLATIVE SITUATION.

That the introduction of radical automobile legislation is by no means a thing of the past is borne out by the number of such bills which have made their appearance in various states during the past few weeks. Some legislators still retain the opinion that they were elected for the purpose of imposing unwarranted hardships upon owners and users of motor vehicles. It is a hopeful sign of the times, however, that in most instances the legislatures as a whole are more kindly disposed toward the motorist, and there is little attempt to rush radical measures through without proper hearings.

The continued appearance of these proposed statutes indicates clearly the necessity for watching the state house, while the legislature is in session. Organized motorists have the opportunity at this season to give a decided reason for their existence. Incidentally, it may be remarked that automobile owners and users owe much to these bodies, and the least they can do to show their appreciation of the efforts in their behalf is to become identified with those who are working for better conditions.

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

MOTOR STANDS FOR THE OVERHAUL.

With the approach of spring the progressive motorist begins to make his arrangements for the annual overhaul of the car. While many make it a practise to have the work done at a repair shop it is interesting to note that there is a growing tendency among owners to do their own repairing. And many are

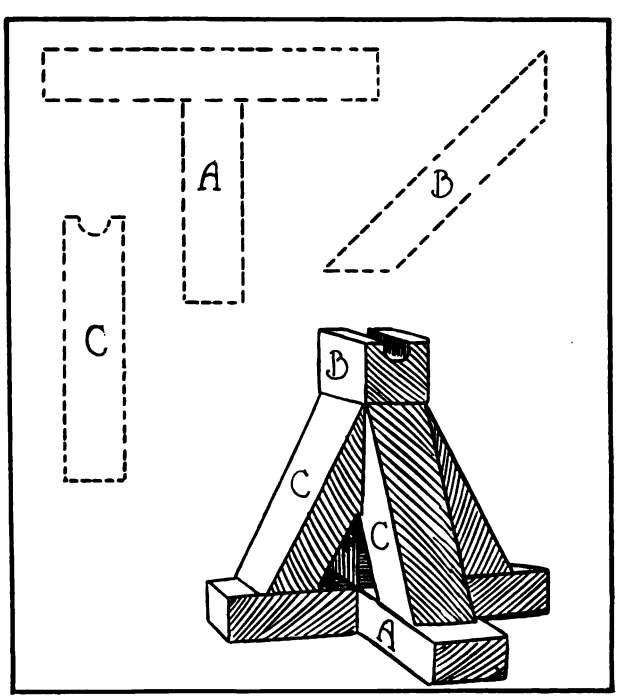

Fig. 1—Plan of Wooden Supports Made of Joist for Suspending the Chassis During Its Overhaul.

quite proficient in this respect, displaying a familiarity with the components of the motor car and the proper methods of assembling.

While the majority attend to their own repairs as a matter of economy, it is noted that some owners like to work around a machine although fully able to have the work done elsewhere. There is a fascination about the automobile and many excellent amateur repairmen have been developed through curiosity leading them to study its components and their relation to one another. Others merely become acquainted with certain factors in order to know what to do in the event of trouble on the road.

Many owners in overhauling the car lose considerable time and expend labor unnecessarily because of the lack of proper equipment. This should not be taken to mean that an extensive outfit is essential to place a car in first class shape as the work can be performed with ordinary tools aided by a few devices which may be constructed with little or no expense. These will depend upon the thoroughness of the overhaul. Some make it a practise to pull down the motor only, while others give the transmission and rear system attention, as well as the steering gear, springs, etc.

Regarding the motor, the amount of work to be performed will depend upon its condition. If the car has been in service but one season it may be possible to overhaul the power plant without removing it from the frame, the work calling for taking up the main bearings, connecting rods, camshaft bearings, removing carbon, grinding valves, etc.

If the engine has seen considerable service and the owner desires to make a thorough job the work will be facilitated by removing it from the chassis and dismantling so that a thorough inspection of each component may be had and new parts secured if needed.

A motor stand may be constructed easily and is not expensive. Although made in several forms and so constructed that the engine may be attached and swung to permit work on the bearings as well as cylinders, one of this type is not necessary. One may be made easily with pieces of joists, these being bolted or nailed together, and if the work be done properly will answer all requirements.

At Fig. 2 A is depicted a stand made of two-by-four joists, a type requiring but little knowledge of carpentry to build, as all that is needed is a hammer,

Digitized by Google

saw, nails and a try square to mark off the corners of the material and to line up the supporting members. The side members consist of two supporting legs with a top piece, and it will be noted that a brace is fitted, these members being so arranged as to strengthen the structure. Two cross pieces are attached at each end to take care of side stresses.

This plan makes for sturdiness and will support the heaviest of motors and permit of heavy work being done. No dimensions are given because of the different designs of motors and their manner of suspension in the frame. In planning a stand the supporting arms of the engine should be measured carefully and the stand made wide enough so that when the former is lifted out and set upon the side rails, there will sufficient room to permit the use of a wrench in removing the lower half of the crankcase. The bolt holes in the arms should be in the centre of the supporting members of the stand and the power plant may be bolted down if desired by screw bolts, or holes drilled through the wood and bolts and washers utilized for fastening. In considering the height of the stand it should not be made too low for comfort in working as a backache will be the result of improper dimensions.

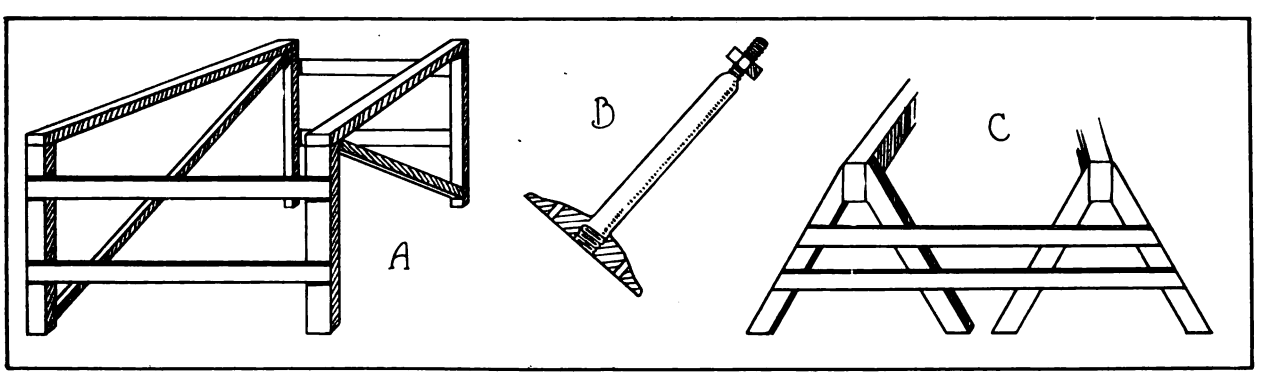

Fig. 2—Forms of Motor Stands for Facilitating the Overhaul of the Power Plant: A, Support Made from Joists; B, Bench Stand, Four of Which Provide an Adjustable Device; C, Method of Utilizing Sawhorses.

Where the garage is equipped with a substantial workbench the repairman may desire to transfer the motor from the chassis to a point where the light is better and the tools handy. At B is shown a stand or support which has the advantage of being adapted to any size of motor inasmuch as its construction permits of this service.

It consists of a piece of 1.25 or 1.5 round steel of sufficient length to permit the bottom of the crankcase to clear the bench at least three inches. The bottom of the support is threaded and screwed into a foot plate and the latter is drilled to take three screws or bolts for fastening the device securely. The upper part is turned down to the size of the holes in the motor arms and then threaded to take a nut. About .625-inch threaded part will fit the average motor. Four of these supports are constructed and when attached to the bench will enable one to get at the bottom half of the crankcase easily.

Sometimes there is a pair of substantial saw horses available and these may be utilized as shown at C. They are spaced apart, the distance being determined by measuring the motor arms. After the engine has been removed from the chassis and set upon the supporting members, strips should be nailed to the saw horses as depicted in the drawing.

If the plan of overhaul calls for the removal of the wheels and extensive work upon the chassis, supports should be constructed for the front and rear axles. If the machine has been jacked up for the winter and wooden supports utilized, these may be used in the overhaul. If the garage be not equipped with these members a set should be made, and at Fig. 1 is presented a substantial support which may be made from two-by-four joists. Six pieces are required. The first step is to cut two members and fasten together as shown at A. The member B is recessed at one end as indicated and the wheels measured to provide for the proper height. This may be accomplished by measuring from the centre of the hub cap to the ground and adding about three inches so that the tires will clear the floor when the supports are in place. The member B is then nailed to A as shown, and three braces made as outlined at C.

Four of these supports are constructed, one for each wheel, and when the chassis is raised from the floor will facilitate the examination of the steering gear and connections, bearings, etc., as well as adjusting these members after overhauling.

In connection with the work it is an excellent plan to secure several wooden boxes for the nuts, bolts, etc., and by using a number and marking these according to the part of the chassis dismantled, the work of assembling will be made easier and considerable time saved that would otherwise be lost in searching for the proper nut, etc.

GEAR SHIFTING HINT.

With some multiple disc clutches, especially in cold weather, the operator experiences more or less difficulty in effecting a change of gears. This is especially true when starting from a standstill and the

Digitized by Google

first speed is utilized. The same trouble is experienced as when in going from the low to the second. This is usually caused by engine shaft revolving at too great speed, or in other words the motor is being fed too much gas, even with the throttle apparently fully closed.

If the carburetor be examined it may be found that the locking device or set screw that regulates the closing of the throttle valve will permit of shortening or lengthening as the case may be so that the amount of mixture fed to the cylinders may be cut down. The locking member should be loosened and the screw adjusted with the motor running until the engine operates as slowly as possible without stopping. If the valves be seated properly and there are no leaks in the induction members and the mixture correct, a motor should throttle down so that the explosions may almost be counted. In making these changes the leads connecting with the lever on the steering wheel will have to be shortened or lengthened as needed to compensate for the change made at the carburetor.

After making these adjustments the car should be tried out and the speed changes should be made easily without the clashing of gears as formerly. In connection with the multiple disc the average operator is apt to neglect this member, not cleaning it until the gear changing becomes troublesome. It should receive attention after being operated a certain number of miles.

ROCKING THE MAGNETO.

When the careless methods employed by many motorists in cranking the car are considered the number of accidents are remarkably small. Much has been written and said relative to the proper way of starting a motor, but in spite of the warnings the automobilist continues to endanger his bones. Some cars are fitted with a dual ignition and this arrangement sometimes breeds carelessness upon the part of the operator, who when his batteries become exhausted relies upon the magneto if it be of the true high-tension type. Some cars will start with this device upon a quarter-turn of the starting handle while others require spinning. To obtain momentum enough some drivers push down on the starting handle. While this is bad practise, what is worse is to rock the handle up and down as in testing the compression.

The construction of a magneto is such that when the armature reaches a certain point the current produced is at its maximum or the point where ignition takes place. If the spark occur before the piston has reached the top of its stroke or dead centre, the result is a premature explosion or a backfire. The rocking motion being a slow one and the piston not being brought up to dead centre or enough energy being brought to bear on the starting handle to cause the piston to pass by this point, the result is that the starting handle flies backward or anti-clockwise, endangering the operator.

FREEZING PUZZLES THE OPERATOR.

An unusual case of the steering gear freezing was noted recently and for a time it puzzled the operator. The car had just come off the washstand when the owner appeared in the garage and took the machine out. It was an exceedingly cold day and after driving a short distance the operator noticed that steering became more and more difficult. Finally it became so bad that the vehicle was almost uncontrollable. In response to a telephone message to the garage a workman appeared and by setting upon the dash he and the owner managed to steer the car back to the garage.

The front wheels were jacked up and an examination of the steering gear and connections made. It was found that the wheels responded more easily to the steering member and a further examination developed the fact that ice had formed on the steering connections. After this had been thawed out the machine operated as well as could be desired.

CARE OF THE STEERING GEAR.

The failure of any part of the steering mechanism is, without exception, the most serious mechanical accident which can happen to a motor car. A failure of the steering control is almost sure to result in an accident of more or less severity, and too great care cannot be exercised in keeping all of the connections in a perfectly secure condition and the moving parts well lubricated. Backlash, or lost motion, should be eliminated as far as possible. After a car has been used for some time, it may become necessary to correct this looseness by adjustment of the joints or other parts. Means are usually incorporated for the taking up of the lost motion and in performing this work the front wheels should be jacked up to test the mechanism which should not be adjusted too snugly. If the spindles be worn these should be bushed to eliminate the side play which might become dangerous especially in the spring when the roads are full of deep, frozen ruts. Under such conditions the strain upon these members is unusual.

WILL MAKE ELECTRICS.

William E. Pratt of the Pratt Manufacturing Company, Joliet, Ill., has purchased the personal property of the Economy Motor Car Company of that city, and expects to acquire the real estate owned by it as well. It is announced that Mr. Pratt will turn his attention to the manufacture of electric vehicles of the light delivery and roadster types.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

Insulating Magnetism.

(1343)—Has any substance been found that will insulate magnetism? G. F. LEWIS.
Renfrow, Okla., Feb. 25.

As far as the writer can ascertain from reliable sources there is none.

Proper Wiring.

(1344)—I have a two-cylinder, four-cycle automobile and employ dry cells for ignition. Will you advise me as to the proper wire to use? Shall I employ a high-tension cable or a low-tension wire, and which is the best? I. K KIRTTEN.
Kenyon, Minn., Feb. 20.

Wires utilized in connection with the ignition systems of motor cars are distinguished by their insulation. These are termed primary and secondary. The former may be recognized usually by their size, being much smaller in diameter than the other type, and this is due to the insulating material employed.

The primary wire does not require as large an amount of insulation because the current which flows through the copper strands is a primary current. This type of wire is suitable for connections from the batteries to switch and frame. The high-tension wire or cable, as it is sometimes called, is employed to convey the electricity from the coil or magneto where the primary current in the former has been built up or strengthened, which is brought about by the windings in the coil. This is necessary to enable the electricity to jump across the gap of the spark plug. This current seeks to escape and to prevent this the metal wires are covered with several layers of rubber and specially prepared material.

This form of wire should be employed in connecting the terminals of the coil and those of the spark plugs, and from a high-tension magneto to the plugs. If primary wire were utilized the electricity would escape, jumping to the nearest metal or ground, and would not cross the gap of the spark plug as previously explained.

Loss of Power.

(1345)—A small car loses power, or at least does not develop that which it should. Will the replacing of the present piston rings with new members develop the power expected? Are new valve springs fitted frequently to save compression? Will a carbonized condition of the engine cause a depreciable loss of power? L. A. ENOS.
San Luis Obispo, Cal., Feb. 29.

Loss of power may be the result of a number of causes such as poor compression, faulty ignition, valves not seating properly, valves out of time, etc. The fitting of new rings will improve the power if the old members are worn badly, but the gain would not warrant the expense if the cylinders were scored badly or worn out of true. As to grinding the rings the writer believes that they should be stoned smooth before fitting to the cylinders unless they are already ground by the manufacturer. This may be accomplished with an oilstone and it is an easy matter to polish them. New valve springs should be fitted when the old members have lost their elasticity, but this is not common, as when constructed properly these members will give long and efficient service. If a motor be carbonized it should be cleaned. Carbon will cause a loss of power and when there is a large amount present preignition is likely to occur and create trouble.

Relative to the Knight Motor.

(1346)—Will you kindly inform me what automobiles are equipped with the silent Knight engine? What machines are fitted with the electric starting device, same as is employed on the Cadillac, and what makes, if any, furnish the Edison instead of the Exide battery, for storing the current? HORACE P. TOBEY.
Wareham, Mass., March 1.

The machines licensed in this country to fit the Knight engine consist of the Columbia, Stoddard-Dayton, Stearns, Atlas and Edwards, the latter having been announced recently. Regarding the machines fitted with the Delco starting and lighting system the Dayton Engineering Laboratories Company, Dayton, O., maker of the device, could supply the necessary information. As to the battery, the Edison Storage Battery Company of Orange, N. J., would be the proper concern to give the information required.

Dual Ignition.

(1347)—Will you please explain the dual ignition? I visited the Boston show recently and secured a number of catalogues and note some makers state their car is fitted with dual ignition consisting of battery and high-tension magneto, but the cars I looked over had but one set of spark plugs and no timer or distributor. Another machine has two sets of plugs and both a magneto and dry cells. One representative informed me that his machine had a dual system, but it was fitted with a magneto and a single unit coil. J. E. RATHBUN.
Wood River Junction, R. I., March 5.

The term dual ignition is not generally understood and as employed is slightly misleading. This same holds true of magnetos, as some of these are called high-tension when they generate a low-tension current which is built up by a coil or a transformer. Many machines are fitted with magnetos alone and their construction is such that the current from dry cells or storage battery may be employed through the distributing mechanism for starting and operating the motor and this form is called a dual ignition system. The true dual ignition, however, consists of

Digitized by Google

two separate systems, one operated by cells or storage battery, timer or distributor, and coil, and connected to a set of spark plugs. The other member is a true high-tension magneto with wires leading direct to the other set of spark plugs. The advantage of such a system is obvious. Should the magneto fail to operate the battery and coil system could be utilized or vice versa.

Choice of Ignition.

(1348)—I have a four-cylinder car which is equipped with a timer, four-unit coil and storage battery for ignition. The coil has been giving me considerable trouble and as I am about to overhaul the machine, am thinking seriously of changing the ignition to a distributor and single coil or a magneto. There is a place to attach a magneto. Which would you advise?

W. R. BROWNING.

Stonington, Conn., March 7.

Disregarding expense the magneto would be preferable. These may be obtained of the true high or low-tension type, but with the latter a step-up coil or transformer would be necessary. With the former a coil could be dispensed with and the motor started without a battery system. The writer suggests retaining the old coil and fitting another set of spark plugs for the magneto, which arrangement will provide dual ignition. The exhaust valve caps could be drilled and tapped for fitting the plugs connected with the battery system and the usual members employed for the magneto. In ordering a magneto care should be exercised to state whether it is to be driven clockwise or anti-clockwise. Any maker of magnetos will give information as to the best model to employ with the car as the make is not stated.

High Speed Slips.

(1349)—I have a two-cylinder ——— car fitted with a planetary transmission, and of late the high speed slips in starting and after a while it grips all right, but slips when I open the throttle. I have tightened it up, but it still slips. I adjusted it once so tight that the car started ahead with the brakes off and besides it makes the engine hard to crank. Can you advise me as to what is the trouble?

W. L. TUCKER.

Westerly, R. I., March 8.

The trouble would indicate that the high speed plate is cracked or broken and this member should be examined. It will be impossible to repair the break satisfactorily and will be cheaper to install a new one, which is not expensive. The reason the clutch slips is that the plate spreads when an attempt is made to lock it. To install the new part it will be necessary to remove the transmission and dismantle the member. It is impossible to assemble it improperly as it will only go together as it should.

NEW REMY SERVICE STATIONS.

Arrangements have been completed with Child, Day & Churchill, Inc., Spokane, Wash.; Washington Auto Supply Company, Seattle, and the Archer & Wiggins Company, Portland, Ore., to act as Remy service stations in their respective cities. Each station will handle a full complement of the products of the Remy Electric Company, Anderson, Ind.; retain a corps of skilled ignition experts, and in every way care for the users of Remy equipment. This is following out the announced policy of the Remy company to establish service stations in all large centres.

EDISON GARAGE IN BOSTON.

Plans are announced for the erection of a private garage for electric and gasoline cars by the Edison Electric Illuminating Company, Boston, which is to be one of the largest, if not the largest in the country. Accommodations will be provided for 150 cars, and the structure will be located on Massachusetts avenue, near the tracks of the New York, New Haven & Hartford Railroad.

The building will face Massachusetts avenue at a slight angle, and will have a depth of nearly 340 feet and a width of 110 feet. The front portion will be three stories in height and the rear only one. In reality it will be two buildings, as the two sections will be entirely separated by a wall.

The front portion will be 110 by 80 feet, and the ground floor will be utilized for the storage of gasoline cars, space being provided for about 50. There will be all the modern facilities for handling these machines, including washing, polishing, filling with oil and gasoline, etc. Additional garage space for about 20 vehicles will be arranged on the second floor, reached by stairs and automobile elevator. The remainder of this floor is to be reserved for the use of chauffeurs. On the third floor will be located the repair shop and paint room, so that all necessary work can be done on the company's premises.

The electric vehicle garage in the rear is to be 110 by 250 feet, with entrances on the sides and end. Four rows of vehicles can be stored on the floor with plenty of room for handling the smallest runabout or the largest truck. This garage will accommodate at least 100 vehicles. Besides the usual facilities for washing, etc., there will be ample opportunity for charging batteries, and for removal and replacing these.

Next to the garage on one side will be the stock building of the company, where all supplies, except the heaviest, will be carried. There will be a street between the garage and the stock building, although this will be covered by glass, the idea being to make it possible to load motor vehicles with the greatest dispatch. As much of this work is done at night, the covered street will aid materially in having the cars ready for the morning deliveries.

Still another building for the heavy stock will be located just beyond the first stock building. The entire group will be lighted by electricity supplied by a transforming station still further back. Merchandise will be received from a spur track, and it is expected that the plant will be completed ready for occupancy within the coming year.

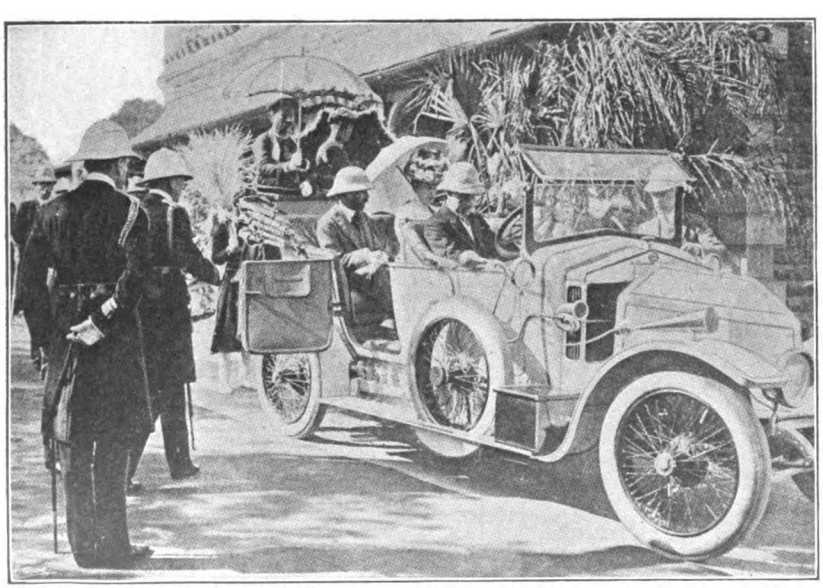
The president of Uruguay has sent to Congress a bill to place certain omnibus motor cars intended for public service on the free list. The proposed law consists of one brief article, as follows: "Omnibus automobiles capable of carrying more than eight passengers and intended exclusively for public service are hereby exempted from the payment of customs duties."

In his message to Congress concerning this bill, the president advocated its immediate passage in order to enable the rural districts to obtain rapid and inexpensive transportation. As soon as the law is passed a firm expects to place two automobiles in trial service between the cities of Fray, Bentos, Mercedes and Dolores.

★



Previous to Nov. 30, 1911, motor car chassis and parts, the product of British manufacturers, were admitted into the commonwealth of Australia free of customs duty. The new revised tariff went into effect on that date, since which time British chassis have been paying a duty of 10 per cent., while those of foreign make pay an additional fee of five per cent. Parts of chassis, in no way assembled, are still admitted free from Great Britain.

An accompanying illustration presents King George V and Queen Mary of Great Britain in a Siddeley-Deasy car, upon the occasion of their recent visit to India for the purpose of being crowned Emperor and Empress of India. The photograph was taken in front of the residence of the chief commissioner of the central provinces.

★

The winner of the Winter cup in the annual winter trials of the Royal Automobile Club of Sweden early last month, has been announced as Capt. John Neren with an Opel car. As is well known the route lay from Stockholm to Gothenburg and return, a distance of approximately 600 miles. Owing to the severe cold weather and the poor condition of the roads, the results this year were not as satisfactory as has been the case heretofore, and it was some time after the close of the contest before the judges were prepared to announce their finding.

King George and Queen Mary of Great Britain in a Siddeley-Deasy Car During Their Recent Visit to India.

Ten cars completed the trials without penalization, but with one exception all these were marked for failure to meet the schedule. Capt. Neren's Opel was the exception, so that his was the only perfect score. The Gothenburg cup, for light cars, went to H. Karlsson in a Darling, while the King's cup, a special prize for cars of Swedish manufacture, was taken by Nies Lundberg in a Vivinus.

The classification of the drivers and cars at the close of the contest for large machines follows: First, Capt. Neren, Opel; second, H. Hjellgren, Vauxhall; third, W. E. Klund, Mathis; fourth, Has Osterman, Minerva; fifth, C. Johansson, Cadillac; sixth, N. L. Lundberg, Vivinus; seventh, Hugo Falck, Fiat; eighth,

C. Shurmann, Minerva; ninth, Mr. Andrezen, Benz; 10th, Erik Akerlund, Mors; 11th, P. C. Kidner, Vauxhall; 12th, Carl A. Eck, Pope-Hartford.

★

It is expected that the action of the Russian government in granting triptyques will result in increased touring in Russia and Finland during the coming summer. The duty on cars with four seats or more is about $117, and the decision of the officials to adopt the same method employed in other Continental countries will make it possible to enjoy a new touring country without meeting this expense.

★

Numerous motor agricultural implements were shown in connection with the annual cattle show in Paris last month. As in former years the live stock was displayed in the Grand Palais, while the motor equipment occupied nearly the whole of the Esplanade des Invalides. America was represented by the J. I. Case Threshing Machine Company, Racine, Wis.

Several tractors and motor plows were exhibited, but it is possible that none attracted more widespread attention that the vehicle from the factory of Heinrich Lanz, Mannheim, Germany, shown in an accompanying illustration. The chief distinguishing feature about this machine, aside from its size, is the method of operating the plow.

As is well known the usual form of plows is such that the act of turning over the earth has a retarding effect upon the motor. In the Lanz machine, the plowshares, if such they may be termed, are designed to dig into the ground and throw the earth backward. This has just the opposite effect from ordinary, in that the plows aid in pushing the machine forward. This is a result of much experimentation.

Lanz Motor Plow Displayed at the Annual Cattle Show in Paris.

The engine is rated at 70 horsepower, and is a four-cylinder unit. Self-starting is accomplished by means of compressed air, stored in a large vertical tank by the vehicle motor. Parallel with the motor shaft is a secondary shaft geared down in relation to the first, from which the drive is taken to the live axle of the rear wheels by means of a single chain. From the outer end of the secondary shaft, a long enclosed chain transmits power to the rear transverse shaft carrying the revolving blades.

★

The deputy postmaster-general of Australia has announced the purchase at Melbourne of a motor car for $2750, which will be utilized in the transportation of mails between the postoffice, railway station and steamers at Hobart.

★

J. D. Ellis, mayor of Johannesburg, South Africa, is deeply interested in the matter of mechanical transportation and has given the subject extensive study. He declares that no firm of any size can carry on business economically without the use of motor cars. It would appear that an excellent market is being worked up for automobiles, both of the pleasure and commercial types, in the Transvaal.

★

An item of some interest to motorists comes from Germany in the announcement that the German navy is about to test a Diesel engine on its warships. The type has been improved somewhat, and has the approval of several expert engineers in that country. The advantage of using an internal combustion engine in such work is that boilers and stacks would be abolished, thereby giving considerable additional space for the disposition of ammunition, etc. Some of this room would be the result of dispensing with coal bunkers, as it is estimated that a Diesel engine will require less than half a pound of oil a horsepower-hour. The principle object of the experiments now under way is to secure perfect combustion to enlarge the cylinder units and to solve the problem of having the explosion transpire on both sides of the piston. German engineers claim to have obtained satisfactory results.

★

An exporter of automobile supplies and accessories on the Mediterranean has informed the American consular agent that he desires to get in touch with American firms manufacturing any of the following articles: Horns and alarm signals, lamps of all kinds, windshields, repair kits and tools, bolts, nuts, washers, oil cups, pumps, solderers, soldering lamps, holders for flower vases, drinking cups, clocks, speaking tubes, speed indicators, cyclometers (marked in kilometers), vulcanizers, steering wheels, jacks, springs, shock absorbers, ball bearings, goggles and a general line of fittings of any kind applicable to the automobile. The

address may be obtained of the bureau of manufactures, Department of Commerce and Labor, Washington, D. C.

★

The report of the Department of Commerce and Labor for the year ending Dec. 31, 1911, shows that the exports of motor cars and parts increased from $13,190,296 to $19,178,484, or practically 46 per cent. during the past year, while the imports have dropped from $2,737,208 to $2,446,248, a decrease of about 10 per cent. Canada still remains America's best customer in this respect, the figures for that country being $5,549,998 for 1911, or more than 25 per cent. of the total. The following tabulation gives the number and value of automobiles exported and imported during the year, so far as these figures are given by the report:

Exports

	1910		1911	
Country	No.	Value	No.	Value
United Kingdom	...	$2,755,592	4,021	$3,380,266
France	...	753,204	420	449,757
Germany	...	331,754	115	124,615
Italy	...	377,750	176	199,986
Other Europe	...	764,463	795	718,360
Canada	...	5,021,043	4,987	5,549,998
Mexico	...	689,903	298	492,974
West Indies	...	412,588	300	343,281
South America	...	519,160	1,116	1,356,445
British Oceanica	...	748,933	2,476	2,217,762
Asia	...	599,756	813	795,576
Other countries	...	216,150	280	295,341
Totals	8443	$13,190,296	15,807	$15,924,361

Imports.

	1910		1911	
Country	No.	Value	No.	Value
United Kingdom	94	$212,969	173	$403,506
France	556	1,066,356	341	770,643
Germany	129	314,577	160	350,239
Italy	169	312,478	131	203,733
Other countries	76	174,175	167	370,360
Totals	1024	$2,080,555	972	$2,098,481

By comparison of these figures, it is noted that the value a car of those exported during the last year was about $1000, whereas those for 1910 averaged $1550 each. If the figures for 1909 be included in the comparison, the average price for that year was $1675. In the matter of imports the valuation has been drifting the other way, the figures showing: Average value for 1909, $1875; 1910, $2000; 1911, $2100.

It also will be noted that the so-called American invasion has had its effect upon the British possessions. Canada has done little more than hold its own, but the British Isles and British Oceanica have been purchasing American cars in so much larger proportions that the total gain is approximately 31 per cent. for the year.

The most notable increase is in connection with South America. In 1909 automobiles to the value of $225,263 were shipped to that continent. This changed very little in 1910, but the increase for 1911 is a little better than 196 per cent., indicating the advisability of exploiting this market.

At the February monthly meeting of the graduates of the Institution of Automobile Engineers in England, Harold Burchall gave an exceedingly interesting and informative paper on the subject of "Pneumatic Tires." The paper was illustrated with sections from tires, showing the effect of various classes of ill treatment, such as the rubbing of the side of the tire against the curb, rust on rims, admission of wet through cuts, etc.

Suggestions were given as to the best arrangement of non-skid devices on the four wheels with a view to meeting the various road conditions. Special attention also was drawn to the necessity of maintaining the correct pressure of air.

★

Cape Colony, South Africa, offers a splendid market for automobiles and motor trucks, according to recent advices from Cape Town. The interest is by no means confined to the cities, many prosperous farmers in the up-country districts having begun to invest in motor cars, some of them owning small fleets. Physicians and other professional men, whose business takes them long distances into the interior, are splendid prospects.

★

K-R-I-T cars, made by the K-R-I-T Motor Car Company, Detroit, Mich., are to be represented in Great Britain in the future by a local concern. The K-R-I-T Motor Car Company, Ltd., has been organized with offices at 24 and 25 Long Acre, London, W. C., and F. W. Berick & Co., Ltd., is acting as the London agent.

COLLEGE MEN AND TIRES.

According to W. D. Shilts, manager of salesmen for the Goodyear Tire & Rubber Company, Akron, O., the development of the finer details of the tire industry was never more forcibly exemplified than at present. "Rubber and tire manufacturers are reaching out in every direction for experts, for trained men," says Mr. Shilts. "The Goodyear Tire & Rubber Company has in its employ, in the experimental and other departments, not less than 17 alumni of Massachusetts Institute of Technology, to say nothing of those of other first class colleges. Tire makers realize that there is a difference between modern and old time business methods, and they are equipped accordingly. University men have had a great deal to do with bringing the tire industry to its present state of advancement and perfection. Goodyear university men could form a football team that would include names very well known on the gridiron, and their achievements in the laboratory are not less noteworthy."

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

PORTO RICO PROSPECT EXCELLENT.

Trade prospects in Porto Rico are excellent, according to John B. Tower, manager of the expert department of the United States Tire Company, New York City, who has returned from a visit to that island. He adds: "Every ship bound for Porto Rico has from two to six American cars, yet the residents do not seem to be able to get them fast enough. At present there are 726 machines owned on the island which has a population of 118,000. The island is a fine market for good cars. The rich can afford to buy them while the other class is too poor to pay any price. Practically all of the motor cars are American products. The roads are fine and provide excellent facilities for touring. Porto Ricans are extremely enthusiastic over the automobile and use them continuously." Mr. Tower visited the principal places and announces that the distributing point for United States tires will Be at San Juan.

BOWSER SALESMEN CONVENE.

Salesmen and officials of S. F. Bowser & Co., Inc., Fort Wayne, Ind., met recently in that city for the annual convention of the prize winning salesmen. The meeting occupied several days and representatives from all over the country were in attendance. A special issue of the paper devoted to the interests of the company was issued, and among matters of interest concerning the convention was the information that W. H. Brown of the Atlanta, Ga., office, won the loving cup and that J. W. Merickel, of Toronto; E. J. Klotz, San Francisco, Cal., and S. D. Stoddard of the same city, had won the honor of having their names inscribed on the bronze tablet that adorns the office wall at the factory. During the convention addresses were made upon subjects pertinent to the industry, and a feature was a banquet at which covers were laid for 125.

INDIANA ENGINEERS ORGANIZE.

Twenty-three automobile engineers met recently in Indianapolis, Ind., to effect a temporary organization of the Indiana section of the Society of Automobile Engineers. Those who will form the nucleur for the branch are: George Weidley, Premier Motor Manufacturing Company; William C. Wall, National Motor Vehicle Company; William H. Reynolds, American Motors Company; E. A. Ryder; Charles S. Crawford, Cole Motor Car Company; Chester S. Ricker; D. T. Brownlee, F. W. Spacke Machine Company; W. H. Buderus, mechanical engineer; Max H. Thoms, Nordyke & Marmon Company; A. W. Tyler, Jr., Auto Parts Manufacturing Company; E. E. White, American Motors Company; William Beaser, Whitmore Manufacturing Company; J. P. Kandel, Auto Parts Manufacturing Company; Henry G. Hoss, Vonnegut Machine Company; C. H. Mohler, American Motors Company; C. M. Barlow, F. W. Spacke Machine Company; Robert D. Zener, Premier Motor Manufacturing Company; Bruce Isthimer, B. F. Goodrich Company; J. O. Fink, Premier Motor Manufacturing Company; A. J. Schumacker, Atlas Engine Works; W. A. Englehart, Premier Motor Manufacturing Company; Karl Felicke, Motor Car Manufacturing Company.

REO INCREASES OUTPUT.

The daily output of Reo cars, made by the Reo Motor Car Company, Lansing, Mich., has been increased to 60, according to R. E. Olds, president of the company. This is due to the better financial conditions of the country and the selling organization of the R. M. Owen Company, New York City, distributor of the Reo line.

The demand of this concern for more machines means the addition of 2500 more workmen to the payroll of the factory, which now comprises seven large buildings, the distance around which is stated to be about a mile. The company maintains its own electric lighting plant and water works and the protection against fire is most modern. The telephone system maintained serves 120 heads of departments.

All vehicles are tested over a banked track, one-third mile in length including an incline of 30 per cent. leading to a trestle over the buildings to the shipping dock. Another large platform constructed recently provides loading facilities for 30 carloads of machines daily. Another recent acquisition is a dining room seating 750 employees. The Reo Motor Car Company cordially invites all motorists as well as those interested in the manufacture of automobiles to visit the plant through which they will be shown by competent guides.

SPLITDORF RACING DATA.

The resume of the racing season, the performances in the different events, are always of interest to the motorist. C. F. Splitdorf, New York City, maker of Splitdorf ignition specialties, has issued an interesting publication which contains a resume of cars fitted with his ignition in competition on road, hill and track and it provides a useful book of reference. It is copiously illustrated and the leading events of 1911 are depicted clearly. The records are authentic and exhaustive and summarized show that Splitdorf ignition has a record of 10 firsts, seven seconds, seven thirds in road racing; 84 firsts, 56 seconds, 30 thirds in track events; 45 firsts, 24 seconds, 16 thirds in hill climbs, and 29 firsts, 20 seconds and 16 thirds in beach races, besides victories in motor boat racing, motorcycle and aviation. A free copy of the brochure can be had upon application to C. F. Splitdorf, 138th street and Walton avenue, New York City, or at any of the branch houses.

ILLUMINATING THE ROAD AT CURVES.

Device for Swivelling the Headlights with the Road Wheels from the Driver's Seat---Lamps Also May Be Tilted for Reading Signs, Etc.---Simple and Efficient Solution of an Interesting Problem.

(By Joseph P. Fox.)

THE DESIRABILITY of arranging the headlights on an automobile so that they will swivel with the steering, thus illuminating a curve to be taken by the car, instead of first being obliged to turn the vehicle fully into the new path before the road can be lighted up, is well established. It is clear that a long range of brilliant light is absolutely necessary for the safety both of the occupants of the car and the other users of the highway. The road must be illuminated for such distance as to give the driver time to stop his car from high speed after an obstacle has been sighted. When travelling at say, 20 miles an hour, a distance of at least 100 feet is necessary, and this increases with the speed of the machine.

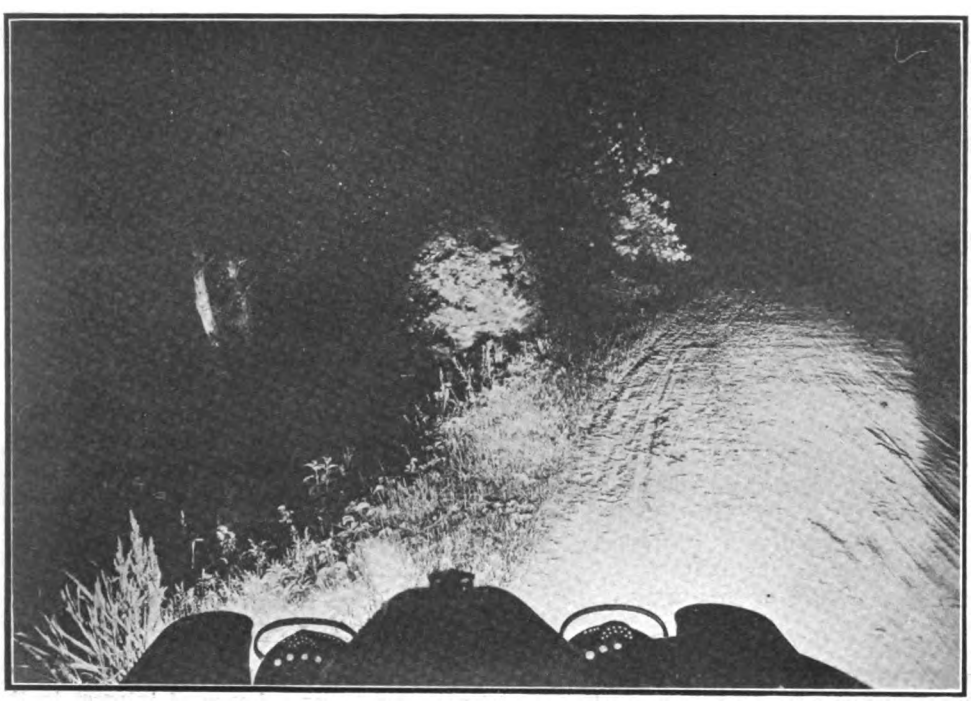

Fig. 1—Illustrating Position of Ordinary Lamps with Reference to Car About to Turn to the Left.

To secure such a light it is necessary to construct the reflector and lens in such manner that the beam of light shall be almost parallel. Of course a lamp of this character does not illuminate the sides of the road immediately in front of the car as well as one which is constructed to give a beam of greater diverging angle. It is because of this that side lights are employed on motor vehicles, in addition to the headlights.

The practical lighting value and length of the light beam decreases very rapidly as the angle of divergence is increased, therefore this angle in the side lamps also must be normal. These lamps, if well constructed, give good service in lighting the sides of the road, and in passing other users of the highway, but they are not sufficient to illuminate the path in turning corners.

It is stated by experts that even should the headlights project beams having an angle of divergence as great as 24 degrees, the light rays still would be insufficient to illuminate the curves, and that such a beam, unless the source of light were of unusual power, would not be able to illuminate the path sufficiently far ahead to be of any practical service on country roads. The lateral rays would be devoid of strength and such a beam would squander great portions of its light value. Furthermore, the blinding dazzle from a beam of such divergence would be dangerous.

It is the side reflected light which is so disagreeable and dangerous to pedestrians. The unreflected, almost parallel beam lights up the road so far ahead that it is possible to drive at full speed over a dark country road, and to people meeting this light, except when they are a long way in front of it and directly in the path of the car, there is no dazzle. As they come out of the parallel beam, they obtain light enough from the side lamps to see the sides of the road up to the mudguards of the vehicle.

Digitized by Google

From the driver's point of view, objects not well illuminated by the lamps are less visible than if no lamps were used, and the night around appears to be darker. One illusion about driving on a dark night is that of being on the approach of a blind corner where the road appears to end abruptly, this corner being the furthest point ahead to be seen. Accidents often are the result of having poor lamps or lamps with quick diverging beams, either of which makes it impossible to distinguish between the real and imaginary blind corner, or other danger. As a result, the driver, having become accustomed to the imaginary blind corners, is apt to take chances, which sometimes spells disaster.

Problem of Swivelling Lights.

With due consideration of these conditions, it is evident that lamps projecting almost parallel beams, so constructed as to swivel with the wheels and illuminate the road to be taken, are proper for power vehicles. But there are a number of important constructive features to be considered, as well as many difficulties to be overcome, in the production of a practical lamp device for swivelling the headlights, some of which may be enumerated as follows:

Absolute safety. Stability of the lamps in all positions and absence of vibration. Easy movement, avoiding any noticeable friction or pressure on the steering post. Light weight. Simplicity of construction; of attachment; of adjustment; of take up in case of wear without being obliged to renew the parts. Simplicity of operation. Enclosure of all moving parts. Symmetrical lines to conform with the fastidious requirements of modern motor car construction.

The writer has given this subject careful study and has invented the swivelling lamp device described and illustrated herein. It not only provides for illuminating the road in front of the vehicle at corners, but is so arranged that it is possible to deflect or disconnect the lamps by hand from the driver's seat. Moreover, it combines all of the elements above mentioned.

Advantages of Fox Device.

The danger of driving around curves in the night already has been commented upon. The illustration at Fig. 1 is taken from an actual night photograph and shows the inadequate lighting of a curve even with the best of lamps which are not made to swivel with the steering wheels.

As a matter of fact, there is no side street or curve in the picture, but the forward portion of the car is at the extreme left of the road, with the front wheels turned fully to the left and the remainder of the car partially so. Everything is in exactly the same position as if the machine had been steered toward a road to the left, and were about to be driven around a sharp corner in that direction. It is easy to imagine a road to the left in the photograph, and if such were the case it readily may be seen that it would not be illuminated to the satisfaction of the driver.

Fig. 2 presents a car fitted with the Fox swivelling lamp device, and it will be noted that the headlights are turned so as to project their beams fully in the direction which it is desired to take. Of course, there are other devices upon the market which aim to bring about this condition, but it is not the object of this discussion to enter into the comparative merits of these inventions. Special interest attaches to the methods employed in bringing about the desired results in this construction.

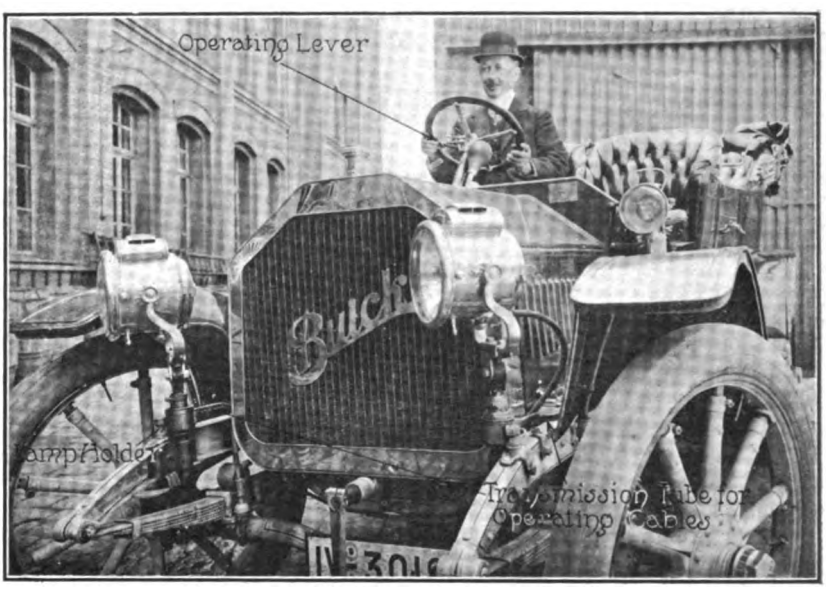

Fig. 2—Car Equipped with Fox Swivelling Lamp Device About to Turn to the Right.

It has been stated that this device is operated from the driver's seat. Fig. 3 shows the operating mechanism at this point, the movement of the lamps in a lateral direction being accomplished by the lever mounted on the steering column as indicated. Fig. 4 brings this out still more clearly.

The lever 1 is pivotally connected to a sleeve 2, or to a bracket-like projection thereof, by which the lamps are driven. It will be seen that the outer end 3 rests against a spoke 4 of the steering wheel 5 in such manner that it can be disconnected instantly. When in the position shown in the drawing, any movement of the wheel will carry the lamp controlling device with it, thereby turning the lamps when the road wheels are turned.

This lever is firmly pressed against the spoke by the spring 6, arranged about a pin 7. This portion

Digitized by Google

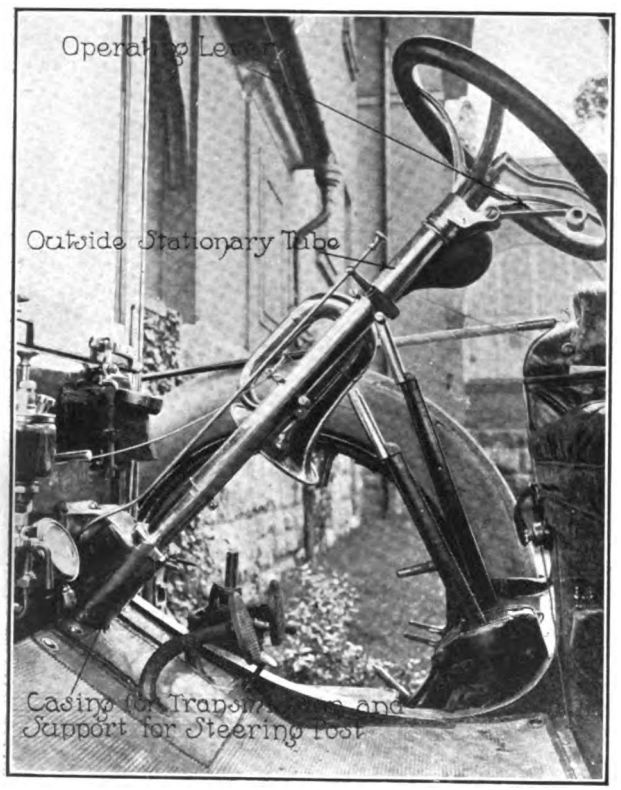

Fig. 3—Steering Column Equipped with Fox Lamp Turning Device.

of the mechanism is of spring steel, so that it is possible to release the clutch, as it is termed, automatically, when excessive resistance occurs in consequence of any part of the mechanism for adjusting the lamps becoming clogged. In this manner all danger to the occupants of the car, due to the possible breakage of the lamp adjusting mechanism, is avoided.

It is preferable, particularly when rounding corners at high speed, to turn the lamps more quickly than the road wheels, and to this end suitable gearing is interposed. In the drawing at Fig. 5 A, the required ratio of transmission is obtained by proportioning the pitch of the threads 12a of the sleeve 12 and the screw wheel 13. Consequently the rotation of the lamps throughout their entire angle of deflection is terminated earlier than the slewing of the wheels. Thus it is that the lamps are ready to throw their beams into the road ahead, before the road wheels are fully steered around the curve or corner.

Disconnecting the Lamps.

When the lever 1 is in the position shown at Fig. 4, it is impossible for it to free itself and jump between the spokes of the steering wheel, because of the set screw 10, abutting against the extension of the sleeve 2. Arrangement is also made for putting the device out of action when it is desired to drive in the daytime or in lighted streets, where the swivelling lamps are not needed.

In this case the end 3a of the lever 1 is rocked downward out of the position shown at Fig. 4, when the adjusting mechanism is disengaged from the steering gear and the lamps remain arrested in their middle position. Obviously, the lever can be actuated by hand in every intermediate position in a convenient manner for turning the lamps. If they are to be arrested after this lever has been disengaged from the steering wheel, this can take place in the lower position of the lever by hooking its outer end into a suitable hole 11a in the fixed steering column 11.

To recapitulate: It will be seen that the lamps may be placed stationary, or instantly connected with the movements of the steering gear to follow automatically the angle of the road wheels in lighting the curves before the car has entered them. In addition, the lamps may be deflected by hand or foot, independently of the steering gear, so as to make it possible to read mile stones, sign posts, street names, house numbers, etc.

How Lamps May Be Tilted.

This is a feature which will be appreciated by all who have travelled by motor car in the night season. It is decidedly disagreeable to be obliged to leave the machine and hunt around in the dark with matches or small lamps to find and read the necessary directions. The convenience of being able to utilize the headlights of the car for this purpose is evident, especially when this may be accomplished by the simple movement of a lever near the driver's seat.

That portion of the device which enables this deflection of the lamps is outlined at Fig. 5C, and comprises a cable 23a connected with the lamps in a manner described later with reference to the lamp holders. This cable is attached to arms 20a of the lever 20, and is guided in the tube 14 to the pulley

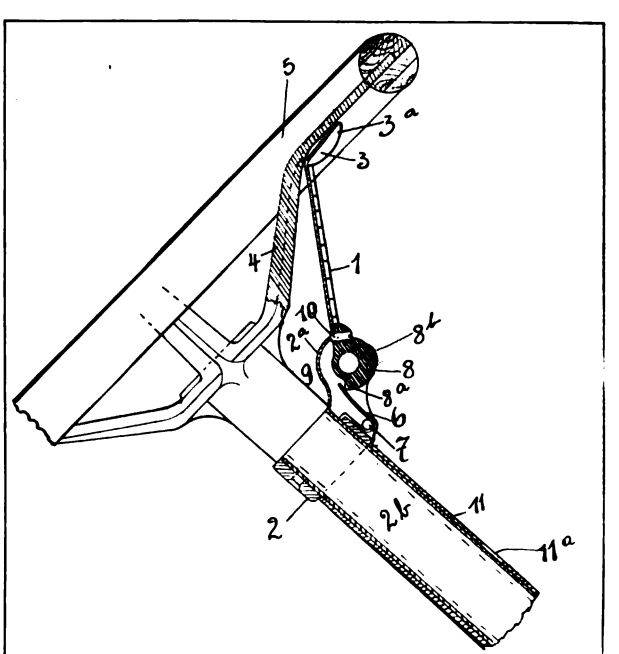

Fig. 4—Operating Lever and Mechanism of Fox Lamp Control.

Digitized by Google

35 of the lamp holder, Fig. 5D. The arms 20a are connected with the lever 20 by means of a shaft. This lever is within easy reach of the driver's seat and may be operated either by the hand or foot. When it is operated, a suitable tooth is let into the various holes or recesses 18a of the case 18, corresponding to the different position of the lamps.

The Lamp Holder.

In Fig. 5D is shown the manner in which the motion of the driving mechanism is imparted to the lamps. The holder consists substantially of two parts —the lower outwardly screw threaded casing 24 for screwing into the bracket, and the upper rotating part 30, into which is led one of two flexible shafts 23. An inner tube 32 is connected with the upper part 30 by means of screws, and serves as a guide for the hollow supporting stem 33 of the lamp fork.

upward for reading signs, etc., but downward, so that it is possible to deflect the blinding light from the eyes of other users of the highway, when passing through cities and towns. This is a feature which eliminates the necessity for extinguishing the headlights, or reducing their brilliancy by means of other attachments.

The outside of the rotating part 30 is provided with an annular groove 30a, in which the ropes 23 and 23a are placed before this part is inserted in the casing. The cable 23 is for the purpose of swinging the lamps in a lateral direction, while cable 23a operates the tilting mechanism, as previously explained.

Operation of Swivelling Action.

At A and C may be seen the tubes 14 in which these ropes are conveyed to the lamp holder. It also will be noted in D that the cable 23 is placed in the

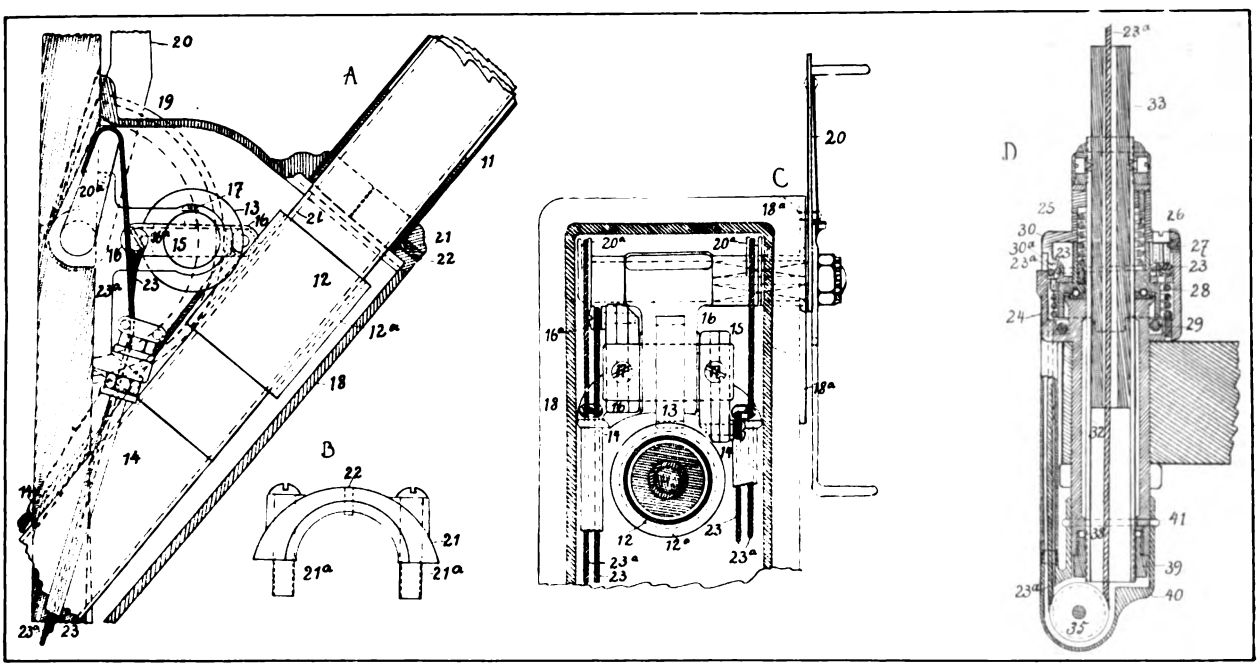

Fig. 5—A, Transmission Mechanism; B, Clamp for Holding Casing; C, Device for Tilting Lamps; D, Lamp Holder.

The rotating part is mounted on ball bearings 38, which serve as an abutment for the nut 39, screwed on the tube 32 and prevent the rotating part from being lifted. Another set of ball bearings is interposed between the intermediate member and an inner lug of the casing 24, this serving to support the lamps and rotary parts. By this arrangement the heaviest lamps may be turned as easily as those of the lightest construction.

The lamp is tilted in the following manner: By moving the lever 20 upward the cable 23a is pulled out of the tube 14. As this cable passes over the pulley 35 in the lamp holder, it pulls the lamp either upward or downward, according to whether it is attached to the rear or front portion of the lamp. Reverse action is accomplished by means of a spring. It will be seen that the lamps not only may be tilted

annular groove 30a and is wound around the screw 26, the purpose of which is to provide tension for the rope. The set screw 27 prevents the screw 26 from turning backward.

In the casing 24 are arranged two set screws 29, which limit the rotation of the intermediate member, by being able to strike against a lug on this member. Obviously, an uneven adjustment of these screws will affect the angle of rotation toward the one or the other side. A spring 28 is arranged in the fixed casing 24, which always tends to rotate the lamps in one direction.

The lamps are turned in the opposite direction by the tension of the rope acting against the spring. The mode of operation is therefore, that the rotating part is first driven by the rope and, through the medium of the intermediate spring 25, drives with it the

Digitized by Google

intermediate member under the tension of the spring 28 until the stop lies against one of the set screws. The rotating part continues then to move against the tension of the spring 25. In order to load the steering gear as little as possible, the arrangement is such that the springs 28 of the two lamp holders act in opposite directions, and the ropes 23 are mounted correspondingly.

Transmission Mechanism.

Referring again to Fig. 5A: It will be noted that the screw 12a is rotated by a tube 2b on the steering column, working against a screw wheel 13. The cables 23 are attached to bearings 16a at opposite sides of the so-called screw wheel 13. These bearings are so situated at the ends of the crank arms 16, which turn with the axle 15 in such manner that when one rope is pulled the other is let loose. These bearings are arranged so as to be moved and regulated as required in order to secure the desired rotation of the lamps on different cars. When adjusted by screwing either in or out of axle 15, the position of the crank arms 16 is then secured by the set screw 17.

A case 18, to cover the transmission mechanism, is constructed to serve at the same time as a holder or bearing for the steering post and to hold the outer tube 11 in the latter stationary. This tube 11 serves as a bearing for the outer rotary tube of the steering post and also as a stop or holder for the lever 1 in its lowered position, when the lamps are to be disconnected from the motion of the road wheels and held stationary. This tube may be held tightly to the case by means of a clamp in the form of a half-ring Fig. 5B, which is screwed to the case in such manner by screws 21a that it presses tightly against the tube. A pin 22 on the inside of the half-ring prevents the tube 11 from turning.

This device has received much favorable indorsement, both in America and abroad, and it may be mentioned that the well known lamp firm of Herm, Riemann, Chemnitz, Germany, has undertaken its introduction for the European market.

CHANGE IN TIRE SELLING POLICY.

A radical change in the selling policy of the United States Tire Company, New York City, is announced Formal notice has been posted in all of the company's 26 branches in various cities from New York to San Francisco, stating that in the future no automobile tires will be sold at retail by this concern.

This voluntary retirement from the retail field has been under consideration by the officers of the company for a long time. In finally declaring itself, the concern relinquishes a profitable trade, as all of its branches have done large business in dealing direct with the consumer. However, it was argued that this business rightfully should go to dealers in towns where these branches are located, and the move was determined upon accordingly.

In making this announcement to the trade, the United States Tire Company desires to show in a substantial manner that it appreciates the decidedly friendly attitude which dealers have manifested toward its line.

PITTSBURG CLUB ELECTS OFFICIALS.

At the annual meeting of the Automobile Club of Pittsburg, Penn., the following officers were elected for the ensuing year: President H. L. Mason, Jr.; vice presidents, E. J. Kent, W. N. Murray, W. H. Seif; secretary, P. C. Wolff; treasurer, W. A. Heyl; board of governors, J. C. Bragdon, A. E. Neidman, L. B. Fleming, F. B. Niweeds.

MANY JOIN TIRE SERVICE BUREAU.

That motorists are beginning to realize that a little attention given to tires is a profitable investment is shown by the large number of automobilists who have joined the service bureau of the United States Tire Company, New York City. The purpose of this department is to aid the consumer in obtaining the maximum service from shoes and to date over 17,000 names have been enrolled. Commenting upon this phase of the tire industry, J. M. Gilbert, general manager of the United States Tire Company says: "Adjusting departments of big tire concerns claim that about 50 per cent. of the tires discarded as unfit for service, are not actually worn out but have deteriorated through abuse or neglect, or both. Whether or not we accept this 50 per cent. estimate of tire waste in its entirety the fact remains that in America each year, enough money is thrown away through this channel to finance a couple of nations. The responsibility, in many instances, rests equally upon the tire manufacturer, the selling agency through which the factory product is handled and the consumer, the former because of negligence in acquainting the user with steps he should take to conserve the strength and prolong the life of his tires, the consumer for a tendency to disregard these rules even when they have been pointed out to him. While many purchasers of cars are posted upon their mechanism they give little if any attention to the tires and the result is incessant trouble.

PREMIER TOUR FILMS SHOWN.

The moving pictures of last summer's Ocean-to-Ocean tour of 12 Premier cars, made by the Premier Motor Manufacturing Company, Indianapolis, Ind., were shown in that city recently in the big assembly hall of the Claypool hotel. The pictures were explained by John G. Monihan, secretary of the tour. The hall was crowded and the exhibit proved exceedingly interesting. It will be shown in leading cities.

Advocate the use of lights on all vehicles using the public ways during the hours of darkness.

Consult and Consider AJAX FULL MEASURE Records Before Buying Tires

AJAX TIRES

"Guaranteed 5000 Miles"

Bulletins

No. 1

The Ajax Guarantee of 5,000 Miles has become the standard of FULL MEASURE for automobile tires. It is a **real** guarantee in every sense of the word; for it is not only more liberal than any other guarantee, but it is also more dependable and strictly adhered to.

No. 2

The best possible proof of Ajax Quality is the Ajax Guarantee. If Ajax Tires did not give mileage equal to the 5,000 Mile Guarantee, the manufacture of Ajax Tires would no longer be profitable to the makers.

No. 3

The real test of a tire is in long, rough road usage, as most motorists are tourists and not track racers. In recent years Ajax Tires have been the winning tire equipment in more reliability and touring contests than any other make of tire. This is a demonstration of their superiority for YOUR purpose.

No. 4

In every Glidden Tour they have entered, Ajax Tires have always made the best showing. In the 1911 Glidden Tour all four of the trophy-winning cars had Ajax equipment—and not one of the sixteen casings had to be replaced during the whole rough trip of 1454 miles.

Dealers Bulletin

There was a big business in Ajax Tires last year, and it will be bigger this year, for Ajax Tires are coming to the front on sheer merit. It will pay to form an early dealer connection with the winning tires.

SELECTING TOOL EQUIPMENT.

The small repair shop, and there are many of these, must always exist. Many owners of motor cars favor these establishments, because of the practical and skillful workmen, and the high class work performed at reasonable charges. This is due in a measure to the fact that the overhead expense is not as great as with the larger and completely equipped plant in the heart of the city.

These small shops usually make it a practise to send the greater portion of the machine work required to some outside firm, the amount of this depending largely upon the character of the work and

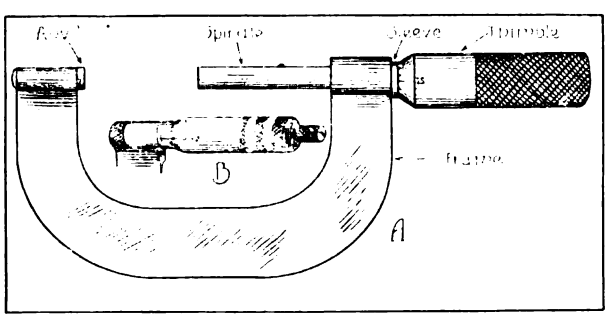

Fig. 1—Measuring Devices: A, Standard Form of Micrometer; B, Ratchet Stop.

the equipment of the garage. Some are fitted with a small foot lathe for light work while others are provided with better facilities for handling different grades.

In a thorough overhauling job there are more or less renewals to be made and some of these cannot be effected with new parts owing to their peculiar relation to one another. When the lathe is utilized to handle the piece, it is essential that the work be turned accurately and to accomplish this it is necessary that the operator be equipped with the proper measuring devices and have a knowledge of their use. It is the intention of the writer to present from time to time a description of the various tools needed to complete the equipment of the small garage, as well as to describe the uses to which they are adapted.

Micrometers.

Considering first the measuring devices: The workman should learn to understand thoroughly the necessity of close or accurate measurements. With the aid of a micrometer he will soon be able to detect differences in measurement down to one-thousandth of an inch. These instruments provide convenient as well as accurate means for fine external measurements and are made in different sizes and styles. They are graduated to read to thousandths of an inch, and one-half and one-quarter as well are estimated readily. Some of these instruments have verniers by which a still finer measurement may be made.

The chief mechanical principle embodied in the construction of a micrometer is that of a screw free to move in a fixed nut. An opening to receive the work to be measured, is provided by the backward movement of the screw and the size of the opening is indicated by graduations. A standard form is shown at Fig. 1 A, this tool enabling measurements up to one inch by thousandths.

Method of Use.

To use the micrometer the article to be measured is placed between the anvil and the spindle. The frame being held stationary, the thimble is revolved by the thumb and finger. The spindle being attached to the thimble revolves with it, and moves through a nut in the frame, approaching or receding from the anvil. The measurement of the opening is indicated by lines and figures on the sleeve and thimble.

The pitch of the screw threads on the concealed part of the spindle is 40 to an inch. One complete revolution of the spindle therefore moves it longitudinally one-fortieth or 25 thousandths of an inch. The sleeve is marked with 40 lines to the inch, corresponding to the number of threads on the spindle.

When the instrument is closed, the beveled edges of the thimble correspond with the line marked 0 on the sleeve, and the 0 line on the thimble coincides with the horizontal line on the former. If the microm-

Digitized by Google

eter be opened by rotating the thimble one full turn, or until the 0 line on the thimble coincides with the line of the sleeve, the distance between the anvil and

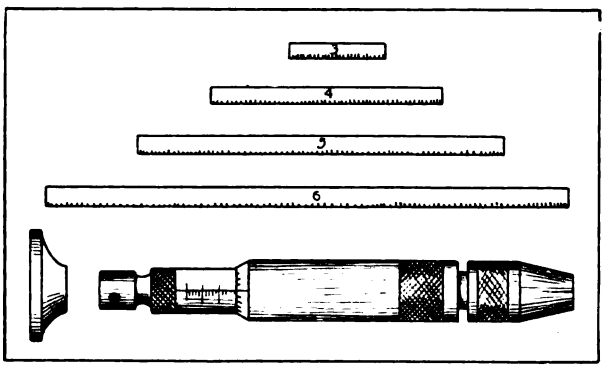

Fig. 2—Inside Micrometer Gauge for Making Internal Measurements, Such as Rings, Cylinders, Etc.

spindle is .025 inch, and the beveled edge of the thimble will coincide with the second vertical line on the sleeve. Each of the latter indicates a distance of .025, and every fourth line is made longer and is numbered 0, 1, 2, 3, etc. Each numbered line denotes a distance of four times .025 inch or .1.

The beveled edge of the thimble is marked in 25 divisions, and every fifth line is numbered, from 0 to 25. Rotating the thimble from one of these marks to the next moves the spindle longitudinally one twenty-fifth of twenty-five thousandths, or one thousandth of an inch. Rotating it two divisions indicates two thousandths, etc. Twenty-five divisions will indicate a complete revolution, .0125 inch.

To read the micrometer: Multiply the number of vertical divisions on the sleeve by 25, and add the number of divisions on the bevel of the thimble, from 0 to the line which coincides with the horizontal line on the sleeve For example: If there are 10 divisions visible on the sleeve, multiply this number by 25, then add the number of divisions shown on the bevel of the thimble, which is 10. The micrometer is therefore opened $10 \times 25 = 250 + 10 = 260$, or 260 thousandths.

Ratchet Stop.

At B is depicted a ratchet stop. When using this device the ratchet slips by the pawl when more than a certain amount of pressure is applied, thereby preventing the measuring spindle from turning farther and perhaps springing the instrument. It is adaptable where a number of measurements must be taken quickly and especially where they are taken by more than one person with the same device, as by its use the same amount of pressure is applied to the article to be measured, in every case.

Inside Micrometer Gauges.

The inside micrometer gauge shown at Fig. 2 is designed for making internal measurements, such as rings, cylinders, setting calipers, comparing gauges, etc. It is also well adapted for measuring parallel surfaces. It consists of a holder provided with a micrometer screw and thimble, and the former has a movement of .3 of an inch. By the use of the extension rods, measurements from three to six inches may be made by thousandths. The extension member varies by inches, and should be readjusted only when the points have become worn.

Depth Gauge.

The gauge depicted at Fig. 3 is utilized for measuring the depth of grooves, holes or irregular parts. It has a one-half inch movement of the screw, reading in thousandths, and with two one-half inch and one one-inch standard collars to slip off or on the spindle 2.5 inches, readings in thousandths may be obtained. The split nut is covered and protected by a graduated sleeve, which not only protects the nut from the dirt, but provides a quick and accurate way of taking up wear and adjusting the device to insure correct reading. The sleeves being held by stiff friction, may be rotated with a spanner wrench, so that the zero lines will always coincide for correct reading. The head carries with it a knurled set screw for locking the spindle to prevent changing after being set.

NOVEL TWO-CYCLE MOTOR.

The two-cycle motor is frequently referred to as the valveless engine which dispenses with a large number of working parts. In some designs, however, simplicity is obtained at the expense of flexibility. This is no doubt due largely to the desire of inventors to avoid the use of valves as much as possible.

Believing that efficiency should not be sacrificed to simplicity, E. H. Micklewood of Plymouth, England, has brought out a novel type of two-cycle motor which is depicted at Fig. 4, and it is claimed that the engine is quite as flexible as the average internal combustion motor of the four-cycle type. In the design the mixture is admitted to the combustion chamber under pressure, and it is interesting to note that the exhaust begins before the completion of the firing stroke, and

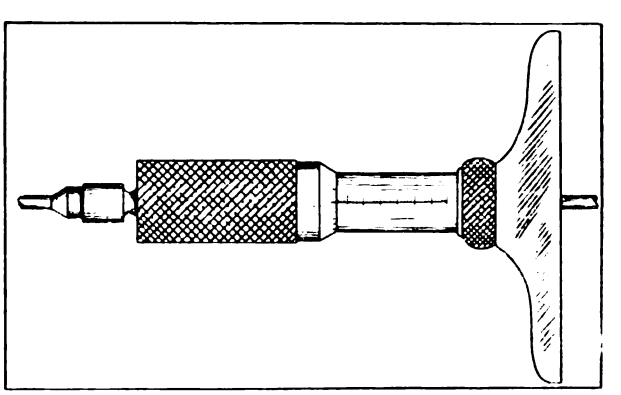

Fig. 3—Depth Gauge, Employed for Measuring Holes, Grooves and Irregular Parts.

that before the exhaust member is closed again a volume of fresh air under pressure is admitted to the cylinder to ensure the thorough scavenging of the

Digitized by Google

burnt gases. After this operation fresh mixture is admitted and compressed and exploded in the usual manner by a spark plug.

It will be noted that the piston is considerably longer than the usual type, and that its lower end is larger in diameter than the upper. The lower end is confined between the upper extension of the cylinder walls and the fixed sleeve which is shown in solid section. A reciprocating exhaust valve is fitted, this being operated by eccentric motion from the timing wheel. On the opposite side is located the intake member which consists of an air and mixture distributing valve rotated by a silent chain driven from the crankshaft at the speed of the latter.

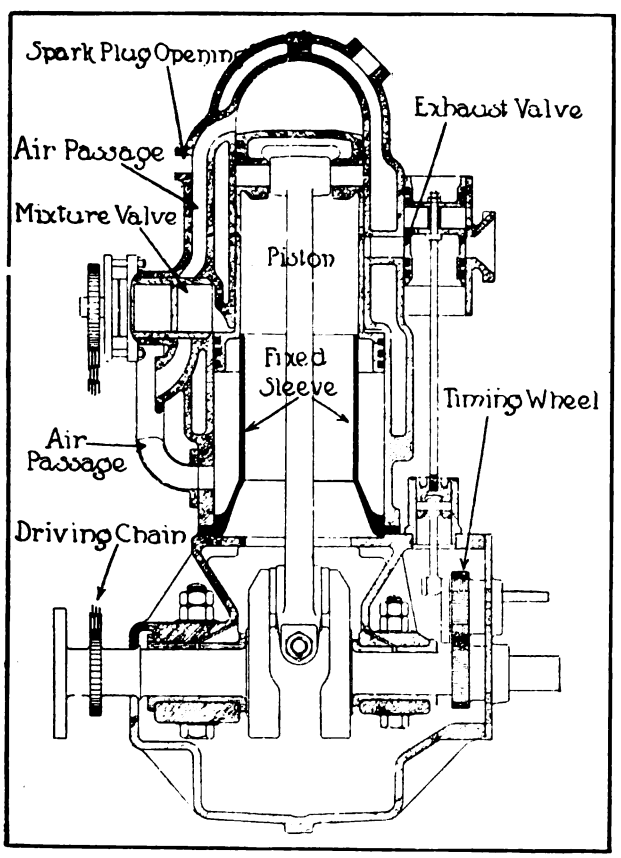

Fig. 4—Novel Two-Cycle Motor Utilizing Rotary Form of Distributing Intake and Exhaust Valves.

In the drawing, the piston is depicted at the top of its stroke, and from this point the cycle of the motor is as follows: Upon the explosion of the charge the piston is driven downward during which movement mixture from the carburetor is drawn into the space above the enlarged portion of the piston, pure air being compressed below it. At the completion of the stroke the rotary distributing valve cuts off communication with the carburetor, and at the same time opens up passages for the compressed air below the piston to reach the combustion chamber.

Just previous to this, however, the piston in its movement uncovers the exhaust port and exhaust begins, this being facilitated by the sudden admission of the compressed air as previously outlined. This intake of air is of very short duration, for as the piston begins to rise the distributing or mixture valve closes the air passage and opens that between the combustion chamber and the mixture space above the enlarged part of the piston by the way of the upper passage, allowing mixture under pressure to find its way to the space above the piston. Compression is completed when the piston attains the top of the stroke, but in the meantime the distributing or mixture valve has opened up the air space below the piston to the open air, and on the upstroke atmosphere is drawn into the space.

This completes the cycle, for as ignition takes place, the piston again descends, compressing below it the air drawn in during the previous upward stroke. The spark plug opening is at the side of the cylinder, located in the upper air passage, and is thoroughly scavenged by the air that rushes past it after each down-stroke, and at the completion of the intake period has fresh mixture surrounding it for ignition.

It would appear that the area of compression space over the cylinder is unusually large, but this is said to be due to the larger volume of mixture forced above the piston than is usually drawn into the combustion chamber of the four-cycle type. It is claimed that for this reason compression is maintained properly. In trials it is stated that the motor ran perfectly on low throttle and even with the latter almost closed. This is attributed to the location of the spark plug.

ANNEALING COPPER OR BRASS.

In fitting brass or copper tubing to the car when the material is not flexible it may split or crack in the operation. This may be prevented by annealing. Heat the piece to a dull red and plunge it in cold water. This will soften the metal so that it can be worked easily. Care should be exercised not to heat the tubing too hot.

VARNISH FOR COPPER.

An excellent varnish for copper and one that will prevent the metal from oxidization may be made by mixing one part of disulphide of carbon, one part benzine, one part oil of turpentine, two parts methyl alcohol and one part hard copal. Several coats of this mixture should be applied to the metal surfaces to be protected.

TO HARDEN SMALL ARTICLES.

To harden small tools or articles that are likely to warp in the process, the following method is recommended: Heat the part very carefully and insert in a raw potato, then draw the temper as usual.

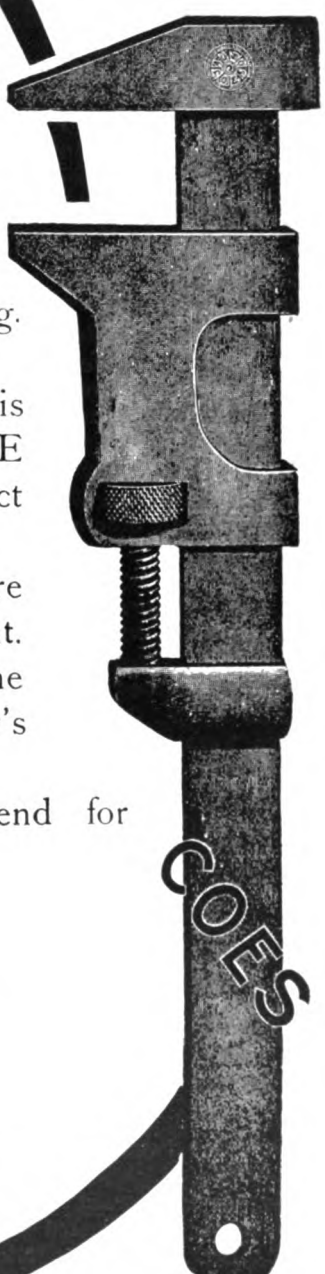
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

SEE US AT THE SHOW and send for literature now.

Unless present signs fail, there will be five nations represented in the fourth international aviation race for the Gordon-Bennett cup. While the date and place have not been selected by the Aero Club of America these must be announced before April 1. The time for filing challenges closed March 1 and on that date challenges had been received from the aero clubs of Great Britain, France, Belgium and Holland.

Chicago is making a determined bid for the honor of holding the meet. The Aero Club of Illinois is attempting to raise a fund of $50,000 with which to finance the undertaking, and it is announced, though this may be a trifle premature, that the meet will be held without admission charge. In addition to the international race it is proposed to hold a grand circuit event, which shall include the cities of St. Louis, Milwaukee, Minneapolis, Dubuque, Cincinnati, Dayton, Indianapolis and others, each to assist in financing the project.

As each country mentioned above is entitled to name three aviators, the prospects of at least 10 machines in the big event seem good. It is remembered, however, that three challenging countries were entered for the second international race held on Long Island in 1910. Of these only France, England and America were represented in the finals. Last year there were five nations listed, but Austria and Switzerland failed to put in an appearance when the race was flown at Eastchurch, England.

The first race for the Gordon-Bennett cup was flown at Rheims, France, in 1909, and was won by Glenn H. Curtiss in a Curtiss biplane for America. The second was held at Belmont Park, L. I., in 1910, and was won by Claude Grahame-White of England in a Bleriot monoplane. The third event was held last year at Eastchurch, England, and was won by Charles Terres Weyman of America with a Nieuport monoplane.

Some effort has been made this year to limit the makes of machines to the countries represented by the aviators flying them, but the Federation Internationale Aeronautique, which has general jurisdiction over such matters, has determined that the manufacture of aeroplanes has not progressed far enough to warrant a rule of this character. It follows that while America may again take the cup it may be won by a machine other than of American manufacture.

It is altogether too early to make suggestions as to who will compete in this year's event. The aviators who will represent the respective countries will be selected by the aero clubs of their countries, and need not be named until 24 hours before the date of the race. Elimination events may be necessary to select the various teams, if sufficient applications are received. Weyman has the right to defend the cup without further trials.

Although several attempts have been made to construct a parachute device which may be considered satisfactory for use by aviators in flight, the first practical test of such apparatus from an aeroplane was made by Albert Berry at St. Louis March 1. The parachute was released when the machine was at an altitude of about 1500 feet and worked perfectly.

Berry is an experienced parachute jumper, having taken many leaps from balloons. He left the Kinloch field with Anthony Jannus in a biplane, the parachute hanging in a specially constructed case under the machine. When a speed of 55 miles an hour had been reached with the aeroplane about 1500 feet above the earth, Berry climbed out of the biplane and swung free on a trapeze bar, at the same time cutting the cord which connected the parachute to the machine.

As Berry shot downward the biplane bobbed upward like a cork, swayed for a moment and soon righted itself. The parachute opened very suddenly, and the remainder of the trip to earth was accomplished without difficulty. Later Berry explained that he really believed the man in the biplane was in greater danger than he.

French aviators have an opportunity to earn a prize of 10,000 francs by flying 10 meters without using mechanical power. Already 79 entrants have filed their intention of competing for this award. Among the names are found those of Colliex, Reyrol, Cayla, Gabriel, Voisin and Dupont. In addition, La Justice, apparently in a spirit of humor has offered a prize of 100,000 francs for a similar flight from Paris to Versailles.

The rules governing the international Michelin prize for 1912 provide that the winner shall be the aviator who covers the greatest number of kilometers over a course made up of three different circuits, at an average speed of 40 kilometers an hour throughout.

Digitized by Google

Each national aero club must lay out its own course and submit it to the Aero Club de France.

Each of the three circuits must start from the same point, and the first and third, each of about 500 kilometers, must have three or four obligatory stopping places, while the second, of 255 kilometers, must have one or two. The starting line will be the same for all three.

At each of the intermediate landing places the competitor must alight in a square, of which the sides are not more than 500 meters long. Replenishments may be made only at the starting point, and while covering each circuit the competing machine must average at least 60 kilometers an hour. The circuits will be numbers 1, 2 and 3 and must be covered in their proper order. It will not be permissible to cover the same circuit twice in succession. Should a competitor land at a place otherwise than officially designated, he must start the circuit over again.

Before starting, the machine must have certain parts sealed, and must carry a sealed barograph. For each 75 kilograms of useful load carried beyond the pilot and necessary fuel, etc., a bonus of 25 per cent. will be allowed on the time up to the maximum of 100 per cent. This extra load may be made up of passengers or ballast. If the latter, it will be weighed and sealed at the start, and weighed at each intermediate stopping place.

Pilots of competing machines must possess a certificate under the rules of the Federation Internationale Aeronautique. Each national club must arrange six periods of five days each on which attempts may be made and each date must be announced at least a month in advance. The last period of five days must terminate before Oct. 1, 1912. If a pilot aviator makes several attempts for the prize only the best one shall count. Should there be a tie in the classifications for the cup, the length of each circuit covered will be multiplied by the extra weight carried and the results added together, the cup going to the competitor with the best record.

The parts to be sealed include the cylinders of the motors, the propellers, the wings, rudders, elevators and ailerons. Any supplementary regulations made by the national clubs for attempts to take the prize outside of France, must have the approval of the Aero Club de France. The cup is now held by M. Helen of France, with a Nieuport monoplane.

It begins to look as if the proposed hydro-aeroplane meet at Monte Carlo, Monaco, later this month, would bring out a number of Continental craft. Until recently the only canard, as they are termed in France, made in that country was the Voisin. Lieut. Cayla began trying out a Farman hydro-aeroplane at Buc, France, last month, and now an entirely new canard is announced by Capt. Morel.

This is shown in an accompanying illustration, although it would appear that the hydroplane attachment had not yet been fitted. Apparently, the inventor, who is well known as the constructor of the Morel monoplane, prefers to test his new device on land before venturing on the water. It is understood that the machine is designed to be flown tail foremost.

Morel Biplane Designed to Be Flown as a Canard, the French Term for Hydro-Aeroplane, at the Monte Carlo Meet This Month.

The length is 22.9 feet, spread 30.5 feet, supporting surfaces 215.2 square feet, weight 880 pounds. The motor is a 60 horsepower Anzani, and accommodations are provided for three persons, two beside the pilot. It is expected that the machine will be entered for the Monte Carlo meet.

In order to supply the United States army with an efficient reserve aerial corps in time of need, the War Department has issued an order permitting not only commissioned officers of the regular army but officers of the organized state militia to qualify as military aviators, providing they can pass a rigid physical

Digitized by Google

test and operate an aeroplane as stipulated by the department. The officers who qualify will be placed upon the army register as military aviators.

The details of the physical test will prove of interest. The visual acuity without glasses should be normal. Any error of refraction requiring correction by glasses will be cause for rejection. The candidate must be able to estimate distances and color blindness for red, green or violet is cause for rejection. Any diminution of the acuity of hearing below normal will be cause for rejection. The order also reads:

"These tests for equilbrium, to detect otherwise obscure diseased conditions of the internal ear should be made: Have the candidate stand with knees, heels and toes touching. Have the candidate walk forward, backward and in a circle. Have the candidate hop around the room.

"These tests should be made with the eyes open and then closed, the candidate trying to hop or walk in a straight line or in a circle. Any deviation to the right or left from the straight line or from the arc of the circle should be noted. Any persistent deviation either to the right or left is evidence of a diseased condition of the internal ear and nystagnus is also frequently associated with such a condition. These symptoms therefore should be regarded as cause for rejection.

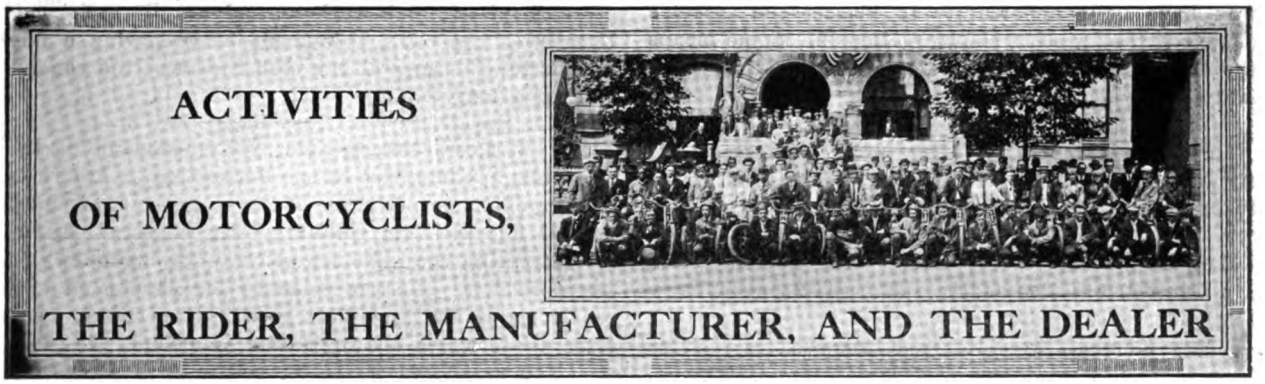
Having passed the physical test, the applicants must make a flight in an aeroplane attaining an altitude of at least 2500 feet, recorded by a suitable barograph. They must make a cross country flight of at least 20 miles, 10 miles going and 10 returning, at a minimum height of 1000 feet. They must make a flight of at least five minutes duration with the wind blowing at least 15 miles an hour. They must carry a passenger to a height of at least 500 feet, and the combined weight of the passenger and pilot must be at least 250 pounds. In addition, applicants must be prepared to execute a volplane from an altitude of at least 500 feet with the engine completely shut off, and cause the aeroplane to come to rest within 300 feet of a previously designated point on the ground. A military reconnaissance flight of at least 20 miles at an average altitude of 1500 feet also is necessary.

The shares of the Eastern Aeroplane Company, Brockton, Mass., held by Alfred F. Gay and J. H. Geary, have been purchased by E. Percy, H. O. and L. L. Miller, three brothers, who have become interested in the construction of monoplanes of the Bleriot type. E. Percy Miller, who becomes president, has made short flights and will undertake the production of practical machines under the guidance of experienced constructors.

Russia appears to be taking considerable interest in the **hydro-aeroplane.** Not long ago the Russian government purchased a Curtiss machine of this type from Glenn H. Curtiss of America, and announcement has been made that certain government officials have been in France for the purpose of investigating the Voisin canard, with a view to purchasing if found satisfactory.

Driving a 140 horsepower Gnome-engined Deperdussin monoplane at Pau, France, March 1, Jules Vendrines created a new world's record for sustained speed by flying 101.6 miles in an hour. This also is a record for an hour's flight. During the second international cup race at Belmont Park, L. I., in October, 1910, Alfred LeBlanc set the first mark at 59 miles, using a Bleriot monoplane. The late Edouard Nieuport, with one of his monoplanes, raised this to 79.5 miles at Mourmelon, France, in June, 1911. Vendrines in a Deperdussin exceeded this Jan. 19, when he flew 88.3 miles.

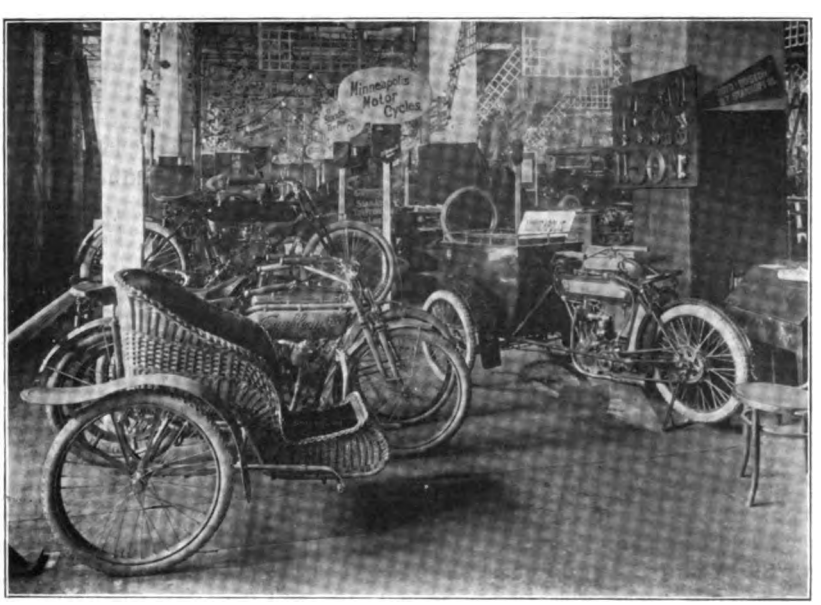
Twice within a week, while flying at Pau, France, Maurice Tabuteau in a Morane-Saulnier monoplane created new world's records for two hours' flight. Feb. 24 he covered 127.8 miles, and March 2, 141.2 miles. He also set new world's marks for all distances up to and including 250 kilometers. His time for 100 meters was 51:07.8; for 200, 1:42:17, and for 250, 2:07:54.



Using a self-starting device constructed at the factory of the Burgess Co. & Curtis, Marblehead, Mass., Walter Brookins made a successful flight unaided in his Burgess-Curtis hydro-aeroplane at Palm Beach, Fla., last month. The device is said to weigh six pounds and is not similar in any way to the self-starters used in automobile work. With it, the aviator simply turns a handle at the seat and this governs a gear attached to the propeller shaft. It will be remembered that an English aviator recently tried out a similar device with satisfactory results.

Plans are progressing favorably for the international exhibition which is to be held by the Aero Club of America in New York City in May. The Italian government is said to have granted permission for the display of at least one of the machines used by its army in the campaign against the Turks in Tripoli. Other foreign machines to be seen will include the Bleriot, Nieuport, Deperdussin, Etrich and Henri Farman. The Wrights have consented to show the first machine they flew with a motor, as well as a number of the 1912 models, and Glenn H. Curtiss will have on exhibit the machine with which he took the first international cup race at Rheims, France, in 1909. Several well known American types will be included in the display.

NEW MARYLAND COMMISSIONER.



Former Senator Harry A. Roe of Caroline county, Md., has been named as automobile commissioner to succeed John E. George. Mr. Roe had the support of the Automobile Club of Maryland, and it is expected that his administration will prove satisfactory to all parties concerned.

BOSTON SHOW EXHIBITORS.

Times have changed materially since the days when the members of the Motorcycle Manufacturers' Association considered the Boston show one of the big events of the year and made display at this exhibition in the same manner as at the so-called national shows. It was not until last year that the national organization of makers decided the Boston display was not of sufficient importance to warrant continuing its support as formerly. Undoubtedly this decision was based somewhat upon the fact that Mechanics' Building, as large as it is, does not afford opportunity to place all of the exhibitors in an advantageous position, and the motorcycles were relegated to the basement.

Where the Motorcycles Were Displayed in the Basement at the Boston Show—Emblem in the Foreground.

Last year's announcement came so late in the season that the local dealers were unable to make such provision as they desired in order to be satisfactorily represented. This year the manufacturers assisted the local dealers by supplying exhibition machines, etc., and a better representation resulted, although the motorcycles were to be seen in the basement again, under conditions similar to those which governed previous displays.

Only about half a dozen makes were shown. Emblem models were displayed by the Boyd Motor Company, 27 Stanhope street, which also handles the Minneapolis. Both were to be seen in connection with side cars and tandem equipment. Indian machines were shown by George N. Holden, 141 Massachusetts avenue, and these also were with side car and tandem devices. The Hub Cycle Company, 40 Portland street, exhibited the Yale; the New England Motorcycle Company, 178 Columbus avenue, the Harley-Davidson and Pope, and the M. M. Motorcycle Company, 187 Columbus avenue, the M. M.

In addition to the completed machines on view, several of the accessory exhibitors displayed fittings and supplies particularly adapted for motorcycle use. Specific mention need not be made of the long list of lubricants, lamps, horns, speedometers, etc., which were to be found at these various booths, but it may be pointed out that the Hub Cycle Company showed a full line of Corbin coaster brakes, made by the Corbin Screw Corporation, New Britain, Conn., and Eclipse free engine pulleys, the product of the Eclipse Machine Company, Elmira, N. Y., besides a large number of other standard supplies and fittings carried by this concern.

Naturally, the display was not visited by riders and prospective purchasers in the same numbers as during the years when more attention was paid to the Boston show by the makers. It undoubtedly is true that the interest in automobiles overshadowed the two-wheeled mounts in a marked degree, but there are a large number of riders in the New England states

Digitized by Google

who have little opportunity to inspect the season's models if they are not shown at Boston. Some means should be devised for calling more attention to them in 1913.

New Members in February.

Four hundred and forty new members were signed up by Secretary-Treasurer G. B. Gibson of the Federation of American Motorcyclists during February. Classified by districts, the list reads as follows: Lake, 129; Atlantic, 90; Pacific, 79; Southwestern, 31; Central, 30; Peninsular and Gulf, 28 each; New England, 16; Canadian, nine.

New members by states were received as follows. New York, 56; Ohio, 41; Washington, 36; California, 28; Oklahoma, 27; Idaho, 22; New Jersey, 18; Illinois, 18; Montana, 18; Kansas, 17; Pennsylvania, 14; Georgia, 13; Massachusetts, 12; Indiana, nine; Florida, nine; British Columbia, nine; Missouri, seven; Alabama, five; Minnesota, five; Nebraska, three; South Dakota, three; Oregon, three; Maryland, three; Connecticut, two; Rhode Island, two; Wisconsin, two; Iowa, two; Michigan, two; Arizona, two; Tennessee, one; North Carolina, one; Utah, one.

Young Women of the Los Angeles Motorcycle Club Ready for a Day on the Road.

Los Angeles' Fair Enthusiasts.

The East has heard much concerning the young women of the Los Angeles Motorcycle Club, Los Angeles, Cal., of whom there are a large number. It would appear that the young women of California are more largely interested in motorcycling than those in any other section of the country. Many of them own their own machines, and it is not an uncommon occurrence for them to hold their own runs, while they often accompany the male members on strenuous endurance contests.

An accompanying illustration shows a number of these young women ready for a day on the road. They are enthusiastic club workers, and usually assist materially in the day's enjoyment by preparing a fine supper for the boys at the club rooms at the conclusion of a long run.

Repair Shop as Recruiting Station.

E. M. Estabrook, Bangor, Me., chairman of the membership committee of the Federation of American Motorcyclists, spends some of his spare time, of which he has but little, in thinking over ways and means for increasing the influence of the organization which he represents. He has come to the conclusion that repair shops are first class recruiting stations, especially those which are registered as official. He says:

"The registered F. A. M. repair shop already is demonstrating its possibilities and worth as a successful recruiting station for the F. A. M., and more than this, it is contributing largely to the general popularity of the motorcycle and the sport through its ability to create and maintain interest. Instances are at hand daily where local interest is being awakened, clubs promoted or affiliated, entertained or housed by these active spirits.

"According to my information and experience, it is taking a rather narrow view of the matter to say that all of this well meant activity of the dealer or repairer is accounted for only in a mercenary way. First and last, I don't believe it. I have never been able to prove a case of this kind, but on the contrary, I could always disprove it.

"Before a man goes into the trade as a repairer he usually is a genuine enthusiast with respect to the motorcycle and the sport. That is what brings him into it. And it is not a gilt edged vision of 'easy money' that induces him to work his head off year in and year out, without being able to 'dig up' much at that. Think this matter over a little."

Emblems at Toronto Show.

Emblem motorcycles, made by the Emblem Manufacturing Company, Angola, N. Y., were prominently displayed at the big show in Toronto, Ont., last month. Three singles and one twin were exhibited by Hyslop Bros., Ltd., and in addition to this firm's representatives, L. S. Taylor, the well known Emblem racing rider, was on hand to explain the fine points of this make. President W. G. Schack of the factory was in attendance two days.

Lang Takes More Harleys.

It will be remembered that the Harley-Davidson Motor Company, Milwaukee, Wis., maker of Harley-Davidson mounts, announced early in the season that C. H. Lang, the Chicago agent, had contracted for 1000 machines for the 1912 season. During the re-

cent Chicago show Lang disposed of 300 of these and the demand seemed so insistent he was afraid his thousand wouldn't last the year out. Accordingly, he has increased the order to 1200 machines. This is believed to be one of the largest single orders for motorcycles ever given.

Late Affiliations.

Included in the list of recent affiliations with the Federation of American Motorcyclists are the following clubs: Enid, Oklahoma, No. 222; J. A. Olinger, secretary, 209 West Rand street, 26 members. Boise, Idaho, 223; G. A. Hill, Box 593, 20 members. Butte, Mont., 224; J. E. Seaker, 610 East Platinum street, 17. Flower City, Rochester, N. Y., 225; W. Krieg, Lincoln Park, 14. Aberdeen, Wash., 226; Leon McNeal, Box 542, 15. Batavia, N. Y., 227; S. F. Houseknecht, 46 Main street, 23.

Three New Records for Excelsiors.

Three new world's records were created at the meet on the stadium at Los Angeles, Cal., Feb. 25. Jacob De Rosier on an Excelsior rode six miles in 4:08.6; Joseph Wolters on a machine of the same make, covered three miles in 1:59.6, and Charles Balke, also on an Excelsior, made four miles in 2:40.4. The summary of the meet follows:

Two miles, match—First, De Rosier, Excelsior; second, Wolters, Excelsior; time, 1:21.2.

Four miles, professionals—First, Albright, Indian; second, W. Samuelson, Indian; time, 3:02.2.

Three miles, professionals—First, Wolters, Excelsior; second, Balke, Excelsior; third, Hasha, Indian; time, 1:59.6.

Four miles, professionals—First, T. Samuelson, Indian; second, Humiston, Indian; time, 3:09.6.

Four miles, professionals—First, Balke, Excelsior; second, Wolters, Excelsior; third, Seymour, Indian; time, 2:40.4.

Five miles, professionals—First, W. Samuelson, Indian; second, Albright, Indian; third, Humiston, Indian; time, 3:52.6.

Two miles, match—First, De Rosier, Excelsior; second, Wolters, Excelsior; time, 1:24.4.

Five miles, professionals—First, Ward, Indian;

second, Wolters, Excelsior; third, Balke, Excelsior; time, 3:23.8.

Six miles, free-for-all—First, De Rosier, Excelsior; second, Ward, Indian; third, Seymour, Indian; time, 4:08.6.

Raymond Snyder of Columbus, O., and His Emblem Motor Sled.

Emblem Motor Sled.

That it does not require good roads and warm weather in order to enjoy motorcycling thoroughly has been proven conclusively by Raymond Snyder, the 15-year-old son of W. H. Snyder, proprietor of the American Machine Company, Columbus, O. During the winter months, when the deep snow made it impractical for young Snyder to ride his Emblem in the usual manner, he conceived the idea of constructing a motor sled, and that he succeeded is indicated by the accompanying illustration.

Taking the motor, tank and rear wheel from his four horsepower Emblem young Snyder mounted it on a double sled body of his own design, and the result was an entirely practical vehicle which has attained speeds of between 40 and 45 miles an hour on the roads around Columbus.

Besides being a lad of a practical turn of mind, Snyder is a road rider who has attained some distinction. Last summer, in company with three other Columbus riders of twice his age, he toured the Eastern states, covering some 2400 miles. Considerable bad weather was encountered but Snyder found no difficulty in maintaining the schedule set by the others.

New Official Repair Shops.

The following have been added to the list of official F. A. M. repair shops: Michael Curnow, 205 South Montana street, Butte, Mont.; C. H. Tompkins, 327 North Broad street, Richmond, Va.; Victor R. Stenger, 111 South 10th street, Nebraska City, Neb.; Jacob Petske, 2514 West Jackson boulevard, Chicago, Ill.; F. N. Bailey, 919 Tacoma avenue, Tacoma, Wash.; Progress Auto Company, 1736 Richmond turnpike, West New Brighton, N. Y.; A. C. Shaw, 414 Commercial street, Emporia, Kan.; Gene Johnson, 469 North Beach street, Daytona, Fla.; J. E. Sayre & Co., 331 Ohio street, Terre Haute, Ind.; E. F. Horn, Sixth avenue and Superior street, Antigo, Wis.; John N. Ellsworth, 233 Main street, Watsonville, Cal.; Barnes & Hansen, 404 East Wishkah street, Aberdeen, Wash.; Oakdale Cyclery, West Railroad avenue and G street, Oakdale, Cal.; Clarence O. Sibley, 636 Jefferson street, Joliet, Ill.; Motorcycle Supply Company, 412 East 15th street, Kansas City, Mo.; P. S. Coulter, Homestead, Penn.

Cripple Tours With Minneapolis.

Alfred Leroy of 330 South Spring street, Los Angeles, Cal., met with a severe accident some years ago, as a result of which he was deprived of both legs and one arm. This crippled condition does not preclude his enjoying the motorcycle. An accompanying illustration shows him with his Minneapolis machine, which has been transformed somewhat by the addition of a novel tricar arrangement. With this he has travelled all over southern California without aid and expects to take a trip East in the near future.

New Indian Station in Chicago.

The Edwards-Crist Company, Chicago, Cook county agent for the Indian, made by the Hendee Manufacturing Company, Springfield, Mass., has opened a new retail store and service station on Evanston avenue, on the North side of that city. This branch will be in charge of C. A. Leander, a well known Indian endurance rider and a prominent member of the North Shore Motorcycle Club.

Club Notes, Here and There.

The Attleboro Motorcycle Club has been organized at Attleboro, Mass., with the following officers: President, Herbert James; vice president, Ira Cook; secretary, Charles H. Obrist. The club will affiliate with the national body at once.

The Black Hill Motorcycle Club, Deadwood, S. D., has been organized with the following officers: President, Albert Wolley; secretary, Phil Shoenberger; treasurer, A. E. Bailie; captain, J. De Picaza; lieutenant, C. E. Applegarth. The club will hold a dance

Alfred Leroy of Los Angeles, Cal., and His Converted Minneapolis Mount.

Digitized by Google

St. Patrick's night, the purpose being to raise funds for fitting up club rooms.

Ithaca, N. Y., joins the list with a new motorcycle club, in which the following have been chosen as officers: President, John T. Hastings; vice president, Frank Martin; secretary-treasurer, Levi C. Morris.

The Colorado Springs Motorcycle Club, Colorado Springs, Col., has elected the following officers for the ensuing year: President, Orrin G. Lewis; vice president, U. S. Emmick; secretary, U. S. Johnson; treasurer, H. G. Schif; captain, H. W. Clark; lieutenant, F. W. Weatherby.

The recently organized Washington Motorcycle Club, Washington, D. C., has decided to affiliate with the F. A. M. on a 100 per cent. basis. The following officers have been elected: President, George Cockran; vice president, Edward Mangold; secretary, G. C. Billard; treasurer, C. F. French; captain, Edward Mangold.

New clubs are being formed by the following, according to Chairman E. M. Estabrook of the F. A. M. membership committee: George W. Cooper, Grand Forks, B. C.; Alfred C. Hackberth, Murray street, Meriden, Conn.; C. Hanson, 1406 Grand avenue, Kansas City, Mo.; Barter & Co., 55 Public square, Watertown, N. Y.

Twenty riders in Port Arthur, Tex., have formed the Port Arthur Motorcycle Club with W. F. Gerken as president and J. McFarland as secretary-treasurer. F. A. M. affiliation is to take place as soon as possible, and weekly runs to nearby towns are to be regular features throughout the season.

Latest Emblem News.

The Wichita Bicycle Shop, Wichita, Kan., has changed its name to the Dickinson Cycle Company and will represent the Emblem motorcycle in that territory in the future.

The W. A. Doubleday Company, 517 South Salina street, Syracuse, N. Y., has taken the agency for the Emblem, and it is expected that several Syracuse riders will be utilizing the Angola machine during the coming season as a result.

George Evans of Columbus, O., who has been spending the winter months acquiring a mechanical knowledge of the Emblem at the factory in Angola, N. Y., has returned to Columbus to take charge of the motorcycle department of the American Machine Company. L. S. Taylor, who formerly held this position, will remain at the Emblem factory. It will be remembered that Evans created a number of records on Emblem machines last year.

The Emblem will be represented in Racine, Wis., this year by the G. W. Burkert Company of 611 Wisconsin street. This is a large concern which has been identified heretofore with automobile interests but which sees a large future for the two-wheeled mount.

Among the new agencies recently appointed by the Emblem Manufacturing Company are the following: Browning Bros., Ogden, Utah; C. J. Jobe, Canton, O.; Groise Brcs., Holyoke, Mass.; United Cycle Company, Hartford, Conn.; L. R. Elliott, Attleboro, Mass.; R. G. Davis Automobile Company, Providence, R. I.; Taylor Bros., Oklahoma City, Okla.; A. F. Mueller, Evansville, Ind.; Moultrie & Maginni, Yonkers, N. Y.; J. C. Stafford, Fort Wayne, Ind.; Clinton E. Carpenter, Grand Rapids, Mich.; E. E. Fenn, Bloomington, Ill.; Smith & Wolfe, Denver, Col.; H. J. Kingsbury, Kalamazoo, Mich.; William Lintner, South Bend, Ind.

Waverley Changes Its Name.

Announcement is made from Jefferson, Wis., that the name of the Waverley motorcycle has been changed to the P. E. M. The reason for this action is said to be found in the fact that the old name conflicted too much with those of the Waverley automobile and Waverley bicycle.

Rhode Island Club's Smoker.

The annual smoker of the Rhode Island Motorcycle Club will be held in Providence, R. I., early in April. The committee of arrangements is busily engaged working up the programme, which will be even more elaborate than in past years. These annual events of the Rhode Island Club have become a matter of decided interest in that state and they are looked forward to with interest by a large number of riders. Incidentally the club has found them a valuable aid in recruiting new members.

New Club for Evansville.

The Evansville Autocycle Club has been organized in Evansville, Ind., under the leadership of John A. Sink, well known as a promoter of racing events. The following are the charter members: F. Kiechle, J. A. Miller, A. H. Schnell, E. Twietemeyer, W. H. Karges, H. F. Miller, F. H. Mohr, C. T. Davis, E. Nelson, E. Kuehn, C. Mesker, A. Blair, C. D. Beverly,

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head, as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

R. Haag, S. Niehaus, A. Legler, C. E. Bruck, O. Strange, W. Francis, W. Winterhelmer, W. Johann, D. Stewart, E. Inkanbrandt, H. Reisinger, G. A. Beard, F. Droit, J. A. Sink, M. Schaeffer, F. Emig. The following officers have been elected: President, John A. Sink; secretary, M. Schaeffer; treasurer, August Schnell; directors, G. A. Beard, J. A. Sink, F. B. Droit, D. Stewart, C. Mesker, J. A. Miller, W. T. Gregson, C. D. Beverly and F. H. Mohr. Club runs, track events and hill climbs are to be included in the programme of activities. Club rooms will be fitted up as soon as opportunity affords.

Harley Wins Hill Climb.

Max Wilson, riding a 1912 single-cylinder Harley-Davidson, won first place in the big hill climb held by the Wichita Motorcycle Club at Winfield, Kan., last month. The course was up the famous Observation hill and proved a splendid test for the different machines entered. The place winners were: First, Max Wilson, Harley-Davidson; second, Ray Weishar, Indian; third, J. K. Brown, Yale.

Monarch a New Mount.

The Ives Motorcycle Corporation, Owego, N. Y., exhibited its first Monarch motorcycle at the automobile show in Binghamton, N. Y., last month. It was the intention of the company to have this model ready for display at the Chicago show, but was unable to do so. It is a single cylinder machine, the motor having a bore of 3.375 inches and stroke of 3.75, and being rated at five horsepower. Ignition is by Herz magneto. Power is transmitted to the rear wheel by V belt, and an Eclipse free engine pulley is fitted as regular equipment. The lines are graceful, and the rear of the frame has been dropped slightly to permit of a low saddle position. Road shocks are taken care of by a substantial spring fork of the double type. Tires are either Empire or Diamond, and an option of Corbin or Eclipse brake is offered.

Columbus Holds Independent Show.

With all this talk about a separate showing of motorcycles, the Columbus Motorcycle Club, Columbus, O., seems to have taken the initiative in practical results. When it became known that the local dealers were dissatisfied with the plans the management of the Columbus automobile show had made for showing motorcycles, the club took up the matter and arranged a showroom at 39 East Chestnut street. Six dealers helped the club to make the venture a splendid success. These were: American Machine Company, Emblem; L. P. Birkenbach, Thor and Yale; Franklin Cycle & Supply Company, R-S and Excelsior; Barr Motorcycle Company, Indian; P. I. Haynes & Co., Harley-Davidson; A. C. Edwards, Merkel.

New Departure Wins.

Judge John R. Hazel of the United States district court at Buffalo, N. Y., has issued a decree sustaining the coaster brake patents held by the New Departure Manufacturing Company, Bristol, Conn. Nov. 30, 1910, this concern brought action against the Forsyth Manufacturing Company of Buffalo, alleging infringement of patents. The decision holds that the New Department patents are good and valid and that they cover the "original, first and true invention" of the coaster brake.

In this connection it is proper to note that the New Departure Manufacturing Company was one of six companies and 18 individuals indicted by the last federal grand jury at Buffalo on a charge of violating the Sherman anti-trust law, so called. A petition to have the indictments quashed is now pending before Judge Hazel. The federal authorities admit that these indictments grew out of the action against the Forsyth Manufacturing Company.

The companies indicted with the New Departure Manufacturing Company were: Corbin Screw Corporation, New Britain, Conn.; Aurora Automatic Machine Company, Aurora, Ill.; Eclipse Machine Company, Elmira, N. Y.; Miami Cycle & Manufacturing Company, Middletown, O., and the Buffalo Metal Goods Company, Buffalo, N. Y., all of which are licensed to manufacture under the New Departure patents. Obviously, the decision is of importance to these concerns as well.

Chicago Association Short Lived.

Advices from Chicago indicate that the recently organized Chicago Motorcycle Dealers' Association, which was formed for the purpose of conducting an extensive local advertising campaign, will soon pass out of existence. It is announced that the members could not agree upon the proper method of dividing the expense, some representatives feeling that certain makes were to receive rather more for their money than others.

TO MERGE NATIONAL BODIES.

The movement which has been on foot for some time looking toward the merging of the National Association of Automobile Manufacturers and the Automobile Board of Trade into one large organization, has been referred to a committee of conference between the two bodies. A tentative plan was brought forward at the recent meeting of the executive committee of the former association in New York City, and this will be submitted to the Automobile Board of Trade for ratification.

The following committees of the N. A. A. M. have been appointed for the ensuing year: Commercial vehicles, S. D. Waldon, W. C. White, B. A. Gramm, Fred White; show, H. O. Smith, A. L. Pope, W. C. Leland; legislative, A. L. Pope, Benjamin Briscoe, Charles Clifton; good roads, R. D. Chapin, S. D. Waldon; contests and demonstrations, Alfred Reeves, W. T. White, W. C. Leland; auditing, Benjamin Briscoe, S. T. Davis, Jr., Charles Clifton; membership, G. W. Bennett, L. H. Kittredge, S. T. Davis, Jr.; traffic, A. L. Pope, L. H. Kittredge, Hugh Chalmers; conference, Alfred Reeves, A. L. Pope, R. D. Chapin; electric vehicles, H. H. Rice, W. C. Anderson, Fred White.

Boulevard Motor Delivery Company, Chicago; capital, $2500; incorporators, C. H. McDonough; C. D. Black, George H. Davis.

Krebs Commercial Car Company, Clyde, O.; capital, $100,000; incorporators, J. C. Krebs, R. A. Becker, F. X. Bachle, Homer Metzger, George Slessman.

Testers of the Cole Motor Car Company, Indianapolis, Ind., Successfully Negotiating a Clay Road Softened by a Severe Rainstorm.

GARAGE AND DEALER.

The Morse-Readio Auto Company, Springfield, Mass., has secured a tract of land between Dwight and Chestnut streets and plans to erect a six-story structure of the latest fire proof design. The foundation will be reinforced concrete, the framework of steel, and floors and roof of fire proof material. The building will have a frontage of 78 feet and be 97 deep.

The Wade & Dunton Motor Car Company, Lewiston, Me., is occupying new quarters. The structure is 50 by 100 feet, four stories in height and of brick. The first floor will be utilized for automobiles, the second as a salesroom and the third for storage, and top floor as the repair shop.

Bishop & Whitney, which operates a garage at Cananseraga, N. Y., has acquired the garage conducted by Roberts & Son, Elmira, N. Y.

The Horst & Strieter Company, Davenport, Ia., is now occupying new quarters in the Horst building, 1417 Second avenue. The concern is headed by Henry W. Horst with Henry T. Horst, vice president, and M. E. Strieter, secretary and treasurer.

Fred E. Folger has purchased the garage department of the Warner Automobile Company, Watertown, N. Y., and will handle all kinds of supplies and conduct a general repair business. He was formerly sales agent for the Ford Motor Company, Detroit, in Alberta, Canada. Mr. Warner will retain the agency for the Ford line.

William Fairchild and Ralph McGraw, Newburgh, N. Y., have purchased the garage on Grant street conducted by Daniel Aber. An adjoining building has been secured and will be utilized as an office with a rear driveway connecting with the other structure.

The Atlanta Automobile Top & Trimming Company, Atlanta, Ga., of which George W. Anderson is president and owner, has secured the agency in Georgia for the Bergdoll, made by the Louis J. Bergdoll Motor Company, Philadelphia.

The A. C. Guy Company, Worcester, Mass., wholesaler of lubricants, has moved from 102 Commercial street to 120 Main street.

The Ohio Motor Sales Company, Des Moines, Ia., has contracted for the agency of the De Tamble line, manufactured by the De Tamble Motors Company, Anderson, Ind.

Edwin R. Stancliff, Elmira, N. Y., has been appointed general manager of the Auto Car Sales Company, Los Angeles, Cal., and will have full charge. He formerly was connected with the New York office of the company.

The J. W. Bowman Company, Boston, has added the Waverley electric, made by the Waverley Company, Indianapolis, Ind., to the line of pleasure and commercial vehicles carried by it.

A. F. Shallberg, Moline, Ia., has given up his agencies for the gasoline vehicle and will devote his attention in the future to promoting the sales of the Rauch & Lang electrics, made by the Rauch & Lang Carriage Company, Cleveland, O. He has disposed of his garage, but it is his intention to open a new one devoted to the interests of electric vehicles.

The Warren Garage, Worcester, Mass., is undergoing extensive alterations. A section near the entrance and adjoining the office is being converted into a show and salesroom.

The Steenrod Auto Supply Company, Wheeling, W. Va., expects to occupy its new four-story fire proof garage at 2106 Main street shortly. It will have a capacity of 200 machines. The first floor will be utilized for storing cars while the second will be employed as the repair shop. As business increases the remaining floors will be used.

The Blue Ribbon Garage, Inc., Meriden, Conn., which was organized about two years ago, by Bridgeport parties, has been sold to Mauritz Mathison, David E. Brown and Arthur Oldroyd. The new company will conduct an

Digitized by Google

up-to-date service station and will make a specialty of repairing.

Harry E. Pence, president of the Pence Automobile Company, Minneapolis, Minn., has secured the Hennepin Avenue Methodist Church property and will convert it into an automobile plant having six stories of ample floor space.

J. G. Tennant & Co., 2247 Michigan avenue, Chicago, has taken the agency for the Simplex, made by the Simplex Automobile Company, New York City.

Thomas Bush, Elmira, N. Y., has joined the sales force of the Chemung Motor Company of that city.

L. B. Keeton, Elmira, N. Y., has entered the employ of A. M. Zimbrich as salesman of the various lines which the latter represents.

The Ford Sales Company, Utica, N. Y., has secured property on Pine and Lafayette streets and will tear down the present structure and erect a two-story brick building, which will be 48 by 87 feet. The lower floor will be devoted to a salesroom and garage and the upper utilized as a repair shop. The building will be constructed of fire proof material. Electrical appliances will be employed throughout.

Cecil C. Robinson has been appointed general manager of the Roberts Motor Company, Jacksonville, Fla. Bert Farnum will have charge of the repair shop.

The Osen & Hunter Auto Company, San Jose, Cal., is erecting a new building at the corner of McAllister and Polk streets. Some changes are announced in the firm, O. C. McFarland, the San Francisco manager of the concorn having purchased the interests of A. E. Hunter and the company's name hereafter will appear as the Osen-McFarland Auto Company. Mr. Hunter will continue in the present quarters as agent for the Garford and Firestone-Columbus.

William Klockau, Rock Island, Ill., is planning to erect a three-story brick garage at Fourth avenue and 16th street.

The G. W. Blake Auto Company, Inc., Colorado Springs, Col., will erect a new garage and salesroom on North Nevada avenue. The new structure will be of fire proof material and equipped with modern conveniences for the repair and maintenance of automobiles.

WITH THE MANUFACTURER.

The Connecticut Shock Absorber Company, Meriden, Conn., announces the opening of an office, show and stock room at 231 West 54th street, New York City, where a complete line of Connecticut shock absorbers and fittings will be carried as well as installed.

The Cole Motor Car Company, Indianapolis, Ind., gives its product a thorough testing before the body is fitted and car equipped. In the accompanying illustration is presented two machines negotiating a road of soft clay and it will be noted that the wheels are sunk in the mud nearly to their hubs.

"The Great Western Tattler," a publication devoted to the interests of the Great Western Automobile Company, Peru, Ind., contains several interesting as well as instructive articles pertinent to the motor car.

The Central Transfer & Storage Company, Indianapolis, Ind., maintains a fleet of automobiles and in the accompanying illustration is depicted four Mais trucks, made by the Mais Motor Truck Company, and six Premier delivery vehicles, manufactured by the Premier Motor Manufacturing Company of the same city. These machines are utilized by the newspapers of Indianapolis and one publication, the News, has 36 sub-stations which are supplied by 10 machines, these doing the work in about one-third the time formerly required by 18 horse drawn vehicles.

The Abbott Motor Company, Detroit, announces a sales agency at South Edmonton, Alberta. O. J. Edinger, an experienced automobilist, is the proprietor, and the agency will be known as the S'Cona garage.

Edward Wells of Boston has been re-engaged by the E. R. Thomas Motor Car Company of Buffalo, N. Y., as assistant sales manager of the factory.

A. C. Stebbins, secretary and general manager of the Lansing Company, Lansing, Mich., is making a trip through Guatemala and Panama.

The Stewart & Clark Manufacturing Company, Chicago, has moved its Minneapolis, Minn., branch from 45 South 10th street to 1202 Hennepin avenue, where larger and more convenient quarters will be had for the handling of the Stewart speedometer as well as its installation. The new office will be in charge of T. J. Snelling, who has been with the company for some time. A. H. Champlin, who has had charge of the office, will call upon the trade in Minnesota, outside of Minneapolis and St. Paul, and Iowa.

Charles F. Kellom & Co, the New England branch of which is located at 284 Columbus avenue, Boston, announces that the Darling Automobile Company of Portland and Auburn, Me., has secured the exclusive right for the sale of Invader oil in the entire State of Maine.

The Remy Electric Company, Anderson, Ind., maker of ignition specialties, has appointed the following concerns to act as Remy service stations in their respective cities: Child, Day & Churchill, Inc., Spokane, Wash.; Washington Auto Supply Company, Seattle, Wash.; Archer & Wiggins Company, Portland, Ore.

J. K. McKeough has accepted a position with the Chicago branch of the Velie Motor Vehicle Company, Moline, Ill. He will be connected with the commercial car department.

Edgar E. Muller has been appointed manager of the recently established service department of the Ohio Motor Car Company, Cincinnati, O.

The Abbott Motor Company, Detroit, announces that arrangements have been made whereby the White Automobile Company of Baltimore, Md., will have the exclusive sale of Abbott-Detroit cars for the States of Maryland and Virginia. Another contract is that with the Eastern Motor Company of Atlantic City, N. J.

The Stewart & Clark Manufacturing Company, Chicago, has leased the store and basement at 174 Columbus avenue, Boston.

Manager Westerdale of the Chicago branch of the R-C-H Corporation, Detroit, has appointed W. J. Williams manager of the local retail sales.

The Greenville Metal Products Company, Greenville, Penn., will engage in the manufacture of motor cars, having closed a contract, it is stated, for the delivery of 13,500 cars to a western concern. The officers of the Greenville concern consist of: President, S. H. Penfield; vice president, Fletcher Goodwill; secretary and treasurer, F. L. Fay.

The Omaha Motor Company, Omaha, Neb., which was incorporated recently, is to erect a factory on the site adjoining that of the Stroud Machine Works. The company is to build a five-passenger car of moderate price.

Hamilton Cowley, Elwood E. DeHart, Edward G. Richardson and Walcott V. Smith are recent additions to the sales force of the New York branch of the R-C-H Corporation of Detroit.

The Fishback Motor Company of Newark, N. J., is negotiating with the Bristol Business Men's Association of Bristol, R. I., relative to removing its plant to that town.

Lucius Wilson has resigned as secretary of the Chamber of Commerce, Detroit, to become associated with the Warren Motor Car Company of that city, maker of Warren cars, in the capacity of vice president and general manager.

The De Tamble Motors Company, Anderson, Ind., has been reorganized, and James W. Sansberry, president of the National Exchange Bank, has been appointed general manager. Charles H. Walters, who has been secretary and general manager, is to become general superintendent. The capital stock has been increased to $200,000.

The King Motor Car Company, Detroit, maker of the King car, is occupying its new plant formerly utilized by the Hupp Motor Car Company. The factory will provide a floor space of about 70,000 square feet, and comprises practically a group of four buildings.

The Steenrod Dual Ignition Spark Company has been organized and will locate in Wheeling, W. Va. The company will manufacture a dual ignition device which distributes two sparks to one cylinder at the same time by the use of a single distributor. The ignition system is the invention of George W. Steenrod. It is applicable to both new and old motors.

The Bridgeport Brass Company, Bridgeport, Conn., is issuing a neat postal folder calling attention to the Atlas pump and other products made by it.

The Remy Electric Company, Anderson, Ind., announces the establishment of a new service station with the Lamb Electric Company of Grand Rapids, Mich.

Digitized by Google

STUTZ WINS BAKERSFIELD RACE.

The first really big road race of the year was held over the Bakersfield-Maricopa-McKittrick course at Bakersfield, Cal., Washington's Birthday, the distance being 212 miles. Fourteen cars started but only 10 completed the first lap. The event was won by John Bayse in a Stutz car, made by the Ideal Motor Car Company, Indianapolis, Ind. G. J. Packer in a National led the field for the first 150 miles.

In winning the Lakeview-Gusher cup and $1000 in cash, the Stutz thus occupies the most prominent position in the racing end of the industry at the beginning of the 1912 season. It will be remembered that the first car of this make took part in the 500-mile race on the Indianapolis speedway, Memorial Day of last year, and completed the entire distance without stop. The Stutz finished second in its class in the Fairmount Park race at Philadelphia in October, and third for the Shettler cup at Santa Monica, Cal., the same month.

The place cars in the Bakersfield race were as follows: First, Bayse, Stutz, 5:44:59; second, Klipstein, Mitchell, 7:05:25; third, Goochenauer, Buick, 7:08:49.

MERCER LOWERS ROAD RECORD.

One of the cars on display at the Boston show was a Mercer raceabout, made by the Mercer Automobile Company, Trenton, N. J., in which Hugh Hughes, head of the Mercer's racing team, covered the distance between New York and Boston in 7:45:00 of night driving just previous to the opening of the show. This is held to be a new record for the distance between these two cities, and was undertaken for the purpose of giving a convincing demonstration of the Mercer as an all-around car.

Hughes left Columbus Circle in New York City at midnight, Saturday, March 5, and arrived in Boston the next morning at 7:45. The distance by road between the two cities is approximately 260 miles, and the Mercer lowered the best previous record by 36:00.

MATHESON ADOPTS NOVEL PLAN.

A unique selling plan has been adopted by the Matheson Automobile Co., Wilkesbarre, Penn., maker of the Matheson six. Utilizing its New York office as a nucleus field, crews of its employees will cover the bulk of its selling territory east of the Alleghenies. Each crew is composed of two salesmen and a service expert, and three different types of cars will be driven sufficient to make a travelling display of the company's standardized designs. The crew will call on all Matheson owners, inspect their cars, overhaul any little defects that may need attention, give general advice and otherwise see that every machine is giving perfect satisfaction. The salesmen will interest dealers in the establishment of agencies and follow up prospective buyers. This co-operating with the owners is a striking development of the manufacturer's willingness to stand back of his product and is of particular interest to the trade, inasmuch as it constitutes an aggressive policy of going after business. The first crew is touring New Jersey, Delaware and Pennsylvania, and others will visit New England.

REMY REPRESENTED IN CANADA.

Announcement is made by the Remy Electric Company, Anderson, Ind., that Taylor & Arnold, Ltd., the largest railway supply house in Canada, has been appointed sole representative of the American Electric Headlight equipment for locomotives, a product of the Anderson concern. The branches maintained by Taylor & Arnold at Winnipeg and Montreal will be used as service stations as well as distributing and selling points. Each station will employ a corps of skilled mechanics.

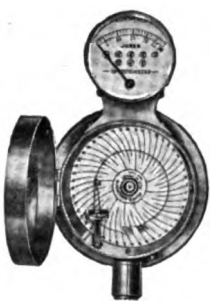
TIRE MEN IN EFFICIENCY MEETING.

In keeping with its policy to bring about a closer spirit of co-operation between the manufacturer, selling agent and consumer those connected with the service branches of the United States Tire Company, New York City, are brought together at certain central points, and under the direction of R. R. Drake of New York City, manager of the service department, schooled along lines calculated to improve the service of the company to each individual motorist. One of these "efficiency" meetings was held recently at San Francisco, Cal., where Thomas Wilkinson, manager of the branch, entertained a large number of the employees of the company. In addition to the business meetings there were theatre parties and dinners.

NEW DIXON LUBRICANT.

The Joseph Dixon Crucible Company, Jersey City, N. J., is placing upon the market a new chain graphite, especially intended for lubricating chains of pleasure and commercial vehicles. The preparation is put up in sticks, cylindrical in shape, about two by eight inches, encased in a neat cardboard carton, weighing about one pound each. It provides a convenient article as it may be carried upon the machine and the chain lubricated by rubbing the bar against it.

CRONE VAPORIZER.



A device for facilitating vaporization of gasoline has been brought out by F. G. Crone, Buffalo, N. Y. It is fitted easily in the intake manifold of a gasoline motor and by it any raw fuel drawn from the carburetor is converted into a mixture. It provides a considerable vaporing surface and not only gives increased mileage but prevents danger of fire in the event of backfiring.

The **LAMBERT**

A Car For Every Purpose

Model 66 Complete **$1100**

It is important that you study the construction of different types of cars so as to decide upon which is the best for your service. Study the illustration. That on the left illustrates the usual form of power transmission. That on the right the **Lambert Patented Friction Drive.** Six expensive compticated units as compared to two simple components. The cost of lubricating oil alone in the one on the left will amount to more than the replacement of parts on the **Lambert Friction Drive.** The Lambert will climb a 50 Per cent. grade.

SIX MODELS OF PLEASURE CARS—3 MODELS OF TRUCKS

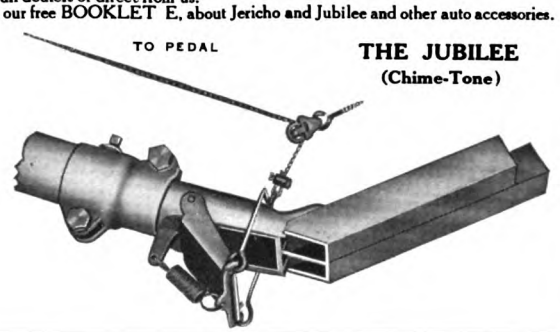
Jericho ONE TONE Horn
Jubilee CHIME TONE Horn



THE SIGNAL OF A GENTLEMAN—WARNS WITHOUT OFFENCE.

Jericho is superior to bulb horns, electrical horns and all other exhaust horns.
It is superior to the bulb horn because it is equally suitable for use on crowded city streets or winding country roads.
It is superior to electrical horns because it costs nothing to maintain the Jericho.
It is superior to all other exhaust horns because Jericho is the ONLY exhaust horn that absolutely WILL NOT CLOG.
Jericho gives a loud, clear signal of a pleasing mellow tone. It is worked by foot pedal connected with the exhaust.
The best horn for both city and country driving.
Equip YOUR car with a Jericho or Jubilee and motor without anxiety.

JERICHO COSTS $7, $8 and $9, ACCORDING TO SIZE.
JUBILEE COSTS $8, $9 and $10, ACCORDING TO SIZE.

Sold by all dealers or direct from us.

THE GARAGE BEAUTIFUL

JUST AS EASILY BUILT RIGHT AS WRONG AND A GREAT DEAL CHEAPER TOO IF YOU GET OUR

FREE WORKING PLANS

ALTHO not in the Garage Building, Selling or Planning business, our wide experience in the exclusive equipment business has led us into every quarter of the globe where we have consulted the world's greatest architects, solving some of the most difficult problems, in providing shelter for one or any number of Motor Cars, **at total building costs from $35 to $2500.** We carefully compiled this valuable data on account of its rare educational value in this comparatively new field, and while the work could not possibly be duplicated under an expenditure of Thousands of Dollars, we will distribute this entire work, together with one complete set of the Garage Beautiful, **working plans absolutely free of cost** to all active or prospective Motorists who are willing to pay for the mailing expense, **Only Ten Cents,** coin or stamps. These Working Plans are complete in every detail and designed to meet a flexible range of requirements both as to size and building material to be chosen, from a construction of wood siding to concrete, at cost estimates to correspond. Our one and only object in doing this is in hope of incidentally acquainting you with our equipment for present or future emergencies, and the expense of this **Free** offering will be charged to our advertising account. Understand, we make this unprejudiced gift absolutely with the fame of our name at stake, and in no way further obligate or annoy you, as we are not in business for such purpose. To any one unable to fully appreciate the value of this exclusive set of plans, worth alone Twenty-five to Fifty dollars, to say nothing of the **innumerable other plans suggested,** we certainly prefer your returning them to us so we can give back your Postage Money at once and send plans to another applicant, as our supply, or sincere motive, will not justify a waste.

HERZ PLUG

"BOUGIE MERCEDES"

There is more real service in one Herz Plug than in three or four of the ordinary kind.

D. F. WILCOX

Fall River, Mass., Feb. 9, 1912.

HERZ & CO., New York, N. Y.,

Dear Sir:—I have been using a set of your Bougie Mercedes plugs for two years in the same machine, during that time **the machine went thirty thousand miles** and I wish to tell you that **the plugs were never touched and are still running** as well as ever. I have sold the machine and of course the plugs went with it.

Yours truly,

(Signed) Samuel E. H. Wilcox.

$1.50 *GUARANTEED A FULL YEAR* **$1.50**

As a matter of fact, the **Herz Plug** will give perfect service for much longer than that. It is Double Stone. It is self-cleaning—cannot foul. The sparking points are platinum-alloy, and will not burn away. And remember the 4-point, rolled-in disc.

At Your Dealer's, or **HERZ & CO.,** 295 Lafayette St., New York

NEW TYR

Far superior to any other preparation on the market for the two-fold purpose of dressing and preserving tires. A rubberized liquid preparation that fills the cracks and holes, prevents sand blisters and keeps the rubber from cracking. New Tyr can also be used on running boards and floor of car if desired with a very dressy effect. Uninjured by temperature or weather—water has no effect upon it. NEW TYR stays put and is applied in the same manner as paint.

Try a pint can of NEW TYR—it means a better looking car and better tires, covers more surface and is far superior to any other preparation on the market. Used in Germany and European motoring countries for years.

PRICE OF PINT CAN, 75c.

Looking For Information?

If it's about Gasoline Motors

THE A B C OF INTERNAL COMBUSTION ENGINE Maintenance and Repair

By VICTOR W. PAGE, M. E.

Will prove almost Indispensable to the } OWNER, OPERATOR, DEALER, BUILDER, SALESMAN or REPAIRMAN

Of Motor Cars, Power Boats or Motorcycles

It contains more *PRACTICAL* information than any three dollar book published. **Has Over 50 Illustrations,** and the **8 Full Page Charts** dealing with systematic location of trouble are worth many times the price of the book.

A treatise which will assist those who know as well as the layman. An ideal work for the busy man, and while all superfluous matter is eliminated, it is practically an encyclopedia that *FITS THE POCKET.* Just off the press, it really fills the demand that has existed for a

SIMPLE, PRACTICAL AND COMPREHENSIVE WORK OF REFERENCE, that will be UP TO DATE

Polarine Oil
Best for All Makes of Motors

When a car starts out lively in the morning and then shows signs of sluggishness later in the day, it usually means something is wrong with the lubrication.

Use POLARINE Oil, and you will avoid two-thirds of all motor troubles.

Polarine is the best automobile oil yet produced.

It gives the maximum lubrication for the amount used. It insures the least possible friction and wear, with full compression and power. It is carbon-proof.

Look for the flat, convenient can—just fits the toolbox.

Our free booklet tells all about the Polarine Brands, and contains many useful hints on the care of a car.

High price is not an infallible indication of quality

When you can buy coal that gives you *maximum heat efficiency* at $8 a ton, you won't pay $16 to another dealer simply because he needs the money.

You can get the *maximum* of efficiency out of a *Stewart Speedometer.*

That's why *four* cars out of every five carry *Stewart Speedometers.* Eighty per cent of car owners are so *level headed* that they make sure that they are getting the *utmost* when they buy a speedometer.

Speedometers, $15 to $30
Clock Combinations, $45 to $70

Magnetic principle; jewel bearings; wearing parts hardened and polished; open dial; large figures, easily read; absolutely accurate; 100,000-mile season odometer; 100-mile trip register, can be reset to any tenth of a mile. Guaranteed for five years. Strongest flexible shaft; drop forged swivel joint; noiseless gears.

IF you visit the Show as a prospective purchaser of a new car or as an owner interested in improving your present model, you must not miss seeing the demonstration of the

Truffault-Hartford SHOCK ABSORBER

For comfortable, safe and economical motoring the Truffault-Hartford has no peer. The fact that the great majority of leading cars on exhibit are regularly equipped with this device at their factories is the strongest testimony we can offer of Truffault-Hartford value.

Come and see how we can make yours an easy-riding, longer-lived car.

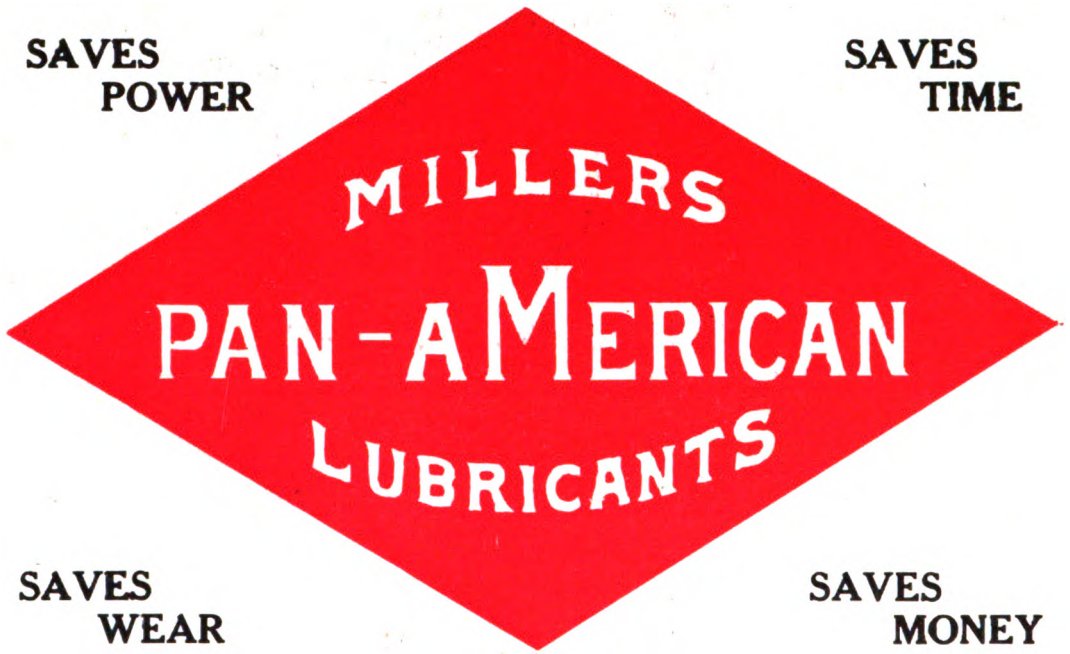
* the oil that lubricates most *

GARGOYLE

Mobiloil

A GRADE FOR EACH TYPE OF MOTOR

ARE YOU USING THE PROPER OIL ON YOUR CAR?



You can reduce your automobile upkeep expense by giving intelligent study to the question of lubrication, which is a neglected but very important factor affecting the economic operation of an automobile. Improper and therefore ineffective lubrication is most largely the cause of automobile depreciation. Experienced users of automobiles appreciate the benefits of scientific lubrication and the great saving in depreciation and economy of operation derived therefrom. Business concerns of the greatest magnitude, where comparative tests have been made, concede the superiority of Mobiloil for motor truck lubrication.

If oil saves power, it follows that one oil saves more power than another.

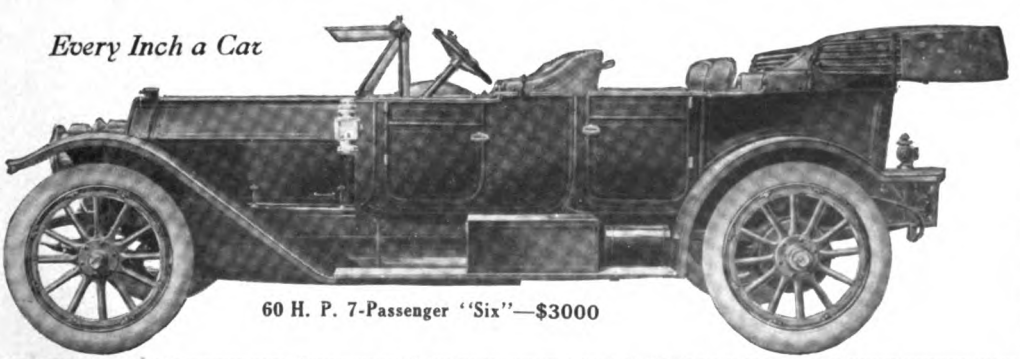
THE PRESTIGE OF THE KISSELKAR

30 H. P.....$1500
40 H. P.....$1850
50 H. P.....$2350
60 H. P. "Six".....$3000
1½ to 2 Ton, 3, 4, 5 Ton Trucks, Delivery Wagons, etc.

A few automobiles have acquired a certain value which, although it is separate from the car itself, is by no means an empty value.

This value may be expressed by the word **prestige**. It is the especial esteem which people who are familiar with automobiles have for a few particular cars.



Some cars have this prestige in certain localities—a few cars have it nationally, among the latter the KisselKar. The KisselKar shares its prestige with only a few of the costliest cars. And this prestige is nothing less than the sum of impressions made by the KisselKar's performance, appearance and service—it is the award to a car that has thoroughly "made good."

Write for KisselKar Portfolio, one of the most comprehensive automobile books ever published, and for name of our representative in your territory.

The Lightest,
Practical
Rim Made

It Is Not Enough to Specify Demountable Rims For Your New Car---Insist Upon

"Firestone"

Quick Detachable

Demountable Rims

Built from the Tiremaker's Standpoint and Experience.

Look into the past records of demountable rims; see how long any one of them has withstood the test of time; find out from users which one is most practical and dependable in *actual service.*

We have no doubt as to your decision. Other rims have come and gone, while the Firestone has steadily gained in leadership. You will choose the Firestone—

Because the Firestone rim has a *continuous* bearing-support all around the wheel. The Firestone rim has no wedges placed here and there to force it out of round.

Because the Firestone rim has a "no-split" or unbroken base that makes it water-tight—keeps moisture from working through and decaying the tire.

Because the design of the Firestone rim does away with all complications and delicate adjustments, absolutely preventing rusting together of parts, ensuring reliability and ease of operation, and requiring no special tool to operate.

Because the Firestone quick detachable feature enables you to change inner tubes when rim is *on* the wheel as well as *off* of it. Think what that means when overtaken by repeated punctures.

Because several years of success have refined Firestone rims to the lightest weight consistent with safety and practibility.

VOL. XXXIII, No. 4 MARCH 25, 1912 Price $1.00 the Year

WORLD'S LARGEST TRUCK SHOW AT BOSTON.

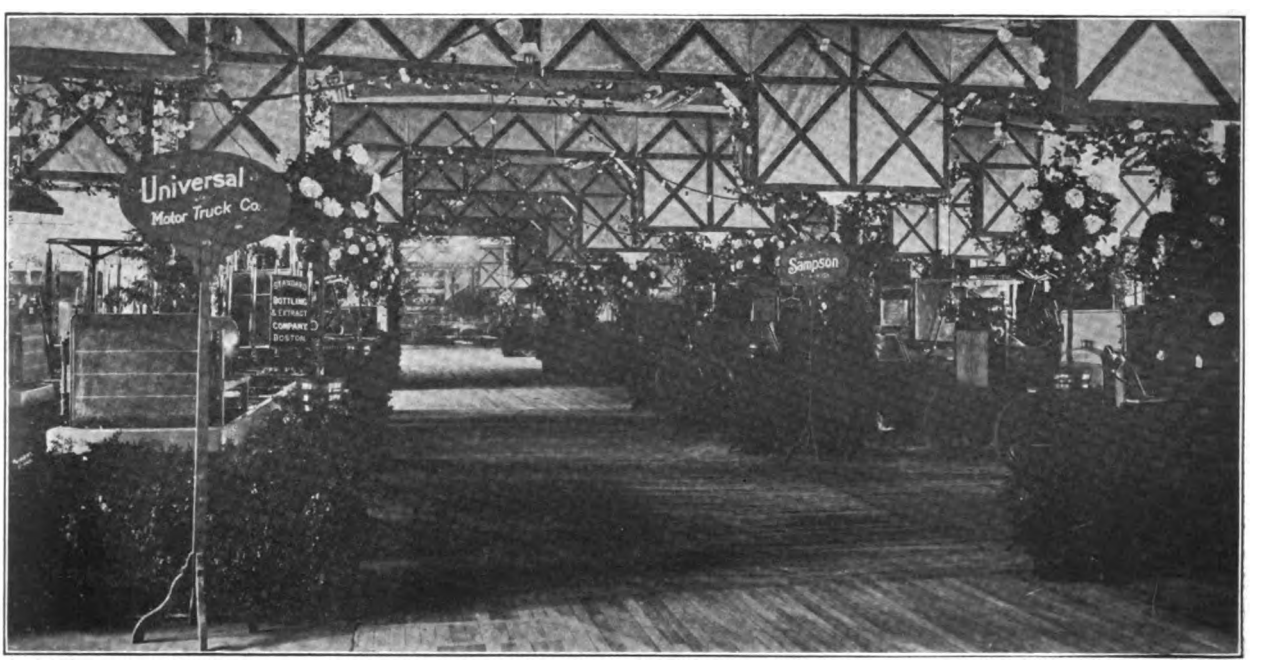
Exhibit Included Nine Makes Not Seen Elsewhere and Three New Vehicles of Home Production---Record Number of Machines Under One Roof---Enormous Business Prospects in Market of Unlimited Possibilities.

THE largest exhibition of power wagons ever held in America, and probably in the world, was that conducted by the Boston Commercial Motor Vehicle Association at Mechanics' Building, Boston, which was was concluded the evening of March 20. It was held under one roof, in direct contrast with those of other cities, and the visitors saw 182 complete vehicles and 42 chassis, this making a total of 224, representing 61 different makes. Had it not been for the delays that prevented the arrival of the purposed exhibits of several concerns the show would have been somewhat larger, the inability to make display being bitterly disappointing to concerns that had to ship from distant points and were victims of railroad transportation failure.

Looking Across Grand Hall from the Balcony, Showing the Power Wagon Display in Decorations Representing a Spanish Mission Scene.

But all in all it was a grand exposition of the mechanical transport. The success of the exhibitors in exploiting their productions was complete from every point of view, and the volume of business transacted—that is, actual sales—was very surprising, even to those who made careful estimate of the possibilities. The show was the first separate display of power wagons ever made in Boston, but there is no reason to doubt that every exhibitor was gratified with the interest manifested and the really remarkable desire for industrial machines made evident.

Regarded from any viewpoint the Boston show was far superior for those who were desirous of purchasing. It afforded opportunity for those who wished to make close examination and careful comparison of



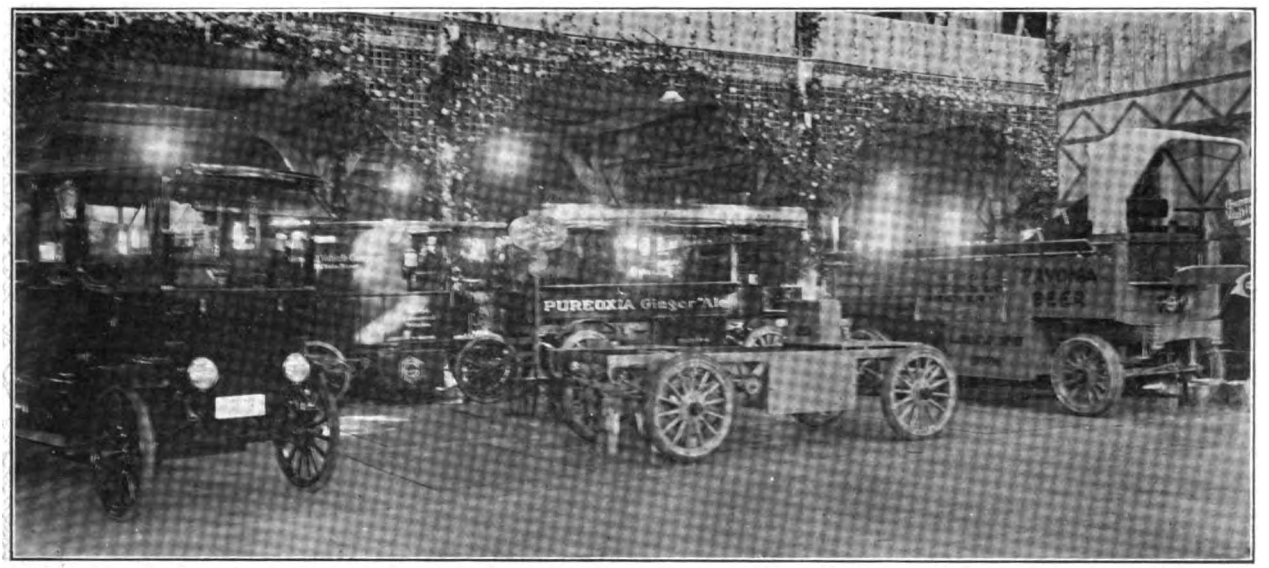
Digitized by Google

the machines. There was practically double the number seen at either New York exhibition, and it may be said that the exhibits were what might be regarded as standard productions. Spacious as is the building it did not permit the full lines of any maker to be shown. The best that could be hoped for was a display of the different chassis, and while some made an admirable showing of bodies it is evident that it was impossible for any one to exhibit what might be regarded as more than a suggestion of service equipment.

The show was the greatest education ever organized among business men of the Eastern market as it illustrated practically the possibilities of the development of transportation facilities. There was a noticeable absence of freak constructions. The purpose of every designer was to create what would yield service continuously and under all conditions, and there was a universality of opinion as to what will make for endurance, impelled by the better knowledge of requirements and materials and engineering experience. It is unquestioned that there is no willingness to deal with constructions that have not been thoroughly experimented and tested. The market has been studied carefully as to demands and the majority of the makers are disposed to standardize and develop types that are favored in the market.

The Boston shows have always been productive from a selling point of view, but the results so far as the exhibitors of vehicles were concerned was surprising in that many of them were unable to cope with the demands, at least so far as immediate deliveries were concerned. In fact, the sales exceeded all expectations and with the manufacturers the applications for agencies were exceedingly gratifying.

The attention given to the show by organizations of business men was such as to justify the belief that there will be remarkable impetus to the adoption of the power wagon for every service. The New England Coal Dealers' Association members visited the exhibition and systematically examined the vehicles adapted for their purpose. Then incidentally, they listened to addresses before them as a body by experts concerning the subject of haulage. The addresses and their own investigations placed at their disposal information that would not under ordinary circumstances have been available. It is hardly necessary to indicate the value of such detail, or the influence that it must have so far as the market in this particular field of activity is concerned.



Looking Down a Long Aisle in Machinery Hall with Its Decorations Suggesting an Old English Rose Garden in the Early Spring.

It is evident that the business men are carefully studying the haulage problems with a view of adapting their own systems to the use of motor vehicles, and with the assurance of the economy of power wagons from a mechanical viewpoint, and their unquestioned superiority to any other available service, there can be but one conclusion—that the market is not only remarkably active, but the demand will be steadily increased. While the condition stated will obtain generally, it will be unusually manifested in the East, where the commercial centres are numerous and close together, linked by admirable thoroughfares, and where the keen business competition and the suburban patronage will compel wider range of activity and delivery.

The attention given to the eastern market by the

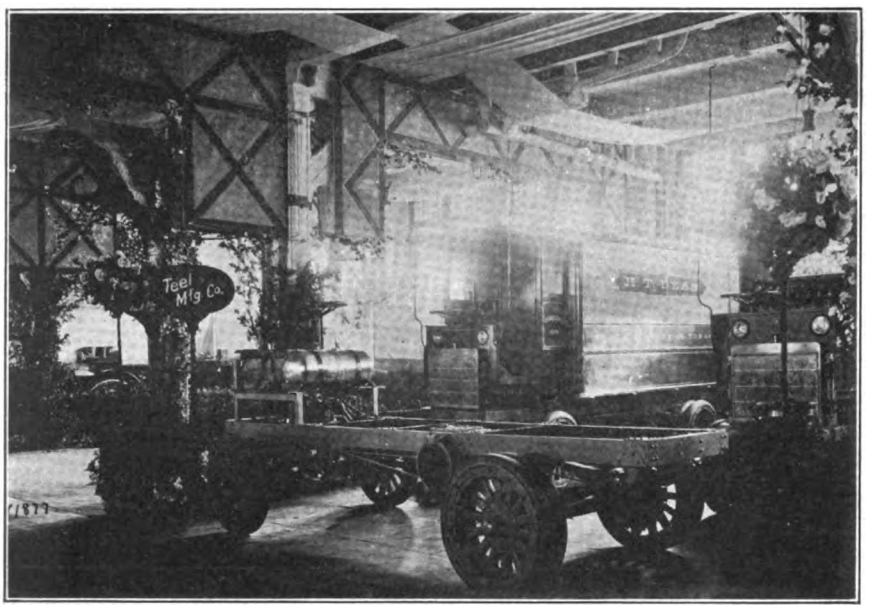
A Glance Into the Stand of the General Vehicle Company, Showing a Special Ambulance, Delivery Wagons, a Brewery Truck and a Chassis.

manufacturers of power wagons was evidenced at the Boston show by the presence of the executives of practically every concern of prominence. With the knowledge of the motor experience of the people and the business requirements the patronage and interest of the visitors was regarded as the best measure by which to gauge the prospective business for the year, and while there was not the curiosity ordinarily manifested at the shows the deep concern and the information sought was sufficient to satisfy any observer that the show was in every sense a repetition of the Boston pleasure car shows in direct purchasing quality.

There were many conditions that made clear that, despite the promise of the market there was not the capacity of manufacturing to produce anything like the number of machines desired within the period set for delivery, so that many buyers will be compelled to wait for vehicles—some of them for what may appear to be discouraging lengths of time.



Taking the exhibition as a whole it may be said that it was in every sense satisfactory, but brief considerations show that five concerns showed practically 25 per cent. of the exhibits, and that 14 makers displayed 119 machines and chassis, or more than 50 per cent. of the entire exhibition. The remaining 47 exhibitors showed 105 wagons and chassis, or about 48 per cent.

The distinction of showing the largest number of

Where the Decatur "Hoosier Limited" Was Displayed, the Exhibit Consisting of a Complete Vehicle and a Chassis.

Digitized by Google

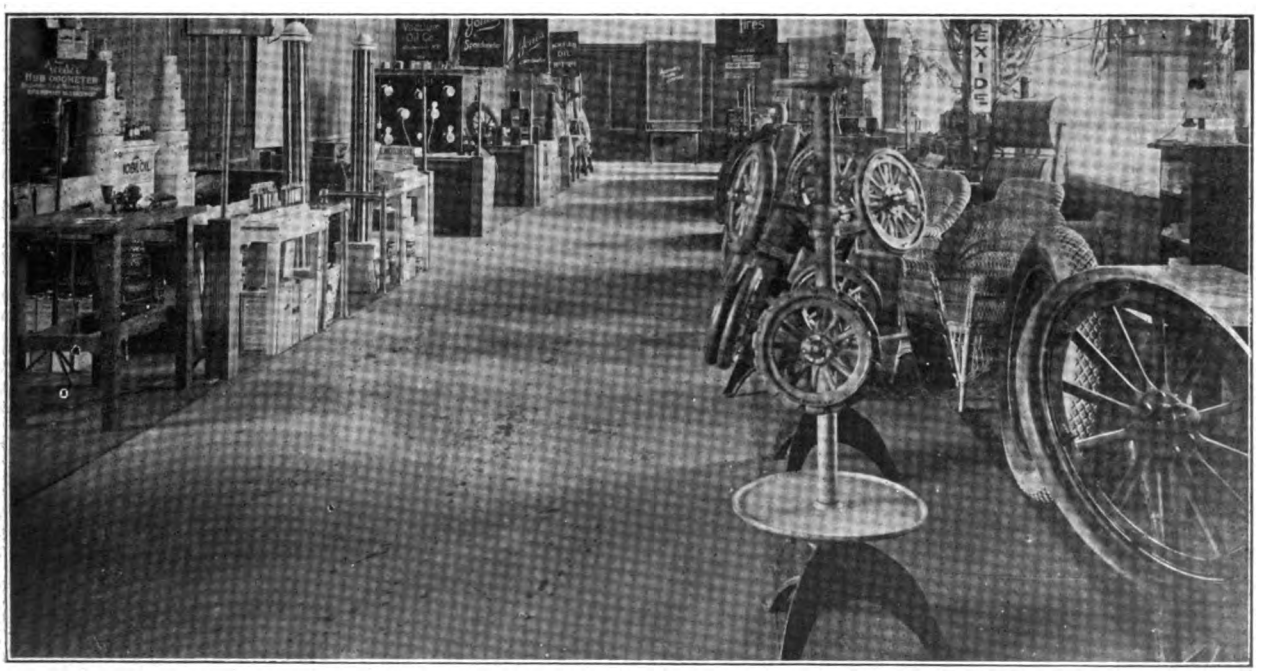
The Teel-Woodworth Three-Ton Chassis with Its Surroundings of Power Wagons and Hedges.

chassis was shared by the makers of White and Kelly trucks, each with 14, but of these the latter had 13 bodies installed and the former but eight. Next in point of numbers was the Packard with 13 chassis, all but one with bodies. The General Motors Truck Company was third with 12 chassis, nine of these with body equipment, and the Autocar Company was fourth with 10 chassis, eight of them with bodies. The International Motor Company divided its exhibit into nine Mack trucks and seven Saurer chassis, four of the latter being body equipped, one exhibit being an imported fire pump and the other two chassis. Six Sampson wagons and trucks and one chassis made up the display of the United States Motor Company, while the Atterbury with six trucks, the General Vehicle Company with six chassis, four body equipped, and the Knox display of six chassis, including two fitted for fire service and an ambulance, made up the list of the makers showing more than five cars.

In contrast with the previous shows there was better opportunity for buyers to examine the machines. There was as a whole sufficient room for those interested to see every part, and in no case was there such congestion that the visitors could not have access to every constructional detail. Of the 42 exhibitors in the industrial department of 1911, 26 made display at the show of 1912, and of these two made change of exhibit, so that 16 did not care to or could not secure representation. But there were 37 new exhibitors, including the two referred to. Of the 61 makers represented nine did not make display at either New York or Chicago, so that these may be considered to be practically new machines.

These were the Chalmers, Clark, Couple-Gear, Eckhard, Ford, Mais, Mora, Teel-Woodworth and Stanley, the last mentioned being the first showing of a steam vehicle adapted for industrial purposes by the pioneer builders. The other 51 machines were seen at some of the preceding exhibitions. Of the 1911 exhibitors those to return were the Alco, Atterbury, Autocar, Buick, Chase, Commerce, Dayton, Decatur, Garford, Grabowsky, General Vehicle, International Harvester, Kelly, Knox, Morgan, McIntyre, Overland, Packard, Peerless, Pierce-Arrow, Sampson, Speedwell, Victor and White, while the Ford taxicab and the Clark two-cycle motor truck were also shown. Those shown in 1911 that made no exhibit were: Atlas, Beyster-Detroit, Brush, Cass, Detroit electric, Franklin, Harder, Harrison, Hupmobile, Johnson, Rapid, Reliance, Randolph, Stoddard-Dayton, Warren-Detroit and Wilcox. The Rapid and Reliance are now marketed as G-M-C gasoline vehicles.

The exhibitors who made no display in 1911 were: Bessemer, Baker electric, Chalmers, Clark, Commerce,



Democratic Vehicles, Couple-Gear Gravel Cart and a General Vehicle Brewery Wagon, Shown Amid the Hedges and Climbing Roses.

Digitized by Google

Couple-Gear, Eckhard, Federal, Ford, Gramm, G-M-C, KisselKar, Koehler, Lansden, Lauth-Juergens, Locomobile, Lozier, Mack, Mais, Mercury, Modern, Mora, Motor Wagon, Martin tractor, Pope-Hartford, Poss, Reo, Sandusky, Sanford, Saurer, Stanley, Stearns, Sternberg, Teel-Woodworth, Velie, Walker and Waverley.

Of the 1912 exhibitors the Baker, Couple-Gear, G-M-C, General Vehicle, Lansden, Walker and Waverley are electric, the Stanley is steam driven, and the Chase, International Harvester, Kelly, Mercury and Sanford are air-cooled. The number of machines shown rated as water-cooled was 48. Of the air-cooled power plants the International Harvester, Mercury and Sanford are light wagons, the latest Chase machine has capacity of 4000 pounds, while the Kelly is cooled by a blower system and the trucks

The East Aisle of the Main Accessory Department Looking Toward Paul Revere Hall, with the Kelly-Springfield Tire Company's Display in the Foreground.

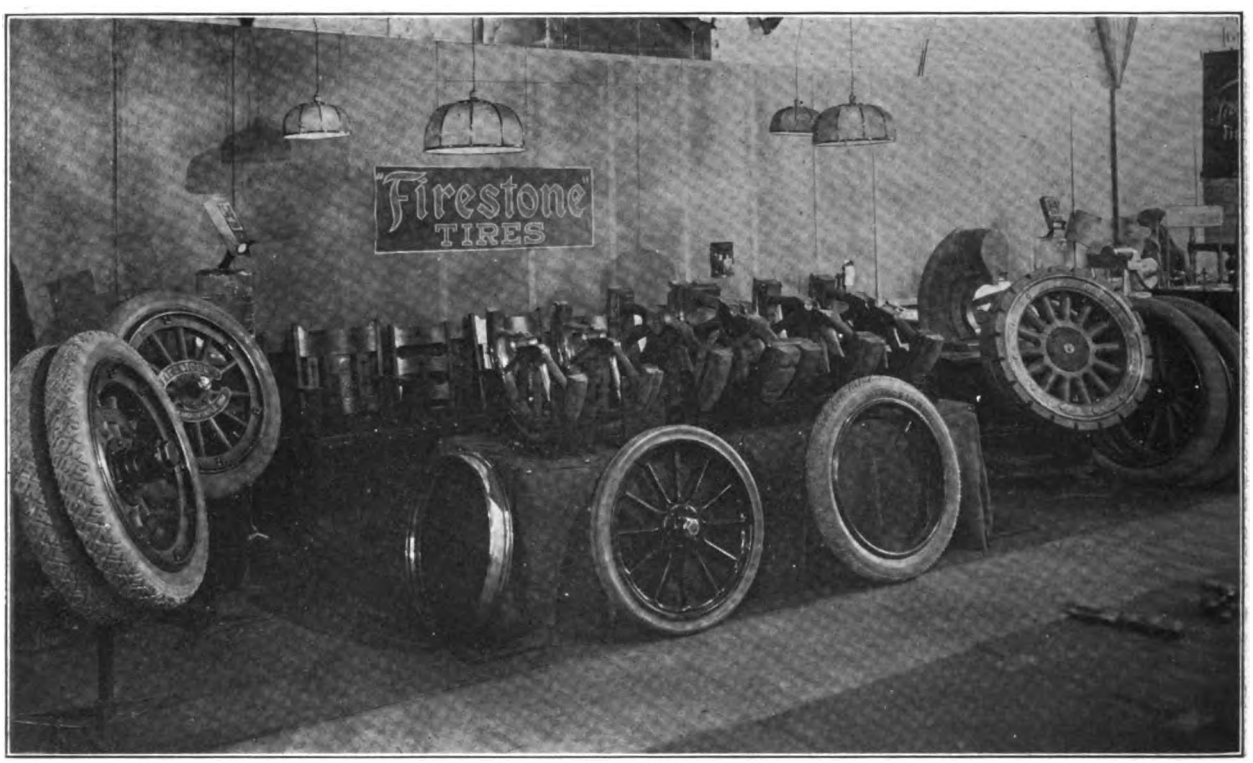
are built up to five tons rating. The Stanley is a comparatively light duty machine. The electric wagons and trucks, however, have load capacities ranging from 1000 to 10,000 pounds.

If there is any reason for comment concerning the standard lines of vehicles, both in electric and gas engine drive, it is desirable to emphasize the attention given to the construction to secure uniformity of strength and endurance. Without exception there has been abundant margin of safety of components, but the designers have directed their endeavors toward increasing weight of metal wherever rigidity has been found desirable, stiffening the chassis frames and affording protection against the stresses resultant from constant service. The purpose has been largely to protect wearing parts from effects of abrasive accumulations and to provide means of lubrication where metal faces may be subject to friction. There has been keen realization of the destructive effects of extreme vibration and so far as this may be done the members have been created with a view of long resistance to every influence that may cause deterioration.

With the makers of chassis there is generally a desire to sell without body installations because of the widely differing requirements and demands of the purchasers. This does not mean that the desires cannot be met, but to provide every probable form of body means the addition of a body-building plant to the works producing the chassis, a practically separate industry in which many manufacturers have no inclination to engage. This has brought about activity by body makers who are specialists in their work and who are prepared to furnish whatever may be required within the limitations of the chassis.

The show was not so much of bodies as might be assumed because the majority of the makers preferred to make display of what could consistently be regarded as standard equipment, but in numerous instances there was exhibition of special bodies which demonstrated possibilities for varied delivery service. One of the uses for which a number of bodies were especially designed was coal haulage, for which end, side and chute discharge are used very generally. Another class of service developed varying types of quick discharging equipment, there being some demonstration of hand and powered hoists by which the machines may be unloaded in very brief space of time. Some of these were utilizations of body elevators used

Digitized by Google



on animal carts, while others were more recent constructions designed to eliminate any effort by the drivers and to economize the time of the machines.

Of unusual interest to all visitors was the Eckhart truck, built by the Hercules Motor Truck Company, Boston, this being a five-ton vehicle in which was installed a six-cylinder motor, the only one exhibited at the show. This machine is an admirable creation from a mechanical viewpoint and the workmanship was unusually well executed throughout. Designed for heavy duty this engine is remarkably accessible. With minimized effort work may be performed upon every part of the motor. To illustrate, either side of the engine case may be opened quickly for work on the crankshaft, camshafts, connecting rods, and bearings. The valves are located in the head, and the valve pushrods and the roller tappets may be released and lifted out by removing a nut holding one yoke on each cylinder unit, the cylinders being in pairs. The valve cages may be similarly released and removed by turning off a nut holding a series of yokes.

The motor has bore of 4.5 inches and stroke of 5.5 inches and while rated at 48.6 by the S. A. E. standard it has produced 54 horsepower by brake test at 800 revolutions a minute. The governor is limited to 900 revolutions, which will yield approximately 60 horsepower. The engine is cooled by a radiator with heavy bronze bottom and top cells, into which copper tubes with spiral radiating flanges are swaged as are the tubes in a steam boiler, the construction being unusually heavy and capable of resisting a considerable steam pressure. A grating protects the front of the radiator.

Both motor and gearbox are carried in sub-frames and the rear of the motor sub-frame and the front of the gearbox sub-frame are suspended from a frame cross member by wide yokes that are pivoted at the frame member, and each sub-frame is mounted at the other end on the chassis frame by strong arms. It is claimed for this construction that no matter what the twist in the chassis frame from load or road shock there can be no strain upon the transmission.

One of the most unique features of the driving system is the enormous gearset, which is carried in a sub-frame and is coupled with the pinion shaft of the jackshaft differential through a second clutch. Both clutches are of the reversed cone type and they are interlocked so that when the gear ratio is changed the gearset is instantly stopped by a brake and the gears may be meshed without possibility of damage. Instead of the torsion rods of conventional design the driving effort from the rear axle is carried to the front axle by a long rod extending between the axle centres. There is a heavy chain attached to the centre of the rear chassis frame member and carried on a hook on a vertical arm rising on the axle housing that resists any twisting movement of the axle.

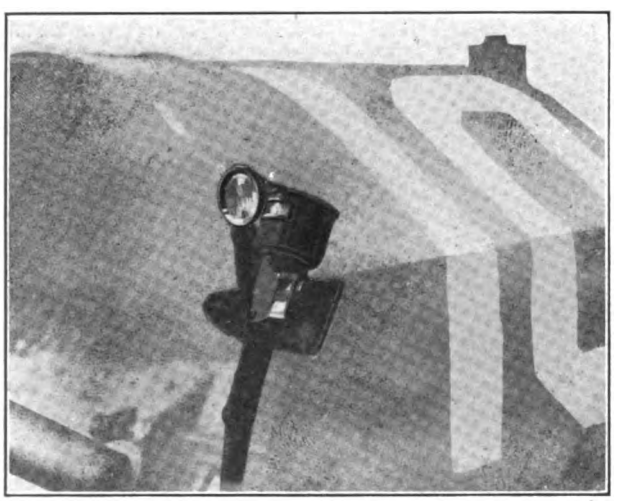
The second Boston-built truck is the Clark, produced by Edward S. Clark, for years a builder of steam pleasure cars, who a year since showed a two-cycle engine power plant in a power wagon. He is now building trucks of conventional type of three and five-ton capacities, one of the smaller being shown. The Clark design is noticeable for the fact that there is a careful adherence to sound engineering and established mechanical principles. It has been worked out with clear knowledge of the requirements of varying service and large factors of safety have been provided. The motor is four-cylinder, 4.125-inch bore and 5.25-inch stroke, giving 35 horsepower. The ignition is the Bosch high-tension dual system, the lubrication is by mechanical force feed from two plunger pumps through a dash sight gauge, the cooling is by gear-driven water pump and tubular radiator, the carburetion is by a float-feed automatic water jacketed carburetor, and the driving system is through a leather faced cone clutch and gearset, giving three forward speeds and reverse, attached to the jackshaft.

The frame and other chassis construction details are according to standard practise, there being a wheelbase of 120 or 130 inches. The springs are semi-elliptic with a cross or jack spring to carry the load. The service brake operates by bands contracting on the jackshaft drums and the emergency brake shoes expand in the rear wheel drums. The driver's seat is at the left side with centre control levers, steering being by an irreversible worm gear.

The Stanley steam machines follow the design developed in Stanley pleasure cars with somewhat heavier construction. One model shown was a 2000-pound delivery wagon and the other was a 12-passenger depot or observation wagon.

The Chalmers delivery wagon has capacity of 1000 pounds and it has either open or closed body fitted on a model M chassis with longer and straighter frame, heavier springs and lower drive gear. The wheels are fitted with 34 by 5.5 pneumatic tires.

The Ford delivery wagon has a special enclosed body installed upon the regular Ford chassis. The wagon has a capacity of 750 pounds and the contents may be protected effectually from the elements or individuals, and the driver is shielded by an extension that covers him completely, yet affords full sight at either side.



A Corner of the Accessories Display, with the Stand of the Veeder Manufacturing Company Where the Hub Odometer Was Demonstrated.

The Teel-Woodworth truck is three tons capacity, and is built by the Teel Manufacturing Company at Medford, Mass. The designer has included in his machine standard components, such as a four-cylinder 30 horsepower Continental engine, Bosch high-tension ignition, Hele-Shaw clutch, Cotta transmission, Timken front and rear axles, Ross steering gear, and nickel and vanadium steel for every construction. The components are of liberal proportions throughout, provision is made for thorough lubrication of all wearing parts, and adjustment can be made where there shall be wear. The motor is driven with fixed spark and accelerator.

The Couple-Gear machines shown were a Philadelphia dump cart and a wagon with bottom discharge, these having the regulation Couple-Gear equipment of front wheels with the battery placed under the driver's seat. The platform is carried forward on the Couple-Gear driving wheels and the rear on the usual large wooden cart wheels both being designed for heavy haulage such as is desired by contractors, with 90 per cent. of the load carried on the steel tires. The machine is driven and steered by the front wheels and is especially adapted for work in traffic or narrow streets. The speed is comparatively slow but the machines are in every way economical.

The Mora wagon is a light delivery vehicle driven by an opposed-cylinder water-cooled engine of 16.8 horsepower S. A. E. rating. It is designed for comparatively fast service work and is equipped with either platform or express body. The drive is by planetary transmission and through double side chains.

Magnifying Glass Attached to Speedometer on Stutz Racing Cars.

It is conventionally built and has a simplicity that commends it to those who desire practical service.

The accessories exhibited during the show were in considerably reduced number as compared with the pleasure car display, but there was a very fine and comprehensive showing of tires, which received much attention.

MAGNIFYING GLASS ON STUTZ.

An accompanying illustration presents a novel and useful feature which is fitted as standard equipment on all Stutz racing cars. It is a magnifying glass in focus with the driver's position, by which he can see the entire dial of the speedometer enlarged several diameters. The idea originated with H. C. Stutz, chief engineer of the Ideal Motor Car Company, Indianapolis, Ind., maker of Stutz cars. Gilbert Anderson, who used it first in the Fairmount Park road race at Philadelphia, Oct. 9, says that when a man is driving more than 80 miles an hour there isn't time to take a speedometer reading under the usual conditions, while with this magnifying arrangement it is possible to note the exact speed at a single glance. It will be remembered that Anderson, driving the Stutz No. 10, finished second in the class and the car was the only competing machine which completed the entire distance without a stop of any nature.

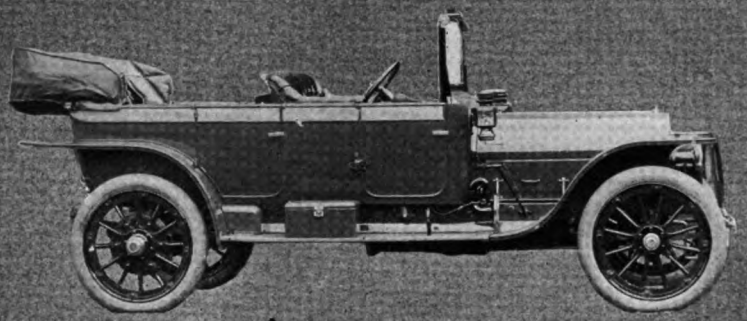
PUBLIC TAKES RUSSELL STOCK.

Recently, the Russell Motor Car Company of Montreal, Can., the licensee under the Knight patents in Canada, offered $400,000 of new preferred stock to the public, and announcement is made that all has been subscribed. Although the terms of issue called for an initial payment of $80,000, over $285,000 has been paid in, many of the subscribers taking advantage of the opportunity to take up their entire allotment.

TOURING CLUB TESTS CUT-OUT.

On order to determine the necessity for the use of the cut-out, the Touring Club of America recently conducted a demonstration in the laboratory of Joseph Tracey, a consulting engineer in New York City. A Packard 30 horsepower motor was utilized in the trials, and the result of operation with the cut-out closed and open is shown clearly by the following table:

R. P. M.	H. P. Closed	Car Speed, M. P. H.	H. P. Open
300	13.5	10	13.625
1000	43.0	33	41.750
1800	47.5	60	48.000
900	38.5	30	38.500



SHAWMUT TIRES AT THE SHOW.

One of the features of the recent Boston automobile show was the exhibit of the Shawmut Tire Company of that city, in which the manufacture of Shawmut tires from the tree to the completed shoe was presented in a thoroughly educational manner. First, there was the rubber tree and the method of sapping it. Solid biscuits of pure rubber in the form in which this component is shipped to this country also were shown. Lastly, Shawmut tires were presented in all the various stages of production. The exhibition also including a device for determining the elasticity and toughness of the Shawmut tubes. Another innovation was the full line of repair material, this being put up in screw top, air tight cartons with full instructions for using.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

Preparing the Equipment for the Spring Overhaul

by C. P. Shattuck

PROGRESSIVE motorists are beginning to plan the necessary equipment for the spring or annual overhaul of the car, and it is interesting to note that the number of owners who engage in this work is increasing each year, this being the result of the educational campaign conducted by the manufacturer and the motoring magazines. While many undertake their own repairs because of a desire to effect economy in upkeep, there are others who though fully able to have this work done outside, don the overalls and dissect the mechanism of the automobile to become fully acquainted with its components and their relation to each other. In both classes will be found skilled workmen, possessing considerable knowledge of mechanics, and it is from such operators that the manufacturer has received valuable suggestions in the past. Numerous clever devices have been invented by the owner of the pleasure vehicle, and a large percentage of the practical accessories owe their origin to the owner and driver.

Many have model garages in which provision is made for a workshop and some of these are fully equipped, containing as they do, modern appliances for the care and maintenance of the motor car. Those possessing a knowledge of machinery have installed lathes, drills, etc., operating these by electricity or by a small gasoline motor, and during the long winter evenings have turned out the new parts needed in the overhaul. Others have a less complete equipment, confining themselves to a set of practical tools and apparatus, and having the necessary machine work done outside.

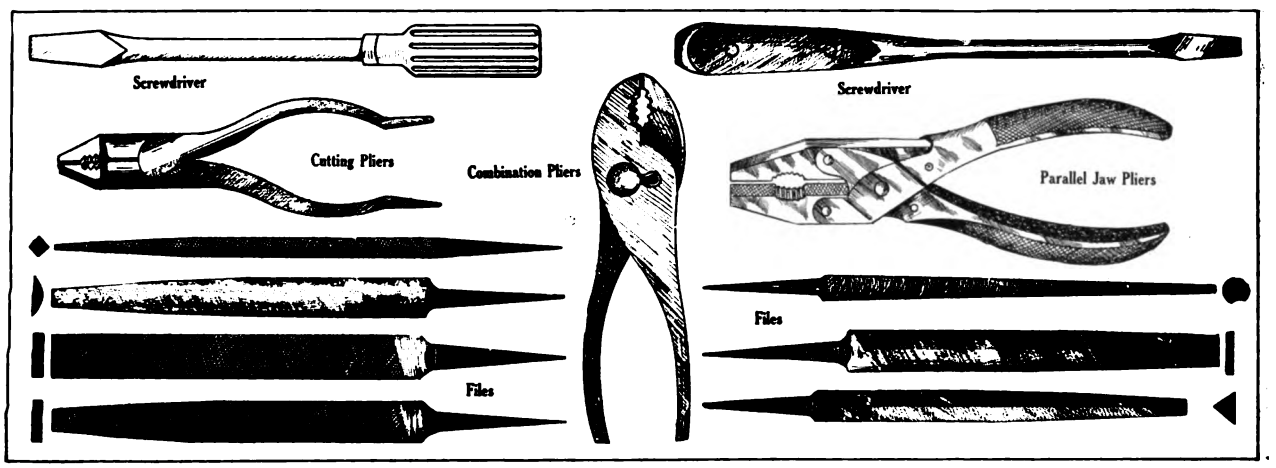
There is still another class, the comparatively new owner, who although possessing an elementary knowledge of the automobile, desires to make his own repairs, and it is for his benefit that the suggestions herein are made. While to those who have gone over the ground before the equipment outlined will be familiar, it will serve as an aid in checking the list of tools and material essential to the work. Regarding these, the reader should not take it for granted that every article named must be purchased. The majority will be found in the average private garage and it is probable that those required may be secured at a very little outlay of money. The greater part of the material may be secured for a few cents, such as valve grinding compound, wire, small tools, etc. When the latter are picked up one at a time, and cared for properly, a most complete equipment is secured very rapidly. Special sales provide excellent opportunities for securing first class instruments and in selecting these, quality should receive first consideration.

The Wrench Equipment Is Important in the Overhaul and Should Include S, Coes, Socket and Stillson.

Digitized by Google

The extent of the equipment will depend upon the nature of the overhaul; that is, the age of the car and its condition. It is obvious that a machine which has been in service but a short time will require less adjustment than one which has been operated several thousand miles. If the work consist of removing the cylinders, scraping out carbon and grinding valves only, the average tool kit will answer all requirements, with the addition of the grinding compound. If the chassis is to be stripped to the frame and a thorough overhaul required, the use of a more complete equipment will be essential to accomplish the work properly.

Stands and Clothing.



Assume that the automobile has seen considerable service and its condition is such that the owner is warranted in stripping it to the frame, disassembling each of the components, and that these need attention. This work will require the services of a motor stand and frame supports which were described in the last issue of The Automobile Journal. If the garage be *not* equipped with a work bench some form should be constructed, and elsewhere herein is described and illustrated a practical, inexpensive bench which may be built by the motorist.

While a pit is desirable, saving as it does crawling under the chassis, and facilitating the work, it may be dispensed with if the garage be not thus equipped. A creeper may be constructed or purchased, this being optional. In the overhaul, as well as in reassembling, the operator will be obliged to work under the car, and in the absence of a pit or creeper may employ an old blanket or robe with one end rolled up to form a pillow. The latter will be appreciated.

Overalls and jumpers are usually employed over old clothes, as these may be washed from time to time, but an old suit may be utilized. Bruised knuckles and damaged hands may be prevented by the use of an old pair of gloves with the finger tips cut off. As the gloves become saturated with grease they may be cleaned with gasoline. A cake of hard soap should be included for filling the finger nails before starting work as it will not only prevent griming of the fingers, but will facilitate washing. An old cap with a visor is handy as in working underneath the car particles of dirt are apt to drop into the eyes. A pair of old goggles may be used as it is extremely awkward trying to remove foreign elements from the eye when the hands are covered with grease. Regarding soap, there are several excellent preparations. Powerful compounds should be avoided as the skin will be roughened and inflamed by their use.

Tool Equipment—Wrenches.

In selecting a vise for the work bench one having at least three-inch jaws is favored, and a larger one is even more desirable. It should open at least four or five inches to take large work. The wrench outfit is perhaps the most important, and a set of standard S members should be included. These have openings ranging from .125 to 1.25 inches graduated by sixteenths. Special sets are obtainable at any supply house, these including five members the openings of which vary from .375 to 1.25 inches, and are not expensive. Some owners have a complete set while others get along with the ordinary outfit.

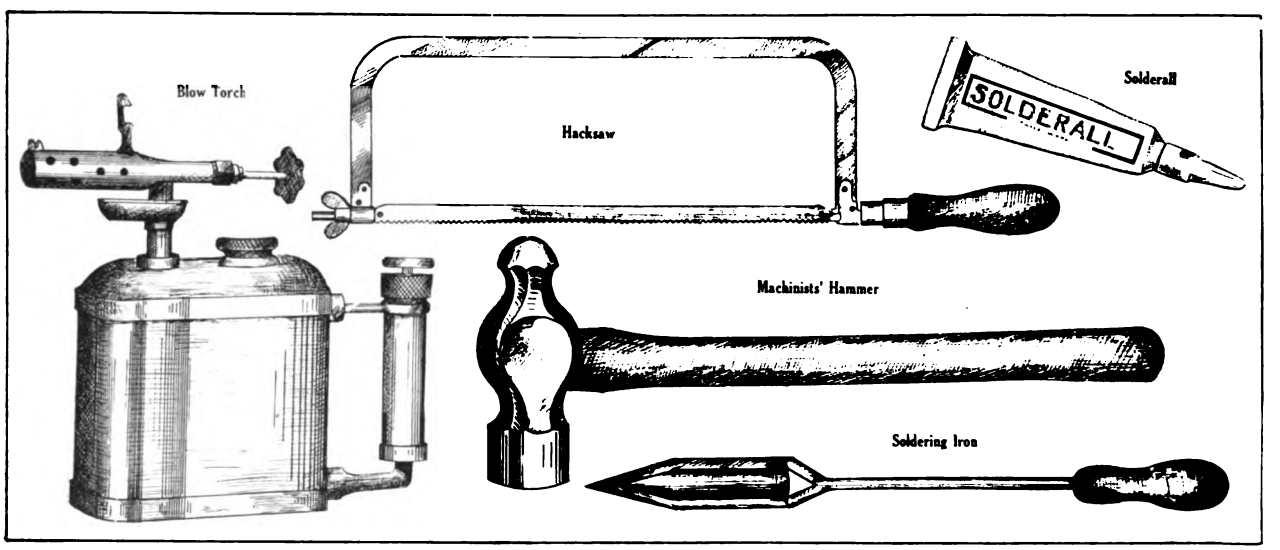
Pliers, Screw Drivers and Various Types of Files Useful in the Overhaul.

A Coes all metal monkey wrench is recommended as it is very durable and will withstand hard usage. One about eight inches long will answer for ordinary purposes, but a larger member will be useful for heavy work. A Stillson is essential and at least two will be required. A small one for light work is usually found in the average road kit and to this should be added an all metal member 14 or 16 inches long. When a piece of piping about three feet or more is slipped over the handle, the most stubborn part will yield to the leverage exerted. A small bicycle wrench will be handy for light work such as for small nuts and bolts. A set of box or socket wrenches should form a part of the equipment, as with the universal joint and ratchet device considerable time will be saved in unloosening nuts difficult to reach with the ordinary wrench. The socket type is particu-

Digitized by Google

larly adaptable to the overhaul of the motor.

Hammers and Screw Drivers.



At least two hammers will be required, a machinist's for heavy work and another and lighter member for riveting, etc. A rawhide and lead hammer may be included, but in the absence of these a block of lead or hard wood may be substituted when driving out parts which preclude the use of the regular members.

Screw drivers are not expensive and three of different sizes will prove useful. A very small member for making fine adjustments, another with a wooden handle for light work and a heavier design for removing the stubborn screws, are needed. The last of metal and having a riveted wooden handle.

Two pairs of pliers will answer ordinary requirements, a pair of combination and those having side cutting jaws for cutting wire, cotter pins, etc. For heavier work the hacksaw will be necessary and adjustable frame members are not expensive and permit .625 and .75 inch, will answer ordinary requirements. A diamond pointed cape and round nosed chisel may be included, all of which will prove useful. A couple of solid punches will be none too many as these tools are necessary in driving out pins, bolts, etc. A centre punch is required for marking gears and other parts, and may be plain or knurled as desired.

A breast drill having two speeds is invaluable in the garage. The smaller size is adaptable for light work and its wooden handle is utilized for holding the drills, these ranging from 0 to .15625 inch. The larger drill is preferable as jaws of the chuck will grip drills ranging from the smallest to .5 inch in diameter. Straight shank drills may be purchased in sets or singly in sizes from .03125 to .5 inch by sixty-fourths. In connection with these tools should be mentioned a countersink which is indispensable when fitting new brake linings, riveting, etc.

Regarding taps and dies, these are optional. Some motorists have a set adapted for standard work about

The List Should Include Blow Torch, Soldering Iron, Hacksaw and a Good Machinists' Hammer.

of the use of different sized blades. The latter should have coarse teeth for heavy work and fine for cutting tubing, etc.

In selecting the files those of good quality should be given preference. The set should include: Round or rat tail for filing out holes, square for finishing key ways or cleaning burred splines, half round for finishing surfaces to which their form is adapted such as the inside of bearing boxes, connecting rod and main bearing caps, etc. The three-cornered file will prove useful while the flat member can be utilized on all plane surfaces. Wooden handles should be fitted to the files and these members kept in the bench rack when not in use.

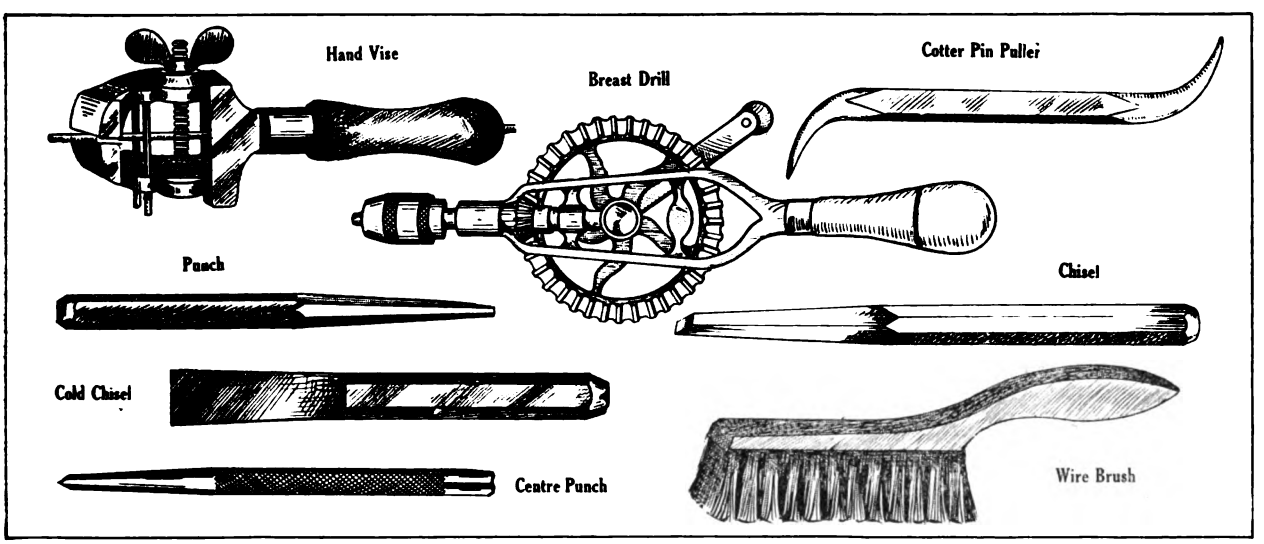
Cold Chisels, Punches, Etc.

Cold chisels in their various forms are not expensive and the motorist is warranted in having several of these handy tools. Three of the plain type, .25,

the car, while others purchase as required. The same may apply to reamers, but if the machine work is to be done outside these members will not be needed. A tempered steel rule will prove valuable for making fine measurements and these members are inexpensive. A pair of calipers for making inside and outside measurements should be included, and if the garage be equipped with a lathe and fine work is to be done, a micrometer will be required.

Chisels and tools become dulled with use and a grinder operated by hand is useful for resharpening as well as performing many little jobs. With a complete equipment a differential pulley block will save lifting heavy parts such as the motor, etc. A falls and tackle may be substituted, however. With some types of machines a wheel puller is necessary. These may be made or purchased and in addition to removing a wheel may be employed in disassembling the chas-

Digitized by Google



sis. Regarding valve lifters, there are many makes upon the market, and in selecting one of these care should be taken to note if they fit the motor, else the fingers are liable to become jammed in the removal of the keys retaining the valve springs.

Scrapers, Brushes and Soldering Outfit.

If new bearings are to be fitted or old members adjusted, a set of scrapers will be essential. These come in sets of three, adapted for different work, although some repairmen utilize a three-cornered tool. In connection with these instruments a small quantity of Prussian blue is required in scraping a bearing or part accurately. A torch, soldering iron and flux should be included in the equipment, although if there be but little soldering to be done, a tube of Solderall will suffice.

Some motorists add a machinists' hand vise to the list of tools, but this can be dispensed with, although it is a handy device. A pair of tinners' snips are not keeping the nuts, bolts and small parts separate and from being lost, and if the motorist is not experienced in the work it is suggested that each component and its parts be placed in one receptacle which arrangement will make the reassembly easy. A can and a brush with stiff bristles are required for cleaning, as well as waste or old cloths. Three small oil cans, one each for lubricant, gasoline and kerosene are essential, and a squirt gun will facilitate cleaning places not reached easily with the brush or waste.

A small quantity of soft iron and brass wire of different sizes will be of service in securing the water connections where a hose clamp is not used, and for other work. Several sheets of emery cloth, fine and coarse, should be listed, also a small bottle of shellac with a wooden stopper, and a small brush. If the garage be not equipped with cotter pins, lock washers, taper pins, cap screws, nuts and bolts, these should be procured. These come in assorted lots, although the

Punches and Cold Chisels Will Be Required as well as a Two Speed Breast Drill.

expensive and are very useful in working sheet metal and in making repairs. A coarse wire brush will facilitate the removal of carbon after the greater part of the deposit has been loosened. While there are special tools for this work, an old jackknife or chisel will serve. An oil stone for stoning new piston rings and touching up the edges of some tools will be a valuable acquisition to the equipment. A cotter pin puller may be purchased for a few cents and will save much time in removing obstinate pins. The list may be augmented by the addition of special tools adapted to the automobile to be overhauled and the equipment may be made as complete as the motorist desires. The tools mentioned will suffice, however, for general overhaul and the writer has managed successfully with only a part of those mentioned.

Small Material.

There are numerous small articles and material essential for the overhaul, and the sum total of cost is slight. Several wooden boxes should be secured for cost of a box of each is slight and will prove useful from time to time.

Graphite Has Many Uses.

A can of flake or fine graphite can be utilized for many purposes. It is used as an anti-rusting compound for rims, between the leaves of the springs, on the valve caps, and numerous other places where heat will burn up grease or oil. It is an excellent lubricant, resisting as it does the action of water and heat, and in addition fills the pores of the surfaces of contacting metal.

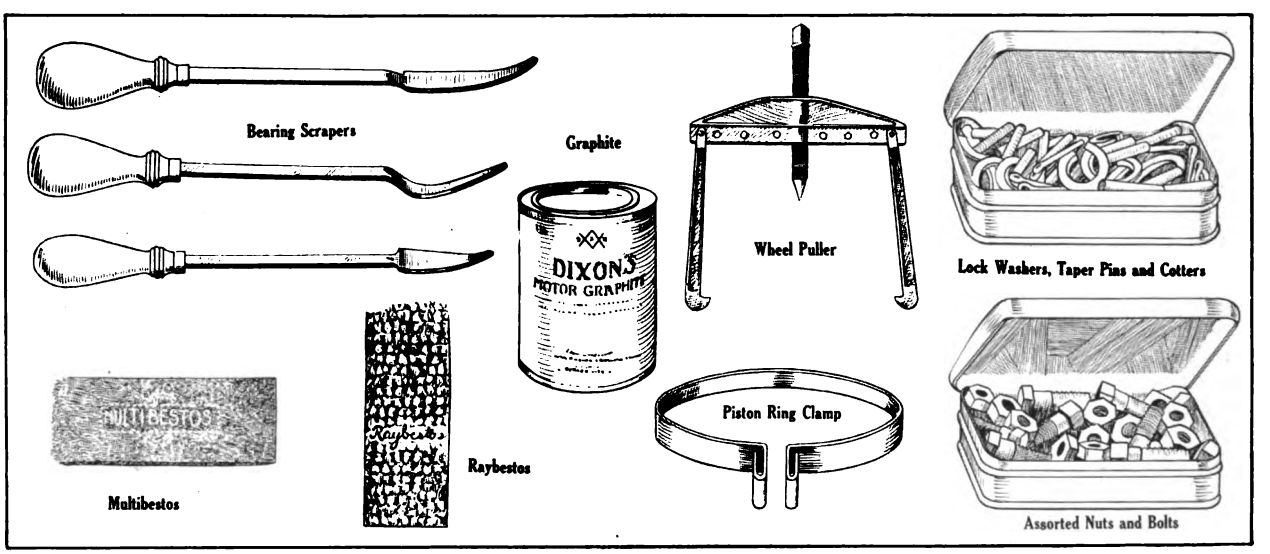
Although there are many excellent valve grinding compounds upon the market the motorist may prepare his own, either with emery and powdered glass or carborundum. The writer favors the finest grade of the latter and when used properly it provides superior abrasive qualities. A few cents will secure enough to last several seasons. It should be mixed with plenty of oil when grinding in a valve.

A bundle of candle wicking provides an ex-

Digitized by Google

packing for some types of water pumps and connections, and a small can of white lead should be procured at the same time. A package of assorted machine and wood screws will prove of service, as some of the members removed from the car may be damaged or rusted. Sheet asbestos is not expensive and is employed for gaskets where the parts are exposed to considerable heat. A form of asbestos copper gaskets is manufactured in different sizes and these may be employed when possible for making gas tight connections for the valve caps, intake and exhaust manifolds.

Mobiline is favored by many repairmen as it may be used several times if not damaged in the removal from the motor. Several sheets of cardboard of different thicknesses as well as heavy wrapping paper will be serviceable in the overhaul. If the felt washers utilized on the bearings are worn new members may be made from the same material which may be secured at a mill supply house. As the usual tool kit includes friction tape this may be eliminated from this list of material.



In connection with the preparations for the overhaul the brakes should be inspected and if the friction material be worn new should be purchased. Raybestos or Multibestos is recommended and this material may be purchased at any supply house or agent of the maker. Fibre comes in sheets of varying thicknesses. This is utilized for many purposes among which may be mentioned that of shims for bearings. If a small quantity be needed it may be secured for a few cents from some repair shop.

Piston Ring Holder.

In pulling down and assembling a motor the removal and replacing of the piston rings is not only difficult for the motorist without assistance, but the spring-like circles are broken easily. A simple method is to utilize strips of thin metal or old hacksaw blades, slipping these between the rings and the piston and sliding the former over the strips, three or four of which should be used for successful operation.

In replacing the cylinder the amateur is apt to break the rings and to nip his fingers. A handy clamp may be constructed from a piece of band iron, .125-inch thick and .5 inch wide. Assuming that piston is 4.5 inches diameter, a strip of metal 16 inches long will be necessary. This is bent into a circle and after measuring off 1.5 inches on each end, is placed in the vise and bent as shown in an accompanying illustration. The diameter of the circle when closed should be less than 4.25 inches to enable the clamp to hold firmly the piston ring in its seat.

The cylinder is replaced by sliding it over the piston and holding while the clamp is placed slightly above the top of the ring. With a pair of pliers the ends of the clamp are squeezed together and held. As the cylinder is lowered, the clamp will be forced downward, the ring sliding into place. The next ring is then held and the operation repeated. The device can be so constructed that pliers will not be necessary. The ends of the clamp can be drilled and tapped and a setscrew utilized to bring and hold these together.

In a Thorough Overhaul Bearing Scrapers Will Be Needed, Also a Wheel Puller and Small Material.

DISBROW AND HERRICK WITH CASE.

Louis Disbrow, who is scheduled to drive a Case car, made by the J. I. Case Threshing Machine Company, Racine, Wis., in the 500-mile race on the Indianapolis speedway, Memorial Day, has gone to California, where he will take part in beach and road races until some time in May. It is understood that Disbrow will be seen at the wheel of a Case in the Santa Monica road race of May 4, and that Harvey Herrick, who holds the world's road race record in a National car, also will drive a Case in that event.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

UNITED STATES MOTOR NEWS.

Having completely recovered from his recent illness, covering several months, J. D. Maxwell, president of the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., and vice president of the United States Motor Company, New York City, has returned to the latter city, where he will make his headquarters in the future.

The United States Motor Company, which markets Maxwell, Columbia, Stoddard-Dayton, Courier and Brush pleasure cars, and Sampson trucks, has added three new supervisors, whose duties involve the supervision of the branch houses and dealers in different parts of the country.

Ernest H. Brandt will have charge of what is known as the New York district, including the branches and dealers under them, operated in New York, Albany, Syracuse and Buffalo, with headquarters in New York City. Fred A. Harris will care for the middle district, embracing the branches in Chicago, South Bend, Newcastle, Indianapolis and St. Louis, with headquarters in Chicago. S. D. Porter is appointed for the western district, including the branches in Minneapolis, Kansas City, Des Moines, Omaha and Dallas, with his headquarters in Kansas City.

The New England territory is supervised by F. J. Tyler at Boston. W. F. Smith of Philadelphia has charge of the branches in Philadelphia, Wilmington, Trenton, Baltimore, Washington, Pittsburg, Charlotte and Atlanta. A. I. McLeod of Detroit looks after the interests of the branches at Detroit, Cleveland, Toledo and Columbus. A. M. Barkman is in charge of the Pacific Coast branches at San Francisco and Los Angeles.

BOSCH WINS ANOTHER RECORD.

It transpires that the Deperdussin monoplane, utilized by Jules Vendrines in creating his remarkable record of 124.2 miles in 1:15:20, was equipped with a Bosch magneto. This is particularly gratifying to the Bosch Magneto Company, New York City, as it adds another aeroplane record to the long list of automobile, motor boat, motorcycle and aviation marks won by machines equipped with this make of ignition.

SELF-STARTER BOOKLET.

The interest which has been awakened in self-starting systems during the past few months has been such as to indicate a desirability on the part of the public for information concerning the various types in the market. Obviously, the best information is that compiled as the result of a thoroughly unprejudiced analysis. The Luverne Automobile Company, Luverne, Minn., claims to have secured a treatise of this nature, which it is distributing gratis to all who make application therefor.

AN EFFECTIVE SPEED GOVERNOR.

A speed governor, so constructed that when a truck reaches a certain speed it will automatically cause a shrill, piercing whistle, is claimed to be a practical and exclusive feature of the new light delivery wagon to be produced by the General Industrial & Manufacturing Company, Indianapolis, Ind. This timely warning is designed not only to safeguard the public against reckless drivers but to protect the vehicle itself by informing the operator that he is exceeding a safe and reasonable speed.

DICKSON BELIEVES IN QUALITY.

George M. Dickson, general manager of the National Motor Vehicle Company, Indianapolis, Ind., whose likeness is shown herewith, believes in Quality with a capital Q. Mr. Dickson is a graduate from the bicycle industry, and even his competitors were compelled to admit that he understood the selling end of that business. Despite the fact that he is still young in years, he is a veteran in the manufacture of motor vehicles, having been connected with the production of National cars for a number of years and general manager of the company for some time. Like most successful men he has some very well defined ideas as to how the automobile business should be conducted. After 12 years of experience he is justified in feeling that he can offer a few suggestions, and among these is that of Quality. Mr. Dickson says that no matter how large the factory may be, and no matter anything else, a motor car must be measured by but one standard—Quality. He adds that even if the builder wanted to unload an inferior product upon the people he would be unable to do so, because the public is now motor-intelligent. He also takes comfort in the fact that every day sees the sum total of motor-intelligence increased, and holds that this is the salvation of the industry.

George M. Dickson, General Manager, National Motor Vehicle Company.

Advocate the use of lights on all vehicles using public ways during the hours of darkness.

MARTIN WINS PROMOTION.

C. W. Martin, Jr., who has been associated with the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires and other rubber goods, for some time as manager of the company's southern district with headquarters at Atlanta, Ga., has been promoted to become manager of the motor truck department. He has been transferred from Atlanta to the general offices at Akron, where he will be located in the future.

JOINS ABBOTT MOTOR COMPANY.

At a recent meeting of the directors of the Abbott Motor Company, Detroit, maker of the Abbott-Detroit line, Clayton E. Bailey of Jamestown, N. Y., was elected first vice president of the company and chairman of the board. For several months past C. W. Jamieson, president of the company, has been seriously ill and his condition is regarded such as to compel the selection of a man capable of assuming direct charge of the business.

Clayton E. Bailey, Vice President, Abbott Motor Company.

Mr. Bailey has been associated in other business enterprizes with several of the principal stockholders in the Abbott company for a number of years, and recently acquired a heavy financial interest in this concern. He is well known in New York City as a financier and manufacturer and brings to the Abbott company a wide knowledge of business methods.

For several years he has been president and the moving spirit in the Bailey Table Company at Jamestown, one of the largest and most successful furniture manufacturing establishments in that section. He also has been closely allied with the management of numerous other manufacturing and financial institutions in that city. In addition he has large financial interests in the Southwest and has shown a very considerable amount of strength in handling transactions involving large capital with business interests in New York City.

It is anticipated that Mr. Bailey's policies, which are conservative and at the same time progressive, will continue to develop the business of the Abbott Motor Company and cause it to become one of the best manufacturing concerns in the industry. It is Mr. Bailey's intention to remove his family to Detroit and take up his permanent residence there in the immediate future.

SIMPLICITY IN AUTOMOBILE DESIGN.

That automobile engineers and designers are striving to obtain the best results with as few parts as is consistent with absolute safety, is the opinion of Charles B. King, president of the King Motor Car Company, Detroit. Inasmuch as he was the first man to drive a motor vehicle through the streets of Detroit in 1894, he is permitted to make some comparison between that machine and the product of the present. He says:

"In those days the thing most sought after was to make a car that actually would run. As naturally might be assumed, the result was a complicated piece of mechanism, in many instances. Engineers and designers had not time to pay much attention to simplicity.

"As time went on, the buying public declined to accept the more or less crude construction that was hardly any better than could be expected, and some attempt was made to eliminate troubles by standardizing methods. Refinements in construction and manufacture followed, and then the search for simplication.

"With all this progress, there are today only a few cars which can make any claim that they have reduced their number of parts to an appreciable degree. The great difficulty to be overcome is to make this reduction without weakening the car and the average automobile of today has between 2600 and 4000 parts.

"One designer of a well known car made in Detroit has had greater success, reducing the number of parts in his car to less than 1000, and this is actual, not theoretical. How this has been accomplished will be understood readily when it is stated that the frame front cross member, for instance, does seven duties."

CANADA MAY INCREASE DUTY.

An attempt is being made in Canada to pass an act of Parliament increasing the duty on finished automobiles to over 50 per cent. and to decrease the duties on parts not assembled. Apparently, the object is to force American manufacturers to establish factories in the Dominion. Several have done so already, but there are many makers who continue to pay the present duty and produce the finished cars on this side of the line.

Motorists should see that their individual states require lights on all vehicles using the highways at night.

RECENT DEVELOPMENTS IN SELF-STARTERS.

A Resume of the Situation as Revealed During the Show Season Just Closed--Brief Description of Some of the Devices Presented.

MOTORISTS are beginning to study the self-starting problem with renewed interest. While a large number of these systems have been on the market for some time, several of these were not brought

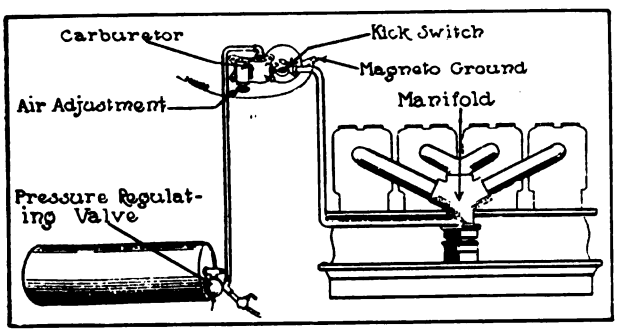

Fig. 1—Eureka Device Utilizes Specially Designed Acetylene Carburetor.

to the attention of the public generally until at the recent shows. It may be added that still others have been undergoing extensive experimentation and are only just making their appearance.

The Automobile Journal, in a series of articles on this subject, recently described briefly many self-starting systems which had been brought to its attention. This treatment will be continued herein, presenting some of the offerings seen at the New York, Chicago and Boston shows, as well as others which have come to light since the publication of the articles mentioned.

Among those who have given the subject careful study, including many engineers of note, the problem cannot be regarded as wholly solved. By this is meant, that while most if not all of the systems offered can be relied upon to do their work in a satisfactory manner under practically every condition, there is still the question as to which system is the best, taking into consideration all of the elements which enter into the proposition.

The situation has reached a point where it may be held that all self-starters are divided perhaps into four classes; i. e., mechanical, compressed air, explosive mixture and electrical. No attempt is made here to give these according to merit, but rather in the order in which they have made their appearance.

Some engineers have published interesting discussions in which they have assigned an order of merit to the various productions, but in most instances it will be found upon careful analysis that such classification has been largely a matter of personal opinion, and there is by no means that unanimity of opinion which carries complete conviction. While engineers continue to disagree it hardly can be expected that the mere layman will be able to follow them to a definite conclusion.

It must be remembered in this connection that there still remains considerable difference of opinion among engineers as to the relative merits of certain other features of motor car construction and equipment. Inasmuch as it is not to be expected, apparently, that engineers will agree on the subject of the long or short stroke motor, for instance, and as each type seems to be able to produce satisfactory results, it is perhaps, unnecessary that there should be any unanimity of opinion regarding self-starters.

It follows, therefore, that the layman motorist must be guided largely by his own inclination, based upon such information as he is able to glean from the discussion of engineers, feeling reasonably certain that even the poorest form of self-starter is better than the older method of cranking by hand. And this should not be taken to infer that the self-starters on the market have not been subjected to thorough experimentation.

There is a mistaken impression among many that none but the cars of medium or low price are being equipped with self-starters this year. Inquiry at all of the three large shows, New York, Chicago and Boston, elicited the information that practically any machine can be purchased with this latest fitting. There are several reasons why some of the older and better known makers have delayed the adoption of a self-starter as standard equipment.

Those who employ chauffeurs and do very little

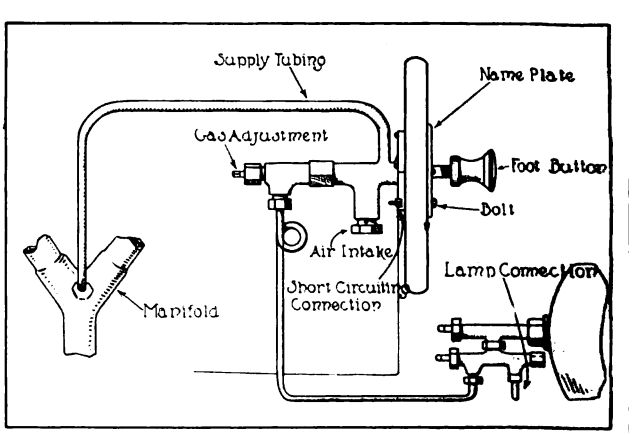

Fig. 2—Crankless Acetylene Starter Also Introduces Mixture Through Intake Manifold.

driving themselves are not so deeply interested in the self-starter problem. There will be little question that certain manufacturers make their appeal more directly to this class of purchasers, but even with these

Digitized by Google

there is opportunity to secure the new equipment if desired. And so far as it can be learned all of these are experimenting with self-starters, either of their own design or of some make now on the market. The

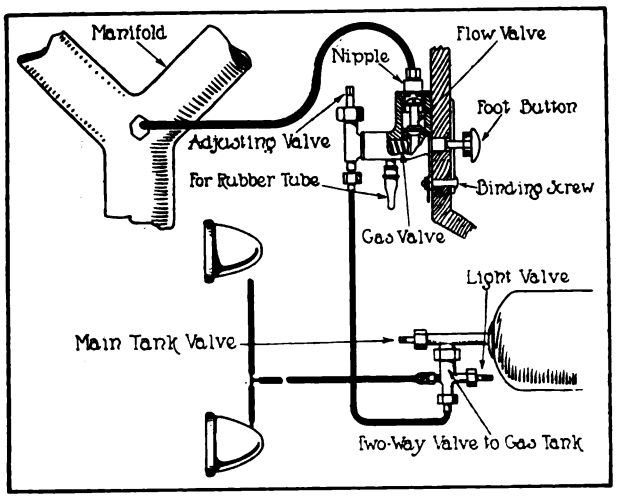

Fig. 3—Illustrating Method of Operating the Empire Acetylene Self-Starter.

man who does his own driving demands the self-starter now, while those who in the very nature of things, have given little thought to the matter are content to wait until it shall have reached an even better state of perfection.

Although the so-called mechanical device made its appearance first, it is worthy of comment that by far the larger majority of those which are now being projected are of the explosion type, and most of these utilize acetylene gas. The underlying principle is much the same in each instance; that of introducing acetylene and air in the proper proportions to the cylinder about to fire and exploding this by means of a spark. In some, however, this mixture is introduced when it is desired to start the motor, and with others it is drawn into the cylinders when the engine is brought to rest, there to be retained until needed.

A starter of the latter type is illustrated by the drawing Fig. 1. This is the Eureka, made by the Automobile Equipment Company, Detroit, and comprises a pressure regulating valve, acetylene carburetor, and combined kick switch and valve. The pressure regulator is attached to the acetylene tank; the carburetor, on the dash under the hood, and the kick switch on the front of the dash adjacent thereto.

When gas lamps are to be supplied from the same tank, a two-way valve is located at this point, the pressure regulator being attached to the .25-inch tubing leading to the acetylene carburetor. A .125-inch gas connection is fitted to the intake pipe above the carburetor and leads to the manifold of the engine. Obviously, the carburetor is for the purpose of mixing the air and acetylene in proper proportions, and the charge is claimed to be only of sufficient power to turn the engine over at a slow speed.

The Eureka is operated entirely by the kick switch and the starting button on the coil switch. Throwing the lever to the "on" position cuts off the spark from the magneto side and opens the valve from the acetylene carburetor to the intake, giving the engine a charge of mixed air and gas as it stops, and is then ready to start again. To start: The switch is turned to the battery side and the starting button is touched. The gasoline throttle is closed and the spark retarded, until the motor has begun to operate on acetylene, when the gasoline throttle is opened slowly, and after the engine picks up speed, the starter switch is cut off and the electric switch is thrown to the magneto.

The Crankless is made by the Cox Brass Manufacturing Company, Albany, N. Y., and is another acetylene starter which charges the motor as it is about to come to rest. The principal parts are outlined in the drawing Fig. 2.

Located at a convenient place on the dash is a push button. Pushing this forward cuts out the ignition and opens two small valves in the starter proper and allows the motor to draw into the cylinders by way of the inlet manifold a mixture of acetylene and air. This is retained until it is desired to start the engine, which may be done by operating the starting button on the coil, or if the car be not equipped with a coil, the company recommends the use of a mechanical vibrator produced by it.

In attaching the Crankless starter, the regular union is removed from the gas tank, and the twin connection is applied. This is equipped with two needle valves, one of which regulates the supply of gas to the lights and the other to the starter. One end of an insulated wire is connected to the special short circuiting connection and the other to the ground terminal and magneto. The drawing makes plain the other features of construction in this type.

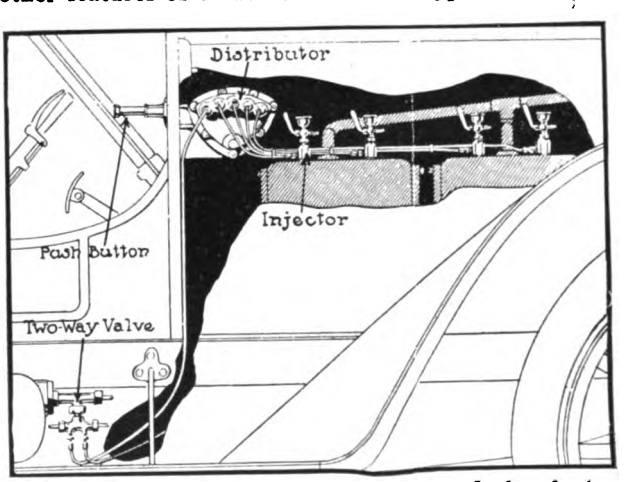

Fig. 4—Panwood Design Arranged for Introducing Acetylene Mixture at Time of Starting.

Still another acetylene device of the same nature is the Empire, made by the Empire Self-Starter Company, 1731 Broadway, New York City, and illustrated at Fig. 3. By the same nature is meant that the mix-

Digitized by Google

ture is introduced into the motor when it is about to come to rest, as in the other two mentioned. Obviously, the arrangement is different.

With this, as with the others, a special two-way

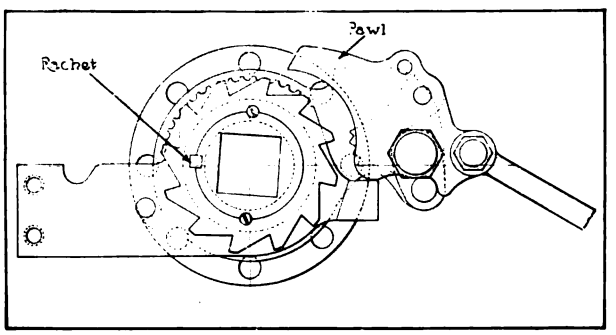

Fig. 5—Simplex Mechanical Device Is Utilized in Combination with Priming Pump.

valve is utilized at the gas tank. This regulates the flow of acetylene either to the lamps or the starter. The latter is installed on the dash in a convenient position to be operated by the foot, and it is of particular moment to see that the flow valve leading to the intake manifold is in a vertical position.

Just before the motor is brought to a stop, the starter button is pressed by the foot and held in position until the engine is at rest. The switch is then placed in the neutral or "off" position. To start: The spark lever is retarded, and the switch is placed on the battery position. Pressing the button on the coil completes the operation.

The Panwood, made by the Panwood Manufacturing Company, Grand Rapids, Mich., is illustrated at Fig. 4. This is designed to introduce the mixture to the cylinder when it is desired to start the motor. The device consists of a special distributor, injectors and two-way valve.

The distributor is located on the dash under the hood, opposite the push button. Pressing the latter causes a measured amount of acetylene to be conveyed along the piping to the injectors and introduced to the cylinders, where it is mixed with air. The two-way valve is attached to the gas tank, and regulates the flow of gas to the lamps and starter.

The operation of the Panwood is decidedly simple. By a slight pressure of the foot, the gas is instantly distributed in equal and sufficient amounts to each cylinder. Upon removing the foot, the gas is shut off automatically, outside the distributor. All that remains to be done is to turn on the ignition switch and explode the mixture in the cylinders.

The first action of the foot pressure causes the main check valve to open automatically and allow the gas to enter the distributor. As this action is continued the valves to the cylinders are opened in rotation. The injector consists of a threaded fitting which is screwed into the cylinder in place of the priming cup.

With reference to the mechanical starter, mention may be made of the Simplex, produced by the Simplex Manufacturing Company, Anderson, Ind., and shown at Fig. 5. This differs materially from other devices of this type, in that it has in connection a priming pump, located in front of the seat, for introducing gasoline into the cylinders so that the motor may be started without the necessity for spinning.

The drawing is a sectional view through the starter proper. The parts are assembled on a bushing, which is mounted on the main shaft between the clutch and the transmission, or on the crankshaft in front of the motor. The operation is by pedal, which can be furnished in a style to match the brake or clutch pedal if desired, and can be located in any convenient place on the toeboard.

This pedal is connected by suitable cranks to a pawl, so that a forward movement causes the pawl to engage a ratchet and rotate the motor. Should the operator press the pedal with the spark in the advance position, another pawl will engage in notches on the stationary disc and allow the motor to rotate in the reverse direction, thereby eliminating any chance for injury either to the operator or mechanism.

The priming pump draws gasoline from the main supply line, bringing it in through the bottom and up into cylindrical chambers, ready to be forced into the cylinders of the motor. With the down-stroke of the pump, four pistons working in the cylindrical chambers spray gasoline in equal proportions to each cylinder. After the motor has been primed in this manner, it is rotated by the pedal, as above described.

Figs. 6 and 7 illustrate the Paris electric system, made by the Paris Electric Starter Company, Chicago. The principle is the same as with all electric starters. The equipment consists of a complete motor-

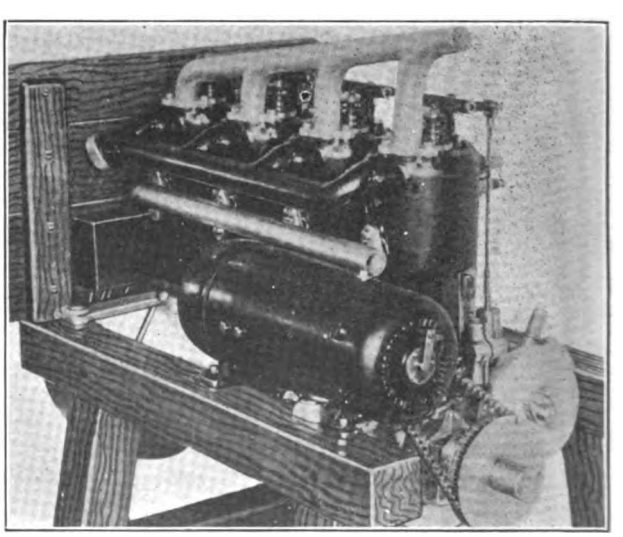

Fig. 6—End View of Paris Electric Starter, Showing Transmission Connected with Engine.

generator and storage battery, the latter energizing the former and turning over the engine by means of suitable transmission mechanism.

The motor-generator and transmission are assem-

Digitized by Google

bled as a unit, being about 6.5 inches in diameter and 16 inches long. This is fitted with a regulator for controlling the output of the generator to a predetermined value, regardless of engine speed. A multiple-contact push button completes the outfit.

Pressing the push button energizes the motor from the storage battery through the transmission which gives the motor the advantage of a 30-to-one ratio. As soon as the engine runs on its own power, the operator releases the push button and the motor is automatically thrown into engagement through a three-to-one ratio to run as a generator at three times the engine speed. The automatic change of ratios is accomplished by the action of a magnetic clutch, which also locks the gears of the transmission from rotating with respect to each other so that the entire mechanism revolves with the generator as a unit. The transmission gears are therefore only in operation when cranking the engine. There are no clutches or levers to operate, the pressing and releasing of the push button automatically performing the proper functions in proper sequence.

The regulator is a simple but ingenious device for automatically holding the output of the generator to a predetermined value regardless of the engine speed, effecting a "taper charge" for the batteries. It also performs the functions of automatically opening the circuit between the generator and batteries, when the speed of the former falls too low, thus preventing the generator from "floating" on the batteries.

The storage batteries are of special design, long lived, and of ample capacity for cranking the engine 30 times, continuously, if required. The over-all dimensions of the battery unit complete are: Length, 16.25 inches; width, eight inches; height, eight inches; four cells of six-volt 40 ampere-hours capacity, being connected in multiple when generating, thus giving a combined capacity of 160 ampere-hours for lighting and ignition purposes, and 24 volts at 40 ampere-hours capacity when cranking.

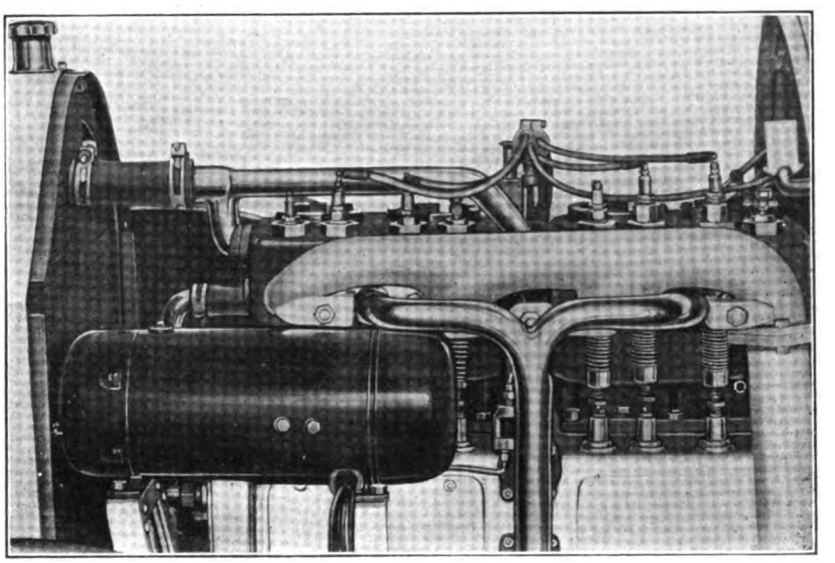

Fig. 7—Illustrating Location of Paris Electric Motor-Generator Relative to That of the Automobile Engine to Which It Is Applied.

(To Be Continued.)

FISK TIRES FOR TAXICABS.

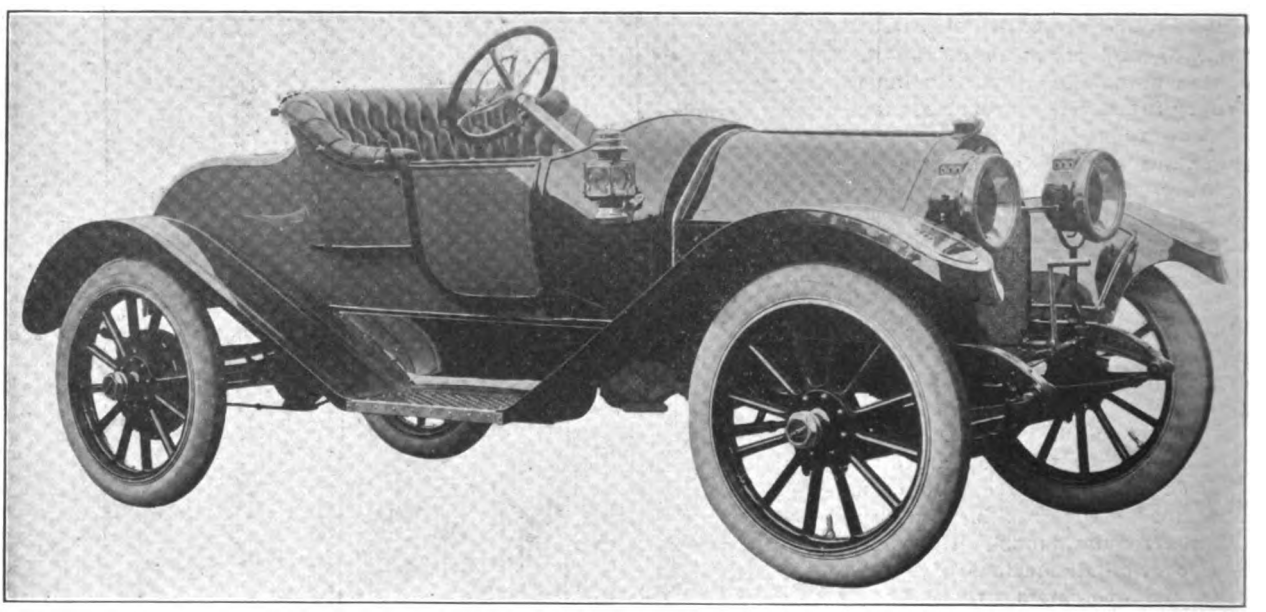
Taxicab service is exceptionally hard on tire equipment, and it will prove of interest to note that the Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk bolted-on tires, has closed a contract for the equipment of the cabs operated by the Detroit Taxicab & Transfer Company of Detroit. Fisk tires are used on over 1000 taxicabs in New York City alone, and are prominent in Chicago and other larger western cities.

MARMON BELIEVES IN SHOWS.

"One of the big questions now before the automobile industry," says H. H. Rice, sales manager for the Nordyke & Marmon Company, Indianapolis, Ind., maker of Marmon cars, "is the exact importance of the large shows. The whole business of selling motor cars is in the process of evolution, and what was considered a good sales proposition two years ago may no longer be worth the time and trouble.

"The value of the automobile show lies not in its direct sales, but in the fact that it intensifies interest in the entire business. If all shows were abandoned it would mean merely the dropping of one form of advertising, and no serious results would follow, but so long as the national shows are held each year the local shows will be a matter of interest.

"The Marmon has been exhibited this year in the greater shows in New York, Chicago and Boston. In addition, the cars have been displayed by our dealers in almost 25 other cities. We do not consider the cost out of proportion with the results obtained by individual exhibitors and the industry as a whole.



"In one of these shows, an automobile club delegated engineering experts to investigate various mechanical features of all cars inspected and make a report. The Marmon was pronounced as the most nearly approaching the ideal and more nearly able to fulfill its maker's claims in the features inspected.

"Could some action of this sort be taken and reports made on various cars, the show would reach a greater point of efficiency. If this idea were followed out and critical inspection be made by unbiased experts, the interested visitors would find that one of these shows comprised education in mechanical construction, efficiency and the comparative value of the cars exhibited."

FOUR MODELS IN OAKLAND LINE.

THE Oakland Motor Car Company, Pontiac, Mich., maker of Oakland pleasure automobiles, is building four sizes of chassis, which are known as models 45, 40, 30 and 33 in order of size. Of these the larger is fitted with seven-passenger touring or berline limousine bodies; model 40 is equipped with five-passenger touring, three-passenger sociable roadster or Colonial coupe bodies; model 30 has a five-passenger touring body, and model 33 is known as the "Oriole" roadster, having capacity for two passengers. These machines in proportions, accommodations, finish, appearance, power and price afford an unusual range of choice, each vehicle being produced to carefully developed design by complete and efficient facilities, from thoroughly tested materials by experienced men, long associated with the manufacture of this line.

Model 40 Oakland "Sociable" Roadster, with Sightly Torpedo Body and Comfortable Seat for Three.

The maker of Oakland cars maintains that in every sense they represent development along engineering principles well established by sound experience. There is nothing experimental and nothing uncertain. The machines are regarded as finished from every point of view and the equipment of the chassis is in keeping with the mechanical refinements that have been characteristic of the name. Consistency in very detail has been sought and it is claimed that nothing could be desired in a car that has not been considered and provided for.

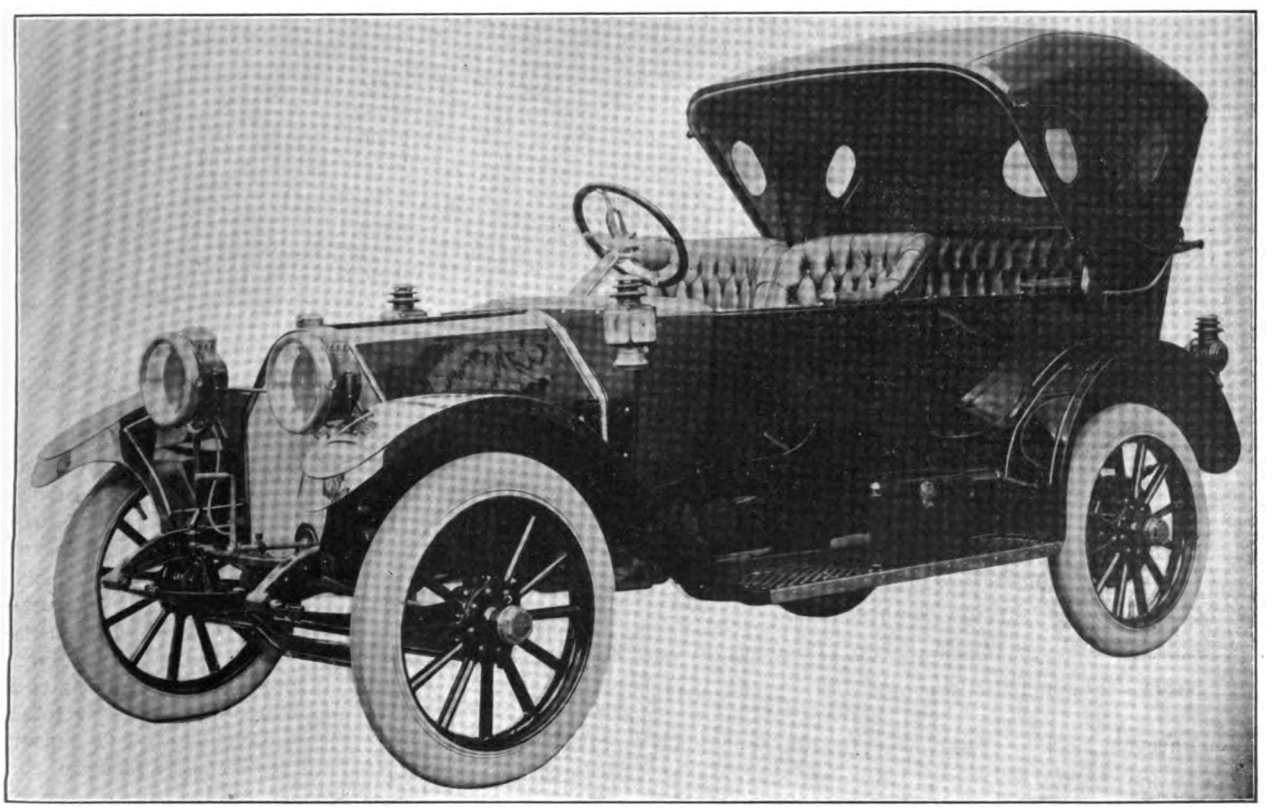
While the chassis installations appeal to motorists it is believed that this is secondary to the mechanical construction on which depends the service and life of the car, and in the development of this there has been constant endeavor to create what will embody every quality of protection and accessibility, and eliminate all weaknesses and possibilities for failure. In keeping with this policy attention has been directed toward the power plant, which, as adopted for models 45, 40 and 30 is of the unit type, including in a single assembly the motor, clutch and transmission, every operating part being enclosed and protected from every influence that might cause deterioration or loss of efficiency.

With this construction the entire mechanism is supported on three points and is safeguarded against the effects of frame distortion from driving stresses and road shocks, and the life of the assembly is decidedly prolonged as well as insuring an economy of maintenance and upkeep that cannot but appeal to the man who can choose, with other equally potent qualities, as will be brought out herein.

Features of Power Plant.

In considering the Oakland unit power plant it is well to emphasize that this form of construction has been approved by many designers, and while certain details may have been developed somewhat differently the main purpose has been to yield greater strength with no more, or even less, weight, secure maximum power and efficiency and increased flexibility, minimize lost power, decrease the number of parts and afford the height of accessibility for examination or work upon the components.

The assemblies for each model, save for 33, are identical in every respect aside from proportions, and for the purpose of description that utilized for model 45 has been chosen. Reference to the illustrations will demonstrate the compactness of the mechanism and the smooth and sightly finish of the case, the enclosing



Digitized by Google

of the moving parts and the insurance of shaft alignment under all conditions of operation. There is an accessibility not possible were the groups separated and it is apparent that the saving of time in the care of the machine is a factor of large importance to the man who operates his own car.

The cylinders are cast from a superior quality of gray iron in pairs with the water jackets and valve pockets integral. The head is of the L type with the valves at the left side. The water spaces are generous, practically surrounding the head and the valves and affording certain cooling of the motor under all conditions of operation. The bore is 4.5 inches and the stroke 5.25, this giving a stroke ratio to bore of 1.166

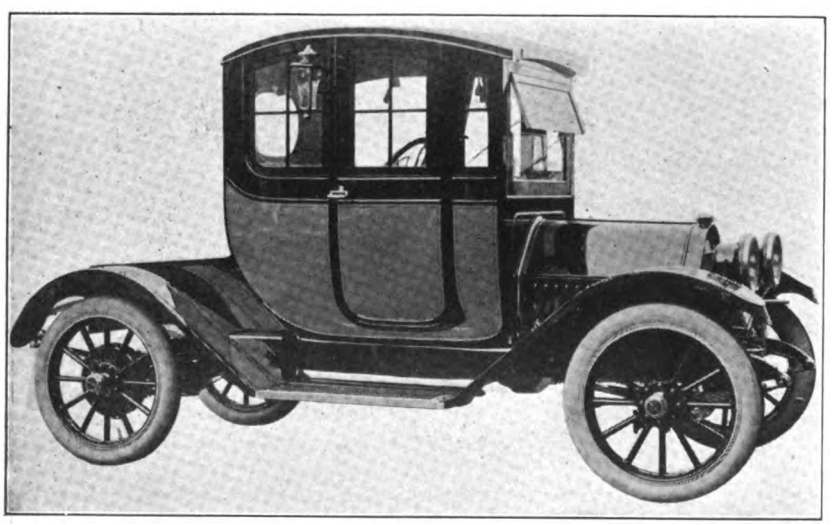
Clutch and Transmission.

The engine case and the clutch and flywheel housing are cast integral, of aluminum, there being a web and bridge construction that insures lightness and maximum strength of the case. The transmission case is a separate casting, while there are end plates that enclose both the timing gears at the engine case and the rear of the transmission casing. There is a large handhole at the left side of the engine case so that the forward bearings and the crankshaft and camshaft may be examined, another directly in the top of the case above it, and there is a handhole for examination of the flywheel. Back of this are cover plates which will permit work on the clutch and

Model 40 Oakland Five-Passenger Touring Car, with Straight Line Body and Victoria Top.

to one, the horsepower rating by the S. A. E. standard being 32.4 at 1000 revolutions a minute. The motor will deliver an energy largely in excess of this.

The water inlet to the motor is at the right side at the base of the water jackets and the outlet is at the left side above the exhaust valves. The cylinders are carefully bored, reamed, aged and ground accurately to exact size. The pistons are of the same material as the cylinders and after they are turned they are ground and lapped to precise fit, and channelled for the rings. The rings are ground on the edges and face and are then split, being pinned in the channels to prevent turning. Great care is taken to insure the maximum compression in the cylinders.



the transmission. It would be unnecessary to remove the power plant from the chassis to do practically any work. Large supporting arms are at either side of the flywheel housing, these being cast integral with the case.

The crankshaft is mounted in three main bearings, that in the centre being carried on a heavy cross web in the engine case. The journals are plain and are of a fine quality of babbitt metal, the front bearing being 3.5 inches length, the centre 2.875 inches length, and the rear bearing 4.5 inches length, this giving a total bearing length of 10.875 inches. The crankshaft has a diameter of 2.125 inches at the centre and 1.875 inches at the rear, two inches at the front.

Digitized by Google

The crankshaft is a drop forging of special alloy steel and it is carefully ground and balanced. The camshaft is of special alloy steel of liberal size and it is made with three large bearings, being mounted in journals lined with babbitt metal, carefully fitted. There is an outside camshaft at the right side that is driven by the timing gears that operate the water pump, and an extension from this shaft actuates the magneto.

The connecting rods are drop forged of a special alloy steel, I section, of large size and are heat-treated to secure special strength. The wristpins are of a special steel, hardened and ground to size, having liberal bearing surface. The wristpins are retained in the piston bosses by set screws that are locked to prevent slackening. The bearings are of a high grade babbitt metal, die cast, the big ends being capped and retained by bolts and nuts. By the removal of 11 nuts in the lower half of the crankcase the connecting rods and bearings may be reached and examined or adjusted.

Model 40 Oakland Colonial Coupe, a Winter Car Easily Convertible for Summer Use.

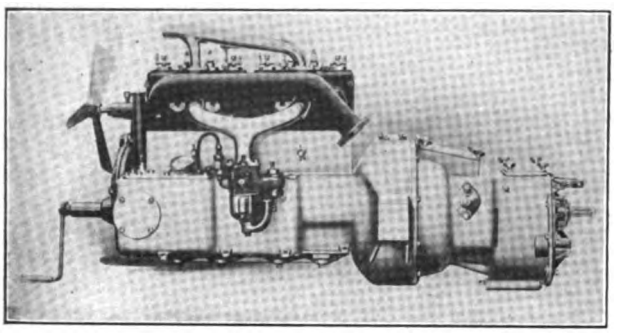
Intake and Exhaust.

The valves are of large size, which insures an ample intake of fuel and thorough exhaust of the products of combustion, and these are effectually cooled by the circulation of the water. The valves have heads of 3.5 per cent. nickel steel, electrically welded to steel stems. The valve guides are unusually long and have corresponding endurance. The valve springs are of large size and retain their resiliency under all conditions of operation. The tappets are carefully ground to fit with ample bearing surface on the cams and are adjustable to any desired clearance. The operation of the valves is practically without noise. The tappets, tappet guides, valve stems, springs and retaining members are fully enclosed by specially designed plates that are retained by studs and winged nuts. The valve mechanism is abundantly lubricated and there is assurance of very long life of every part, this minimizing one of the greatest causes of engine deterioration and loss of efficiency and power.

The timing gears are nested at the forward end of the crankcase assembly, they being covered by a casing, an extension of the crankcase, cast integral, shielding the gear that drives the water pump and magneto drive shaft. The gears are spiral cut and with wide faces, operating without noise and being lubricated by a bath of oil. By the removal of the cover the gears may be exposed for examination or work.

Cooling and Lubrication.

The cooling is by a circulation of water by a large centrifugal pump driven by gears from the camshaft, which passes through the cylinder jackets and into the generous radiator of the cellular type, supplemented by an air draft from a three-bladed aluminum fan that is mounted on a bracket carried on the engine case. The fan shaft is supported by a ball bearing and the drive is by an endless flat belt off a pulley on the water pump shaft. This bearing is adjustable to maintain the belt tension. It is claimed that no matter what the conditions of operation the correct temperature of the engine is maintained.



The lubrication is by a combination of the mechanical force feed and splash, a uniform supply of oil being given the engine at all times. In the base of the engine case is an oil reservoir with a capacity of six quarts, that is covered with a transverse horizontal web, and into this reservoir is installed a gear driven pump. A filter screen surrounds the pump intake to arrest all particles of foreign matter in the lubricant. The oil is drawn from the well and forced through a sight feed on the dash in front of the driver, and thence to the centre bearing of the engine, the drainage from the bearing being distributed to the four oil compartments in the base of the engine case. The regulation of the flow of oil is by a screw set into the cover of the oil case. The oil pockets are so formed as to always have a level of lubricant under the big ends of the connecting rods and the rod ends are fitted with specially designed dippers that take up and distribute the oil to the connecting rod bearings. The splash of the oil lubricates the entire interior of the engine, the cylinder and piston walls, the wristpin bearings, crankshaft, camshaft and all moving or frictional parts. There is a system of grooves cast in the engine case that provides equal distribution of the oil and the return of the overflow to the reservoir. There are level cocks for each oil compartment and these determine the supply

Digitized by Google

available at any time, as well as facilitating the flushing of the pockets for the removal of metallic particles.

Ignition and Carburetion.

The ignition is the dual type, the main current being supplied by a Bosch magneto which generates

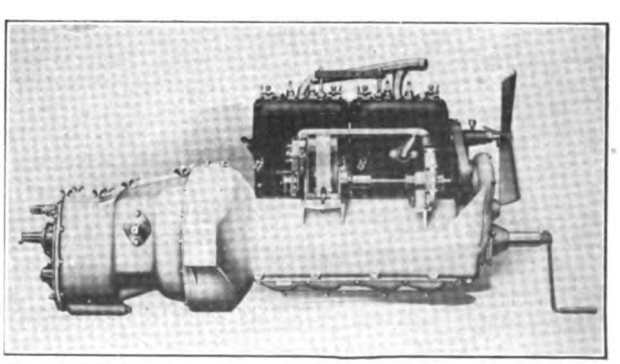
Left Side of the Oakland Unit Power Plant, Showing the Fuel Intake and Exhaust and the Water Outlet Manifold.

a low-tension current that is intensified by a transformer coil. The spark plugs are located in the centre of the caps covering the intake valves, where the sweep of the fresh fuel will clear the electrode points and insure a large and efficient spark. The wiring system is simple and is well protected from wear and other influences for deterioration. There is a battery of dry cells provided for starting the motor and as a reserve.

The fuel is vaporized through a carburetor of the automatic float feed type that is claimed to be very efficient under all conditions of service and to afford a thoroughly uniform mixture. The intake manifold is large and has sweeping curves to insure a full supply of gas to the intake ports. Reference to the illustration of the left side of the engine will show the proportions of both the intake and the exhaust manifolds, and the reason for the power and silence of the engine.

The clutch is of the cone type with the cone engaging with a recess in the flywheel. The cone member is designed with spokes for lightness and the face is covered with a high grade of oak tanned leather. To insure ease in clutching the cover is put on over six flat springs that eliminate all harshness and prevent the possibility of slipping. The clutch spring tension may be adjusted by means of three nuts and bolts.

The transmission is mounted in a case at the rear of the assembly and the design is such that there is always perfect alignment of the driving shafts and the crankshafts. The gearset is of the selective type with three forward speeds and reverse, the countershaft being directly below the main shaft. The gears are large and of chrome nickel steel with wide face. They are mounted on large shafts of the same material. Imported annular ball bearings are used throughout the gearset, making for long life and high efficiency.



The driving system from the transmission is through a housed universal joint and a large driving shaft coupled to the pinion shaft by a second universal joint. These coupling joints are packed in heavy lubricant and are subjected to a minimum of wear.

Axles and Frame.

The rear axle is of the full floating type with a very large pressed steel shell that is reinforced by steel tubes through which the axle shafts are installed. The rear of the centre section of the housing may be removed for examination or adjustment of the differential cage and gears. The pinion shaft and pinion are carried on two New Departure ball bearings and the differential assembly is installed on the same make of bearing. These bearings may be readily adjusted and will permit of maintenance of a precise relation of the gears. The axle shafts are 1.375 inches diameter and are of high grade carbon steel. These are fixed to the wheel hubs by clutch plates and the wheels are mounted on New Departure annular ball bearings carried on the ends of the axle housing. The spring saddles and the brake shoes, on flanges on the axle housing, are bolted to the steel shell. The alignment of the axle is preserved by a heavy torsion rod that parallels the driving shaft and is attached to the stout cross member of the chassis frame.

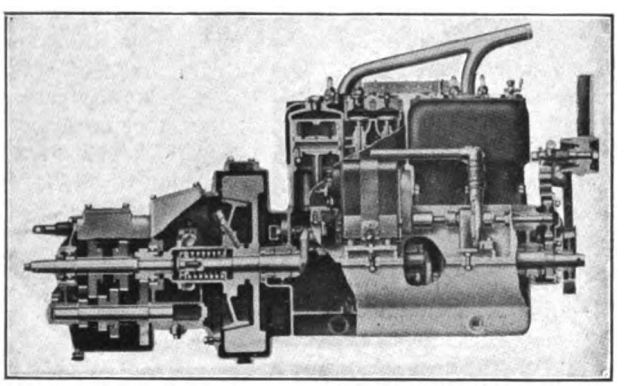
The front axle is a steel I section, drop forged, and heat treated, the steering arms and knuckles being the same material. The spindles are fitted with improved cup and cone ball bearings 1.625 inches diameter. The cones are of the finest tool steel and the inner and outer balls are .75 and .625 inch diameter, respectively. The tiebar is according to standard practise, carried behind the front axle for protection.

The chassis frame is a high grade of carbon steel channel section, pressed cold and heat treated for special strength. It is stiffened by three cross members and by strong gusset plates at the rear. There is a

Right Side of the Oakland Unit Power Plant, Illustrating the Magneto, Water Pump and Fan Drive by Outside Camshaft.

double drop in this frame. The springs are of the highest quality crucible steel, hand-fitted and oil tempered, of the scroll type, semi-elliptic forward and three-quarter elliptic rear, the rear being respectively and 50.5 inches length, and 2.25 inches width.

Digitized by Google



service brake is external contracting bands on drums on the rear wheels 16 inches diameter, and the emergency brake is internal expanding shoes in the same drums. Both brakes are equalized.

The control is by a large hand wheel on a steering column with a connection of the worm and nut type, all the wearing parts being enclosed and adjustable for wear. All the steering draglinks are of spring design and may be adjusted as desired. The left pedal operates the clutch and the right the service brake, and there is a foot accelerator between these pedals. The speed changes and the emergency brake are actuated by levers at the right of the driver. The usual spark and throttle levers are carried on a quadrant on the steering wheel.

The wheels are of the artillery type, of second growth hickory, 36 inches diameter, fitted with 36 by 4.5-inch tires on demountable rims. The wheelbase is 120 inches. The gasoline capacity is 20 gallons.

Details of Model 40.

The power plant for model 40 differs with that described in that the bore is 4.125 inches and the stroke 4.75 inches, this giving a power rating of 27.2 by the S. A. E. horsepower rating. The ignition is by a Briggs or Remy magneto and a dry cell battery through the usual transformer coil and distributor.

Sectional View of the Oakland Unit Power Plant, Demonstrating the Alignment of the Driving Shafts and Bearings.

There is a semi-floating rear axle assembly in which the housing is divided in the centre, and to this housing is bolted the torsion tube in which is carried the driving shaft. The forward end of the pinion shaft is mounted in a long Hyatt heavy duty roller bearing, and there is a thrust bearing forward of the roller bearing. The rear end of the shaft is mounted on a New Departure bearing. The differential assembly, of the bevel gear type, is carried on large Hyatt bearings that are adjustable and run on a hardened and ground sleeve. The outer ends of the axle shafts are supported by long Hyatt roller bearings and to these shafts the wheels are keyed.

The drive is through the torsion tube, which is reinforced by a pair of distance rods attached to the forward end and to the rear axle housing. The brake drum on the rear wheels is 14 inches diameter. The service brake is external contracting and the emergency brake, operated by the hand lever, is internal expanding. The foot brake is equalized. The springs are of the same type and length but are two inches width. The steering gear is the worm and gear type and in other details it has the same general features. The wheelbase is 112 inches. The gasoline tank will hold 16 gallons for the touring car and 37 gallons for the roadster. The wheels are artillery pattern and of second growth hickory, 34 inches diameter, with quick detachable rims and fitted with 34 by four-inch tires.

The Other Models.

The unit power plant for model 30 is with bore and stroke of four inches and a horsepower rating of 25.6 by the S. A. E. standard. The radiator is the fin-tube type and the ignition is by a Remy magneto and a dry cell battery with dash coil to intensify the current. The driving system is practically the same as for model 40 in all proportions. The chassis frame has a single drop and the wheelbase is 106 inches. The springs are 35.25 inches length and the rear springs 48 inches length, with width of 1.75 inches. The brake drums on the rear wheels are 12 inches diameter and the service brake is external contracting, and the emergency brake is internal expanding. The service brake is equalized. The steering gear is of the worm and nut type and is completely enclosed and adjustable for wear. The gasoline tank capacity is 14 gallons. The wheels are the same as with model 40 and are fitted with quick detachable rims and with 34 by 3.5-inch tires.

The Oriole roadster is not built with the unit power plant. The motor for this machine is four cylinders, L type, with bore and stroke of four inches and with a horsepower rating of 25.6 by the S. A. E. standard. The lubrication is by a positively driven force feed system and splash, the oil pump being adjustable. The lubricant capacity is six quarts. The ignition is by low-tension magneto and a battery of dry cells. The clutch is a multiple disc design of large efficiency. The transmission is the selective type with three forward speeds and reverse. The springs are semi-elliptic forward and full elliptic at the rear. The other details, save that the wheelbase is 100 inches, are the same as for model 30.

LEWISTON SHOW NEXT MONTH.

J. Henry Graham of Old Orchard, Me., has decided to abandon plans for the race meet long enough to manage the second annual show in Lewiston, Me., April 4-6. The event will be staged in Auburn Hall, and many from other cities have engaged space.

New England is much interested in the forthcoming race meet at Rockingham Park, Salem, N. H., Memorial Day. The contest board of the American Automobile Association has granted a sanction, and work will begin toward putting the track in first class condition as soon as the frost is out of the ground.

HANDSOME NEW COLE CATALOGUE.

Strictly in keeping with the high class of workmanship bestowed upon the Cole cars, the 1912 catalogue of the Cole Motor Car Company, Indianapolis, Ind., just issued, is a handsome product of the printer's art. The various models are shown in a manner calculated to bring out their merits, and the various components are presented in like manner. In addition, other illustrations offer interesting suggestions as to the enjoyment that comes with the possession of a Cole car. The text amplifies the illustrations and leaves nothing to be desired in the matter of describing the 1912 product. The booklet is free upon request made the company, or the Henderson Motor Sales Company, Indianapolis, general sales agent for this product.

MARMON WINS AT HAVANA.

During the race meet at Havana, Cuba, March 10, a regular 1911 Marmon stock car, shipped to A. H. DeDiaz & Co., Cuban representative of the Nordyke & Marmon Company, Indianapolis, Ind., in the fall of 1910, defeated all the cars in its class. The Marmon was entered in two races, winning both of them against a Lancia, Chalmers, two Mercers, Locomobile and two Mercedes. It also was awarded the Championship prize for making the fastest time of any car in the races held during the meet. An interesting fact in connection with one of the events was that it was run over, the Marmon winning a second time with an even larger margin.

NEW EVERITT AGENCIES.

Everitt cars, made by the Metzger Motor Car Company, Detroit, will be handled in Baltimore, Md., and adjacent territory by F. E. Magee, 1200 Mt. Royal avenue, under the firm name of the Everitt Auto Company of Baltimore. George D. Prentice of Great Falls, Mont., has the Everitt agency for his territory. The Stearns Auto Company of Seattle, Wash., will handle this make throughout certain counties in Washington. George D. Holm & Co., of Helsingfors, Finland, will represent the Metzger company in Finland and several provinces in Russia.

NATIONAL'S ADVANCE MODELS IN BOSTON.

W. H. Stevens, Boston, local agent for the National car, made by the National Motor Vehicle Company, Indianapolis, Ind., is showing the first of the 1913 models, these presenting a trend toward low, comfortable bodies. The maker finds that it is not necessary for it to produce something entirely new for the coming season, and is concentrating its efforts on the four-cylinder 40 horsepower car. The new models therefore are very similar to those for 1912, with the exception of a slightly longer stroke motor, inclosed valves and automatic tire pump. The construction is somewhat heavier throughout, following the general design which was so successful in racing events last year. The body and upholstery work is entirely new, having low, straight line effects, and including the fullest possible equipment. All 1913 National cars will be fitted with self-starting devices and many other novel features which make for comfort and convenience.

VANDERBILT AGAIN ON LONG ISLAND.

A determined effort is being made to hold the 1912 Vanderbilt Cup race over a Long Island course, preferably in the vicinity of Riverhead. The contest board of the American Automobile Association has been asked to modify the rule regarding the policing of road courses by state militia, in this instance. Chairman William Schimpf has the following to say regarding the situation:

"The drawback in the matter of holding road races on Long Island is that we cannot see, in view of what happened on previous occasions, how a contest can be held safely unless military protection is insisted upon. Any race of the fame of the Vanderbilt Cup, held close to the most congested centre of population in the United States, is certain to draw an enormous assemblage.

"Personally, I would like to see the race brought back to this part of the country. The Vanderbilt is the Long Island classic, and this should be its home; but as an official of the contest board, I certainly would hesitate to take the responsibility of sanctioning such a contest, unless absolute assurance of safety to spectators and contestants could be given.

"That is the situation as it stands today. The contest board has the power to sanction a race anywhere, but if it does allow the holding of the Vanderbilt Cup race at Riverhead, or even on any other part of Long Island, it will only be when we are certain that the protective measures will be sufficient to insure perfect safety to all."

RECIPROCITY BALKED IN JERSEY.

Two weeks ago there was every indication that the so-called reciprocity bill, which already has been passed by the lower house in the New Jersey Legislature, would meet with the approval of the Senate and become a law without delay. Since that time, there has been an apparent change of heart among some of the senators, and the legislation is still in the committee. The Legislature is scheduled to adjourn April 26. Senator Colgate, who has the bill in charge, feels that he lacks two votes, and motorists hope to convince at least two men before the date mentioned.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

FIVE CARLOADS OF CARTERCARS.

A special express shipment of five carloads of Cartercars was made recently to the Chicago branch of the Cartercar Company, Pontiac, Mich., in order to take care of the increasing demand in that territory. E. D. Knowles, branch manager in Chicago, went to the factory, so imperative was it that the shipment be made at once.

In commenting upon the outlook in Illinois, Mr. Knowles said: "I do not see how things could look better. The demand is substantial and not merely a boom. Men who are now buying motor cars are doing so after full deliberation, and are exercising great care in selecting a car that is suited to their particular needs and pocketbook."

WATERBURY TO HAVE SHOW.

The first automobile show to be held in Waterbury, Conn., is scheduled for the Auditorium, March 27-30. All of the available space for the display of pleasure and commercial vehicles has been taken, and very little remains in the section set aside for the accessory exhibits. The event is expected to stimulate business in a material degree throughout the entire Naugatuck valley.

KISSELKAR GIVES SATISFACTION.

J. E. Faggard of Dallas, Tex., recently purchased a KisselKar, made by the Kissel Motor Car Company, Hartford, Wis., with which he immediately set out on a 2000-mile trip throughout Texas. The route included Greenville, Gainesville, Forth Worth, Waco, Houston, Galveston, Corpus Christi, San Antonio and Austin. Both Mr. and Mrs. Faggard were immensely pleased with the performance of the car throughout. Particular attention was paid to the growth of the automobile business in this district, an example of which is shown in Houston, where there were but 250 cars three years ago and some 2300 today.

GENEVA PLANS AUTOMOBILE SHOW.

The Chamber of Commerce in Geneva, N. Y., has arranged with Louis Blumenstein, who conducted the successful show in Elmira, N. Y., recently, for the first organized exhibition of motor cars and accessories in Geneva, March 28-30. The Geneva Automobile Club will assist in making the event one long to be remembered in the history of the city.

MORE GOOD ROADS IN MAINE.

The Maine Legislature has passed a resolve submitting to the people for their approval at the regular state election in September, a constitutional amendment authorizing the issue of $2,000,000 in bonds for the construction of good roads throughout the commonwealth.

SEVERE INNER TUBE TEST.

A demonstration which should convince the most skeptical was conducted recently in Redlands, Cal., when William Thornquest of the Redlands Vulcanizing Works, agent for Fisk pure gum inner tube tires, made by the Fisk Rubber Company, Chicopee Falls, Mass, pulled a 3000-pound Cadillac car over the streets for some distance. A rope was attached to the back axle of Mr. Thornquest's machine and this was tied around the tire. Another rope attached to the Cadillac was made fast to the other side of the tire, the latter being the connecting link between the two ropes. When the two machines were stopped and started again, the tire would stretch a matter of 10 feet, but it was not damaged at the end of the demonstration.

BOSCH NEWS FOR MARCH.

The March issue of "The Bosch News," published by the Bosch Magneto Company, New York City, pays particular attention to the subject of spark plugs. It is pointed out that this engine accessory is given very slight consideration by the average operator, and particular effort is made to indicate that it has very important functions which should be understood. A copy may be secured by addressing the company at 223-225 West 46th street, New York City.

BIG DEMAND FOR CUTTING CARS.

During the past week an order was placed with the Clarke-Carter Automobile Company, Jackson, Mich., under the terms of which a carload of Cutting cars will be shipped each day to the Cutting Motor Company, Sioux City, Ia., beginning April 1 and ending July 1. This company also is shipping two carloads of Cutting cars each to Australia and New Zealand.

NEW BEDFORD JOINS SHOW LIST.

The first automobile show to be held in New Bedford, Mass., will be staged in the Elm Rink, March 27-April 2. Many new effects in decorations will help to make the building attractive, and the local dealers are enthusiastic over the prospects. Considerable interest in motor boating is noted in this vicinity, and an opportunity will be afforded to see boats as well.

WILL ADMIT ACCESSORY MEN.

Appreciating the value of membership in the Indiana Automobile Manufacturers' Association, the Remy Electric Company, Anderson, Ind., maker of Remy magnetos, recently made application for admission. Until that time, it was impossible for accessory makers to become members, but the bylaws and constitution were changed for this purpose. Besides the Remy concern, the R. J. Irwin Company, Indianapolis, Ind., body builder, has joined recently.

Digitized by Google

This is the logical moment to think about Next year's business

Arrival of the Spring touring season multiplies responsibilities for tire dealers.

Thousands of cars which have been in winter retirement soon will be in service again. Your customers will want tires.

What tires are you going to sell them?

There are two important facts you should carefully consider in mapping out this season's campaign—the immediate requirements of your customers and the future of your business.

If you start right this Spring—establish your reputation for reliability—you not only satisfy your customers, but you lay the foundation for next year.

Once you satisfy a customer it is an easy matter to sell him again. Enough satisfied customers absolutely insure you a profitable business. Therefore, your permanent success as a tire dealer depends entirely upon the quality of the tires you sell.

United States Tires have wearing qualities not possessed by other tires because they

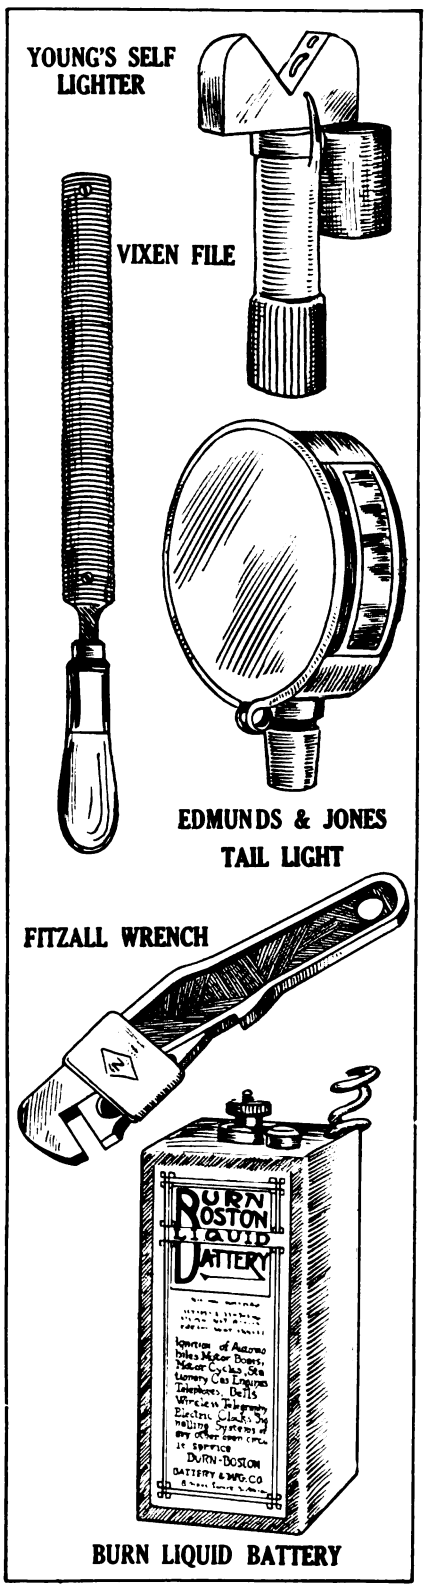
are the product of four great factories presided over by four groups of experts, presenting an aggregate of tire-building knowledge not even approached by any other tire concern.

In United States Tires these experts have assembled the strongest individual points of four world-famous brands of tires.

Tires made as these tires are made offer you an absolutely certain foundation upon which to build up a big, lasting, profit-yielding business.

And they cost no more than other kinds.

UNITED STATES TIRE COMPANY
New York.



Digitized by Google

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

Young's Self-Lighter is a practical device which will appeal to motorists whose cars are equipped with acetylene. By it the lamps may be lighted or extinguished without the driver leaving the seat, the operation involving but a turn of a valve and a throw of a switch lever. A feature of the equipment is its simplicity. Anyone may attach the entire outfit in a few minutes and once installed it does not require any attention whatsoever. The burners consist of the usual members but carry a wire which is utilized for jumping a spark across the gap, which ignites the acetylene. The construction of the burners is such that the heat does not affect the lighting device or its operation. The system includes a special switch, a gas valve and the burners. The switch is fastened to the dash and a wire leads from it to one of the burners and a second lead to the secondary terminal of the regular coil. The gas regulating device is also mounted upon the dash and is operated easily. When the use of the lights is desired the valve is turned and the switch lever moved, thus closing a circuit and causing a series of sparks to jump across the gap in the wires at the burner. Another position of the lever extinguishes the lamps and shuts off the gas. The self-lighter is not expensive and does not interfere with the use of the lights in the ordinary manner. It is manufactured by A. G. Young, Pittsburg, Penn. William H. Pollack, 607 Webster avenue of the same city, is selling agent.

★

Edmunds & Jones Tail Light, produced by the Edmunds & Jones Manufacturing Company, Detroit, is operated by electricity and has in addition to the usual red semaphore a white lens by means of which the license plate is illuminated. The lamp is constructed of a high grade material, compact and very neat in appearance. By removing a set screw the member may be dismantled for inspection or adjustments. It is dust, moisture and weather proof.

★

The Vixen File, for which the maker claims non-clogging and superior abrasive qualities, is the product of the Vixen Tool Company, Philadelphia. It was invented by Alexis Vernaz of Switzerland and has deep semi-circular teeth on either side, the design of which produces, it is stated, a keen cutting edge as well as a shearing cut. The tools are made of a very high grade crucible steel and the teeth are cut one at a time with an end mill shaped like a hollow cylinder, and the edge beveled off to an angle of 60 degrees. This method of forming the teeth leaves the steel untouched as regards its constituent parts. The Vixen file will permit of resharpening from four to six times. It is made in different styles and sizes.

★

Fitzall Wrenches, so named because of their fitting and adjustable qualities, present a new application of a well known mechanical principle, that of the inclined plane or wedge. They consist of a shank having a fixed jaw, a wedge shaped slideable jaw or tooth block, and a movable locking band. The latter two members slide easily and are locked positively when pressure is applied. In addition to being instantaneous in action they are free from knurled nuts, screws, etc., and permit of openings of varying dimensions very quickly. The only wearing part is said to be the tooth block which is removable and may be renewed at a very slight expense. They are manufactured by the Standard Wrench & Tool Company, Providence, R. I.

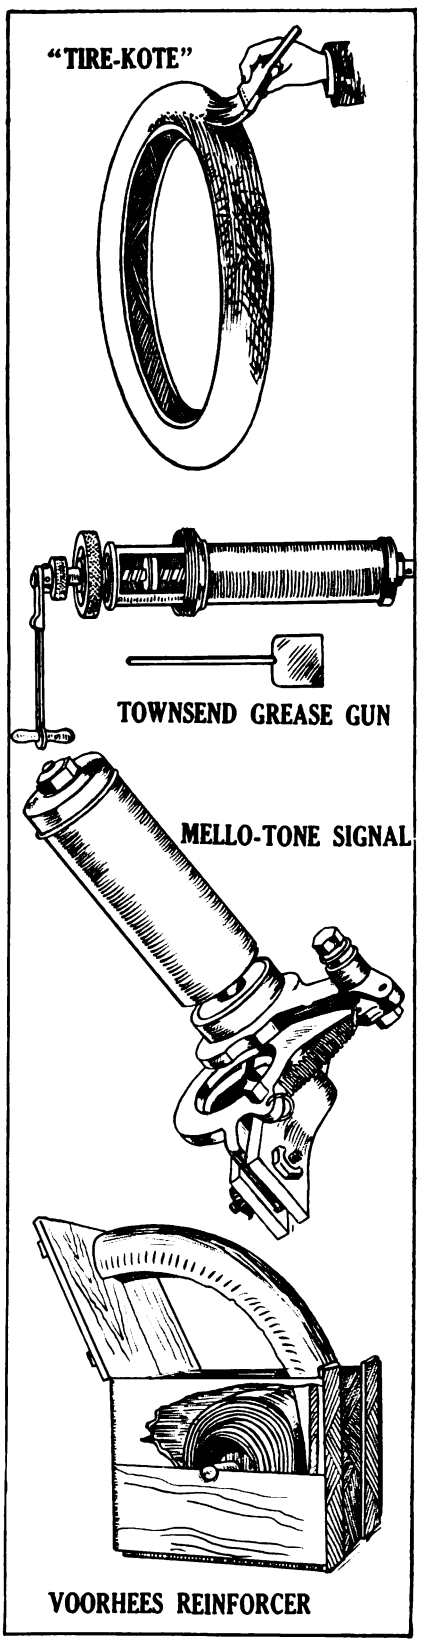
★

The Burn-Boston Liquid Battery, made by the Burn-Boston Battery & Manufacturing Works, Boston, is produced in two forms, water and moisture proof, the lat-

Digitized by Google

ter type being known as the Noloss. They are similar to the usual square dry cell and require the same number in a set, but it is claimed that they will give considerably longer service and will not deteriorate when out of service. This is due to the composition of the electrolyte which is liquid, non-freezing and non-sulphating, and will not evaporate. The zinc connection of each cell is a flexible wire, permanently attached. Each carbon terminal is equipped with a lock washer, preventing a connection from working loose by vibration. The voltage of each member is 1.5 and amperage about 20.

★



Tire-Kote is a liquid preparation made by the Page-Lester Company, Chicago, for preventing the deterioration of tires when not in use, as well as when in service. The fluid is applied with a brush after the surface has been cleaned thoroughly and it is said that it will dry in about 10 minutes. By its use cracks, crevices and cuts are filled and the preservative prevents action of oils, water, sun or other deteriorating influences. A feature emphasized of Tire-Kote is that shabby and travel-stained shoes are made to look like new as it imparts a white color. It is stated by the maker that the composition is not affected by mud and is thoroughly water and weather proof.

★

Voorhees Ideal Reinforcer is manufactured for the convenience of tire repairers and comes in reels of 50 and 150-foot lengths, mounted on a spindle which fits inside of the shipping case, this arrangement making for accessibility as well as keeping the material clean. It is utilized for the reinforcement and protection of tires, and is produced by the Voorhees Rubber Manufacturing Company, which concern maintains offices at Jersey City, N. J., New York City and Boston.

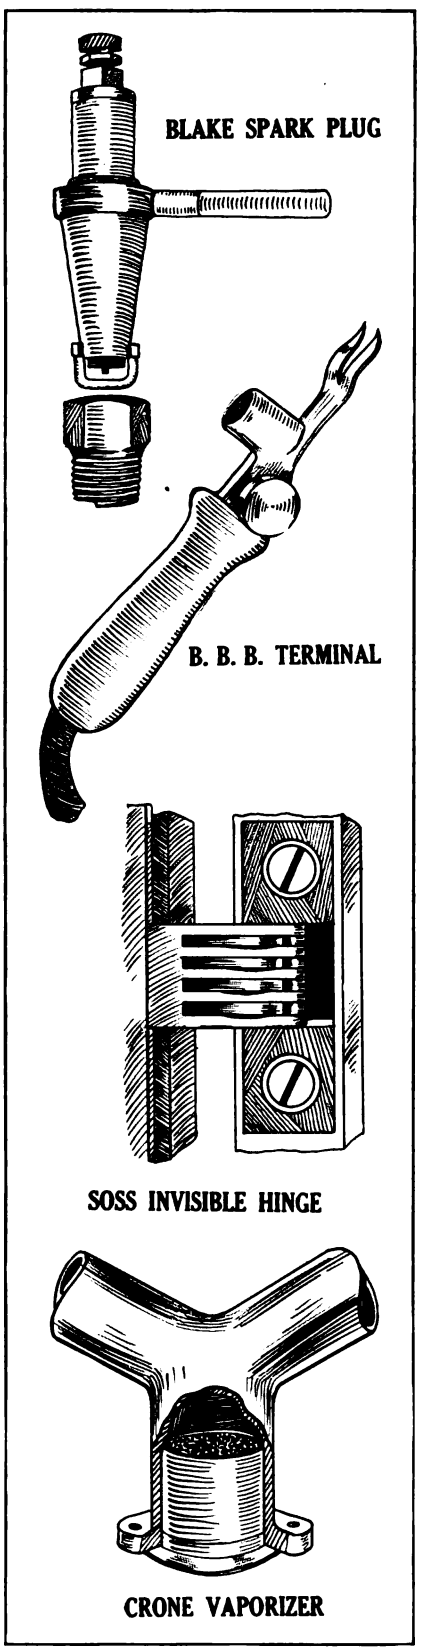
★

The Townsend Grease Gun differs from the usual device utilized for the handling of hard lubricants as it may be completely filled, is clean to handle, and is operated easily and quickly. It comprises two seamless brass tubes, telescoped together. The outer member is equipped with a threaded cap which is movably mounted upon a rod or plunger. The outer end of the larger barrel is threaded for the purpose of attaching a cap when the grease gun is being operated and to allow the inner barrel to be moved out when lubricant is being inserted. The inner tube is open at the forward end and closed at the rear. A screw .375 inch in diameter and eight inches long is journalled in the rear end of the inner tube, and is fitted with a jointed handle. Attached to the screw member is a piston with a lip which fills the opening and also stops the lubricant from crawling backward. This lip prevents the piston from turning, but when the handle is rotated the screw revolves and the piston travels along the tube, pushing the grease before it. The inner tube has a section cut away and this is filled with lubricant by means of a steel paddle. When the compartment is filled, the inner tube is moved inward and the cap screwed on. The device is 2.5 inches in diameter, eight long and holds about one pound of lubricant. The nozzle member is slightly curved and its opening is approximately .1875 inch in diameter. It is said that the gun may be filled and emptied in about 40 seconds and that it may be loaded without soiling the hands. Owing to the liberal sized opening in the inner tube and the fact that this member is loaded separately, air pockets are avoided and the gun may be completely filled. It is made by S. P. Townsend & Co., Orange, N. J.

★

The Mello-Tone Auto Signal is produced by the Electric City Manufacturing Company, Buffalo, N. Y., of which J. J. Kelleher, 612 Columbus avenue, Boston, is New England distributor. It is a neat, compact, signalling device, adapt-

Digitized by Google



able to motor cars, boats, motorcycles, etc., and is operated by the pressure of the exhaust. The tone is clear and musical and the volume is varied by the amount of pressure upon the pedal actuating the device, this member controlling the size of the opening through which the gases pass. A wide range in tones is also possible. It is designed to be attached to the exhaust pipe leading from the muffler, and in fitting the device it is not necessary to cut or alter the exhaust pipe. It is installed easily and quickly by means of a patented clamp, a feature of which is that two sizes of these members will cover pipes from one to 2.5 inches in diameter.

★

The Blake Q. D. Spark Plug, produced by the Blake Spark Plug Company, Cambridge, Mass., presents interesting features, inasmuch as it may be quickly disassembled without the use of a wrench or other tools. Integral with the mica or porcelain member is a handle and by giving this a quarter-turn the plug is unlocked and removed easily, leaving the threaded part in the cylinder. The recess into which fits the metal member carrying electrode is tapered and a cam guide-like device forces the two parts together making the plug gas tight, and at the same time locking them securely. The handle is covered with wood, thereby preventing shocks when the plug is removed for testing the spark or cleaning the points. It is claimed of the device that these never have to be adjusted. It is of special value on cars not equipped with a priming cup as by the removal of the electrode member gasoline may be inserted in the cylinder without detaching the wire.

★

The B. B. B. Spark Plug Terminal will appeal to motorists who have experienced the unpleasantness of a shock when testing out a faulty spark plug. It is a combination device inasmuch as it serves as a regular terminal and provides means for proving the action of the spark when the plug is removed and laid upon the cylinder. The terminal is substantially constructed of metal, nickel plated, and may be attached to any type of plug. An enameled wooden handle is fitted to the terminal and is so constructed that the secondary wire may be inserted and locked securely. Being of wood, a non-conductor of electricity, shocks are prevented. The device is made in one size, this being adaptable to any plug, and is manufactured by the B. B. B. Combination Terminal Company, Dorchester, Mass.

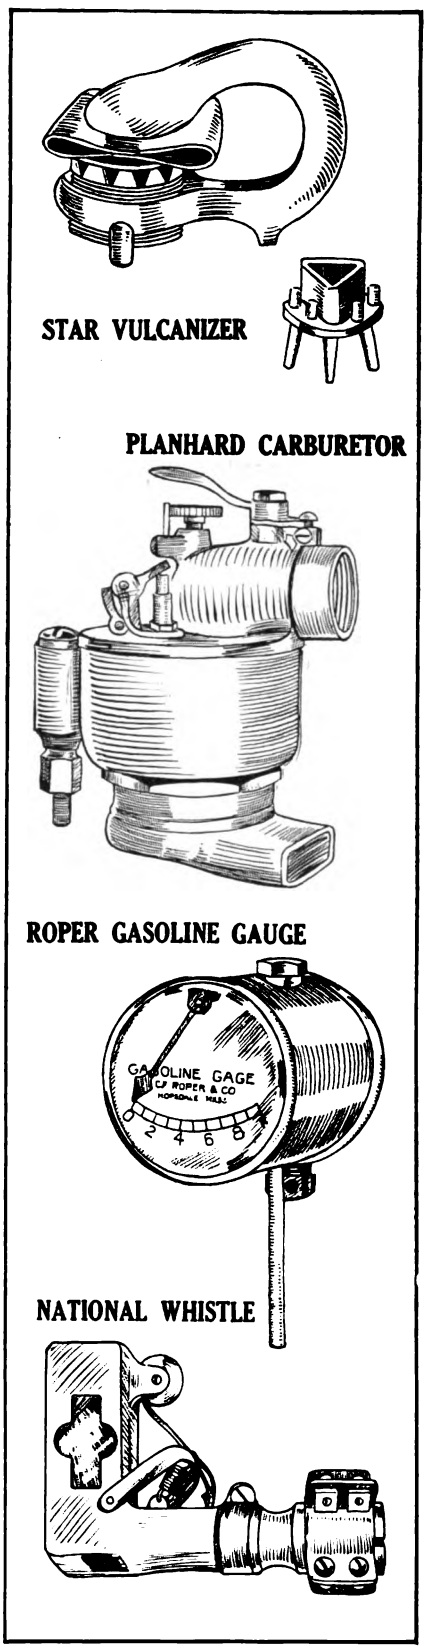
★

Soss Invisible Hinges are produced by the Soss Manufacturing Company, Brooklyn, N. Y., and are designed for motor cars, although applicable to any type of door. When fitted they hold the door rigid, but provide a perfectly smooth action. They are constructed of a frictionless metal connected by links and are especially adapted where the body of a vehicle is curved. A feature emphasized is that they require less thickness of wood in the post or body, as the width of the plates is 1.125 inches, allowing them to be mounted in a post 1.25 inches wide, and at the same time provide for a throw of one inch. The hinges are made with a separation of .125 inch between the plates and it is claimed they will withstand rough usage. They are finished in black, oxidized copper, bronze, etc. The installation is simple, requiring only screws and washers.

★

The Crone Vaporizer is a device which may be inserted in the intake manifold of a hydrocarbon motor without alteration to the piping and which does not interfere in any way with making the regular connections mixture tight. The construction is of metal, one end having a lip or extension for fastening it securely. A fitting of corrugated mesh breaks up any raw gasoline that is draw from the carburetor and converts the fluid

Digitized by Google



into a perfect and dry mixture. Being constructed in tubular form it provides a vaporizing surface, according to size, from 150 to 1000 square inches. Back pressure is absent and the mesh will not clog or get out of order. It is claimed that with the vaporizer, faulty action of carburetors is regulated and that a considerable saving of gasoline is effected. Carbon caused by too much fuel is prevented as well as danger of a backfire to the carburetor. It also is held that overheating of the motor is eliminated, inasmuch as the device provides a dry mixture. It is manufactured by F. G. Crone, Buffalo, N. Y.

★

Star Self-Regulating Vulcanizers, manufactured and marketed by the Star Rubber Company, New York City, are designed especially for the motorist who makes his own repairs to inner tubes. They are compact and put up in a strong, nicely finished hinged box adapted for carrying in the car. Being constructed of solid aluminum, they are very light. In practise the tube is clamped between the plates and one of the triangular heat units lighted. These give off the proper heat and the device does not require any watching or adjusting, the temperature being regulated automatically. The heat units come in boxes of 10 and are inexpensive. The equipment includes material for vulcanizing, etc.

★

Planhard Carburetors make for simplicity, inasmuch as they are free from springs, and have but one spraying nozzle, this being located in the centre of a cup shaped member and surrounded by a constant air opening. At low and intermediate speeds air is admitted through these openings, but upon the speed of the piston increasing, its suction lifts one or more balls in a plate surrounding the fixed air passages, increasing the amount of air admitted. This plate is adjustable and is fitted with six balls. A concentric float is utilized, enclosing the upper fixed air passage. This is controlled in the usual manner and equipped with a priming device. The needle valve proper is adjusted underneath and locked by a wing nut. It is claimed of the Planhard carburetor that a perfect mixture is obtainable and that economy of fuel is effected. It is made by the Planhard Manufacturing Company, Kokomo, Ind., with general sales offices at Philadelphia.

★

The Roper Gasoline Gauge is a device for indicating the amount of fuel in the tank. It is fitted to the dash and does not detract from its appearance, being not unlike a speedometer in design. The dial is calibrated in inches and a movable hand indicates the amount of fluid in the tank, whether the car is on the level or a grade. There being no complicated mechanism, there is nothing to get out of order. The gauge is enclosed in a polished brass case, has an enamelled dial and a beveled glass face. It is connected to the fuel tank by a .25-inch copper pipe and is installed easily without special fittings. It is manufactured and marketed by C. F. Roper & Co., Hopedale, Mass.

★

The National Whistle, manufactured by the National Signal Company, Brooklyn, N. Y., is attached to the exhaust pipe of the muffler and is operated by the pressure of the burnt gases. It is constructed of aluminum, trysquare in shape, and is said to be carbon proof and productive of a rich, mellow tone, yet of sufficient strength to be audible over traffic noises. It is fitted with movable valve which in normal position closes the sound chamber allowing the gases to flow directly out into the open air. When the valve is moved forward by a cable actuated by a pedal, it almost closes the exhaust passage, leaving a small opening through which the gases are forced in a thin air current, these breaking against a sharp edge of the valve and being deflected into the whistle.

THREE PREMIERS
OF THE
MOTORING WORLD

Specialized Publications For Owner, Industry and Trade

The AUTOMOBILE JOURNAL—Devoted to the Interests of the Owner and User of the Motor Vehicle for Pleasure. The Most Comprehensive Popular-Priced Magazine Published. The year, **24** issues, **$1**; the Copy, **10** Cents.

The MOTOR TRUCK—The National Magazine of the Power Wagon Industry, Promotive of the Interests of the Manufacturer, Distributor and Owner of Industrial Transports. The Leader of Its Class. The Year, Monthly, **$1**; the Copy, **15** Cents.

The ACCESSORY and GARAGE JOURNAL—The Only Publication in America Given Over to the Motor Car Industry and Allied Interests. Exclusively a Medium of Trade Information for the Trade. The Year, Monthly, **$1**; the Copy, **15** Cents.

TEN STANDARD MECHANICAL AUTOMOBILE HANDBOOKS

The A B C OF INTERNAL COMBUSTION ENGINE MAINTENANCE AND REPAIR—The Most Complete Work Ever Written of Gas Motors. Not Principles, But Practise. Illustrated by More than 50 Cuts and Drawings and Eight Full-Page Charts. Price **35** Cents.

The A B C of MAGNETO IGNITION SYSTEMS—Every Detail of Construction, Maintenance and Care, Covering Standard Makes of Instruments and Their Service, Illustrated by More Than 100 Cuts, Drawings and Wiring Diagrams. Price **35** Cents.

The A B C OF CARBURETOR CONSTRUCTION, MAINTENANCE AND REPAIR—Theory and Practise of Carburetion by All Recognized Methods and Devices Exhaustively Reviewed and Described, with More Than 125 Special Illustrations and Charts. Price **35** Cents.

The A B C OF BATTERY IGNITION SYSTEMS—All Standard Constructions and Their Adaptations in Practise, Together with Special Applications and a Series of Wiring Diagrams for All Installations, Shown by 50 Illustrations and Charts. Price **30** Cents.

The A B C OF MOTOR CAR OPERATION—A Complete Text Book of Theory and Practical Experience with All Types of Standard Automobile Vehicles, Systematically Written and Illustrated by More Than 200 Cuts and Full-Page Charts. Price **50** Cents..

OVERHAULING, REBUILDING AND REPAIRING THE MOTOR CAR—A Treatise of All Conventional Types of Cars with Advice for Meeting All Service Conditions, Based on Practical Experience. Containing More Than 200 Illustrations and Diagrams. Price **50** Cents.

The A B C OF MOTOR CAR CHASSIS MAINTENANCE AND REPAIR—Systematic Presentation of Conditions Resultant from Use, and Means for Remedy and Restoration Applied from Practical Knowledge. Contains More Than 50 Cuts and Charts. Price **25** Cents.

MAINTENANCE AND REPAIR OF MOTOR CAR TIRES—An Exposition Treating of Tire Service from the Viewpoint of Economy, Founded on Manufacturing, Repairing and Operating Experience. Illustrated by More Than 100 Cuts and Charts. Price **25** Cents.

LIGHTING THE MOTOR CAR BY ELECTRICITY—A Comprehensive Work on All Current Producers, Lamps, Lights, Installations and Practical Wiring Diagrams for Every Type of Vehicle, Singly or in Combination. More Than 75 Cuts and Diagrams. Price **25** Cents.

The A B C OF AERIAL NAVIGATION—A Veritable Encyclopedia of Aerial Science, Dealing with the Latest Designs and Types of Airships, Construction, Materials, Equipment, Control, Etc. Containing More Than 200 Illustrations and Charts. Price **50** Cents.

FULL SET, 10 VOLUMES, $3.60.

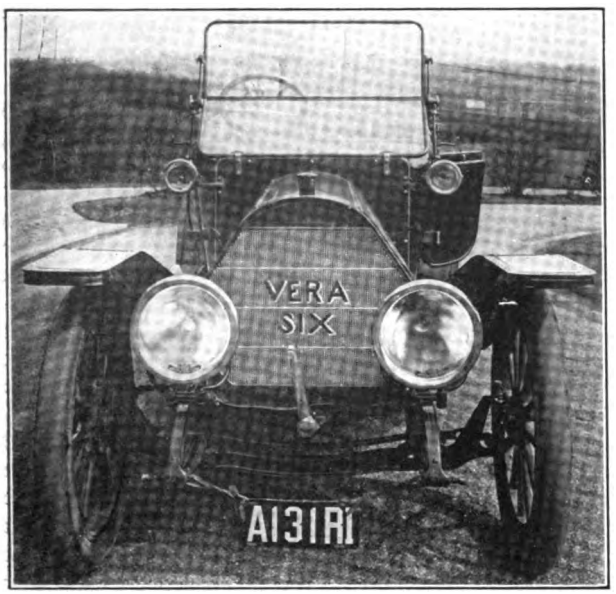
THE VERA SIX-CYLINDER CARS.

HAVING determined by careful and extended demonstration and experimentation every feature of design and quality of construction the Vera Motor Car Company, Providence, R. I., has placed in the market the Vera pleasure car, a six-cylinder machine with a conservative power rating of 50 horsepower. But one type of chassis is produced on which is installed either two or three-passenger roadster and five or seven-passenger touring bodies. It is not in any sense experimental, for its design combines only qualities that have been established as thoroughly mechanical and enduring, and are approved from every engineering viewpoint.

The Vera car has several features of construction that make it distinctive. It is well nigh noiseless, being silenced admirably. It may be driven on second speed without evidence of the operation of the gearset, so quiet are the gears. The control is unusual in that the machine may be throttled to practically a walking pace and the flexibility is highly commendable. The chief feature is that the machine is driven through the torsion tube and chassis frame instead of the springs and distance rods, while the full floating rear axle relieves the driving system of any thrust whatever and eliminates stresses that might result from road shock.

The car has great accessibility, it being believed that the saving of time in its care and maintenance is a decidedly important factor with any purchaser. The components have a wide margin of safety, and the quality of materials is extremely high, insuring abundant strength and endurance with comparatively light weight. The car is finished with unusual care and so far as the body installation and equipment is concerned it may be regarded as a "custom built" vehicle. The purchaser has latitude in the choice not possible with the usual stock productions of other manufacturers.



The car is the joint design of H. J. Willard and F. V. Cooke. Mr. Willard is a pioneer of the industry, has had life-long engineering experience, and for 3.5 years was connected with the American Locomotive Company, directly supervising the production of Alco power plants. He is a mechanic both from a creative and a productive viewpoint. Mr. Cooke has been identified with the motoring world for 10 years in practically every capacity save actual manufacturing, being connected with the Packard Motor Car Company's eastern selling organization for a considerable period.

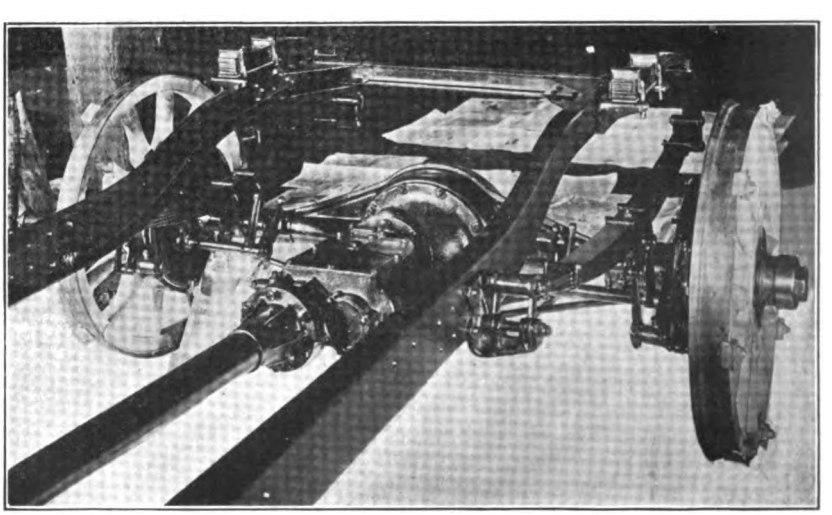
The Vera Six-Cylinder, 50 Horsepower, Five-Passenger Touring Car, Built by the Vera Motor Car Company, Providence, R. I.

The Vera Motor Car Company has as executive president, Johns H. Congdon of the Congdon & Carpenter Company, Providence; as vice president and general manager S. J. Greene, treasurer of the Eastern Coal Company, Providence; as secretary and treasurer F. D. Simmons, president and general manager of the Eastern Coal Company, and these three with Mr. Cooke, as sales manager, and Mr. Willard, as superintendent and engineer, compose the board of directors. The officers of the company are business men of large and mature experience. The assembling and testing of the cars is directed by William J. Harris, assistant superintendent, for six years in charge of the assembling department of the Ameri-

Digitized by Google

The Vera Six-Cylinder Five-Passenger Touring Car Head-On, Showing the Strength of the Forward Suspension and the Sightly Radiator and Hood.

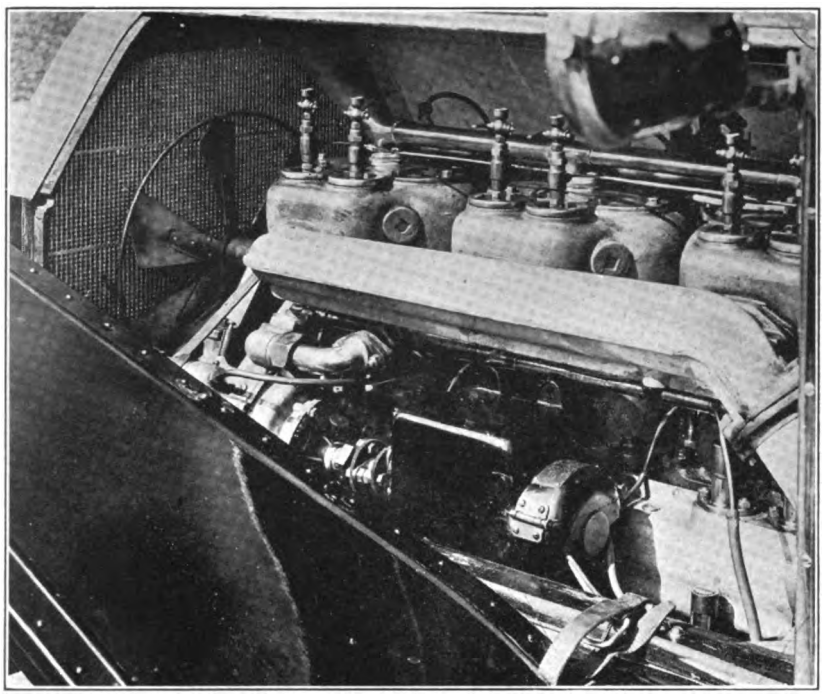
can Locomotive Company, who was the mechanical expert in charge of the racing cars in all the events in which Alco machines were entered during his connection with the company.



The purpose is to produce a car in every sense individualized and specialized, that has power and speed beyond what is necessary for even extraordinary conditions, and will yield extremes of service well within its capacity, so that there should be no demand so severe as to reach the full limitations of the construction. In addition the car is designed to have every quality that will make for comfort and luxury.

No detail of mechanical construction has been accepted without the fullest experiment to ascertain its desirability and fitness. Large margins of safety have been provided with relation to every wearing part. Provision is made for adjustment that the entire assembly may be perfectly maintained. Care has been taken to produce a high quality machine that is practically standardized and may be accepted as mechanically correct throughout. The name of the car, the Latin for true, was applied because, in the opinion of the officers of the company, in every detail and as a whole it is what the name implies—a true car.

The Vera motor cylinders are cast in pairs from fine close-grained gray iron with valve chambers, cylinder heads and water jackets integral. The cylinders are T type with the fuel intake at the right and the exhaust at the left side. The cylinder heads are reinforced with cross ribs and the cylinders and the valve passages are entirely water jacketed, a cock at the lowest level affording perfect drainage of the jackets. The top of the water jacket is open, which insures uniformity of casting and complete cleaning of the core sand. The openings are closed by bronze plates, to which the water outlet manifold is attached.



The castings are sand-blasted, pickled and hand-filed before the machine work is begun. The cylinders are bored on a special machine weighing eight tons. After reaming they are allowed to age and are ground to a precise fit. To insure against imperfection or leak they are subjected to a heavy water pressure test. The base flanges of the cylinder units are reinforced by bosses through which the bolts retaining them to the engine case are passed. The valve caps are set into the cylinder heads with asbestos filled copper gaskets on the cap seats.

The pistons are of the same material as the cylinders. After casting they are pickled, and when turned and ground to exact size are slightly taper, there being .003 difference between the top and bottom of the piston walls to allow for expansion. The wristpin bosses are reinforced by webs to give additional strength. Each piston is fitted with four rings of semi-steel and has four oil grooves. The faces and both edges of the piston rings are ground and accurately fitted to the ring channels. The rings are first turned eccentric in a lathe, and then cut and ground to exact cylinder size, this insuring perfect retention of the compression pressure. In the piston, in line with the wristpin, is a wide groove that collects oil from the cylinder wall and leads it to the wristpin bearings. The wristpin oscillates in the bosses. It is of tool steel, hollow, carefully ground

The Vera Six-Cylinder Motor, Exhaust Side, Showing the Apico No. 4 Ignition and Lighting System, Tire and Water Pumps.

and hardened, and is fixed to the connecting rod by a bolt, there being a larger bearing surface than were the pin fixed in the piston.

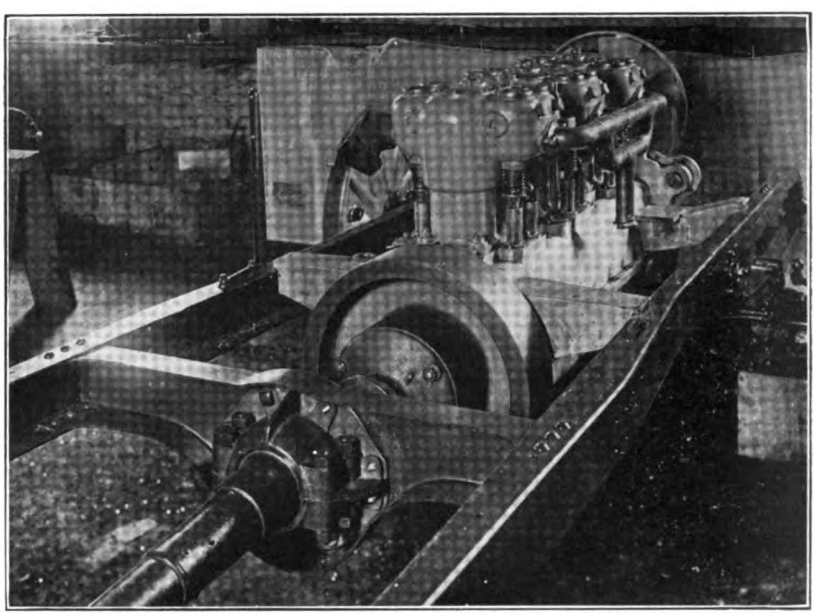
The bore of the cylinder is 4.25 inches with stroke of five inches, and the cylinders are offset .75 inch. The S. A. E. horsepower rating is 43.3, and at 1650 revolutions the engine will yield full 60 horsepower. The engine case is aluminum and is divided longitudinally. The lower section forms the oil reservoir. The case is divided into three compartments by heavy cross webs which, with the ends carry the large main bearings. These webs strongly reinforce the case. The bearings are held independently of the lower section by large through bolts. The bolts retaining the cylinders are supplied with a collar that holds them in place and the cylinders may be removed without taking off the lower section. There are two breather openings, covered with knurled nuts containing fine wire gauze screen. These are close to the oil gauge and are used for supplying the oil replenishments. Outside of the engine case proper is a compartment containing the timing gears and all these gears may be exposed by the removal of the cover. With the cover removed the camshaft, the idler, water and magneto gears may be taken out.

The diameter of the crankshaft at all bearings is two inches. The length of the rear bearing is 3.5 inches. The crankshaft is 40 per cent. carbon steel and is drop forged, heat treated to insure great strength. The forging is carefully pickled and is turned and ground to exact size. The flywheel flange is forged integral with the shaft. The shafts are accurately balanced on Norton running balance machines. The shaft bearings are of Parsons' white bronze. The camshafts are 40 per cent. carbon steel .9375 inch diameter, carefully ground to size. The cams are oil-tempered and ground to a master cam and are keyed and pinned to the shaft. The bearings are of bronze and the front and centre bearings are 2.5 inches long. The connecting rods are I section drop forgings of 30 per cent. carbon steel and are fitted with Parsons' white bronze bearings 2.5 inches length. These bearings are adjustable by shims.

The valve pushrods are large diameter and of tool steel with extra length bearings and have a case hardened adjusting screw. The guides are of phosphor bronze and are retained to the engine case by studs and lock washers. The valves have nickel heads electrically welded to steel stems, both intake and exhaust being interchangeable. They are 2.25 inches diameter and are carefully ground and lapped. The

The Vera Six-Cylinder Motor, Intake Side, Illustrating the Simplicity of Construction and the Strength of the Steering Gear.

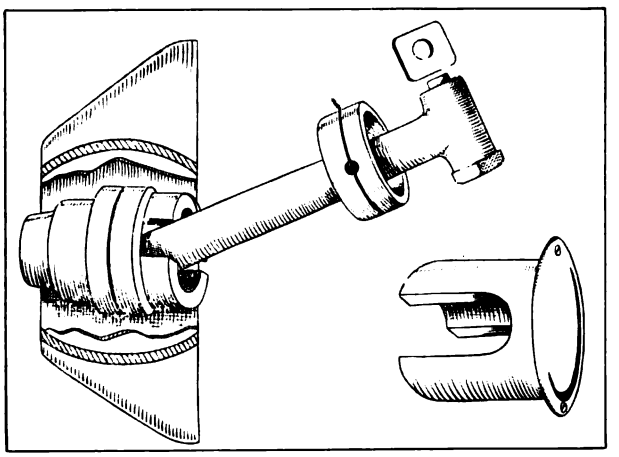
Digitized by Google



cast iron guides are extra length. The very large springs are retained by beveled split bushings and are easily removable. The timing gears are spiral cut with faces 1.25 inches width, are extremely rigid and are of machine steel, semi-steel and cast iron, being fastened to the shafts with woodruff keys and split pins. The faces are ground and machined on hobbing machines. The gear teeth are marked so that when a motor has been taken down it may be assembled and timed with absolute accuracy.

The exhaust manifold is a single steel casting, 2.75 inches diameter, at the outlet ribbed to insure lightness and strength. The intake manifold is of compound yoke pattern with large section and easy curves to insure fullest flow of gas under all conditions of operation. The water inlet manifold is attached to the base of the water jackets and the coolest fluid is circulated about the exhaust valves. The outlet manifold is through the bronze plate covering the cylinder unit head. The motor is cooled by a positive water circulation through a centrifugal pump driven by a gear on the exhaust camshaft, and a large cellular radiator through which a draft is forced by a fan mounted on a bracket carried on the crankcase, ahead of the forward cylinder. The fan is a one-piece steel stamping and is carried on an adjustable ball bearing. The drive is off the pump shaft by an endless water proof flat belt.

The system of lubrication is remarkably efficient. By it the full supply of 1.5 gallons of oil in the crankcase reservoir may be completely circulated in seven minutes. On the exhaust side of the motor case is a ball float oil gauge. If the oil is maintained between the high and low level indications there is no possibility of smoking or damage to the engine. The oil flows from the compartments to the oil well at the rear of the crankcase where, at the exhaust side, and outside the case, is an oil pump driven by spiral gears from the camshaft. The oil is drawn through a filter screen and thence is forced through a large duct integral with the engine base and copper tubes of large diameter to the top of the main bearings. The crankpins are drilled at right angles and at every revolution the holes register with the oil tubes. The bearings are grooved to retain the oil. Through the shaft, the crankpins and the webs or cheek pieces are channels through which the oil is forced to the crankpin bearings and completely distributed to the oil grooves. There is no splash lubrication, but the camshafts, camshaft bearings, wristpins, and the cylinders and pistons are lubricated by the oil thrown off from the crankshaft by centrifugal motion. The timing gears operate in a bath of oil supplied by the drainage from the front main bearing. Every bearing aside from the crankshaft is of phosphor bronze and each bearing is pocketed and grooved for complete lubrication. All the crank and connecting rod bearings are carefully fitted with copper shims for adjustment.



The ignition is the true double system, using the Apico No. 4 combination ignition and lighting system driven from the pump shaft. This system employs a dynamo that generates an electric current and this in turn is supplied to two storage batteries. There is automatic regulation of the current generated so that the batteries are charged whenever drawn upon and the engine is running, there being such control that there is no possibility of over-charge and no danger whatever of exhaustion. The standard of amperage is maintained and there is always sufficient energy available to insure efficient ignition. During the day the excess current generated is stored in the batteries, but it is utilized for both lighting and ignition at night. The ignition is by two sets of spark plugs in the intake side of the motor, one set of plugs at the sides of the valve pockets, and the other above the inlet valves, the sweep of the incoming fuel cleaning the electrodes and insuring uniform and efficient firing. It is possible to use either or both sets of plugs as desired, the firing with the entire number making for more complete combustion and greater power, with a larger economy of fuel. The carburetor is an automatic float feed type that is very efficient.

The flywheel is of cast iron, accurately machined and balanced and bolted to a flange integral with

the crankshaft. The face of the wheel is marked so that the timing of the valves may be done quickly and precisely. There are many other minor details of construction, such as the large diameter valve springs to insure elasticity, retained by a collar held by a split taper steel bushing fitted into a groove in the valve stem, the bronze compression relief cocks, the hand-filed finish of the cylinders, the smooth-finished engine cases, the polished water and fuel manifolds, and the generally perfected workmanship, worthy of attention. Every hardened part is tested on a scleroscope.

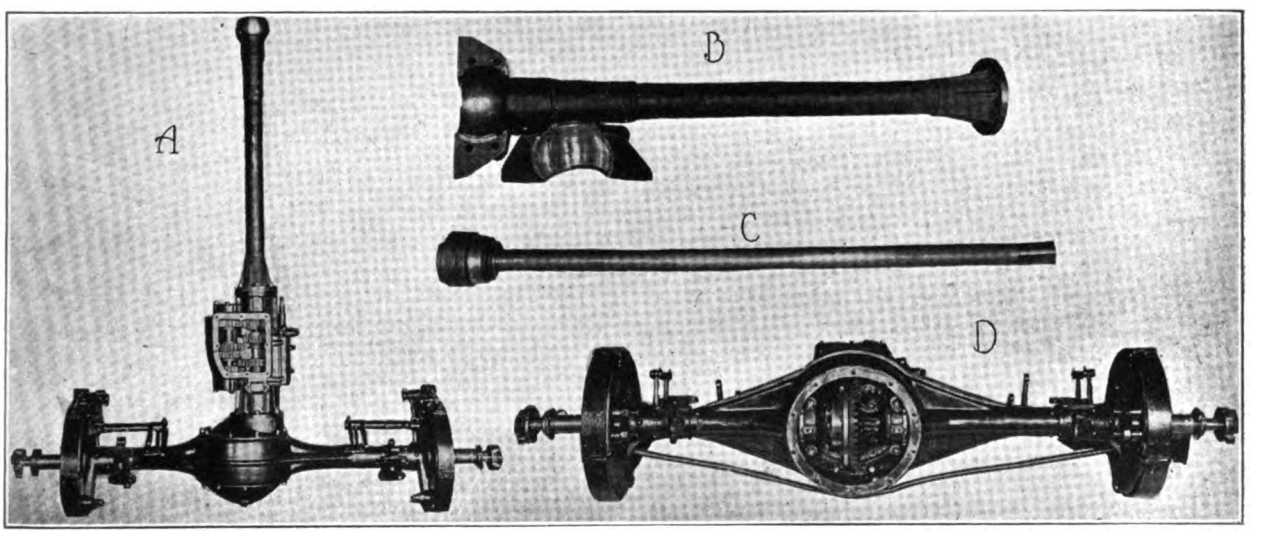
The clutch is of the multiple disc type completely enclosed, with the 39 pressed steel discs operating in an oil bath. These are engaged by a spiral spring of adjustable tension. The thrust collar is fitted with a brake that is engaged automatically when the clutch is disengaged, which effectually prevents spinning and insures the meshing of the gears without clashing. The shafts and the sleeves are designed with a view to prevent leakage of oil and to have abundant strength. The thrust races are grooved to retain the balls and eliminate noise. All the bearings are automatically lubricated when the clutch is disengaged, this increasing the life of the bearing bushings. The clutch has great power, is remarkably smooth in action, and has especially long life with freedom from renewals.

The clutch is bolted to the flywheel and is coupled to the driving shaft by a connection designed especially for this car and known as the Vera rocking clutch. This clutch takes the place of the usual universal joints in the shaft and besides compensating for every possible misalignment of the chassis eliminates the possibility of end thrust upon the driving system. This clutch is illustrated by a sketch not drawn to proportions and by reference to it the mechanism may be better understood. The slotted sleeve shown apart from the other members is bolted to the rear of the clutch casing. Into the slots are placed the blocks carried on the trunnions of the T head of the shaft member. The blocks are square-faced where they contact with the shaft member, but are rounded at the outer side, so that the shaft may be moved from side to side freely, the blocks sliding in the slots in the sleeve. The shaft may also be moved correspondingly up or down on the trunnions held by the blocks. The blocks are retained in the sleeve by the collar, which is slipped on to the sleeve and fixed by a screw that is wired to prevent it slackening.

The rear end of the shaft member is similarly formed and it is fitted into a block that has the same construction as the sleeve, this block, however, having a tapered octagonal channel through it behind the T of the shaft member. Into this channel is fitted the end of the driving shaft and this is secured by a woodruff key, a large nut and a cotter pin. Between the driving shaft and the shaft member is placed a helical spring that constantly forces the shaft member forward into the sleeve bolted to the clutch. The entire assembly is retained in a water and oil tight housing that is packed with a heavy lubricant.

Forward Section of Vera Six Chassis, Showing the Globe-Headed Torsion Tube Installed in the Heavy Cross Member, the Clutch, Flywheel and Power Plant.

Digitized by Google



The driving shaft is carried in a very heavy steel torsion tube, on the forward end of which is attached a sleeve, the free end of the sleeve being formed as a globe with the forward side removed. At the base of this sleeve, in the torsion tube, is fitted a large, heavy-duty roller bearing. The shaft is mounted in this roller bearing and is perfectly aligned. The globe end of the assembly is mounted in a globe socket centred in a heavy frame cross member. This socket is lined with genuine babbitt metal to the depth of .25 inch and scraped to the same fit as is an engine bearing. In this socket the globe is free to move in any direction as the torsion tube is swung, but there is no play in the joint. After a test of more than 25,000 miles of driving an experimental assembly showed absolutely no wear. This socket is assembled with shims for adjustment, however, and it is always possible to maintain a perfect fit. In five minutes the assembly can be dismantled and the coupling removed. The globe is packed with grease and is always perfectly lubricated.

The rear end of the torsion tube is bolted to the transmission case, which is in turn bolted to the differential housing of the full floating rear axle. The transmission is the selective type with three forward gear ratios and reverse, and being carried in correct relation to the differential and rear axle assembly, with the driving shaft always turning at engine speed, there are no undue stresses upon the driving system. The transmission gears are large and with extremely wide faces, making for extreme endurance. There is a large cover to the transmission housing that may be quickly removed for examination of the gears and shafts.

The rear axle housing is of pressed steel, strengthened by heavy webs, and in this the differential cage is mounted on large annular ball bearings that are easily adjustable, so that the precise relation of the bevel and pinion gears may always be preserved. The differential assembly may be removed quickly should this be desirable. The driving shafts are of nickel steel and the clutches bolted and keyed to the outer ends engage with clutch members in the wheel hubs. The wheels are mounted on double sets of ball bearings on the axle housing and there is no road shock stress or strain upon the driving axles, differential, driving pinion, transmission or shaft.

On the axle housing the spring saddles are mounted so as to have slight movement, there being grease cups to afford lubrication and prevent wear of the bands retaining the saddles. Free of the springs the saddles may be moved about the axle shell. The axle relation is preserved by the torsion tube, and the driving movement of the car is always through the torsion tube against the globe and socket in the heavy cross member of the frame, which is forward of the centre of the chassis, and for that reason there is the same steadiness and absence of swing that is found in a car moving on rails. The springs are shackled at both ends and this relieves them of all driving or braking strains, the torsion tube moving easily with every wheel or chassis movement and, being in practically a straight line at all times, there is no loss of power through shaft angularity. No torsion or distance rods are necessary, the torsion tube supplying every need. Mechanically it gives a three point suspension for the entire driving system. Examination of the illustrations will evidence the simplicity and strength of the construction.

The chassis frame is of the finest pressed chrome nickel steel channel section, heat treated, with unusual depth and width, cambered at the rear for the

The Vera Driving System: A, the Complete Torsion Tube, Transmission and Rear Axle Assembly; B, the Globe-Headed Torsion Tube and the Globe Socket Through Which the Car Is Driven, Showing the Socket Divided and the Lining of Hand-Scraped Babbitt Metal into Which the Globe Is Fitted; C, the Driving Shaft and the Rear Member of the Vera Rocking Clutch; D, the Rear Axle with the Differential Casing Open, Showing the Adjustable Annular Ball Bearings and Differential Gears.

Digitized by Google

installation of the three-quarter elliptic springs, and has great strength and resiliency. The forward spring horns are very long and the suspension is such that the body is practically within the axle centres, the 130-inch wheelbase making for extremely easy riding. The springs are of the finest electro-silico-manganese steel and are guaranteed for the life of the car. The front semi-elliptic springs are of 42 inches length and two inches width, and the rear springs are 50 inches length and two inches width.

The front axle is an I section steel drop forging and has unusual strength. The wheel spindles are large and these are fitted with three sets of annular ball bearings for the wheels. The tiebar is carried behind the axle to afford protection against road obstruction. The brakes are of large size, with external expanding shoes in drums on the rear wheels for the service brake, and contracting bands outside the drums for the emergency hand lever brake. The wheels are artillery type, of wood, 36 inches diameter, of best second growth hickory, with 12 spokes to each wheel. The tire equipment is 36 by four inches forward and 36 by 4.5 inches rear for roadster or five-passenger touring car, with 36 by four or 36 by 4.5 optional, and 36 by four inches forward and 37 by five inches rear for seven-passenger touring car, landau or suburban. The machines are fitted with Dorian demountable rims and two spare rims are supplied as equipment.

The control is by two pedals, the left being the clutch and the right the service brake, with foot accelerator and cut-out. The machine is driven by an 18-inch hand wheel on a steering column with worm gear connection, the spark and throttle levers being above the five-spoked aluminum spider of the wheel.

The body is protected by large and graceful mudguards covering the wheels, and the running boards are shielded by a skirt extending from the chassis frame. The hood is sightly and with its length gives a decidedly pleasing impression from the driver's seat. The body is large, of aluminum, of straight-line design, with a cowl that completely shields the dash. The fore and rear doors open from the back. The front doors are 19.25 inches and the rear doors 20 inches width. The front seat cushion is 17 by 41 inches and the rear seat cushion 18 by 50 inches in width and length. There is 35 inches space between the seats.

The upholstery is of Strauss' hand-buffed leather, grain or pebble or dull or satin finish. The cushions are nine inches depth and the back may be either eight or 10 inches depth. Any reasonable option is given as to body detail and finish. The standard body color is brewster green with a fine French gray stripe. The body hardware is all nickelled and black enamel, the footboard and running board bindings being nickel.

Under the rear seat at the back of the body is a storage compartment in which may be carried the tools, spares, etc., and at the back of the tonneau are carried the extra shoes and rims, leaving both running boards free. The gasoline tank is installed under the front seat and has 20 gallons capacity.

The equipment of the car includes a silk mohair top, complete electric lighting system, windshield, Warner auto-meter, Disco self-starting system, power tire pump, robe rail, foot rail, and the usual tools and tire repair kit.

NEW MOTORING LAW IN MAINE.

The Maine Automobile Association of which John C. Scates, Westbrook, Me., is secretary, has prepared a booklet containing valuable information concerning the new motoring law in that state, which went into effect Jan. 1. This book is free to those who make request, and should be in the hands of those who anticipate touring in that commonwealth during the coming season. The features of the law, which appeal to non-resident motorists, may be described briefly as follows:

Non-residents are allowed 30 days in the state without registering their cars, providing the operator is licensed and the car registered in another state and number plates are displayed. If they remain longer than 30 days they are subject to the same registration fees as residents. In the open country the speed limit is 25 miles an hour; in the built-up portion of a city, town or village, 10 miles, but the speed at all times must be reasonable and safe, having due regard to the traffic and the use of the road by others. When passing a team, the car must come to a stop if the occupant of the team raises a hand. Where there are legally erected danger signs on the right hand side of the road, bearing the legend, "Automobiles, Go Slow," speed must be reduced to five miles an hour.

PEORIA CLUB IS ORGANIZED.

Motorists in Peoria, Ill., organized the Peoria Automobile Club in that city, March 10, with the following temporary officers: Chairman, E. J. Case; secretary, Willis Evans; committee on bylaws, R. H. Johnson, S. K. Hatfield, Thomas H. Webb, Frank Miller and Carl Block. The new club will take an active interest in the promotion of good roads, particularly in Peoria, Lacon, Varna, Wenona and Chillicothe.

NEWARK INDUSTRIAL EXPOSITION.

The Board of Trade in Newark, N. J., is planning to hold a monster industrial exposition in that city, May 13-25. It is claimed that 100,000 different articles, including automobiles, parts and supplies, are manufactured in the 3000 shops of Newark's industrial district, and the object is to bring these directly to the attention of the general public in this manner. The committee in charge of the arrangements is composed of the following: Curtis R. Burnett, Thomas A. Edison, Franklin Murphy, Forrest F. Dryden, Frederick Frelinghuysen and Thomas M. McCarver.

INJUSTICE OF AUTOMOBILE TAXATION.

APROPOS of the recent special message of Gov. Foss of Massachusetts, asking the Legislature of that state to increase the registration fees from 38 to 80 cents a horsepower, which already has been followed by the preparation of a bill embodying the governor's recommendations, the following communication will prove of interest. The writer is a resident of Springfield, Mass., who spends his winters in the South:

Editor, Automobile Journal—

Ever since the automobile was introduced, the owner of it has been subjected to "graft" in every conceivable way. Many ingenious laws were passed to authorize and encourage a sort of legal highway robbery by disgraceful trapping, and country constables and old fogy justices were in many cases, it was alleged, in secret partnership in holding up automobilists on most trivial technicalities, and although entirely innocent of any endangerment of the public safety, were fined outrageously. Over-charging at some hotels, and for anything they wished to buy, was common practise. Then a former governor of Massachusetts, wishing to curry favor with the farmers, who were at first "agin" automobiles, though they are now buying them, proposed to heavily tax the machines for use of the roads, while at the same time taxing them for their property value. The tax thus exacted amounts to one-tenth of all the taxes collected by the State of Massachusetts! And yet this is not thought to be the limit of endurance, for the present governor proposes to increase this tax 2.5 times more!

It is time for automobilists to demand some sort of fair-minded justice, and if they are to be taxed for the maintenance of the highways, it is no more than right that all other vehicles shall be taxed in reasonable proportion. That horses and steel-tired vehicles do great injury to the roads is well indicated by a communication which the late Horace Parks, the sage of Russell, Mass., sent to the newspapers in 1901, which was before automobiles were seen oftener than once a month, complaining that the macadam roads were rapidly wearing out Later, after the automobile appeared, the entire blame for destroying the roads has been wrongfully placed upon those vehicles. But that man is wilfully blind who cannot see that a pair of horses, with shoes having 24 steel calks, purposely sharpened to dig into the surface of the road to give necessary pulling power when drawing a heavily loaded wagon, with steel tires, grinding into dust the particles of stone which have been loosened by the steel points on the horses' shoes, are doing destructive injury to the road. Then comes the automobile, which blows the dust away, or pushes it back—though not by suction, be it understood, for there is absolutely no injurious suction to an automobile tire—and thus the surface of the road wears out.

But it is unjust to impose the whole burden of maintaining the highways of the state on automobilists, who are not, I am grieved to say, all millionaires. And then, if one takes his automobile to Florida, for instance, for the winter months, he is called upon to pay another tax to support the highways in that state. It will soon be that only millionaires can run automobiles. Instead of taxing one sort of vehicles, not more destructive of the highways than some others, to maintain the roads of the state, let all be taxed in just proportion. Otherwise, the automobile tax becomes graft.

The former chairman of the state board of highway commissioners, Mr. McClintock, once declared that an automobile passing over a highway at not more than 15 miles an hour, did no more harm to the road than a man walking over it. And this is undoubtedly true. It is equally true that not much more harm is done to the road at a speed of 20 miles an hour, and it is only at speeds exceeding 25 miles an hour, that any very serious damage is done to a well built highway. It must be admitted that on a dirt road about the only harm an automobile does is to splash the mud out of all hollows much faster than narrow tires do.

It is just as reasonable to demand that all vehicles using the highways shall be taxed for their maintenance, as it is that any one kind shall be taxed for such purposes, since all are doing a share in wearing them out. Why should an automobile truck, carrying a load of freight, be taxed $20 or $30 a year for use of the highway, while a pair of horses, drawing the same amount of freight, and unquestionably doing equal damage to the roadbed, go free? If automobiles are to be taxed for maintaining the highways of the state, because their owners are supposed to be fit subjects for graft, and the owners of other vehicles are not, let the fact be acknowledged and the injustice admitted.

MARCUS H. ROGERS.

Daytona, Fla., March 10.

MAXWELL WINS IN ARGENTINA.

Word has been received from Buenos Ayres, Argentine Republic, that Juan Yrigoyen, driving a Maxwell car, made by the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., a constituent of the United States Motor Company, New York City, has won the national automobile endurance run of that country. This event was held under rules similar to those which governed the so-called Glidden tour in this country in 1911. It will be remembered in this connection that the Glidden trophy was won by a team of Maxwell cars last year.

Mr. Yrigoyen made a perfect score in a contest of eight days' duration, competing against skilled drivers and some of the best known cars in Europe and America. The route included no hills, but encircled a large area comprising swamps and rough roads, many of which had never been traversed by motor cars. The contest was conducted by the Argentine Motor Club.

WILL TEACH KNIGHT MOTOR.

Following the adoption of the Knight motor by the makers of the Columbia, Stoddard-Dayton, Atlas and Stearns cars in this country, several automobile schools throughout the country have decided to add a course of instruction in this type of engines. One of the latest to make announcement of this nature is the Y. M. C. A. school in Boston, having an enrollment of 800 students and 14 instructors. J. H. MacAlman, distributor of Columbia-Knight cars in that city, has arranged to place all of the necessary equipment of motors and chassis at the disposal of the school and to provide experts to assist in the lecture and shop work.

LUBRICATING THE MOTOR.

The Joseph Dixon Crucible Company, Jersey City, N. J., is issuing a booklet entitled, "Lubricating the Motor," and the brochure teems with interesting hints upon the function performed by several lubricants. The advantages derived from utilizing graphite are clearly outlined as well as its employment in the transmission and other working parts of the car.

MOTORING NEWS OF NATIONAL IMPORT.

South Much Interested in Racing as Result of Montgomery Meet---Many So-Called Minor Shows Occupy Attention of Dealers in Various Sections---Want National Display in Detroit This Summer.

The first sanctioned track races of the year were held at Montgomery, Ala., under the auspices of the Alabama Automobile Association during the early part of the month. Representatives of eight manufacturers took part, and in the nine events, cars made by the Studebaker Corporation were victors eight times. Three drivers, Lundgren, Cohen and Odom, all of Atlanta, with two 30 horsepower E-M-F machines and one 20 horsepower Flanders, thus secured all but one race.

Henry Cohen, with the E-M-F which won the Tiedeman trophy over the Savannah course last fall, was the largest winner, taking four events, including free-for-alls in which he defeated the Stutz, Oldsmobile, Buick and Overland entrants. Lundgren, driving a Flanders, won three races, a free-for-all handicap, and two class events. Odom's E-M-F won the big 50-mile event in 52:37.

The success of the Montgomery meeting has caused a revival of interest in automobile racing in the South, and already applications for sanctions have been received from Birmingham, Memphis, Nashville, Macon and other cities. It also is understood that Atlanta is anxious to see the speedway reopened and that a new management is expected to hold a number of meets thereon during the coming summer.

LARGE TENT HOUSES SPLENDID DISPLAY AT INDIANAPOLIS.

The Indianapolis Automobile Trade Association, Indianapolis, Ind., tried the plan of holding a special "opening" week at the various agencies last year, and thought they liked it much better than an organized show. This year the same scheme was adopted, and business was stimulated early in the season, but for some reason it was decided to resume the old order of things. Accordingly, the annual exhibition of the association was opened in a tent, bordering University Park, March 23, and will continue until the night of March 30.

As is well known, the manufacturers in Indiana have been active in exploiting the machines produced in that state, and they assisted the local association materially in planning the display which will hold the attention of the people in Indianapolis and vicinity during these seven days and nights. Ample space has been provided in a tent covering three city blocks from curb to curb. The canvas used measures 38,000 yards. Seventy-nine poles from 20 to 22 feet in height support the centre column, and 400 side poles, 10 feet high, are required for the guide ropes. The services of 18 expert canvas men were required for two days in making the tent ready for erection.

Those who are making display of cars are: American Sales Company, American; Archey-Atkins Company, Pierce-Arrow, Hudson, Detroit electric; Conduitt Auto Company, Peerless; Capital Garage Company, Lion; Buick Motor Company, Buick; J. I. Case Threshing Machine Company, Case; Cadillac Auto Company of Indiana, Cadillac; Carr's Auto Palace, Little Giant truck; Fisher-Gibson Company, Stearns-Knight, Stoddard-Dayton-Knight, Flanders electric, Everitt, Brush, Overland, Fiat, Empire; Finch-Freeman, Marathon, De Tamble, Service truck; Ford Moter Company, Ford; Avery Company, Avery truck; Waverley Company, Waverley electric; Walker Electric Company, Walker electric truck; Frank P. Fox, Pope-Hartford; Hearsey-Willis Company, Mitchell, Hupmobile; Henderson Motor Sales Company, Cole; Haynes Automobile Company, Haynes; Indiana Auto Company, Reo, Penn, Chalmers; Ideal Motor Car Company, Stutz; International Harvester Company, International wagon; Auburn Auto Company, Auburn; Empire Auto Company, Empire; Baker Electric Sales Company, Baker electric; Morton Place Auto Company, Moline; Motor Car Manufacturing Company, Pathfinder; Merchants' Electric Auto Company, Woods electric, Westcott, Kelly truck; McFarlan Six Sales Company, McFarlan, Whitesides truck; Mais Motor Truck Company, Mais truck; Nordyke & Marmon Company, Marmon; National Motor Sales Company, National; O. B. Jameson, Staver; Premier Motor Sales Company, Premier; Rinne & Pfaff, Lambert; Frank Staley Company, R-C-H; Studebaker Bros. Company, E-M-F, Flanders; Sterling Motor Car Company, Paige-Detroit, Firestone-Columbus; State Auto-Company, Marion, K-R-I-T; United Motors Indianapolis Company, Columbia-Knight, Maxwell.

Motorcycle exhibitors are: Merkel Motorcycle Company, Merkel; H. L. Dipple, Harley-Davidson; George C. Detch Wheel Company, R-S, Pierce, Pope; G. H. Westing Company, Indian; Gus Habich, Excelsior, Thor; Flanders Motorcycle Company, Flanders.

Other displays include the following: R. J. Irvin Company, bodies and tops; Hide, Leather & Belting Company, accessories; National Refining Company, lubricants; Auto Lighting & Electric Company, lighting systems; Acme Foundry Company, castings; Frank S. Feeser Company, lighting systems; Fisher-Gibbons Company, sundries; B. E. Griffy Company, advertising novelties; Guarantee Tire & Rubber Company,

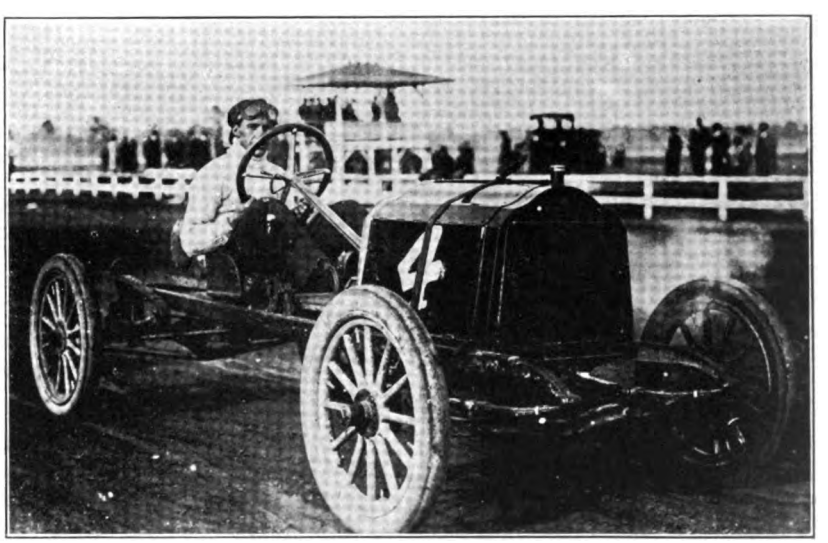
tires; Haywood Tire & Equipment Company, vulcanizing outfits; Hearsey-Willis Company, accessories; Henry Manufacturing & Grease Cup Company, grease cups; International Metal Polish Company, metal polishes; Indianapolis Top & Rubber Tire Company, tops; General Oil Works Company, lubricants; Electric Light & Starter Company, self-starters; Indianapolis Brass Company, brass goods; Motor Starter Company, self-starters; Motor Accessories Company, accessories; Charles H. Moore Company, lubricants; Irwin Robbins Company, bodies; Pumpelly Battery Company, batteries; Wyoming Lubricating Spring Company, springs; Sanborn Electric Company, electrical supplies.



CROWDS FILL STATE ARMORY AT LOUISVILLE'S EXHIBITION.

Twelve sales were reported by one dealer the first night of the fifth annual show of the Louisville Automobile Dealers' Association, in the state armory at Louisville, Ky., March 7-10. There were scores of others. In fact, this proved to be a fair indication of what was to be expected as a result of the exhibition and the business transacted was far in excess of any previous year.

The decorative scheme was that of a garden enclosed by stone walls, and lower walls of the same nature were utilized to mark off the various exhibits. Potted plants and flowers were placed along these at intervals, and vines were disposed to still further accentuate the garden effect. Hanging brackets were suspended from the ceiling.

Despite the poor weather, large crowds attended the event daily, and in every respect it was the most successful display the Louisville dealers have experienced. The show committee was composed of the following: President Prince Wells, Vice President Edward G. Reimers, Secretary-Treasurer Philip S. Longest, Ira S. Barnett, Lee Miles and Frank Glenn.

Cars were displayed as follows: J. I. Case Threshing Machine Company, Case; Radcliff Motor Car Company, Cole, Stevens-Duryea; Thomas Garage, Winton; Inter-State Motor Car Company, Inter-State; Longest Bros., Longest trucks; Urwick Motor Car Company, Marmon, Hudson, Baker electric; Ruby Carriage Company, Mitchell; Kentucky Wagon Manufacturing Company, Urban electric; Layman Motor Car Company, R-C-H, Buick; Prince Wells Company, Rambler; Glenn-Bauer Motor Car Company, Pierce-Arrow, E-M-F, Flanders, Broc electric; Waverley Electric Company, Waverley electric; Reimers Motor Car Company, Locomobile, Ohio electric; Oldsmobile Company, Oldsmobile; Hite D. Bowman, Stearns-Knight, Rauch & Lang electric, Chalmers; Kentucky Electric Company, Kentucky electric trucks; Wieland Motor Car Company, Elmore; Yager Motor Car Company, Peerless, Hupmobile, Columbus electric; Rommel Bros, White, Brush, Marathon; Ford Motor Car Company, Ford; Wilder Motor Car Company, Everitt; Miles Auto Company, Packard, Detroit electric; Kentucky Auto Company, Cadillac, Standard electric; Transit Motor Car Company, Stanley steamer, Alco truck; Glossbrenner Commercial Car Company, Overland.

Twenty Horsepower Flanders Car, Driven by Lundgren with Splendid Success at Montgomery, Ala.

Accessories were shown by: Kentucky Electric Company. electric fittings; Louisville Automobile Supply Company, general line; Levy Bros., clothing; Andrew Cowan & Co., Polarine oils; James Clark & Co., Remy magnetos; Wayne Oil Tank & Pump Company, Wayne storage systems; Racine Auto Tire Company, tires; Moran Flexible Steam Joint Company, brass goods; Aull Sides Klean Company, sundries.

FIRST VIRGINIA SHOW MEETS WITH SUCCESS IN NORFOLK.

The recently organized Norfolk Automobile Trade Association held its first show, which also was the initial exhibition of motor cars in Virginia, in the Fergus Reid building, Norfolk, Va., March 11-16. Fred H. Reh of the Washington Decorating Company was in charge of the work of transforming the interior of the structure for the occasion, and this was accomplished by a liberal use of bunting, flowers and electrical effects. The display was well attended and the result was one which gives abundant reason for expecting a splendid year's business throughout the entire commonwealth.

Those who displayed cars were: Ball & Co., Pierce-Arrow, Stoddard-Dayton-Knight, Kline-Kar, Franklin, Buick; A. Wrenn & Son, Cadillac, Wrenn, Modern truck; Coburn Company, E-M-F, Flanders, Thomas, Brush; Tidewater Auto & Garage Company, Locomobile; C. E. Wright & Co., Overland, Marmon; Chalmers Agency of Virginia, Chalmers; Bell Motor Company, Ford, Spoerer; Reliance Electric Company, Waverley electric; Southern Electric Light & Supply Company, Detroit electric; New York Auto Exchange, R-C-H; Mitchell Agency of Norfolk and Plymouth, Mitchell; International Harvester Company, International truck; C. M. Bayne, Case; E. L. Myers, Maxwell; W. O. Daughtridge, Oakland; Reo Truck Agency, Reo truck; Virginia Auto & Garage Company, Paige-Detroit, Oldsmobile.

Accessories were shown by: Bell Motor Company, Reliance Electric Company, Southern Electric Light & Supply Company, New York Auto Exchange, E. E. Guy's Sons, Standard Oil Company.

ROCKY MOUNTAIN DISTRICT EXPOSITION IN DENVER.

The 11th annual Denver automobile show, termed the Rocky Mountain district exposition this year, was held in the Auditorium, Denver, Col., March 12-16, under the management of G. A. Wahlgreen. Special rates were granted on all railroads coming into the city, these tickets being good until March 20, and as a result the attendance was drawn from a large section of the state, and parts of Kansas, Wyoming, New Mexico and Utah, as well.

A particular feature of the exhibition was the attention paid to commercial vehicles, this being the first show in the Rocky Mountain district in which an effort was made to segregate this type. Several demonstrators were on the ground and every effort was made to convince the visitors of the practicability of the motor truck for industrial purposes. As a result much business was transacted in this field.

Among those who made display of pleasure cars were: Tom Botterill, Pierce-Arrow, Hudson, Columbus electric; Havens Bros., Dorris; Elmore Automobile Company, Elmore; McDuffee Motor Company, Chalmers, Stearns-Knight; W. W. Burnett, Stoddard-Dayton-Knight, Alco; Metzger Motor Car Company, Everitt; Mead Company, White; Voss Rubber Company, Mercer; J. I. Case Threshing Machine Company, Case; Colburn Auto Company, National, Colburn, Glide, Rauch & Lang electric; Charles Blitz, Franklin; Matthewson Automobile Company, Locomobile, Oakland, Reo, Premier, Ohio electric; A. T. Wilson, Mitchell; Western Motor Company, Abbott-Detroit, Marion; Inter-State Automobile Company, Inter-State; Fernald Automobile Company, Maxwell, Columbia-Knight; Felker Automobile Company, Bergdoll, Stevens-Duryea, Waverley electric; Studebaker Auto Company, E-M-F, Flanders; Alkire Motor Company, Thomas, Midland; John Deere Plow Company, Velie; Stanley Motor Car Company, Stanley steamer; Cole Motor Company, Cole; E. R. Cumbie, Rambler; Fritchle Automobile Company, Fritchle electric; W. E. Dineen, American; E. W. Swanborough, R-C-H, Hupp-Yeats electric; Maxwell-Chamberlain Motor Company, Haynes, Peerless; Overland Automobile Company, KisselKar, Overland, Baker electric, Apperson, Winton, Brush.

Commercial types were shown by: Havens Bros., Kelly; W. W. Barnett, Alco, Federal; Mead Company, White; Charles Blitz, Chase; Tom Botterill, Pierce-Arrow; Fernald Automobile Company, Sampson; John Deere Plow Company, Velie; Maxwell-Chamberlain Motor Company, Peerless; Overland Automobile Company, KisselKar, Seitz.

Motorcycles were represented by: Hendee Manufacturing Company, Indian; W. W. Whiting, Harley-Davidson; Mead Autocycling Company, Excelsior.

The following exhibited accessories: Auto Equipment Company, Denver Auto Goods Company, Fry & McGill, Boss Rubber Company, Colorado Tire & Leather Company, Regent Tire Company, Continental Oil Company, Gould Storage Battery Company, Jackson & Wood, Denver Rock Drill, Mann-Aldrich, Denver Auto School, Byron Motor Truck Company, Better-Than-Air Tire Filler Company, Brackett Welding Company.

TWO BUILDINGS NECESSARY TO HOUSE SYRACUSE DISPLAY.

Fifty-five different makes of machines were displayed by 35 dealers at the fourth annual show of the Syracuse Automobile Dealers' Association, Syracuse, N. Y., March 12-16. Two buildings, the State Armory and the Alhambra Auditorium, were necessary to house the exhibition, and the attendance was particularly pleasing.

The interior of the armory was transformed by the use of a blue canopy ceiling and lattice work entwined with smilax. Festoons of electric lights helped to make the scene brilliant and attractive. The auditorium was treated similarly, but more in the nature of a woodland setting, in which numerous canaries were disposed to add to the realistic impression.

Pleasure cars were to be seen at the following booths: H. A. Moyer, Moyer; Kerr-Doane Motor Company, Amplex, Everitt, Velie; C. Arthur Benjamin, Packard, E-M-F, Flanders; F. P. Anderson, Alco, Hupmobile; Overland Syracuse Company, Overland, Garford; T. A. Young, Peerless, R-C-H; A. M. Zimbrich, Stoddard-Dayton-Knight; United Motor Syracuse Company, Columbia-Knight, Maxwell; J. H. Valentine Company, Paige-Detroit, Chalmers, Brush; W. R. Shaw, Rambler, Reo; W. King Smith Company, Stearns-Knight, Moon; Willis Motor Car Company, Oldsmobile, Oakland; Syracuse Motor Car Company, Ford; Genesee Motor Car Company, Cadillac; H. H. Franklin Manufacturing Company, Franklin; Buick-Keating Garage, Buick; J. L. Youman, Mitchell; James Auto Company, Stevens-Duryea; A. A. Lederman Company, Pierce-Arrow; National Motor Sales Company, National; Hazard & Ryan, Michigan; L. H.

Leonard, K-R-I-T; J. I. Case Threshing Machine Company, Case; American-Cole Sales Company, American, Cole; Abbott-Detroit Sales Company, Abbott-Detroit; Souter & Tuttle, Jackson; H. B. Conkling, Elmore; W. F. Horton, Marathon, Bergdoll; Wightman & Rich Company, Winton; Acme Garage, Pullman; Brighton Garage, Detroiter; Sabine Auto Company, Cutting; Syracuse Regal Company, Regal.

Commercial cars were shown by: Sanford-Herbert Company, Sanford; C. Arthur Benjamin, Packard; Buick-Keating Company, Buick; Syracuse Motor Car Company, Ford; Genesee Motor Car Company, Mack; F. P. Anderson, Alco; Chase Motor Truck Company, Chase; W. E. Hookway Motor Truck Company, G. M. C.; Overland Syracuse Company, Overland.

Motorcycles were displayed as follows: Olmstead & Co., Indian; Potter Company, Harley-Davidson; A. H. McGraw, Thor, Excelsior.

Accessory exhibitors were: Syracuse Rubber Company, sundries; Loggie Bros., Miller tires; Standard Oil Company, Polarine oils; F. H. Aubeuf, headlight brackets; Wayne Oil Tank & Pump Company, Wayne storage systems; Hoyt & White, tops and seat covers; J. H. Valentine Company, Hanna self-starters; E. Q. Williams, ignition apparatus; Syracuse Auto Supply Company, sundries; Ignition Starter Company, Disco starters; Jones & Pimm, tops.

CEDAR RAPIDS DEALERS HOLD THIRD ANNUAL EXHIBITION.

Every inch of available space provided by the Cedar Rapids Automobile Dealers' Association in the Auditorium at Cedar Rapids, Ia., for its third annual show, March 12-16, was filled with representatives of the 1912 models and accessories. Ferns, palms and artificial flowers were combined with American flags and bunting, in transforming the interior of the building for the occasion. The attendance was much larger than in former years and the business transacted was quite satisfactory in every respect. As usual many visitors were present from other sections of the state.

Cars were shown by the following: Moline Auto Company, Moline; Courtney Motor Car Company, Ford, Abbott-Detroit; Miller Auto Company, Buick, Marquette; Cedar Rapids Auto & Supply Company, Hudson, Reo, Chalmers, Maxwell, White, Michigan, Stoddard-Dayton-Knight, Waverley electric; Schreiber Auto Company, Staver; Iowa Auto & Tire Company, Cadillac; Foy Automobile Company, Overland, Regal; Fawcett-Russell Company, Everitt, E-M-F, Flanders, Garford; Barton-Ford Motor Car Company, Velie, Detroit electric; Bunting Auto Company, Oakland; Windsor Hotel Garage, Thomas; Mitchell Auto Company, Mitchell; M. V. Bolton, Hupmobile.

DISCUSSING POSSIBLE NATIONAL SHOW IN DETROIT.

Automobile manufacturers and others in Detroit are actively engaged in the promotion of a national show for that city to be held next fall, and while plans already have been made for two exhibitions of this character in New York and Chicago next January and February, following along lines which have been in vogue for a number of years, there is disposition on the part of some makers to advocate that the Detroit display take the place of the other two. In discussing this phase of the situation recently, R. C. Hupp, president of the R-C-H Corporation expressed himself as follows:

"The 1912 show season which has just been closed with the Boston show has brought home more forcibly than ever the necessity of a readjustment of the whole proposition, insofar as the manufacturers are concerned. There are but few makers who have not announced their models for the following season by July 1. The new models usually are in the hands of the dealers within 60 or 90 days thereafter, at the outside. They are discussed in the motor car publications and in the newspapers, and by late summer or early fall the public is thoroughly familiar with them when the show season opens in January.

"From the viewpoint of the manufacturer, it would be infinitely better to have a central show some time during July. I believe in Detroit, because of the fact that it is the centre of the motor car industry, and on account of its excellent geographical location it is the logical place. It would, of course, be necessary to erect a large building, designed especially for the purpose. This could be arranged so that all of the cars could be displayed on one floor and nothing but cars should be shown.

"Coming in July, when the best of the selling season is over, such a show doubtless would attract more dealers than all the other large exhibitions combined. I believe it would be a good idea to have the management in the hands of the manufacturers, each factory to be represented equally on the board of control.

"As it stands now, motor car manufacturers practically are compelled to exhibit in the larger shows, when, as a matter of fact, they are retail propositions. The expense, insofar as the manufacturer is concerned, is so greatly in excess of the benefit obtained therefrom as to constitute a serious problem. By making the big central show strictly a dealers' proposition, the expense to the factories would be reduced to a minimum, or perhaps, if properly managed, it could be made to return a good profit.

"This is not intended as a criticism of the large shows that are held each year. They have their value, and while I believe it would be a better proposition from a retail point of view to have them just before the spring opens instead of in the winter, this is a matter that is governed largely by local conditions. I earnestly hope that the present movement to build a large exposition hall in Detroit will be successful.

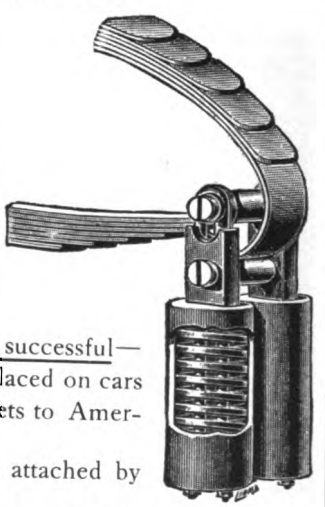
ALMOST UNIVERSALLY USED IN FRANCE

SHOCK ABSORBER

THE RAGE IN ENGLAND

LEARN AT OUR EXPENSE

how to get the maximum of comfort and wear out of your car



"J. M." Shock Absorbers

patented in all civilized countries

give you greatest comfort, because they prevent jolting and jarring from stones, ruts, car-tracks; swaying and rocking from uneven roads, when traveling at good speed;

save expense, because your tires are kept on the ground, do not whirl at high speed in the air to be suddenly slowed upon return to the road and consequently the "J. M." increases largely your engine efficiency as well as tire service.

Note that the "J. M." is not a "rotary friction" shock absorber—and is not to be confused with the devices embraced in the recent decision of the Court of Appeals.

Experience in Europe has proven that the "J. M." is the most successful—and most efficient—shock absorber. Tens of thousands have been placed on cars abroad—and the highly satisfactory results led to the sale of many sets to Americans before we had any branches in this country.

Made in three models—applied to any car whose springs are attached by means of shackles. **Prices $35 to $50.**

Try it on your car—don't pay us a cent till it proves our claims. Send coupon below pinned to your business letterhead for booklet D and full information on this offer. Mention the name, model, weight and width of rear springs of the car you run.

THE SOURCE OF EMERY.

There is a romance attached to the production of emery of which very few people are aware. It was for a long time brought from the Island of Naxos in the Grecian archipelago, the Greek government having granted a monopoly of its trade to an English merchant. In 1847, Dr. J. Lawrence Smith, an explorer in the employ of the Turkish government, discovered large deposits of the mineral at various points in Asia Minor, and the English monopoly was broken and prices greatly reduced. Since that time, deposits of emery have been found in the Carolinas, Georgia and Montana. The supply in these places, however, is too small to compete with the older fields.

Emery is ore of iron, found in opaque grayish black or blue lumps, and is prepared for use by crushing in a stamp mill, and then passing the powder through different degrees of fineness. Fifteen to 20 large wheels for external grinding are used by the Remy Electric Company, Anderson, Ind., in the manufacture of magnetos and electrical supplies each year. A small wheel for internal grinding revolves 50,000 times a minute, and a new one is required each day.

CITY MAY REGULATE SPEED.

The legal department of the city of Minneapolis, Minn., has decided that the law of Minnesota does not impair the right of the municipality to enact ordinances regulating the speed of automobiles and forbidding them the use of certain streets. The opinion states: "The city has the right to regulate traffic and the use of its streets. This is necessary for public safety and the last Legislature never intended to take the power away. The provision forbidding general regulation was made to prohibit unreasonable ordinances in small cities where prejudice might exist against automobiles. Of course, this opinion is subject to possible revision by the courts, but it would appear that the Legislature failed to made its intention fully clear in this instance.

MASSACHUSETTS' LEGISLATIVE RESULTS.

By a vote of five to 14, the Massachusetts Senate has refused to substitute the bill prepared by Mayor Fitzgerald of Boston, allowing that city 25 per cent. of all the fines collected from automobilists in that city. The lower house, by a vote of 12 to 46, also refused to substitute for an adverse committee report the bill requiring owners of automobiles to make a deposit of $5000 as a guarantee for damages when making application for registration. The committee on roads and bridges has instructed a sub-committee to draft a bill embodying the views of Governor Foss in a special message recommending an increase in automobile fees from 38 cents a horsepower to at least 80 cents. This is expected to increase the revenue for highway improvement by about $1,000,000.

COMING EVENTS.

March.

March 25-29—Show, Manchester, N. H.
March 25-30—Show, Indianapolis, Ind.
March 27-31—Show, Waterbury, Conn.
March 27-April 2—Show, New Bedford, Mass.

April.

April 8-13—Show, Oswego, N. Y.
April 8-13—Show, Birmingham, Ala.
April 27—Speedway meet, Los Angeles, Cal.
April 27—Roadability run, Philadelphia, Penn.
April 29-May 4—Show, Burlington, Vt.

May.

May 4—Road race, Santa Monica, Cal.
May 14-17—Commercial car trials, Chicago, Ill.
May 17-18—Track races, Denver, Col.
May 30—Track events, Salem, N. H.
May 30—500-mile race, Indianapolis, Ind.

June.

June 6—Reliability run, Washington, D. C.
June 20—Algonquin hill climb, Chicago, Ill.

July.

July 4—Track events, Petersburg, Ind.
July 4-5—Track events, Taylor, Tex.
July 4-6—Beach meet, Old Orchard, Me.
July 15—Reliability run, Wisconsin.

August.

Aug. 8-10—Beach races, Galveston, Tex
Aug. 23-24—Road races, Elgin, Ill.

September.

Sept. 2—Speedway meet, Indianapolis, Ind.

October.

Oct. 5—Fairmount Park race, Philadelphia, Penn.
Oct. 7-11—Reliability run, Chicago, Ill.

NOVICE'S SUCCESS WITH FLANDERS.

G. A. Gilman of Phoenix, Ariz., had never driven a car previous to the afternoon on which he appeared at the headquarters of the Arizona Motor Car Company in that city and purchased a 20 horsepower Flanders, made by the Studebaker Corporation, Detroit. This did not deter him from driving the machine home, after which he packed his suit case and set out across the desert for San Diego, Cal. He arrived at his destination in less than four days, which is considered excellent time over a section of the country which is shunned usually by experienced drivers. Not even a tire puncture marred his first long distance ride.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

TAXING THE AUTOMOBILE.

Judging from the position outlined in the special message of Gov. Foss of Massachusetts, asking that the Legislature at least double the registration fee in that state, the motorists who have been clamoring for good roads are to be compelled to bear the entire expense of such improvement. Gov. Foss is not alone in his opinion, since throughout the length and breadth of the land there appears to be a general impression that the wisest course to pursue is that of raising the necessary funds by automobile taxation. Moreover, the Governor seems to have struck a responsive chord among the legislators, as was perhaps to be expected, and the committee on roads and bridges has prepared a bill meeting with his recommendations.

Inasmuch as increased registration fees do not lessen in any degree the amount of property tax imposed upon the owner of an automobile, whether it be of the pleasure or commercial type, it readily is seen that the motorist is obliged to submit to a double taxation. He shares with all others in the expense of maintaining state departments, excepting that of highways, and this leads to the suggestion that he alone is to be held responsible for construction and maintenance in this particular field. Massachusetts expects that the increased registration fees will place nearly $1,000,000 extra at its disposal for this purpose.

Charles Thaddeus Terry, counsel for the American Automobile Association, at a hearing before the New York State Legislature, recently declared that the whole system of collecting money from automobile owners for highway improvement was unconstitutional, and that motorists were inclined to submit to it only because of their interest in good roads. He hinted in no uncertain terms that there was a limit to this good nature, however.

It would appear that his remarks were decidedly timely, and that they might apply with equal force in Massachusetts and elsewhere. The public is beginning to realize in a measure that the motor vehicle has an economic value, and as such its development is of direct personal interest to all. This view undoubtedly applies more particularly to the commercial type, but there is no disposition to differentiate between types in applying the tax. In fact, it may even be regarded that horse drawn vehicles reap a decided benefit from good roads. No matter what the viewpoint, the policy of making the motorist bear the sole expense is wrong, and sooner or later he will be compelled to make known his determination that he intends to submit no longer.

Massachusetts demands that every vehicle using the public highways during the hours of darkness shall be equipped with suitable lights. Why don't you advocate a similar measure for your state? Now is the time to act.

MORE CAREFUL DRIVING.

The growing tendency of owners and drivers of motor vehicles to give considerable time to the careful study of the mechanical construction of their cars has been the subject of much comment of late. This is a result for which manufacturers and motoring magazines have been working for some time. In its last analysis, it will mean more careful driving and a decidedly lessened number of accidents.

A large proportion of the pleasure of motoring lies in the feeling that one is complete master of the machine; that all its parts are known, and that they respond to the touch as readily as if they realized who was at the wheel. It is not surprising, therefore, that owners and drivers are beginning to realize how valuable this knowledge is to them.

There is little question that careful attention to

Digitized by Google

the details will mean a large saving in repair bills. The same thing applies to the care of tires and other equipment. The day is past when it was considered necessary to dispose of the old model at the end of the season in order to secure another of later design. Proper care not only results in reduced maintenance expense but in minimized deterioration, thus prolonging the life of the car.

In the matter of careless driving, there has been too much risk in the past. A more thorough knowledge of the machine means a better understanding of what it is called upon to accomplish. With this knowledge comes the desire to avoid mishaps, and the needless expense which they occasion.

Uniform motoring laws would end the needless confusion attendant upon interstate touring. Now is the time to advocate their passage.

BOSTON'S FIRST TRUCK SHOW.

As was to be expected, the attendance at the first commercial vehicle show in Boston was by no means as large as that which passed through the doors of Mechanics' Building during the 10th annual display of pleasure cars. But in this respect, it far exceeded that of so-called national exhibitions in New York and Chicago. The business transacted is sufficient indication that the people who viewed the initial assembly of industrial transports in New England were prepared to purchase.

Doubtless, few persons who attended the display had any idea of the large number of makers engaged in this field. In fact, it was freely commented upon during the show, even by those who considered themselves more or less well informed, that the matter of making selection was by no means as easy as they had been led to suppose.

Particular attention was paid to the matter of body design, a feature which might be expected to make a decided appeal in this territory. New England, from which the attendance was drawn, is essentially a manufacturing community, and the varying requirements of its industries call for specialized efforts on the part of the body designer. In this respect, at least, the Boston show was in a separate class.

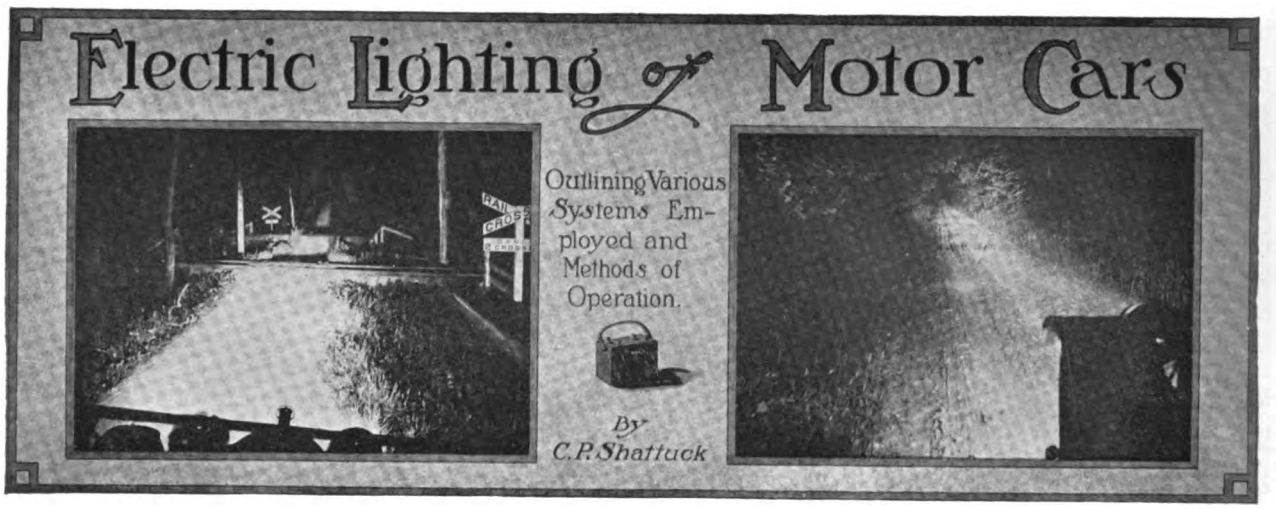
Those makers, who, at New York and Chicago, contented themselves with presenting a chassis simply, felt compelled to utilize their space by adding several body types, and the result was a much better representation of the industry as a whole. It is interesting to note, however, that many of these bodies were the product of makers who specialize in this particular field.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

THE BUSINESS SITUATION.

The entire estimate of the business to be transacted by the automobile industry throughout the coming season must be revised as a result of the recent Boston show. No one occurrence in the history of motor car manufacturing has caused more surprise than the fact that over $2,000,000 worth of cars were sold in that city during one week. And this is expected to have a decided bearing upon the situation throughout the entire country.

The splendid success of the Boston display has overshadowed for the moment the long list of so-called minor shows which have been staged this year, but it should not be forgotten that in practically every instance these have served to stimulate business in a remarkable degree. There appears to be reason for suggesting that the demand for cars is to be much more pronounced than ever before.



There is no danger of over production. Conditions have changed materially during the past few years, and the reports of the Department of Commerce and Labor are sufficient indication that a decided foreign market has been built up. Moreover, the business of the industry has been placed upon a more conservative basis. It follows that those who are contemplating the purchase of cars must make their decision early, if they are to secure their machines in time to be of service to them during the touring season.

Universal lighting and uniform laws are the prime necessities for safe and sane motoring.

LEGISLATION ON RACING.

Few will be disposed to argue that the proposed legislation prohibiting automobile racing in New York State is carrying the matter much further than necessary. The bill is based upon the assumption that such contests endanger the spectators, but it may be pointed out that both track and road events have been held for many years over certain courses without accident of any nature. The secret seems to be in the proper policing of the course.

Part IV—The Berdon Matchless System.

IN THE production of a practical electrical lighting system for the motor car, engineers have been forced to overcome many difficulties which do not exist in the installation of the ordinary equipment, such as required for factory, street or residential lighting. With these the engineer can estimate readily the necessary apparatus, number of lamps, resistance of wires, drop in voltage, loads, etc., but the automobile presents very different problems with its variable speed, method of operation and service.

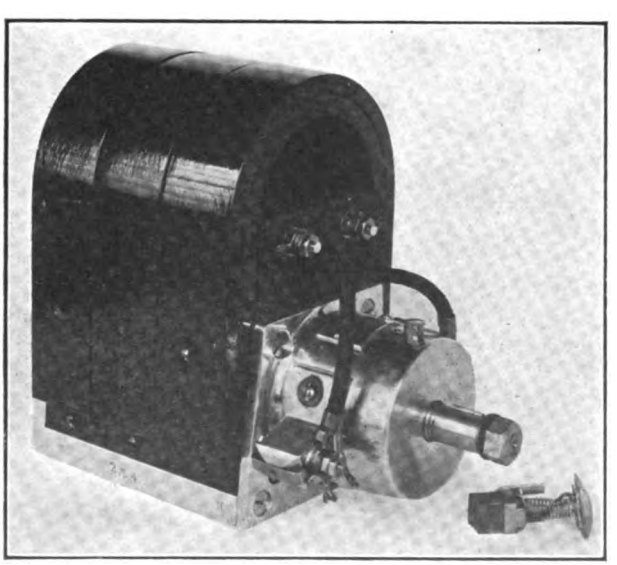

Fig. 23—The Berdon Matchless Generator, Having but One Moving Part and Operates at Slow Speed.

It is absolutely essential with any automobile lighting equipment that the current be steady and the source constant as long as the use of the lamps is required. Any fluctuation will be noted instantly as the lamps will lose their brightness. This variation is best explained by the house equipment. When the lamps are burning brightly the generators supplying current are working at a stated capacity or load. If more lamps are taken care of or the speed of the generator falls, the lights become dim, but when this overload is removed they recover their customary brilliancy.

Speeds Affects Operation.

Unlike the generator of the lighting station, that fitted to the automobile is in constant operation, day or night; that is, its armature is revolving when the motor is running. The number of rotations varies considerably as one owner may drive at a conservative speed while another operates from 10 miles an hour to 60. Then again, one motorist may not use his electric lights but a few hours weekly while another burns them night after night for long periods.

It has been explained that with all lighting systems a storage battery is a part of the equipment, it being utilized when the motor of the car is idle to furnish current to the lamps. These batteries may be employed as an auxiliary or as standard, but in either case when charged by mechanical means on the motor car, the flow of electricity to the battery must be regulated, else the member will be injured.

These requirements are met with the Berdon Matchless system, manufactured by the Esterline Company, Lafayette, Ind. The design of the equipment is based on the fact that the lighting requirements of no two cars are the same, and that the amount of light utilized varies at different times of the year. The features of the system emphasized are: The generator output is proportional to the light used; the generator cannot be reversed in polarity and can be taken apart and put together without affecting its operation; it operates at slow speed and is free from governors or mechanical devices; it delivers sufficient current to the lamps at a car speed of five miles an hour, and the battery is safely and properly charged.

Automatic Control of Current.

The striking feature of the system is that the output of the generator automatically increases when the lamps are lighted and decreases when they are

Digitized by Google

extinguished. This automatic regulation of the current is obtained by using a permanent magnetic field, superimposed upon an electro-magnetic field. At slow

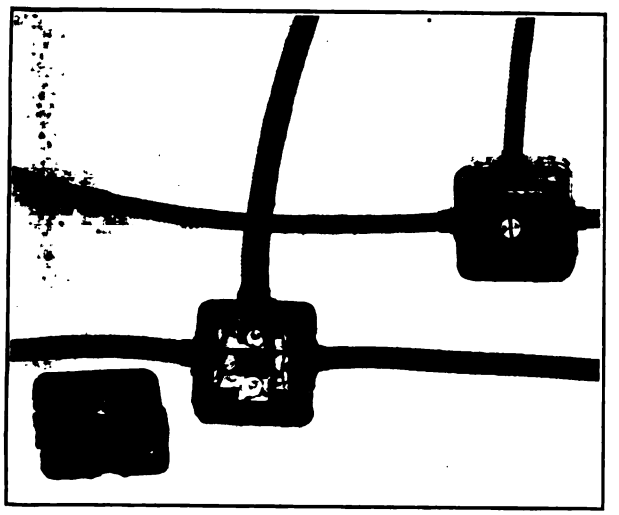

Fig. 24—Neatly Molded Junction Boxes of the Berdon System Eliminate Splicing and Make for Durability.

speeds the permanent magnetic field and the electro-magnetic field operate together in developing a charging voltage. If the current is being delivered to the battery only, the electro-magnetic field is inoperative, but as soon as the lights are turned on, the field of the permanent magnets is aided by the electro-magnetic field.

The Esterline Company maintains that the use of a permanent magnetic field is desirable if not essential, as it insures a low charging speed and makes the generator absolutely irreversible. No governors, clutches or speed controlling devices are fitted to the generator, the latter being driven positively by shaft, gears or silent chain.

The generator is a combined permanent magnet and wire wound type having the stability of the former and the flexibility of the latter. It is carefully designed, the material and workmanship being of the best. The shaft is made of alloy steel, ground accurately to size and runs in an annular type of bearing with large balls. These are enclosed in an oil containing compartment, insuring perfect lubrication and oil is prevented from entering the armature space. The armature windings are impregnated with a water proof, oil resisting compound.

At Fig. 23 is depicted the generator and it will be noted that it is compact and simple, all working parts being fully enclosed and dust and moisture proof. A feature of the device is the removable brush holder which is so constructed that it may be removed and replaced with one hand and it is not necessary to solder flexible connections to insure good contact. The brushes are held at an angle to the commutator surface, not radially, and they do not chatter or spark.

How Switch Operates.

The unique feature of the system is the Berdon automatic switch, depicted at Fig. 27, which makes and opens the connection between the generator and the battery. It is an automatic, self-setting, reverse-current circuit breaker and is built on the same principle as the D'Arsonval electric meter, having a moving coil in a permanent magnetic field, a description of which is presented herewith. The Berdon device is in reality an electrical instrument of very rugged construction, closes the circuit precisely the instant the generator is at the proper voltage to begin charging the battery and disconnects from the generator the instant the charging current ceases. It does not rely upon reverse currents for its operation and as it opens and closes the circuit at the instant the voltages are balanced, there is no exchange of current at the time and therefore no sparking.

The controlling of the voltage by the automatic switch is best illustrated by an analogy between a pump and reservoir of water, and generator and battery. At Fig. 28 are four illustrations, these showing this relation clearly. Here the pump corresponds to the generator, the check valve to the automatic switch, the reservoir to the battery, and the discharge pipe to the lamps. It should be taken into consideration that in the first place the pressure upon the discharge pipe depends altogether upon the level of the water in the reservoir and that the voltage on the lamps is the same as that of the battery.

How Constant Pressure Is Maintained.

At A the pump is illustrated inactive, the check valve closed and the water to the discharge pipe is all supplied from the reservoir. Correspondingly, the generator is at rest, the automatic switch open and

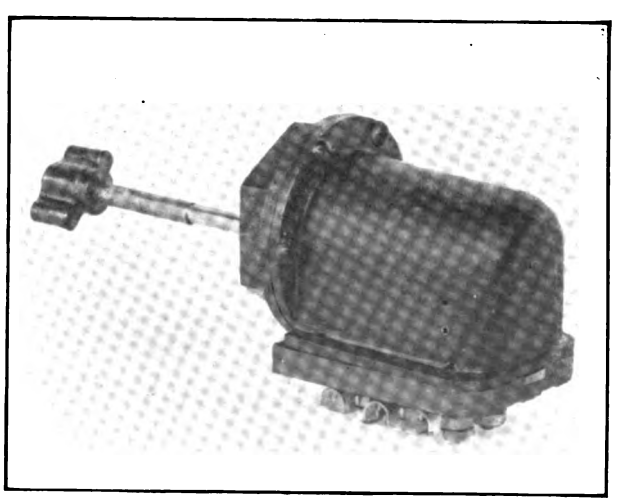

Fig. 25—The Berdon Four-Point Switch Is of Metal and Molded Insulation, Fool Proof, and May Be Locked to Prevent Tampering with the Lights.

all current to the lights supplied by the battery.

At B the pump is running slowly and is delivering a portion of the water to the discharge pipe, the check

Digitized by Google

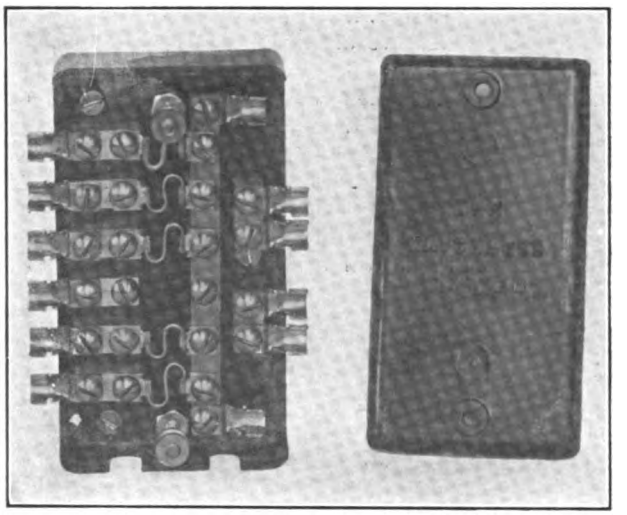

Fig. 26—A Fire Proof Fuse Panel Is a Feature of the Wiring System Which Is Notable for Its Simplicity and Ease of Installation.

valve is open and all of the fluid delivered by the pump is going through the discharge and the excess required is supplied by the reservoir. Correspondingly, the generator is delivering a part of the current to the lights and the balance needed is supplied by the battery.

At C the pump has attained a speed where it is just supplying enough water to furnish the discharge pipe and no fluid is going into or coming from the reservoir. Correspondingly, the generator is operating at a speed where its current is equal to that required by the lamp load. No current is going into the battery and none being utilized.

At D the pump has attained a speed whereby it is supplying more water than is required by the discharge pipe and the excess is going into the reservoir. Correspondingly, the generator has reached a speed where it produces more current than is required by the lamps and the excess is flowing to the battery.

Throughout the different conditions of operation of the pump the pressure on the discharge has remained practically constant, due to the same head of water in the reservoir. In the same sense the pressure on the lights is practically constant and this is due to the fact that the battery is at all times connected to the lamp circuit and it either provides the current required or absorbs the excess electricity generated. This automatic switch is neat and compact, occupying a space upon the dash 2.5 by six inches. The coil, armature, etc., are fully protected by a removable cover and the device does not require any attention whatsoever.

Fuse Panel and Wiring Methods.

Refinement is noticeable throughout in the Berdon system. The lighting switch is composed of metal and molded insulation, and as porcelain or springs are not utilized there is nothing to break or come loose and interfere with proper contacts. All exposed parts project downward and the stem or key is removable at any position so that any group of lights may be left burning and tampering with the system is prevented. The switch provides for four positions. It is located under the hood, with the stem extending through the dash.

The same minute attention has been paid to the wiring attachments. These include a fuse panel molded of fire proof material and each circuit is fused so that should any one of the group become short circuited the fuse will blow. This makes for an easy location of the faulty circuit and does not interfere with the proper operation of other members. Molded junction boxes eliminate the necessity of splicing duplex cable, and make for a neat wiring installation.

The generators are manufactured in three models, each having the same output and differing only in the speed at which they are driven. These machines deliver a maximum current of 15 amperes when the lamps are lighted, a normal current of 12 amperes at a car speed of 15 to 18 miles an hour, and are wound to begin to deliver current at a motor car speed of five to 6.5 miles an hour.

The model E generator runs at crankshaft speed on a four-cylinder automobile and at 1.5 crankshaft speed on a six-cylinder motor. The model H operates

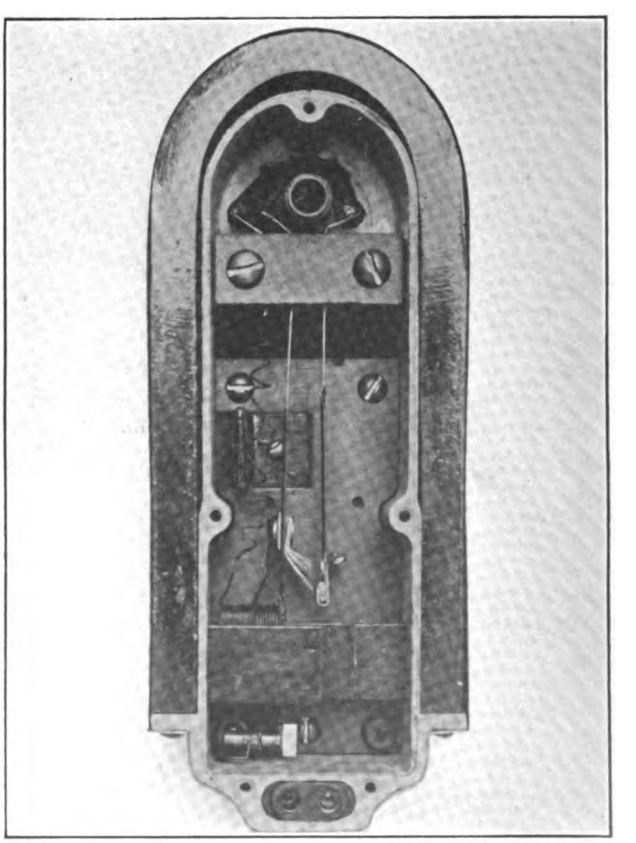

Fig. 27—The Berdon Automatic Controller Which Opens and Closes the Circuit the Instant the Current Is at Zero.

Digitized by Google

at double crankshaft speed. Models E and H generators can be supplied for lighting only, or for ignition and lighting, and are so designed that the ignition equipment may be added easily. Regarding the instrument, some idea of its simplicity may be obtained when it is stated that anyone may take it to pieces and reassemble the parts without affecting its operation.

The D'Arsonval Instrument.

Reference has been made to the ampere meter, also to the D'Arsonval instrument, the latter in the description of the Berdon system. The D'Arsonval, so named after its French inventor, consists of a permanent horseshoe magnet with pole pieces, these being near each other so as to develop a powerful magnetic field between them, as shown at Fig. 29. Attached to a light pivoted coil of insulated wire mounted in this field, is a pointer arm or indicator, the latter projecting out over a graduated scale. This coil causes a wire placed in a magnetic field and carrying a current to tend to move at right angles to the direction of the field.

Function of Springs.

A uniform reading scale is obtained in the D'Arsonval instrument by equalizing the retractive force of the springs, and a uniform field. The former is obtained by winding the springs in opposite directions, or right and left handed, and by placing one above and one below the moving coil. By this arrangement, as the coil deflects it opens out one spring and at the same time contracts or closes the other. Uniformity of field is obtained by proper strength of the permanent magnet, quality and proportioning of the soft iron pole members and the air gap.

Electrical indicating instruments utilized commercially may be divided into two main types, those having a moving coil, such as above described, and those having a moving iron armature. The latter include

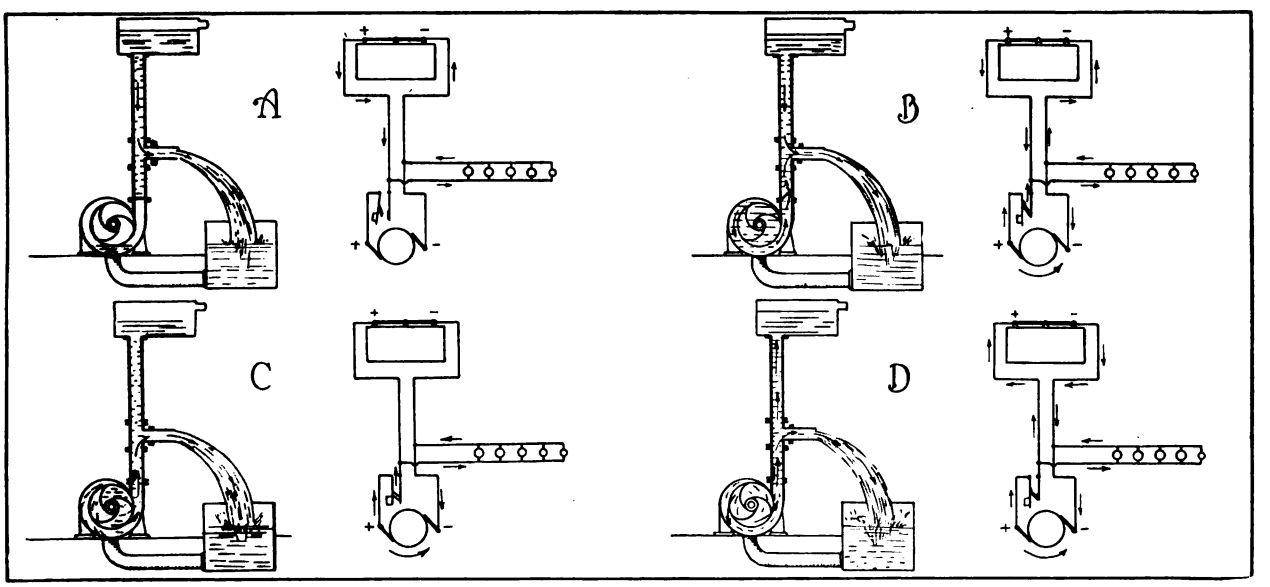

Fig. 28—Illustrating the Action of the Berdon Controller by an Analogy Between a Pump and a Reservoir, and the Generator and Battery.

is composed of very fine wire and the small amount of current that passes through it is proportional to electromotive force passing through the instrument.

Those utilized in connection with the motor car, however, are fitted with a pair of light spiral hair springs of resilient, non-magnetic metal, these serving to oppose the movement of the coil by a force directly proportional to the electricity passing through the coil. When no current is passing through the instrument the pointer stands at zero on the scale, but when a circuit is made, and current passes through the instrument, the pointer moves indicating its strength. The movement of the coil against the springs is caused by the reaction between the strong field of the permanent magnet and that due to a weak current passing through the coil, in accordance with the principle of magneto-electric induction, which the so-called pocket instruments familiar to motorists. In these the moving element to which is attached the pointer consists of a single armature or vane of soft iron. This is mounted on pivot bearings in a magnetic field. In one class of these instruments a coil having a fine and coarse wire winding, respectively, is so mounted as to set up a magnetic field at right angles to the permanent magnet field, and the armature is caused to deflect by the fluctuation in the strength of the coil's field due to the variation of the electromotive force in the circuit to which the device is connected.

In operation the indicator or pointer arm attached to the armature is normally held in the zero position by the field of the magnet. The magnetic flux due to current passing through the coil distorts the main field, causing the armature and its pointer to move

Digitized by Google

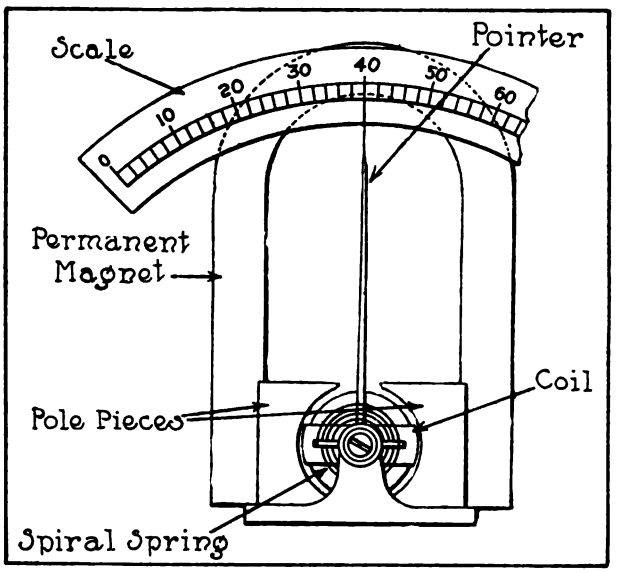

Fig. 29—The D'Arsonval Instrument, the Operation of Which Is Similar to That of the Berdon Automatic Controller.

from the zero position and the extent of the movement is approximately proportional to the strength of the current.

Dead Beat Action.

Reference has been made to a dead beat action. This is brought about by the use of the so-called eddy or Foucault currents. A dead beat pointer in an electric indicating instrument is one that comes to rest promptly at the proper point on the scale, when the circuit is closed, without moving back and forth.

The moving coil is wound upon a light frame of high conductivity metal, usually aluminum, and encloses a soft iron cylinder attached to the base of the instrument co-axially with the coil and permanent magnet pole pieces. This is arranged in such manner that a strong magnetic field is developed with a small air gap, this consisting of the clearance in which the coil frames move freely. Eddy currents are generated in a conductor when it is moved in a magnetic field, and in the generation of these currents, power is absorbed, this tending to check the motion of the conductor. In this way any movement of the aluminum frame in the field is checked quickly. When the instrument is placed in circuit, the pointer comes to rest when it reaches its proper place upon the scale, this making for quick reading and preventing injury to the pointer.

Operation of Meters.

The difference in the operation of a voltmeter and ampere meter may be said to be that with the latter it is connected in the circuit in series and that the entire current of the circuit passes through it. In the instrument itself, nearly all of the electricity goes from one terminal to the other through a bar of resistance metal, in which occurs a small but definite fall of potential equal to the product of the current, and the resistance of the bar. The difference of potential between the ends of the bar is directly proportional to the current passing through it. The moving coil is connected to the ends of the bar, and the difference of potential causes a weak current, proportional to the same, to pass through it. The resistance bar is called the shunt, inasmuch as it diverts from the moving coil most of the current passing through the instrument.

In the voltmeter the circuit goes from one terminal post to the other through the moving coil and a fixed resistance coil in series, the total resistance of the instrument circuit being high. The instrument may be connected directly across the terminals of a battery or generator having an electromotive force within its range without injury, since the current which the full voltage can send through the instrument is very small, and cannot lower the electromotive force of the battery or other source of electricity. It is, however, proportional to the electromotive force and the instrument may be calibrated in volts.

Meters are constructed for measuring both the voltage and amperage in combination; that is, the indication of the amperage is given prominence over that of the voltage in the majority of these devices utilized in electric lighting systems. As has been explained previously, it is highly important that the flow of current from the generator to the battery be at a certain rate. The discharge rate is also considered and provision made for ascertaining the same. In combination instruments the voltage is obtained by pressing a button or similar means. This type is illustrated at Fig. 30. It is mounted on the dash and its dial is illuminated so as to make it possible to note the action of the current.

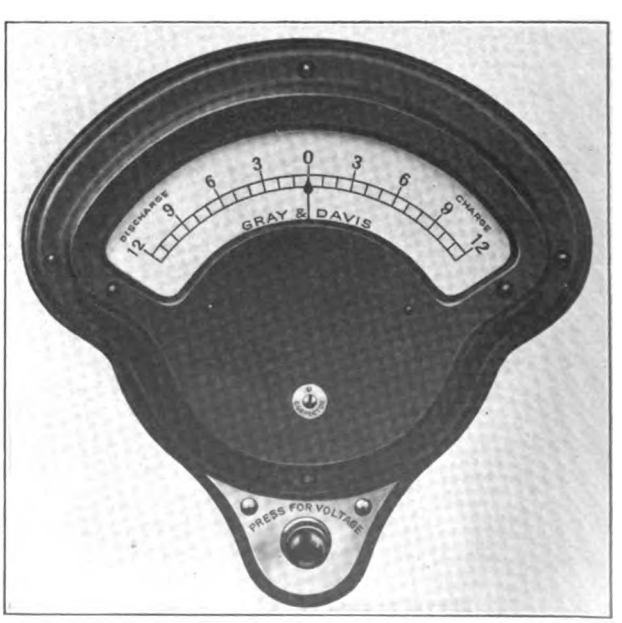

Fig. 30—A Type of Standard Combination Meter for Measuring Voltage and Amperage of Electric Lighting Equipments.

FIGHTING TIRE DATING BILL.

Makers of tires have taken a determined stand against the passage of the proposed bill in New York seeking to compel the dating of automobile tires, and have issued a circular setting forth their reasons, addressed to the dealers in that state, which reads in part as follows:

"This bill will create a situation for the dealers in tires in the State of New York that it will be almost impossible for them to work under. It will place tires in the class of perishable goods. Consumers will decline to accept tires unless dated a few days prior to time of purchase. It is physically impossible for manufacturers to supply the trade of this country under such conditions. Tires cannot be manufactured in sufficient volume to permit dealers to have fresh stock on hand at all times. Dealers could not afford to stock tires in the uncertainty that they would be sold speedily enough to still allow the dates to be sufficiently recent to warrant customer taking the same.

"Manufacturers of cars could not be taken care of so that they could always ship cars to the garages for sale with fresh tires on. It would seriously handicap every dealer handling cars in the sale of cars. The purchaser would insist on old dated tires being taken off and recent dated tires placed thereon. This issue is more vital to the dealers' class of this country than to the manufacturers of tires. You would be left to work off your stock as best you could.

"There is no public injustice righted by this bill, simply a destruction of necessary working conditions under which you must labor. All reputable manufacturers adjust with consumers without reference to the date of production. No public policy is therefore served, but a distinct injury to a large class of dealers engaged in the industry."

Those signing the statement are the following firms: Motz Tire & Rubber Company, Swinehart Tire & Rubber Company, Ajax-Grieb Rubber Company, Diamond Rubber Company, Empire Tire Company, Federal Rubber Manufacturing Company, Firestone Tire & Rubber Company, Fisk Rubber Company, B. F. Goodrich Company, Goodyear Tire & Rubber Company, Kelly-Springfield Tire Company, Lee Tire & Rubber Company, Michelin Tire Company, Pennsylvania Rubber Company, Republic Rubber Company, Seamless Rubber Company, Stein Double Cushion Tire Company and United States Tire Company.

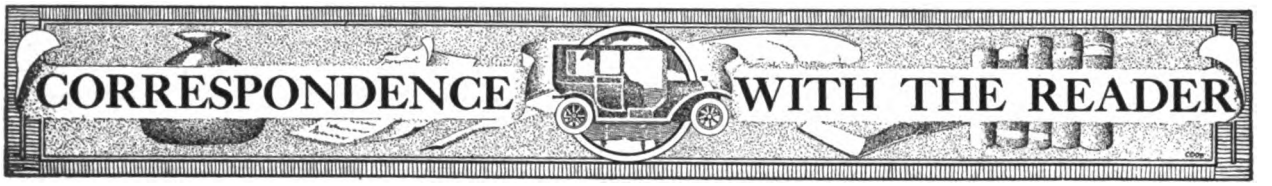
WILL MANUFACTURE ELECTRIC CARS.

The Buffalo Electric Vehicle Company has been incorporated in Buffalo, N. Y., for the purpose of manufacturing electric pleasure and commercial cars. The capital is $1,000,000, of which $700,000 is common stock and the balance preferred. The directors are W. P. Seipp, W. C. Fletcher, Thomas B. Wheeler, Frank E. Lane and Marcus Alexander.

RAMBLER'S 10,000-MILE GUARANTEE.

Ten thousand miles is a long distance to travel, but that is the figure fixed in the new guarantee just made public by the Thomas B. Jeffery Company, Kenosha, Wis., maker of Rambler cars. This means that it would be possible to drive the machine from New York to San Francisco, thence down the Coast to Los Angeles and back across the country to New York by way of New Orleans and Atlanta, when there would still be sufficient mileage remaining to carry the car to the Golden Gate once more with considerable reserve.

"We are making this guarantee," says Charles T. Jeffery, president of the company, "because of our unbounded confidence in every single part that goes into every Rambler car. We make 96 per cent. of these parts, therefore, know what each one can do. The first Rambler Cross Country model that left the factory made a 3000-mile test trip through nine states, over the mountains of Pennsylvania to New York, Albany, Boston and back to the factory. Since then its fame has spread and its service has extended to every state in the Union, to every province of Canada, to Mexico, Australia, South America, Europe and the Orient. Everywhere this Rambler has gone its performance has strengthened our confidence in its ability to fulfill this guarantee."



SUCCESS WITH REO CAR.

E. H. Morse, the well known educator and business expert of Hartford, Conn., is enthusiastic over the success he has had with a Reo car, made by the Reo Motor Car Company, Lansing, Mich., which he bought last year. In a recent letter to the distributor for this line, R. M. Owen & Co., New York City, Mr. Morse expressed himself as perfectly satisfied with the results obtained. He writes as follows:

"Before selecting a car, perhaps I went into a more exhaustive search than most men. I visited the New York, Boston and Hartford shows, and personally tried out what I considered the seven best makes ranging within the price I desired to pay. I put all these to a test on Cedar mountain, a steep hill leading from the New Britain road to the New Haven turnpike. The Reo made it on second speed, and made it easily. No other car which I tried could do it on the second; several could go over on the low speed, and a few could not make the hill at all.

"Last summer, I made a trip through the White mountains, and the northern part of Maine, and returned home by the coast line of New Hampshire and Massachusetts. In that trip and since that time, I have not had the slightest trouble with my car, except such as I could easily remedy myself by the turn of a screw driver. I believe it is running smoother today than it has ever run before."

Acetylene for Starting Motor

(1350)—If one should install a motor starter of the acetylene type and if a large quantity of gas should be permitted to go into the cylinders, would there be any danger in exploding the charge? What I wish to know is would there be any danger with a large amount of acetylene and if it would be injurious to the engine. Suppose the device to be so arranged that there would be small brass tubes leading from the distributor to the cylinders. Would there not be enough gas left in these tubes after the motor started? If so would there be any danger of these tubes becoming hot enough to cause the gas to explode? UTTUS WHEAT.

Holland, Texas, March 15.

Various methods are utilized in self-starters employing acetylene, but the basic principles are similar, that of mixing a stated quantity of air with the gas, conveying it to the combustion chamber of the motor and exploding the mixture by a spark. As with gasoline, it is essential to know the proper amount of air to combine with a given quantity of acetylene to obtain the correct efficiency. Too little or too much in proportion to the fuel will result in a poor mixture and starting conditions will be affected thereby.

An explosive point is reached when only 3.35 per cent. is acetylene and the balance air. Regarding the correct proportion of acetylene to air to ensure proper combustion and maximum force, the experiments of Berthelot and Vielle show that with a 10 per cent. acetylene and 90 per cent. air mixture an explosive force of 11 atmospheres is derived. With an increase in proportion of gas up to 50 per cent., at which point it is 22 atmospheres, the maximum is reached and beyond equal parts, it decreases.

Supt. O. H. Skinner of the Prest-O-Lite Company, Indianapolis, Ind., states that the best results are obtained by using one part acetylene and 10 of air, approximately, and that when this is ignited it will burn explosively and produce a force considerably greater than if gasoline were used, provided, however, some means of obtaining air is installed other than taking it through the intake manifold.

In considering the application of acetylene in a form of self-starter, some form of regulating valve should be incorporated and when the member is of the automatic type the sizes of ports or valves open from the line would accurately gauge the amount of gas being used. The pressure of the latter when brought from a tank should be reduced, as acetylene should not be piped about the car at a pressure greater than two atmospheres, or about 30 pounds. The pressure may be reduced by fitting a two-way valve to the tank when the latter is utilized both for starting and lighting.

Regarding the effect of acetylene upon the cylinders, a well known authority states that it will not injure them provided the mixture is correct and that the explosions brought about are not unduly high. The tubes carrying the mixture to the cylinders would not become heated enough to explode any gas left in them if there were any. If the device should be so constructed as to leave any mixture in the tubes it would be drawn into combustion chamber by the instroke of the piston, and as the amount would be small, it would not affect the gasoline mixture operating the motor. It is obvious that the acetylene from the tank would be prevented from flowing except when the self-starter was being employed.

Regarding Disco Self-Starter.

(1351)—I am considering a self-starter and regarding the Disco system desire to obtain the following information: When the engine has stopped at dead centre and does not start the first time, what becomes of the explosion, also on a cold day when it fails to start? Has there ever been such a thing as blowing off the cylinder head with this starter? Will the explosions injure the motor in any way when it fails to start?

Red Hook, N. Y., March 11. JOHN R. FINGAR.

Regarding the motor stopping at dead centre, the maker of the Disco device states: "Should the Disco fail to start the motor, owing to the latter being on dead centre, it is only necessary to make a quarter turn with the crank and then start on the spark." Stopping on dead centre rarely occurs, however.

As to an explosion taking place and not enough energy being developed to start the motor, or in other words, if the pressure be not strong enough to force the piston down far enough to bring up to dead centre the piston of the next cylinder to fire, the burnt gases will remain and be forced out through the exhaust valve when the motor is cranked a quarter turn or the cylinder in question charged and exploded properly.

Regarding blowing off of a cylinder head with the Disco system, the writer does not see how this could take place, owing to the fact that the gas and air is mixed in proper proportions by the distributor of the system. As to the proper proportions and danger of injury to the cylinders, these questions are answered in the previous communication.

Semi and Full Floating Axles.

(1352)—I am greatly interested in your "Correspondence with the Reader," and believe you will cheerfully answer these questions for me. What is the difference between a semi-floating and full floating rear axle? What advantage or disadvantage has the four-cylinder upright motor with cylinders cast en bloc over one with cylinders cast separately or in pairs? Is it true that a two bearing crankshaft of an en bloc motor has an advantage over the three or five bearing crankshaft of the motor with cylinders separate, or in pairs? A. J. RIKER.

Moundsville, W. Va., March 8.

Digitized by Google

In the full floating type rear axle the housing is constructed substantially in order to support the weight of the car. Each outer end of the tubing surrounding the axle is provided with a hardened steel bushing or cup upon which the balls or rollers of one of the driving wheel bearings are adapted to run, so that the wheels are entirely supported by the ends of the housings. The differential gears have their bearings within the central expanded portion of the housing. Each end of the two axle shafts is squared and fits similar recesses in the hubs of the gears of the differential. The outer ends of the shafts enter corresponding squared out cavities in the hubs of the driving wheels. This makes for a form of jaw clutch and a certain flexibility is given to the power transmitting portion of the axle and any slight deflection of the casing results in no binding of the moving parts. This construction is varied in several ways but the principles are similar.

In the semi-floating type the wheels are mounted directly upon the axles, which carry the weight of the car as well as transmit the power. The axles revolve in bearings mounted in the axle housing. The difference in construction will be noted in the accompanying drawing which depicts full floating and semi-floating types of rear axles.

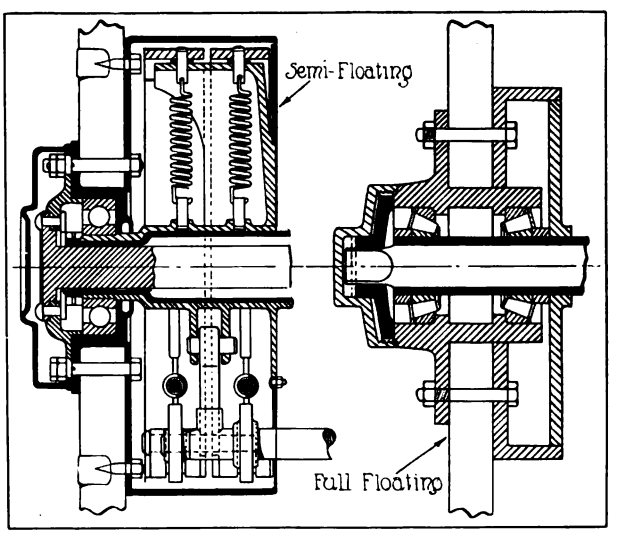
The advantages claimed by the advocates of four or six-cylinder motor cast en bloc is a shorter and more compact power plant, and there is a growing tendency among the automobile manufacturers to adopt this design. The twin and single-cylinder castings are favored by many makers, however.

Regarding the two bearing crankshaft of an en bloc motor and the type fitted with three or five bearings with cylinders cast in pairs or singly, the designers strive to achieve the same results, that of strength and durability. It is obvious that where two bearings are employed these must be larger and stronger than where five are utilized and these points are considered in the design of the crankshaft and crankcase, which are shorter with the en bloc type of engine.

Locating Poles of Battery.

(1353)—I acquired a second hand storage battery recently and wish to do my own charging. The pole marks are not shown on the battery. Will you please tell me how to locate them? WILLIAM E. NEVINS.

Richmond, Va., March 12.



Attach a wire to each terminal and place the ends in a glass of water taking care that they do not touch. The negative wire will give off bubbles and this terminal of the battery should be marked thus —. The other will be the positive and should be marked thus +. In charging, the leads from the charging apparatus should be similarly connected.

Driving Out Ball Races.

(1354)—I have a model ——— car and the large ball races in the front wheels are worn out. Have secured new members from the factory but cannot get the old members out. Have tried the suggestions contained in instruction books, but without success. Have been told that I will have to apply heat to draw the temper and then break up the races with a cold chisel. Is there any method you can suggest? C. B. FORDHAM.

Portland, Ore., March 7.

The easiest and quickest way to remove the races is to dismantle the wheel. The hubs and flanges may be taken apart easily by removing the nuts and driving out the bolts. The hub and flange will come apart and it will be noted that the flange member in which the ball race is located has three holes. These were incorporated by the manufacturer for the purpose of removing the races when other means fail. By utilizing a punch and hammer the race may be removed. The dust ring will come out with the race so it will not be necessary to remove the former separately. In using the punch, it should be employed alternately in each opening of the flange to equalize the driving strains. In fitting the new member, it should be driven in with a lead mallet or with a block of hard wood inserted between the hammer and race, as these members are hardened and break easily.

Depicting Types of Semi and Full Floating Rear Axles.

RECIPROCITY IN MARYLAND.

Several important changes of interest to motorists generally will be made in the automobile law of Maryland if a bill just introduced into the Legislature of that state by Senator Goslin becomes a law. Included in the provisions is one granting full reciprocity, with absolute freedom for motorists of other states and territories to enter Maryland whenever they choose, remaining as long as they desire, so long as the same privilege is extended to Maryland tourists in those states.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

EDENBURN WITH REMY COMPANY.

The predilection of the Remy Electric Company, Anderson, Ind., maker of Remy ignition and lighting equipments, for newspapermen is made still more evident by the enrollment of W. D. Edenburn as publicity and assistant advertising manager. This is the sixth graduate from the news gathering field which has been added to the Remy force, and he is by no means the least known of the six.

W. D. Edenburn, Publicity Manager, Remy Electric Company,

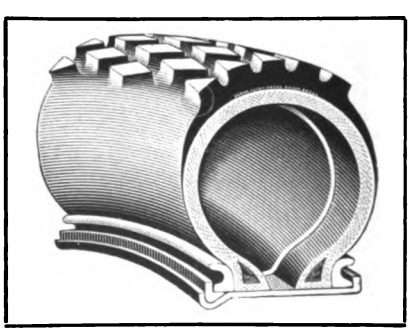
Mr. Edenburn goes to the Remy people from the Indianapolis Sun, where he was manager of the automobile department. He was formerly automobile editor of the Indianapolis Star, where appeared many of his expert articles on racing, shows and other features of motor car activity.

Last summer Mr. Edenburn was closely associated with the Indiana Automobile Manufacturers' Association, and one of the active promoters of the idea of the Four-States tour, which developed into one of the most important contests in the Middle West and one of the best advertising campaigns of the season. His new position with the Remy company will give him even broader scope in the promotion of plans for the general good of the industry.

TRUFFAULT-HARTFORD BOSTON SALES.

The sale of cars during the 10th annual Boston automobile show early in the month was not the only indication that the event exceeded all past records in the matter of sales. Many of the accessory exhibitors found the results equally satisfactory in this respect. D. F. Harvey, manager of the New England branch of the Hartford Suspension Company, Jersey City, N. J., maker of the Truffault-Hartford shock absorber, reports a larger sale than ever before at a similar show. He adds that the business of this concern in Boston, where it is located at 319-325 Columbus avenue, has increased 120 per cent. during the past year, and that he feels confident of an even greater increase during 1912. This company also manufactures the Hartford auto-jack, which is claimed to be second to none.

MERCERS FOR WELL KNOWN DRIVERS.



An interesting bit of automobile news was made public recently in the announcement that David Bruce-Brown and Ralph De Palma, both of whom are well known as American racing drivers and with cars of foreign make, have purchased Mercer raceabouts, produced by the Mercer Automobile Company, Trenton, N. J., for their own personal use. Bruce-Brown was twice a winner of the American Grand Prize, once in a Benz, and a second time in a Fiat. De Palma has made a number of records in Fiat cars, but was at the wheel of a Mercer car in numerous victories in 1911. The former will take his Mercer to Europe and will test it out over the French Grand Prix course.

WEBSTER CLUB HOLDS BANQUET.

The first annual banquet of the Webster Automobile Club, Webster, Mass., was held at the Joslin House, March 14. Among those present were: Hon. Eben S. Stevens, Dr. J. O. Genereux, Nathaniel T. Hurlburt, Clarence E. Cleveland, Dr. L. A. Bragg, Arthur H. Racicot, Dr. George Littlefield, Charles E. Mason, Andrew J. Bates, Louis E. Pattison, A. Samuel Roberts, Nicholas C. Giles, Joseph Dumas, Patrick Prout, Dr. Q. H. Merrill, William Winter, Emil Kisro, N. J. Pierce, Edward H. Pattison, Arthur Choiniere, Herbert G. Alton, Armand J. Brissette, John C. Templeman, Leon J. Kreft, Victor E. Djiembouski, John T. King, John Breen, Bates Craner, E. H. Horton. The officers of the club are: President, Alexander N. Racicot; vice president, Dr. Joseph N. Roy; secretary, Joseph C. Dandurand; treasurer, Arthur G. Pattison.

GOODYEAR NO-RIM-CUT TIRES.

Unfortunately, the drawing selected to illustrate the Goodyear No-Rim-Cut tire in the article on "Tire Equipment and Demountable Rims," in The Automobile Journal for Feb. 25, failed to do this well known product of the Goodyear Tire & Rubber Company, Akron, O., full justice. In several respects, the impression conveyed was erroneous. Herewith is presented a half-tone of the same tire, and it will be noted that the non-skid tread has a series of diamond shaped protuberances, instead of square as the former illustration would seem to indicate. It also will be found that the bead is of somewhat different shape and construction than was indicated in the drawing to which reference has been made.

Section of Goodyear No-Rim-Cut Tire.

NEW HUPP-YEATS FACTORY.

In order to care for the steadily increasing demand for the Hupp-Yeats electric cars, it has been found necessary to provide a much larger factory, and the buildings in Detroit, formerly occupied by the Herbert Manufacturing Company, have been leased for the future home of this car. The Hupp-Yeats has been constructed in the plant of the R-C-H Corporation on Lycaste street, Detroit, the new R-C-H gasoline car also being manufactured in this plant. Although several buildings have been added during the past six months, the growing requirements of the business in connection with the two machines made a change imperative.

Establishing the Hupp-Yeats in new and larger factory quarters not only will permit of a greatly increased output of electric cars, but the space gained at the R-C-H plant will enable the R-C-H Corporation to increase its output of gasoline machines over 50 per cent. One of the important features in connection with the change, is the association of C. W. Fox with the Hupp-Yeats interests. Mr. Fox is widely known throughout the industry because of his connection with Fox Bros. & Co., occupying for a number of years a foremost position in the construction of automobile bodies. He will devote a large part of his time to the production of Hupp-Yeats electrics, although he will retain his interests with the body building business.

There will be no change in the distribution of the Hupp-Yeats, and as heretofore, the car will be sold through the R-C-H Corporation's branches and dealers.

WANTS GLIDDEN TROPHY RETAINED.

Benjamin Briscoe, president of the United States Motor Company, a constituent of which, the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., made the cars which won the Glidden trophy last year, wants this famous cup retained as the chief award in the national tour of the American Automobile Association. He says, in part:

"The Glidden trophy was donated by a sportsman purely in an altruistic spirit. No good reason for its rejection has been advanced. The simple reason that the trophy bears the name of an individual is not sufficient to cause the prestige of our great national contest to be sacrificed to the whims and fancies of a few. It is a menace to the industry to kill the Glidden tour, and it would take years of unappreciated competition to inspire public confidence in a new tour and make the public realize its value."

NEW GOODYEAR BUILDING.

Immediately after the fire which destroyed the branch of the Goodyear Tire & Rubber Company at 251 Jefferson avenue, Detroit, steps were taken to secure a building in a desirable location, but when this was found impossible it was decided to build. The site chosen was at the southeast corner of Antoine and Jefferson avenues. The proposed structure will be five stories in height, 50 feet wide and 200 feet long, of fire proof concrete construction and with a stone front. It will be owned by the Goodyear Tire & Rubber Company, Akron, O.

The new branch will be thoroughly modern in both external and internal appointments, and with plenty of floor space. Opportunity thus will be afforded to carry a large stock of Goodyear tires and other products to cope with the rapidly increasing Michigan trade in a satisfactory manner. The company has concentrated, temporarily, its stock at what was formerly the branch No. 2, 846 Woodward avenue. E. F. Jackson, manager of the Detroit branches, expects the new building will be ready for occupany about July 1.

BOARD OF TRADE'S HANDBOOK.

The ninth annual handbook of gasoline automobiles has been issued by the Automobile Board of Trade, successor to the Association of Licensed Automobile Manufacturers. It is a 207-page volume, listing and describing the product of the members of the organization, and includes more than 500 models of pleasure cars and trucks. A copy may be had upon application to the Automobile Board of Trade at 7 East 42nd street, New York City.

HARRISBURG CLUB'S COMMITTEES.

The following committees have been announced for the ensuing year by the Motor Club of Harrisburg, Penn.: House, E. C. Markley, A. C. Logan, H. H. Hefkin; membership, R. F. Blough, R. L. Morton, Andrew Redmond; contests, J. Clyde Myton, William B. Douglas, Frank A. Stees; auditing, A. H. Frain, John Hoffer, Jr., W. S. Hurlock; signboards, James McCormick, Jr., D. M. Dull, J. Carroll Kinter; routes and maps, W. O. Kickok, F. A. Stees, F. F. Hahn; roads, C. C. Cocklin, William Jennings, V. C. McCormick, R. C. Haldeman, H. C. Wright, D. M. Dull, A. G. Eberly; laws and ordinances, Charles E. Penny, W. E. E. Lancer, Caspar Dull.

SPEEDWAY CASE TO SUPREME COURT.

The famous Speedway test case in Brooklyn, N. Y., is to be carried to the United States Supreme Court, according to the latest information. The question arises over the action of the authorities in restricting the Ocean parkway in that city to the use of horse drawn vehicles. The Long Island Automobile Club feels that an injustice is being done to every motorist who has occasion to use the parkway, and it is for that reason that the organization has decided to have the matter of constitutional rights determined by the highest court in the land.

MOTORING BEYOND 62 DEGREES, NORTH.

An Account of the First Automobile Trip from the Tidewater at Skagway, Alaska, to the Headwaters of the Yukon in the Klondike Region.

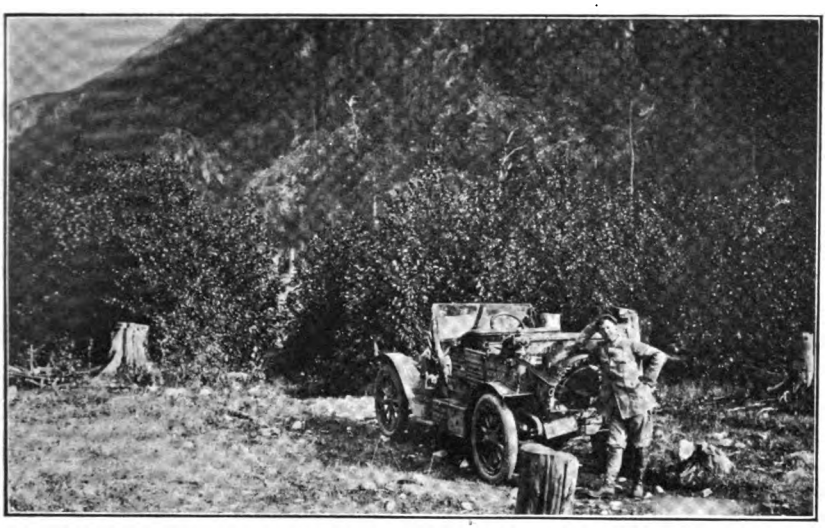
(By Charles G. Percival, M. D.)

BACK in the spring of '98, when the whole world was ringing with the wild reports of great gold discoveries in the Klondike, Skagway, Alaska, at the head of Lynn canal, became the key to the new Eldorado beyond. The sole line of communication with the interior was by the trail leading over the White Pass, used by Indians—a mere footpath blocked at every turn with rocks, boulders and fallen timber, and in many instances abruptly amputated by a stream or swamp.

Skagway Camp No. 1, Arctic Brotherhood, from Which the Trip Was Started.

Many people have an idea that a trail constitutes a sort of bridle path, clearly mapped and practically free from obstructions. The White Pass trail was not only rough, but strewn with the bodies of so many hundreds of dead pack horses, that it later became known as the Dead Horse trail. During the height of the rush, and for a greater portion of the 40 miles through to Bennett, neither man nor horse could travel faster or slower than the speed of that "huge living serpent that slowly wound its way over the Pass. To try to go faster was to be stopped simply; to go slower for a man meant climbing the rocks up or down off the trail, but a horse could not do this and had to keep in line or fall on the trail. A fall meant death, as a rule, unless he could get up quickly, which, overloaded and exhausted, he seldom could. The law of the trail was this: That a man be given time to remove his pack from a fall horse, and then the procession moved on."

I have reviewed this situation, simply to indicate the condition of the country through which we undertook to drive from Skagway to Dawson. The Skagway of 1898 with its transient population of 20,000 has dwindled to a permanent city of 1800. Bennett, which claimed a like number in 1898, is now a deserted city, with but four persons left. The White Pass trail still exists, but communication with the interior is by means of the White Pass & Yukon Route, a railroad, the construction of which was begun in July, 1898, by the late S. H. Graves, a member of the London brokerage house of Close Bros.



It was for the purpose of taking the Abbott-Detroit "Bull Dog" into the farthest North region, that I undertook the journey from Skagway to Dawson, accompanied by George Brown and J. J. Chambers, the latter a representative of the Daily Alaskan, the oldest newspaper in Alaska, and a registered guide of note in the district.

Native Born Alaskan Children Enjoying Their First Ride in an Automobile.

Alaska, meaning Great Country, is indeed rightly named. Not only is it great in area and natural resources, but in scenic grandeur it is the greatest of all

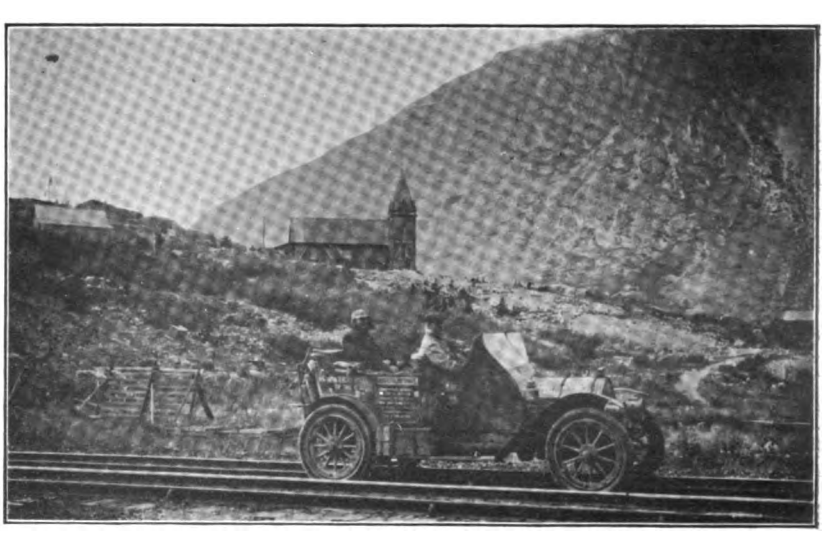
A Picturesque Glimpse of the Old Skagway Trail Near Boulder, Alaska.

countries, for here and in northern British Columbia and the Yukon territory adjoining Alaska on the east, nature has painted her most magnificent pictures—now of soft, wondrous beauty, almost tropical in their setting of luxuriant verdure, then suddenly changing to one that is wild, rugged and forbidding.

The Abbott-Detroit "Bull Dog" proved to be the very first automobile to reach Skagway, and the population who had never seen a real live motor car came out in droves to have a look and take a ride. It will give a vague idea of the number of "lifts" we gave to those who had never before ridden in a car, to state that in one afternoon Brown rolled up 50 miles on the speedometer on the limited 3.5 miles of Skagway streets.



When I learned what I have recited here with respect to the trail as far as Bennett, there was but one card left to play—the 112 miles of railroad over the White Pass & Yukon Route, with its 104 bridges, culverts, cantilevers and tunnels. Nothing daunted, I called upon General Manager O. L. Dickinson, and requested permission to take the car over the ties to White Horse, from which point I expected to make Dawson.

Mr. Dickinson was very courteous. He explained the dangerous nature of the undertaking, dwelling at length upon the fact that the road was narrow gauge, being only 36 inches wide instead of the standard four feet 8.5 inches. The ties, he said, were but a little over six feet in length and would not give sufficient clearance to the 56-inch tread and 4.5-inch tires of the "Bull Dog." He showed me a profile map of the road, pointing out the big cantilever bridge 1020 feet long, above the 297-foot deep Dead Horse gulch, where in the old days so many pack horses lost their footing and were killed. Mr. Dickinson refused us permission to make the attempt.

That afternoon, however, we deliberately drove out 12 miles on the roadbed and successfully negotiated the track and one of the smaller bridges. The next day, by appointment, I again met Mr. Dickinson, Supt. V. I. Hahn and other officials of the company, and displayed for their benefit my album of photographs, showing pictures of the car crossing the high bridge of the Santa Fe over the Colorado river at Parker, Ariz., and of Brown and I driving on the ties in Mexico. A waiver of damages, which Brown and I both signed, brought the meeting to a close.

The permission of the road to make the trip had been won, and the following Sunday, when all trains were pulled off, we started. At that time, we both figured the entire distance on the ties to White Horse, 112 miles, could be made easily in a single day, but we little knew what was ahead of us.

The start was made in a drizzling hail and snowstorm. Owing to the difficulty of obtaining supplies between Skagway and Caribou, a distance of 67.5 miles, we were compelled to carry a great deal heavier load than was deemed wise for such a bumpy, rough journey. The car weighed in the neighborhood of 4700 pounds. In addition to 20 gallons of gasoline, three gallons of lubricating oil and 20 pounds of carbide, we had two 12-foot planks 2.5 inches thick and 10 inches wide. To this we added blankets, for three

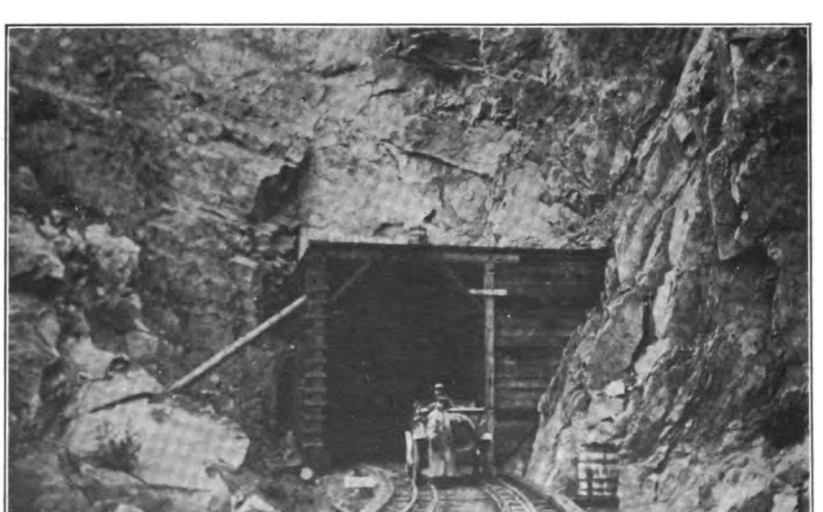
Overhanging Rock on White Pass & Yukon Route, 4000 Feet Above the Sea.

persons, canned goods for three days' rations, cooking utensils, five gallons of alcohol for the radiator, two rifles and ammunition, several changes of clothing, 12 inner tubes, two extra outside casings, an air bottle, pump, tools, spades, axes, Graflex camera and a small tent.



The first seven miles of Section 1, though upgrade, was in excellent condition, and the distance was made in a little over an hour. We began to pat ourselves on the back, thinking of the ease with which we would roll into White Horse before it became dark. But, hardly had we gone beyond Boulder and Liarville, when the upgrade by the famous Denver glacier started our troubles.

Here, despite all the care, caution and money vainly spent by the White Pass & Yukon Route, the elements had conspired to keep the dirt and gravel from between the ties. The constant erosion of the melting and dripping glaciers and the heavy storms had all assisted in washing away the protecting dirt, so that we slid and bumped and crept dizzily from tie to tie.

First, the front wheels would drop down between the ties, then slowly and laboriously they would mount the next one, while the heavily weighted car with its load of freight and three passengers would slide its rear wheels over the same identical way, until it seemed as if the mechanism, frame and springs could not possibly stand such fearful and unequal strains. If the bumping and twisting on the car were anything like the effect it had on the three passengers, I can only add that I felt extremely sorry for the innate composition of steel, rubber and wood that was withstanding this strain nobly under us.

Upgrade, every foot of the way, we travelled straight into a dense glacial fog, through which we patiently made our way at the rate of three miles an hour until the high altitude warned us it was time to put on heavier clothing. A little later we reached that point on the road from which it is possible to see the dead city of White Pass, 1500 feet below. Chambers pointed out the few remaining buildings, and we could see dimly the famous old trail as it wound along the banks of the rushing river, and up the mountain side to disappear between two points around which the railroad climbs. This old trail, pounded hard by the countless feet of gold crazed men and their pack horses, seems like the ghastly slash of an unhealed wound, and strange to say, all along the 22 miles of the old White Pass trail, no vegetation has been able to grow, though nature in her bountiful luxuriance has crept over and smothered every other handiwork of man.

In the heavy fog bank we passed over many of the bridges about which we had been warned. They were called to our attention largely on account of the faster speed permitted, owing to the ties being set closer, and the consequent absence of bumping. The very impediments in the minds of the railroad officials proved, therefore, on close trial to be the easiest portions of the road. The big steel cantilever bridge which curves over and around the dreaded Dead Horse gulch, was negotiated at a speed of 15 miles an hour, and my only regret was the extreme density of the atmosphere which prevented obtaining a picture. Later, when the clouds of dense glacial vapor had

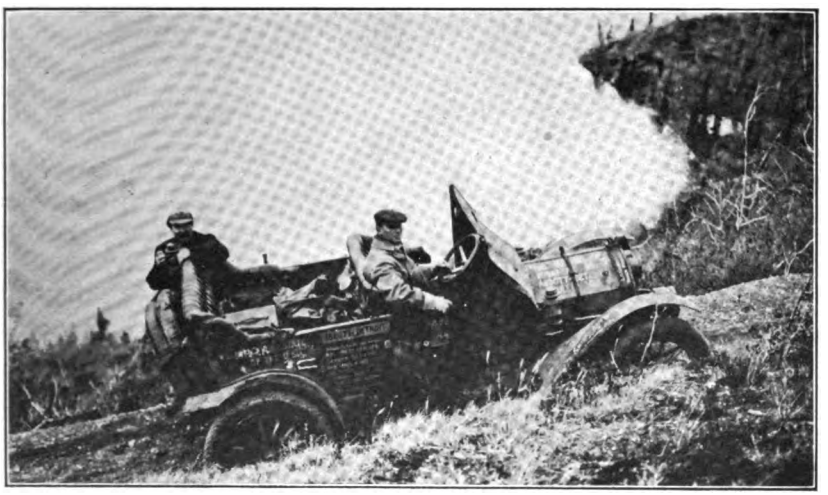
Fording the Skagway River Bed Between Caribou and White Horse.

partially cleared, the ride proved from a scenic point a really gorgeous one, and hardly to be equalled in any other part of the world. I can well realize why travellers have called Alaska the Alps of America. We passed glacier after glacier, the colors of which radiated like a Niagara rainbow. Frequently we could peep through the cleft mountain ranges, which snow crowned to their very tops, stood out in solemn grandeur, making one feel that here was the end of the earth or the jumping-off place. Away beyond, we could see through the intermitting avenues of glistening green spruce and cedar the vast glaciers, shoulder to shoulder, like a massive army of giants keeping silent but guardful vigil over the inland empire of the snow king.

For miles, we drove along the side of a great precipice, where steel and concrete retaining walls alone, withheld us from dropping down into the sullen gorge thousands of feet below. The sensation of driving or riding over the narrow 36-inch rails and the six-foot tires with next to nothing at your elbow is disconcerting, to say the least.

At 20.4 miles, we reached the summit of White Pass, where the United States and Canada have joined forces in the erection of two flag poles, a concrete boundary post and some customs buildings. Here, we stopped for lunch.

At Log Cabin, once a city of 7000 inhabitants, we tried to secure a photograph of the picturesque old building from which the town took its name, but the snow spoiled my luck. While I was endeavoring to obtain a decent focus I heard a snorting and bellowing behind me, and a warning shout from Chambers caused me to turn to face a big bull caribou gazing at the automobile in evident astonishment and rage. He departed, however, before Chambers had opportunity to test his skill with the rifle. From this point to Bennett, we scared up numerous "Tommikins," as the old timers call them—the ptarmigans, or snow white grouse of the Arctic Circle. The heavier bodied Alaska grouse also were plentiful, and Chambers kept us well supplied with them.



Finally we reached Lake Bennett. Here we found the shipyards and docks, where thousands of craft, from rowboats to huge steamers, were built and launched. Here also is what remains of Bennett City. We saw the graveyard where many a daring and foolhardy gold seeker is buried, after being dashed to death in the rapids, murdered for his "poke," or perhaps a suicide from losing his all in the rapids or on the gaming table. Many a human interest story, and many a secret is hidden here beneath the soil of this old cemetery. The wooden headstones have fallen and decayed. Even the carved inscriptions are beyond deciphering, and aside from the neat white painted palings, which the White Pass & Yukon Route keeps around the little plot, there is nothing to tell the story of another inglorious incident of the Klondike and the wonderful rush for gold.

Chambers led us up the little hill, where the vast caravan of buildings stand with sagging doors and gaping windows, all lonesome and deserted. Schoolhouses and churches are there still, weather beaten and battered, and testify to the once prosperous condition of the thriving city. Bennett was the last stop of the gold seeker after making the dreaded White

Alaskan Dog Sledges and Abbott-Detroit "Bull Dog" at Canadian Mounted Police Station.

Climbing 30 Per Cent. Grade at Nine-Mile Lake on the Dawson Trail.

Pass. Here he built himself a boat or a raft and floated down Lake Bennett to Caribou. Reaching Tagish lake, he then proceeded up Six-Mile river to Lake Marsh, then down the Fifty-Mile river, shooting Miles canyon in a 15-mile-an-hour current. Emerging therefrom, the dangerous White Horse rapids, with their whirling white foam and jagged rocks lay before him, barring the entrance to the city of White Horse.

In the extreme winter months, the smooth, hard surface of the lake and rivers offered an easy passage to the swift moving dog sled, so that all the year around Bennett was the rendezvous for the gold seeker. The town flourished and became a metropolis. Hence, the numerous buildings, fragments of what were once lace curtains waving all forlorn in the windows, furniture and furnishings still intact. It cost 10 cents a pound to bring them in. It would cost too much to take them out.

It was after 4 in the afternoon, when we left Bennett, and the railroad skirting the border of Lake Bennett as far as the British Columbia and Yukon territory boundary line, seemed rougher and rougher, and the ties wider and wider apart. The culverts made it necessary for Chambers and I to hop along beside the car with planks in hand, ready to lay them down, so the car might cross in safety. It was hard, tiresome and dangerous work.

Darkness enveloped us before we were within even seeing distance of Caribou. We were still 70 miles from White Horse and the next day —the trains would be running. It certainly looked like an all night siege, but tired as we were after the day's exhausting trip, we continued to plod along. Lighting our lamps we found progress as good as before, but the wide spaces between ties and the annoying culverts continued.

About 8 that night, and to our great amazement, a broad ray of light appeared in the heavens, and played here and there in the firmament. It looked like a searchlight, and before long it was augmented by a second and a third. When, finally, the three rays combined played down the rails in our direction only to disappear and then once more appear, Chambers explained: "It's the steamboats from Atlin, the new mining camp. They're docking at Caribou." We learned later that the citizens of Caribou had received telegraphic information of our coming, and not having heard from us, were playing searchlights to locate us and show us the way to town. It was nearly 10 when we swept around the curve and over the bridge at Upper Caribou Crossing, the first automobile party to reach Caribou, and the whole population of the town, numbering some 200 souls, whites and Siashes, were out to greet us.

The next morning we left the railroad and took to the old government trail, which had not been used, so we were informed, since the introduction of the railroad. We ploughed a track through the deep sand which encompasses Caribou for about four miles, and were underway again. At eight miles, the road disappeared entirely, having been washed away by recent rains. Here we labored over one bad place, only to find another a few miles beyond, and so for 15 solid hours we worked with shovels and axes, digging dirt, filling gullies, brushing swamps, making bridges and laying corduroy roads, until with-

Stuck in Arctic Tundra Beyond 62 Degrees, North—Note Pry Under Wheel.

Digitized by Google

in eight miles of White Horse, where we found an excellent road. We took the town of White Horse entirely by surprise, for nobody expected that we would make the place inside of three days, if at all.

The third morning out, we looked up Supt. Herbert Wheeler of the Royal Canadian mail and Dawson stage lines, who for the past 11 years has had immediate supervision over the carrying of mails in this region. He informed us there was no hope of reaching Dawson, since at this time of the year the Yukon, Pelly and Stewart rivers were not frozen over, and there was no provision for crossing them, as the last boat had come down for the winter. He said we might be able to make Carmack, and he wanted to go with us, because if an automobile could traverse the road, he certainly wanted one for hauling the mails, and he had as yet been unable to find a manufacturer who was willing to give him a demonstration.

And so, after a day's rest, the "Bull Dog" started from White Horse with another passenger, another axe and shovel, extra blankets and provisions. The Dawson trail differs from the old road from Caribou. It has many grades, and in spite of the work that has been done on it for 65 miles at an expense of $25,000 to the Canadian government, it is still a hard road for this distance. In carrying the mail, six horses are used at a time, and in relays of only 22 miles. Three relays are made in a single day of 12 hours' travelling.

For two days we sank up the hubs, and many times over the rims. Only by constant prying, and building up firm foundations of logs under all four wheels and making a firm roadbed beyond could we extricate the car. One favorable thing that can be said of the Yukon, is that there is no need of starving. The country fairly teems with moose, caribou and bear; grouse and rabbits are plentiful, and every stream is alive with trout and grayling. We drove through acres of wild berries of all kinds, and ate them until our faces and hands were stained.

On several occasions we passed encampments of Indians out for their winter's supply of meat and provisions. No amount of persuasion on our part, however, could induce them to stand and have their pictures taken, and in each and every instance they left their camps and took to their heels at the approach of the chugging automobile. They resisted every blandishment of both Wheeler and Chambers who offered them presents of tobacco.

Just before reaching Carmack we encountered the dreaded Arctic tundra. This is three feet deep with moss, underlaid with live springs, and is passable only after heavy cold snaps. It took us three hours to make 100 yards, and then only after we had used every method of prying the car out of the mass, and built corduroy roads. We were compelled to turn back at Carmack, a station on the Yukon river, 128 miles from White Horse, and 30 miles beyond parallel 62 degrees, North.

The return trip was but a repetition of the outward journey, excepting that we had been over the road and knew what to expect. Not once did we sleep in the open. Every 20 miles or so we found one of the deserted cabins of the Northwestern Mounted Police, and the Royal mail and stage stations. One night, beyond Nordenskjiold, it looked for a time as if we would be compelled to camp out, but the quick wit of Wheeler, in blazing out a new trail around a bad piece of swamp, saved the day.

The car withstood the strain remarkably well. We averaged 8.8 miles to a gallon of fuel throughout the entire trip, and used about two gallons of lubricating oil. Despite the terrific racking of the machine, and the extreme weight upon the tires while bumping over the ties, we did not experience a single blow-out or puncture.

We were the first to take an automobile from the tidewaters of Skagway to the headwaters of the Yukon, and besides winning the silver shield trophy offered by the Daily Alaskan, Brown and I were honored by being admitted into the famous secret order of the Arctic Brotherhood, into which none is admitted except he has made the trail beyond 54 degrees, North.

SAN ANTONIO CLUB GROWING.

The San Antonio Automobile Club, San Antonio, Tex., inaugurated a campaign recently to obtain new members and to stimulate efforts in this respect a gold medal was offered to the member obtaining the largest number of applicants. The prize was won by R. T. Pruitt, whose labors resulted in 101 names being added to the membership roll, bringing the total up to 300 and it is expected that another 100 will be secured by the next meeting.

In order to erect a clubhouse, shares of stock at $10 each are being sold and the members have subscribed liberally, assuring the success of the plan. The club has made arrangements for a large number of signs and these will be placed upon the highways and include danger signals. The officers of the club consist of: President, Dr. F. J. Fielding; vice president, W. H. Furlong, Jr.; secretary, W. J. Pearson.

ST. PAUL TO WINNIPEG.

The Minnesota State Automobile Association has taken up the matter of the annual tour for the Dispatch trophy in earnest and is outlining plans for a trip from St. Paul to Winnipeg and return, along similar lines to those which obtained in the tour from Minneapolis to Helena, Mont., last year. The tentative route calls for the following: First day, St. Paul to Little Falls and Wadena; second day, to Ada and Crookston; third, to St. Vincent and Winnipeg; fourth, in Winnepeg; fifth, to Neche and Grand Forks; sixth, to Wapleton and Elbow Lake; seventh, to Paynesville and St. Paul.

THE EAGLE

Clear Vision, Rain Vision, Wind Shield

Designed and Built by Experts

Strong Rigid Silent

Easy to operate, as it is equipped with that wonderful

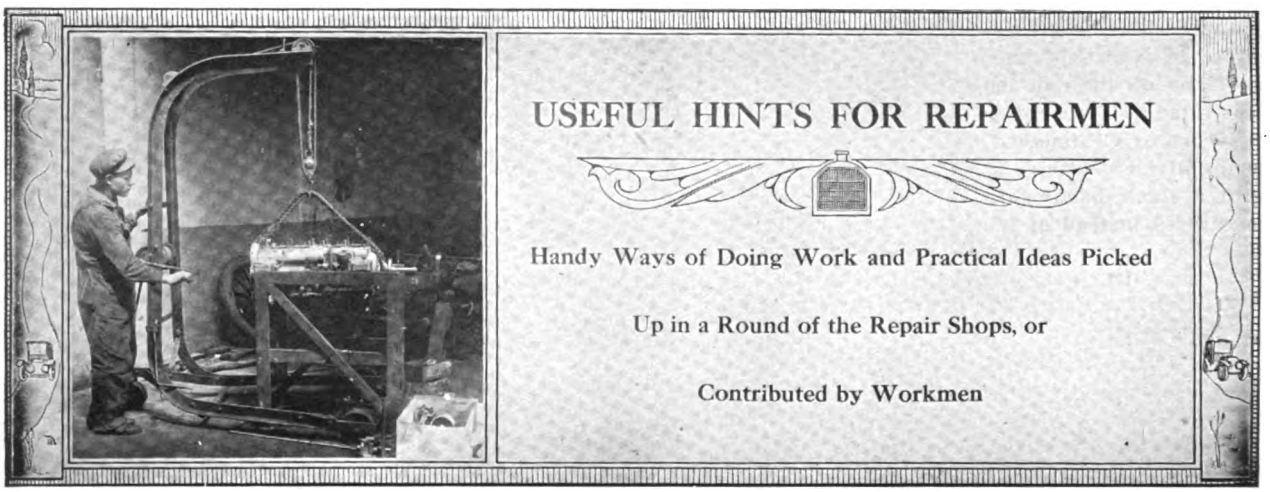
STANDARD FRICTION HINGE

Easily placed in any position and will stay where put.

SPECIFICATIONS:

WIDTH	HEIGHT	ALL GLASS ¼" PLATE TOP	LOWER	PRICE BRASS
41"	27½"	12"	14"	$50.00
41"	31"	14"	16"	50.00
44"	27"	12"	14"	55.00
44"	31"	14"	16"	55.00

Special Finish: White or Black Nickel and Gun Metal, $5.00 extra.



We also carry in stock a complete line of Standard Friction Wind Shields, from $22.50 each to $40.00 each. Send for descriptive circular.

Sole New England Distributors:

MEASURING DEVICES FOR THE SHOP.

In equipping the shop with measuring devices, calipers should not be overlooked as these tools are very essential. They are made in several forms and are not expensive, although in purchasing these members it is poor economy to select cheap instruments.

Those shown at Fig. 1 A may be used either plain or with a spring nut. The device depicted at C is an inside transfer caliper and may be obtained either with a spring or a solid nut. The bow is stiff, making the instrument reliable. It is especially adapted for

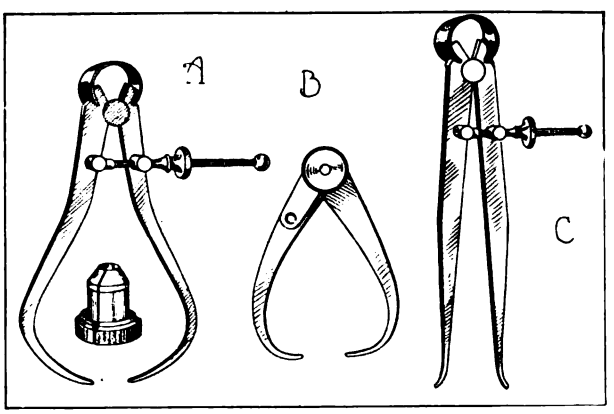

Fig. 1—Some Measuring Devices: A, Calipers; B, Adjustable Firm Joint Members; C, Inside Transfer Calipers.

calipering the inside of a chambered cavity and this is accomplished by springing in the legs so that the tool may be withdrawn. Upon releasing the grip the legs will spring back to their original position, showing the exact size of the opening calipered.

Adjustable Firm Joint Calipers.

The calipers shown at B are made in various sizes and can be instantly adjusted to their full extent, as quickly locked firmly in the joint, and are fitted with means for making a sensitive adjustment. These are an improvement over ordinary forms inasmuch as they are made with a tapering socket joint, locked or released by a partial turn of the knurled disc drawing it together. A spring washer fitted under the disc maintains an easy friction in the joint when unlocked.

In the underside of the short arm is a slot containing a stiff spring. Riveted into the middle leg and projecting through an opening in the arm, is a threaded stud on which is a knurled nut having a beveled hub, bearing against the cone in the arm. The action of the spring holding them together turns the nut, presses them apart and adjusts the legs when the point is locked. As the spring takes up all backlash the legs consequently are firm.

Calipers of the ordinary type, yet having a well constructed joint, are illustrated at Fig. 2 A. The joint is drawn together by means of a screw and the main stud is squared and fitted to one leg, thus preventing the former from turning when loosening and tightening, insuring a smooth and more uniform friction and more or less tension to suit the user. Screw thread calipers are similar to the members depicted at Fig. 1 with the exception that the points are constructed to fit the threads to be measured.

Gauges.

Regarding gauges, these are optional and will depend on how complete the equipment is to be made. For accurate work with twist drills, and when these members are constructed in the shop, a gauge such as shown at Fig. 2 B will be useful. This provides means for measuring the members in sizes from .25 to .5 inch in diameter. Each size of the drill is designated by both common fractions, also by decimals. Number drills from one to 60 are measured by a similar instrument and the size of each drill is given in decimal fractions. Gauges are also made for sheet metal and plates, standard wire, etc.

That shown at C is a screw pitch gauge and provides for measurement of a large number of different sized members. The teeth are sharp and clean cut, and can be used inside of a nut as well as on the outside of a bolt or screw. It also provides a convenient and reliable tool to use as a 60-degree centre gauge or to test the grinding of either an inside or outside threading tool.

Digitized by Google

A machinist's pocket scale or rule should be included in every equipment. These are constructed of steel and of different lengths and thicknesses. That illustrated at D is a conventional type and is graduated in inches or millimeters. At E is depicted a form of spring dividers with solid adjusting nuts and equipped with a small handle or twirler. A spring nut may be utilized instead of the solid members.

PROPER CARE OF CHAINS.

With the rapid development of the commercial vehicle a new branch of repairing is opened to the shop and the increasing number of mechanical transports will have a stimulating effect upon the garage. The progressive owner of the repair shop is already making preparations for this line of business and there is no reason why a well equipped shop should not be able to handle the work as satisfactorily as pleasure machines.

As the majority of the motor trucks utilize chains for final drive it is an excellent idea for the repairman to brush up his knowledge of sprockets and chains. Many workmen who graduated from the ranks of bicycle repairers will discover that their experiences with the chain driven mount will be of value.

The secret of a chain drive, aside from lining up the sprockets, etc., is proper lubrication. Chains should be removed from the sprockets and washed thoroughly in gasoline or kerosene, removing every particle of dirt. A mixture of beef or mutton tallow and flake graphite is prepared in a large receptacle and the ingredients heated over a fire. The chain is then placed in the vessel and boiled. Upon removal it should be hung up to cool. The tallow and mixture will penetrate to all crevices, filling these completely, making an ideal lubricant. Chains cared for in this manner will give efficient service.

USING TINNER'S SNIPS.

The proper use of tinner's snips requires considerable skill. These tools are not only more difficult to manipulate than a file, but far more dangerous, as if handled carelessly or clumsily the pointed blades may cause a dangerous cut to say nothing of pinched fingers. In cutting sheet metal considerable strength is required as well as skill, and experts utilize a peculiar action of the palm and thumb to open the blades after each cut.

The proper way to use these instruments is to hold the tool so that the upper handle rests against the palm of the hand and the thumb bridges the handle. The fingers are placed below the lower handle and the end of the thumb bears upon this handle just above the position of the index finger. Unless one is familiar with the use of the snips, and heavy material is to be cut, the safest and easiest method is to clamp one handle in the vise, on the principle of the stock shears, and work with the other by hand.

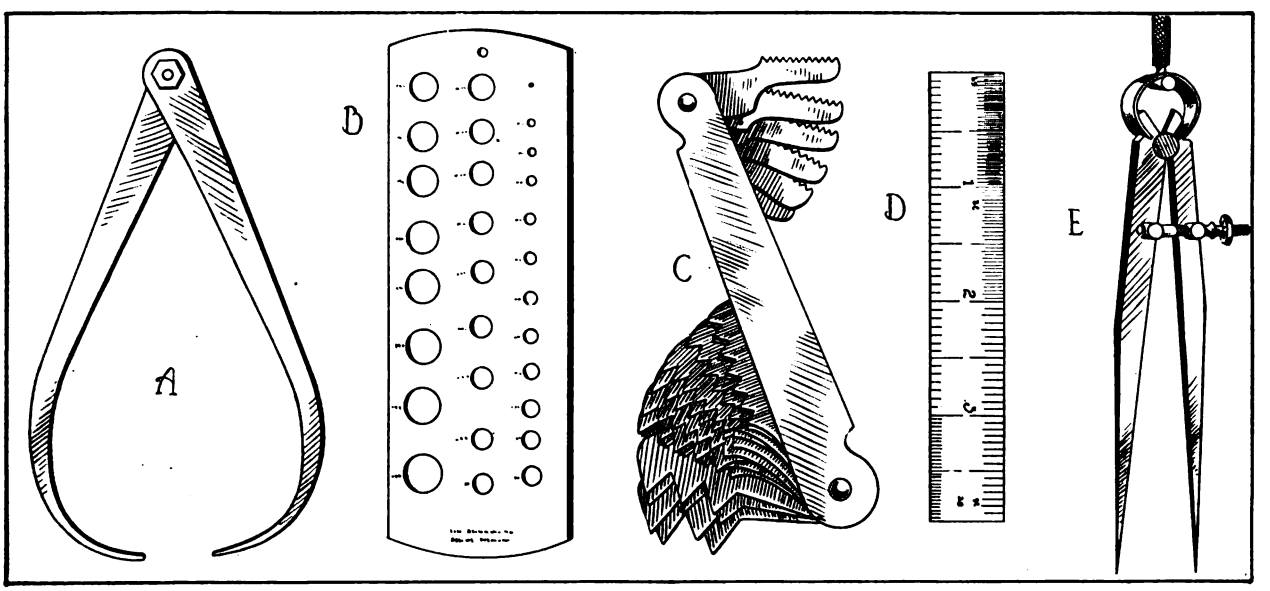

Fig. 2—Measuring Devices: A, Ordinary Form of Callpers; B, Twist Drill Gauge; C, Screw Pitch Gauge; D, Machinist's Steel Rule; E, Spring Dividers.

NOVEL ENGINE DESIGN.

A unique new type of engine, inasmuch as vapor from boiling gasoline is utilized and admitted under pressure to the cylinder, has been brought out in England, and although full particulars of the design are not at hand, sufficient details have been given out by A. R. Low, the designer, to make the motor of interest.

Briefly described, the Low engine may be said to be practically an ordinary jacketed member in which gasoline fills the jacket instead of water. The motor,

Digitized by Google

however, is started in the usual manner by an ordinary carburetor and operated until the fuel in the jacket commences to boil and a vapor at considerable pressure is obtained. The jet of the carburetor is then shut off, so that the piston on the intake stroke supplies fresh air only to the cylinder. This is compressed in the usual manner by the up-stroke but upon the completion of the stroke a small volume of pure gasoline vapor is injected into the combustion chamber by a specially designed valve which is mechanically operated.

The mixture is exploded by a spark plug, but the special valve is so constructed and operated that while it opens quickly, its closing movement is considerably delayed, so that additional vapor continues to be injected into the cylinder. This continues even after the primamry ignition takes place. As soon as the explosion pressure commences to rise, the valve closes.

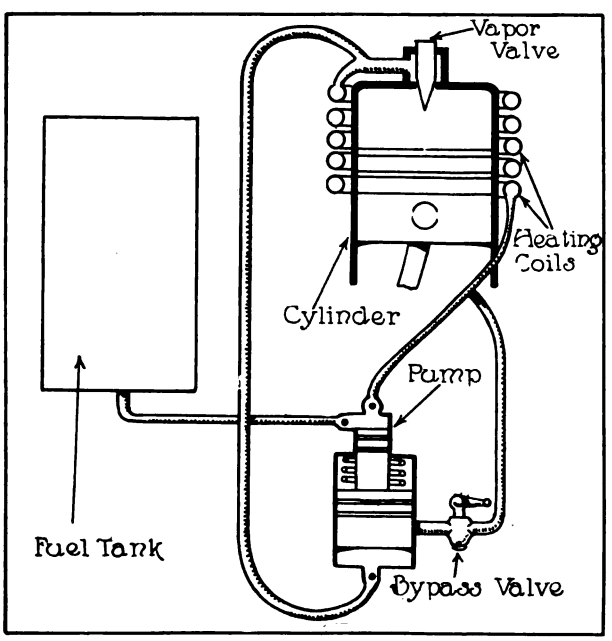

Fig. 3—New Type of Motor Utilizing Vapor from Boiling Gasoline and with Which High Compression Ratios Are Claimed.

Steady Piston Pressure.

The result is that this explosion pressure, instead of quickly resulting in a very high figure and falling off rapidly, drops away more slowly, and the pressure against the piston is more steady than with a sharp impulse. As a consequence, it is said, the torque diagram of the crankshaft of this motor is a very good one, having its peaks flattened down in a similar way to those of the indicator diagram.

The burnt gases are exhausted through a mechanical valve in the usual manner; in fact, it may be stated that the only way the Low motor differs from those of ordinary construction is that it has a third valve and a gasoline jacket instead of a water member. In some respects the Low engine follows the design of the Diesel. The spark of the former, however, instead of occurring momentarily, is purposely prolonged throughout the whole of the explosion stroke, and is supplied by a coil and storage battery, the idea being to provide as complete combustion as possible.

As the fresh air is only in compression on that stroke the compression ratio can be taken to an exceedingly high figure without introducing a liability to pre-ignition. That the engine is very efficient for its size may be gathered from the fact that a twin-cylinder motor with a two-inch bore and four-inch stroke, developed, it is said, about 18 horsepower, but the speed was not stated. The experimental engine was of the motorcycle type.

Supplying the Fuel.

The supply of fuel to the heating jacket is by means of a pump of the Worthington type, which utilizes pressure inside the jacket to force the liquid thereto exactly as a boiler uses its own pressure to supply itself with feed water. At Fig. 3 is shown a sketch of the engine and it will be noted that a throttle valve is incorporated, this controlling a form of bypass in the pump circuit, also regulating the supply of gas to the cylinder by governing the amount of gasoline fed to the jacket. In the new model being constructed it is understood that the air inlet valve will be fitted with an arrangement whereby its cut-off can be so adjusted as to balance with the gasoline vapor control, and when the motor is throttled down, the cylinder will be supplied with the same quality of mixture but a smaller amount. The new motor will have the combustion head jacketed for fuel, the balance with fins for small engines and water jacketed for larger members.

In the feed pump there is a double ended piston one end of which is considerably larger than the other, the smaller being of the direct acting plunger type drawing fluid from the supply tank and forcing it into the coil. As the pressure which is inside this coil is lowered by the volume of vapor which is injected into the cylinder, the piston pump reciprocates and maintains the supply, the throttle or bypass member taking the form of a tap substituted in a pipe which, when uncovered by the large piston, short circuits, as it were, the top and bottom coils of the vaporizer. A spring is fitted above the power piston of the pump, causing the latter to float while reciprocating up and down very rapidly, and by this means a constant and steady supply of fuel is fed to the jacket. The drawing is that of the first experimental engine and it will be noted that coils are utilized instead of a jacket.

HANDY PISTON CLAMP.

In overhauling the piston of the motor it is sometimes necessary to place the member in the vise to perform certain work. The usual method is to grip the piston between two grooved pieces of wood. While this will hold the parts securely, it leaves but a small portion of the piston accessible without changing its position. A handy clip for holding the piston may be

made from a piece of flat .75-inch spring steel about .125 inch thick. This is bent in circular form and two ends left for gripping in the vise.

HEAT RADIATION AND PAINT.

It is generally believed that there is a great loss in efficiency from painting radiators. A series of experiments conducted by Prof. C. L. Norton of Boston upon the transmission of heat through and from painted surfaces shows that the color has little or no effect upon the radiation of heat, though the condition of the surface with respect to glossiness or dullness has quite a sensible influence. Taking the amount of heat radiated from a new pipe as 100, Prof. Norton obtains the following values for heat radiation, under similar conditions, from pipe treated as indicated:

New pipe	100
Fair condition	116
Rusty and black	119
Painted dull white	120
Painted glossy white	100
Coated with cylinder oil	116
Painted dull black	120
Painted glossy black	101

It will be noted that a dull surface, whether it be white or black, has a radiative power of 120, and a glossy surface of either color, has a corresponding value of only about 101.

FILLING HOLES IN CASTINGS.

A metal that is valuable in filling holes in castings, because of its expanding qualities when cooling, is made from nine parts lead, two parts antimony and one part bismuth.

OLD ORCHARD'S BEACH MEET.

What is expected to be the most important racing event in the East during 1912 will be the three-day meet at Old Orchard Beach, Me., July 4-6. Frank Lowry of Indianapolis, Ind., has been appointed chairman of the contest committee of the Old Orchard Automobile Association, which has decided to give approximately $6000 in prizes, in addition to cups, for the meet. Mr. Lowry has been in Detroit during the past month in an effort to interest the manufacturers of that centre in making entry. It is announced that during the meet Louis Disbrow will make an attempt to create new world's records against time in a specially constructed racing machine.

$10,000,000 TAX FOR MOTORISTS.

W. Pierrepont White in speaking on the highway situation in New York State at Albany, recently stated that if an additional $50,000,000 is to be voted for highways, motor cars will have to pay $10,000,000 in license fees. He called attention to the fact that of the $50,000,000 appropriated to construct 2915 miles, 1800 remained unconstructed and that it was proposed to build these in one year and all to serve a few selected counties. This would leave, he stated, slightly over $1,000,000 to complete highways for the remaining portions of the state, and he further averred that the constitutional provision which promised an equitable distribution has been violated. Mr. White suggested that the state should assume entire control, management and maintenance of the proposed 10,000-mile highway system and the roads should consist of main highways only. He also proposed that the state should build the roads and that these be proportioned equally which plan would create in 10 years taxable values of $750,000,000 in return for an expenditure of $100,000,000 in road construction. Even with this vast sum Mr. White stated that it would not be sufficient and that the 200,000 motor vehicles would have to be taxed $50 a machine, creating an annual fund of $10,000,000.

PLUMMER RE-ELECTED PRESIDENT.

John F. Plummer, agent for the Locomobile Company of America, was unanimously re-elected president of the Automobile Dealers' Association at a meeting of the board of directors of that organization held in New York City recently. The other officials selected were as follows: vice president, Frank Eveland; secretary and treasurer. C. P. Skinner; board of directors, M. J. Budlong, R. D. Garden, H. M. Bronner, C. M. Brown, A. L. Newton and Arthur M. Day. The addition of a number of new members was announced as well as progress noted in legislative matters in which the association is taking an active part.

WOULD FORBID AUTOMOBILE RACES.

Senator McManus of New York State has introduced a bill forbidding automobile races on roads or tracks in that commonwealth. Chairman William Schimpf of the contest board of the American Automobile Association has authorized Charles Thaddeus Terry to appear in opposition to the measure, and it is understood that Melvin A. Bender, representing the New York State Automobile Association, will join him.

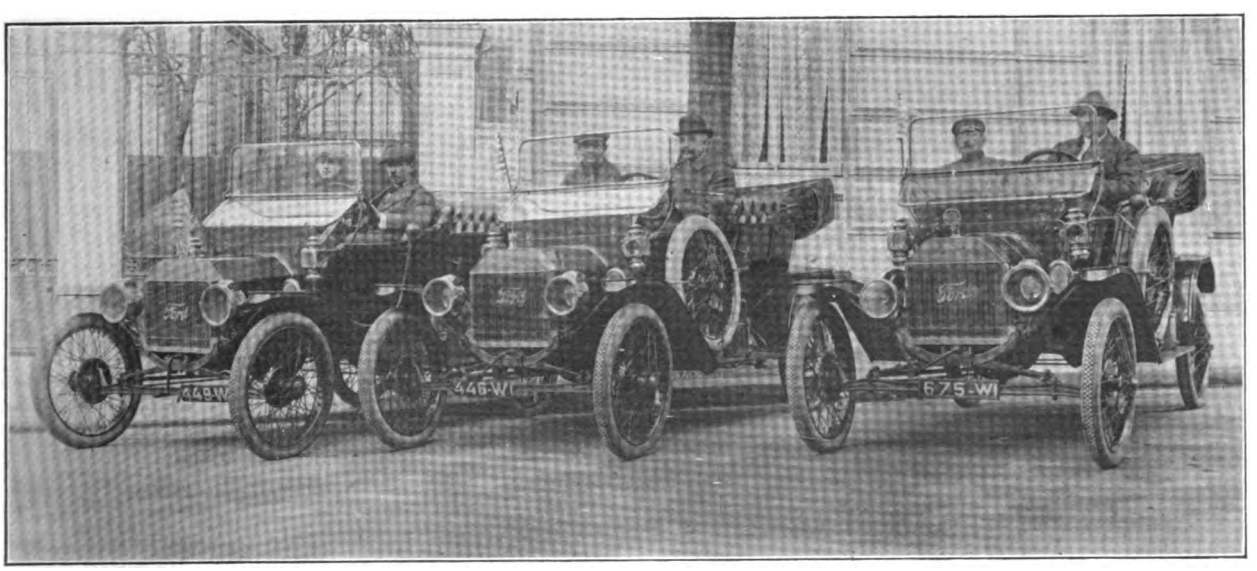
CHINA'S PRESIDENT DRIVES E-M-F.

China, the youngest republic, appears to be up-to-date in all its views. Jan. 29 H. S. Honingsberg, the Studebaker Corporation's representative in Shanghai, China, delivered to President Sun Yat Sen two 30 horsepower E-M-F touring cars. Unlike the custom in the United States, these machines were purchased with private and not governmental funds. However, this is an indication of the liberal views of the new republic, since it is hardly conceivable that the deposed royal family would have dared venture forth in one of the modern inventions.

Digitized by Google

America is more than ordinarily interested in the outcome of the Tour de France, which began under the auspices of L'Auto of Paris and the sanction of the Automobile Club de France, March 1. Six machines of American manufacture took part in the event, which was scheduled to come to a conclusion in Paris, March 20. Undoubtedly, the results will not become known on this side for a few days.

The Tour de France is entirely new, being somewhat upon the order of the so-called Glidden tour in America. While described as an endurance run, with a schedule averaging approximately 240 miles a day, the scores will be based upon the ability of the contestants to maintain a certain speed, this being calculated at 30 kilometers (18.6 miles) an hour for light cars and 25 kilometers (15.5 miles) for voiturettes. In order to prevent racing, no times were announced until the completion of the run.



The route covered about 5000 kilometers (3105 miles), starting and ending in Paris, with night stops at Nancy, Besancon, Lyons, Grenoble, Nice, Marseilles, Montpelier, Toulouse, Bordeaux, Nantes, Le Mans, Rouen and Rheims. Five stops of 24 hours were made for the purpose of demonstrating the contesting cars, so that the event included a sales feature as well.

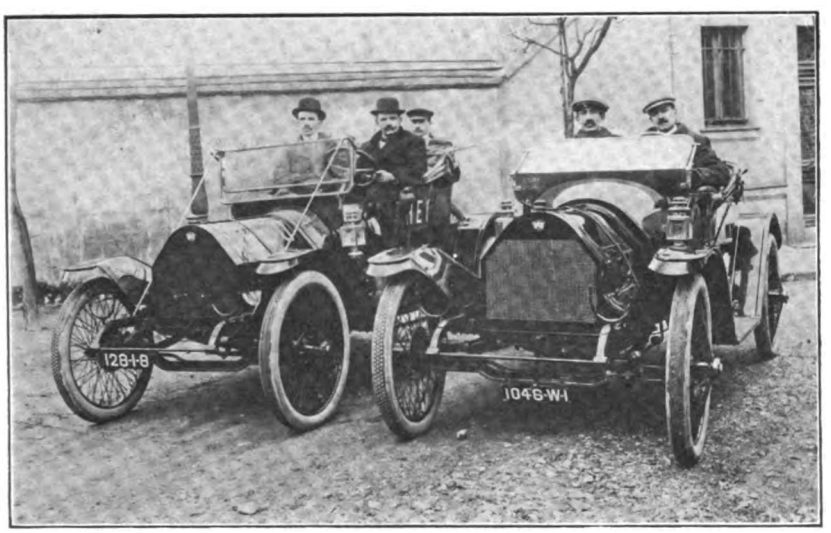
The competing cars were divided into two classes. Light cars included all vehicles of which the chassis price, without tires, did not exceed $1558, and voiturettes, all vehicles of which the price complete with body and tires did not exceed $890. Both classes were required to be fitted with two-seated bodies, windshields, wings, steps, lamps and headlights.

Of the 62 machines entered, three were Fords, made by the Ford Motor Company, Detroit; two were Reos, made by the Reo Motor Car Company, Lansing, Mich., and one was a Hupmobile, made by the Hupp Motor Car Company, Detroit. Accompanying illustrations show the six cars as they appeared when about to depart from Paris at the beginning of the tour. It will be noted that all except the Hupmobile were fitted with wire wheels, which are not included as standard equipment in this country.

★

Discussing self-starters in a recent issue of The

The Ford Team, Comprising Three Cars, Which Took Part in the Recent Tour de France, Under the Auspices of L'Auto of Paris.



Digitized by Google

Autocar (British) J. Dalrymple Bell brought out a number of features which will prove of interest to Americans. Quoting from his article, he says in part:

"The probable reason of the development of the self-starter in America is the difference between the trade systems of that country and this. In America it is usual for the car to be supplied complete with the usual accessories by the manufacturer, while in this country the supply of accessories is, generally speaking, a separate and distinct trade. Between the motor car manufacturer and the accessory manufacturer the self-starter has fallen to the ground.

"The self-starting systems available at present may be classified as follows: A, explosion; B, compressed air; C, electric; D, mechanical.

"When a four or a six-cylinder engine is stopped by switching off, it will, as a rule, start again within a short period by switching on the starting ignition, and to this extent these engines are self-starting. When they refuse to start in this way it is because there is

Two Reo Machines, Fitted with Wire Wheels, in Their First Foreign Contest, the Tour De France.

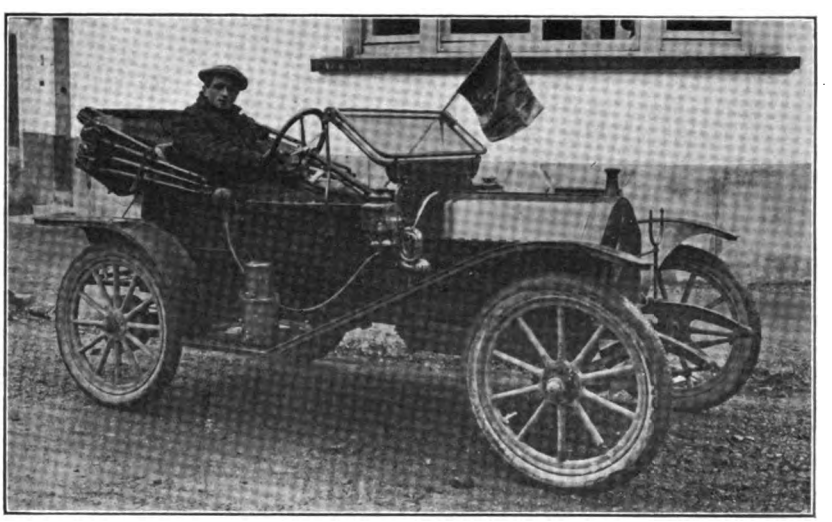
no explosive mixture in the cylinders, or the cylinder, the piston of which is on the firing stroke. It would appear to be obvious and simple to provide some means of insuring the presence of explosive mixture in the cylinders, and a pump for forcing it in at once suggests itself as the simplest solution of the difficulty. In fact, fundamentally, every start is brought about by one way or another causing the fluid to enter the cylinders, so that the crude starting handle might be rightly included in the first class of starters, because by its mean the engine is caused to act as a suction pump and the start is caused by the explosive mixture being drawn in and ignited by the spark.

"But when the problem of forcing the mixture of gas and air in explosive proportions into the proper cylinder, or cylinders, comes to be tackled, several cognate difficulties are encountered. First of all, whether it goes to the other cylinders or not, it must go to the proper one, and two ways of insuring this are to use a distributing valve, either automatic or driven by the engine, and a single pump, or to provide a fuel pipe for each cylinder. If a multiple-barrelled pump be used the several cylinders may be combined in a unit and operated together, but even so, six combined pumps, as would be required for a six-cylinder engine, would be somewhat clumsy.

"One of the chief objections to an ordinary distributing valve is that it must be driven by the engine, and apart from the special arrangements required it is in motion all the while the engine is running. An automatic valve is not subject to this objection.

"The solution of another problem encountered in connection with the explosion starter has in all probability kept back this form of starter more than anything else. However ingenious and perfect the arrangements for conducting the explosive mixture to the proper cylinders may be, reliable starting cannot be obtained unless the mixture is such that the proportion of gas, or vapor, and air are within the explosive limits. For instance, a mixture of gasoline vapor and air in the proportion of two volumes of vapor to 98 of air is the poorest mixture which will explode under atmospheric pressure. Again, a mixture in the proportion of five of gasoline vapor to 95 of air is the richest mixture which will explode under atmospheric pressure, and these proportions are called respectively the lower and upper explosive limits. That is to say, the mixture to be explosive in the case of gasoline vapor and air must be correct within three per cent., which is termed the explosive range.

"This range, however, is increased by increase of pressure, but to what extent has not been determined so far as I have been able to find out. This means that for the purpose of starting with the natural working fluid of the engine, gasoline and air, the mixture must be confined within narrow limits of accuracy, and as an unknown quantity in the amount and quality of the residual charge in the cylinders exists, this accuracy of mixture is all the more difficult.



"When conditions and requirements are known to be variable, they can often be met by a corresponding variation, and in the case of the explosive mixture starter, if a mixture varying from rich to poor be pumped into the cylinders it is bound to pass through the explosive range, and it then only remains to cause an igniting spark to take place while the mixture is within that range. As it is quite easy in practise to do this, this system of pumping the mixture has been adopted in connection with the automatic distributing valve, and also with the multiple-barrelled pump previously referred to, and it is

Digitized by Google

claimed that gasoline and air, when used in this manner, are quite reliable even in the coldest weather.

"One method of meeting the difficulty caused by the narrow explosive limits of gasoline vapor and air is to use pure oxygen instead of air. This gives powerful and certain results, but as such a charge is exceeding inflammable and the explosion exceedingly rapid, the precaution of retarding the ignition must be taken, for with the slightest degree of advance premature ignition will take place in the second cylinder to fire, and as this charge is under compression the effect is very powerful. In fact, the use of pure oxygen creates a greater explosive range than is necessary, and it is advisable that the oxygen should be diluted, or that the mixture should be such that it does not give the maximum explosive effect.

"Another method of meeting the difficulty of mixture is to use another combustible gas, with a wider explosive range, instead of gasoline vapor and air, and acetylene is a suitable gas for this purpose. The explosive range of acetylene and air mixtures extends from three to 52.5 per cent., so that with this gas it is extremely easy to obtain an explosive mixture. The chief objection to its use is that it is foreign to many cars, and it must be used in its purified and dissolved state, and therefore it is a little more expensive. It has, however, the advantage that only five to seven cubic inches are required for the start, whereas 100 to 150 cubic inches of air and gasoline vapor are required, and this means that if a hand pump be used one stroke is sufficient with acetylene, whereas six to 10 strokes would be required with gasoline. Another point is that with this moderate quantity of acetylene a cylinder of dissolved acetylene containing five cubic feet will give over 1200 starts, while a 20-cubic foot cylinder will give four times that, or nearly 5000 starts.

La Voiturette Hupmobile, as the French Term It, Representing America in L'Auto's Tour De France.

"The compressed air system seems to be second in popularity in America, but there are two cars in this country fitted with it as a standard, which have been on the British market for some little time. It is essential in most cases that this system should be fitted by the engine builders and that it should be allowed for in the design of the car. Compressed air or exhaust gas which has been stored under pressure is admitted by means of an engine driven distributing valve, to the cylinder which has its piston on the firing stroke, so that the engine is driven by air pressure until it picks up on its own explosive mixture. At first, in fact, it runs as a compressed air engine.

"The reliability of this system is quite equal to that of the explosion starter provided that the engine picks up at once, as of course it should, but it must always be borne in mind that the supply of pressure is limited, and that its replenishment requires a considerable number of engine revolutions. The pressure used varies from 40 pounds a square inch to 300. Of course, the higher the pressure the greater the storage capacity in a given space, but when the pressure falls under 100 pounds a square inch, or so, it is as a rule insufficient for starting a four-cylinder engine. With a six-cylinder engine less pressure is required, as each piston operates through one-third revolution instead of one-half and there is, therefore, no dead point.

"In putting the electric system in third place of importance, its figure of merit is brought there by consideration of its cost and weight. As it amounts to a separate and distinct power plant in itself, the engine is bound to start if turning it around will cause it to do so. It is even conceivable that the car might be moved about under electric power. This system also has the advantage of providing a source of current for electric lighting, etc.

"In considering the question of self-starters in general, my conclusion is—and I write from experience gained from several years of experimental work in connection with them—that the explosion starter is for general use the best system. It is to the internal combustion engine what 'live steam' is to the steam engine.

"If a really elaborate and absolutely certain system be required, and if the expense be a secondary consideration, then the electric system stands alone. So far as reliability is concerned, the compressed air and explosion systems stand together. So far as simplicity and low cost are concerned, the explosion system stands alone."

★

The Canton du Valais, Switzerland, has authorized the opening of the road which connects Martigny and Chamonix to automobile traffic. This will permit tourists to enter this portion of Switzerland without being obliged to take the route by way of Geneva or Aix-les-

Digitized by Google

Bains. Regulations will date from June 1, 1912, and will be framed with regard to the time of day when cars can use the road. Inasmuch as its width at present will not permit vehicles to pass each other, cars will be driven from Martigny to Chamonix in the forenoon and in the opposite direction in the afternoon.

★

British motoring publications have been demanding for some time that racing cars be rated by classes based upon the cubic capacity of the cylinders, and it would appear that the Royal Automobile Club has acceeded to this demand in announcing a new rating formula for 1912. This will apply to all events held on the Brooklands track in the future, and should give the public better opportunity to compare the results with those made on American tracks.

The new rating does not coincide with that in vogue in the United States, under the jurisdiction of the contest board of the American Automobile Association, but it does provide for taking the stroke into consideration. Nine classes are provided, the maximum cylinder capacity in each being as follows: A, 100; B, 125; C, 150; D, 175; E, 235; F, 305; G, 475; H, 850; J, over 850. The American ratings are as follows: Class 1B, 160 and under; 2B, 161-230; 3B, 231-300; 4B, 301-450; 5B, 451-600; 6B, 601-750.

In the matter of minimum weight the British rules call for the following: A, 1400; B, 1500; C, 1600; D, 1800; E, 2000; F, 2250; G, 2500; H, 2700; J, 3000. The American rules provide: Class 1B, 900; 2B, 1200; 3B, 1500; 4B, 1800; 5B, 2100; 6B, 2400.

Of course the adoption of new rules creates a new record classification, and the present British speed records in miles an hour are:

	Car	Mark	Speed
Class B	Lion Peugeot	Half-mile	72.333
Class D	Singer	Half-mile	90.040
Class D	Austin	Kilometer	93.790
Class E	Vauxhall	Half-mile	100.083
Class E	Straker-Squire	Kilometer	96.670
Class F	Vauxhall	Half-mile	97.670
Class G	Benz	Half-mile	113.759
Class G	Pobble	Kilometer	86.043
Class G	Sunbeam	11 Hours	75.720
Class H	Napier	Half-mile	94.132
Class H	Thames	50 Miles	91.320
Class J	Benz	Half-mile	127.877

★

Although plans for a Prince Henry tour in Germany this year have failed to mature, the Imperial Automobile Club, with headquarters at Berlin, is arranging an international reliability trial for small cars, for July 1-7. The route will lead from Berlin to Dresden in five daily stages, including a detour from Breslau to Glatz and return, July 5. The average distance to be covered each day will be 187 miles, the night stops being at Stettin, Posen, Breslau (two) and Dresden.

It is anticipated that American manufacturers will embrace the opportunity to demonstrate their product in this event. Following the conclusion of the run an exhibition of prize winning vehicles and the distribution of awards will take place at Dresden. This is expected to afford a chance for makers and representatives to call attention to their cars in a manner calculated to establish a demand therefor.

The competition is open to all vehicles with four wheels and internal combustion motors of not less than four or more than eight horsepower. They must be touring cars complying with the detailed regulations which may be obtained from the Imperial Automobile Club, Berlin.

LITTLE GLIDDEN BECOMES IOWA TOUR.

The Iowa State Automobile Association underwent a reorganization during the recent show in Des Moines, and steps will be taken to increase the membership materially during the coming year. H. Leslie Smith of Chicago, an organizer of some note, has been engaged as secretary-treasurer and will receive compensation on the percentage basis. The endurance run formerly conducted by the association under the name of the Little Glidden will be known in the future as the Iowa tour. President W. E. Moyer has appointed a committee to arrange the details for this annual event and to secure a suitable trophy to cost between $1000 and $1500.

BAR HARBOR'S MOTOR WAR ENDS.

By a vote of 469 to 193, the town of Eden, Me., in which is located Bar Harbor and Mt. Desert Isle, has adopted the act passed by the last Maine Legislature granting permission for automobiles to use the road leading from the bridge at Mount Desert Narrows in Trenton to a point in Bar Harbor not more than half a mile from the Bar Harbor postoffice. This ends the war against motor cars which has been carried on by the people of Bar Harbor since 1903, when they petitioned the Legislature for an act prohibiting such use of the highways in the town of Eden. The constitutionality of this act was determined by the supreme court of Maine in 1909, but since that time public opinion has changed decidedly.

NO AMENDMENTS IN NEW YORK.

It is announced from an apparently authoritative source that the New York Legislature will make no change in the so-called Callan automobile law during the present session. Several amendments have been introduced and the organized motorists in that commonwealth have been exceedingly busy at hearings before the various committees. It is claimed, however, that the leaders have come to the conclusion that it would be wiser to give the Callan law another year's trial before making change.

Automobilists should advocate uniform motoring laws, because in no other way can the present confusion of interstate touring be avoided.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

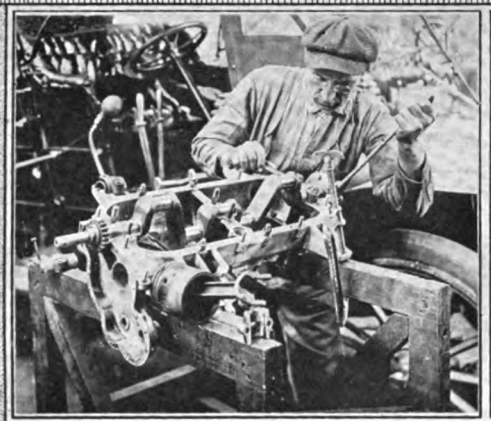
The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

	"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA" 2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—**Add $3.00 to above Price Lists.** (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)



For Use on AUTOMOBILES and MOTOR BOATS

MECHANICAL NOTES FOR OWNERS

Methods of Simplifying the Care and Maintenance of the Car, Discussion of Pertinent Facts and Notes on Operation.

ELIMINATING TAPPET NOISE.

There is a growing tendency to enclose the valve tappets and springs and this practise is not confined alone to the high priced automobile. This not only makes for a quiet running motor, but the life of the mechanism is lengthened considerably by being protected from the dust and dirt of the road which is attracted by the oil covered members.

While many modern motors are designed so that a removable plate may be fitted there are numerous

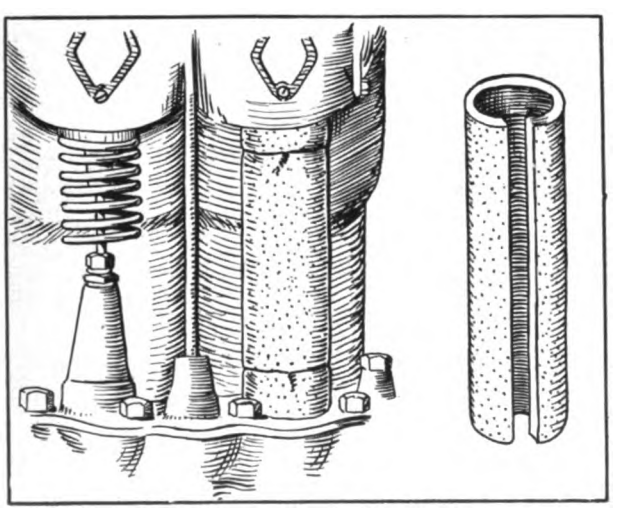

Fig. 1—Suggestion for Quieting Noisy Action of Valve Tappets.

old engines which are giving good service although the tappets are more or less noisy. At Fig. 1 is presented a suggestion for eliminating noise as well as providing protection from foreign elements.

It consists of a piece of rubber tubing fitted around the tappet and valve spring and when properly attached will reduce noisy action of the members to a minimum. With a motor such as depicted in the drawing it is an easy matter to fit the device. The tubing should be larger than the diameter of the valve spring and is cut as shown in the sketch. It is then wired or taped so the edges are drawn together tightly.

In fitting the hose, should the valve springs be larger or the same in diameter as the base of the tappet housing, this and the upper seat of the spring may be enlarged with a washer made from a smaller tubing, and a hose of greater inside dimension employed to cover the extensions. In fitting these devices care should be taken to use a heavy grade of piping with its inside diameter large enough to allow the spring to move freely and without coming in contact with the walls of the tubing.

REMEDYING LEAKY VALVE TAPPETS.

It is very unpleasant after lifting the hood to make a minor adjustment to the motor to discover that the latter is literally covered with dirty oil which has worked past the valve tappet guides and the tappets. It is even more disagreeable if the operator be not equipped with an old coat or arm protectors in the failure of which good clothes often are spoiled.

Two conditions are responsible for the presence of dirty lubricant, and these are more common with old motors or those which have been in service for some time without attention having been given to the valve operating mechanism. When a motor is new and the rings and pistons are fitted properly there is little compression in the crankcase of the four-cycle type. In time the rings wear, especially if the lubrication system has not performed its function properly or the operator has been careless as to the quantity and quality of oil.

When these conditions exist the compression on the up-stroke of the piston leaks past the rings and pressure is created in the crankcase, the amount depending upon the fit of the rings, etc. It is obvious that even with a small amount being forced into the crankcase at every stroke of the piston, it takes but a short time for the pressure to rise and some of this must escape. If the lower half of the crankcase be fitted snugly, the oil will find its way where the re-
